Study Limitations

On behalf of Agnico Eagle Mines Limited (Agnico Eagle), Golder Associates Ltd. (Golder) has prepared this Wildlife Monitoring Summary Report for the 2021 Monitoring Period at Meadowbank Mine.

This report was prepared, based in part, on information obtained from Agnico Eagle and other external information sources. In preparing the report, Golder has relied in good faith on the information provided. We accept no responsibility for any deficiency or inaccuracy contained in this report because of our reliance on the aforementioned information.

The findings and conclusions documented in this report have been prepared for the specific application to this Project and have been developed in a manner consistent with that level of care normally exercised by environmental professionals currently practicing under similar conditions in the jurisdiction.

With respect to regulatory compliance issues, regulatory statutes are subject to interpretation. These interpretations may change over time and should be reviewed regularly.

Executive Summary

As a requirement of the NIRB Project Certificate, the 2021 Wildlife Monitoring Summary Report (2021 Annual Report) represents the 16th of a series of annual reports for the Agnico Eagle Mines Limited (Agnico Eagle) Meadowbank Mine (the Project). Baseline and monitoring programs were first initiated in 1999 and will continue through the life of the Mine. Details of the wildlife monitoring program for the Project are provided in the Terrestrial Ecosystem Management Plan (Version 7, Agnico Eagle 2019). The 2021 Annual Report provides the monitoring objectives, methodology, historical and current year results, and management recommendations for each monitoring program. The 2021 Annual Report builds on data presented in previous reports and incorporates monitoring recommendations from these reports, as well as recommendations and requests from intervenors on past reports made during the NIRB review process. Below is a summary of the results from each component of the 2021 Annual Report.

Caribou Management Decision Tree

- Decision tree process used data from the road, Mine site, viewshed surveys, and satellite collaring to determine the scale of caribou monitoring and management required.

Road Surveys

- In 2021, 177 road surveys were conducted along the All-weather Access Road (AWAR) and 144 were conducted along the Whale Tail Haul Road (WTHR).
- A total of 37,825 caribou were observed along the AWAR (213.7 caribou per survey) and 11,928 caribou were detected along the WTHR (82.8 caribou per survey).
- Road surveys helped facilitate mitigation decisions along the AWAR and WTHR. The AWAR was fully closed on 49 days, partially closed on 9 days and had speed restrictions applied for 39 days. The WTHR was fully closed on 13 days, partially closed on 1 day, and had speed restrictions applied for 29 days.

Pit and Mine Site Ground Surveys

- The incidental wildlife forms were used consistently throughout 2021 to document wildlife seen around the Project. Starting in October 2021, observations from weekly pit and mine site surveys were recorded separately from incidental observations.
- Arctic fox, Arctic hare, caribou, wolf, muskox, and wolverine were recorded in 2021. Bird sightings throughout the year included bald eagle, peregrine falcon, ptarmigan sp., rough-legged hawk, and snowy owl.
- Wildlife deterrents were used on 37 occasions in 2021, and were used for caribou, muskox, wolf, and wolverine. A decoy was deployed at the Baker Lake tank farm to discourage bird nesting. Deterrents were also applied to Quarries 20 and 22 to discourage raptor nesting.
- One wolverine mortality was recorded in 2021.

Wildlife Habitat Monitoring

- An analysis of available wildlife habitat was conducted to compare the actual habitat losses to the permitted areas for proposed development.

- Wildlife habitat losses total 1,130 ha for the Meadowbank Mine Site, 775 ha for the Whale Tail Pit and Haul Road and 180 ha for the AWAR. None of the areas exceed thresholds for high suitability habitat losses.

Caribou Satellite-Collaring Program

- Analysis of caribou migration patterns using collar data from 2005 to 2019 are provided in Appendix F. Agnico Eagle intends to continue collaboration with the Government of Nunavut Department of Environment (GN DoE) caribou satellite-collaring program. Collar data were not available to complete the 2021 analysis.

Viewshed Surveys

- The viewshed surveys implemented in 2021 are to act as an early-warning system for caribou approaching the WTHR.
- Of the 310 viewshed surveys completed, 37 surveys (12%) had caribou sightings, and a total of 190 caribou were reported. Survey effort was focused in the fall season during 2021.

Remote Camera Program

- Data were analyzed from time-lapse images collected from remote cameras on the Whale Tail Haul Road between 2019 and 2021. Caribou were detected in the spring of each year, and road crossing events were detected in 2020 and 2021.
- The majority of road crossing events occurred during road closure. The average time between crossing events and previous vehicle was 23:09 hours, ranging from 2:30 to 85:10. Too few crossing events were detected to statistically compare crossing rates between different road heights, backfill materials, and backfill slopes.

Blast Monitoring

- Blast measurements were collected at 500, 1,500, 3,000, and 5,000 m from the Whale Tail Pit. Blast measurements were collected between December 20, 2020 and August 6, 2021. A total of 139 blasts were measured during this period.
- Surveys for caribou prior to blasts were performed on 165 days between 3 January to 16 December 2021. Of the 165 surveys, 132 surveys yielded no caribou observations. A total of 21 caribou behaviour monitoring surveys were completed during blasts in 2021. Blasting was cancelled on a single occasion due to caribou presence in the vicinity of the Whale Tail Pit.

Hunter Harvest Study

- The Hunter Harvest Study (HHS) included 55 participants in 2021.
- The 2021 HHS data indicated that 43% of reported harvest occurred within 5 km of the AWAR, and 71% occurred within the Meadowbank RSA.
- In 2021, three Caribou were harvested within 5 km of the WTHR. Given the low numbers of reported harvests close to the WTHR and the prohibition of the public from the WTHR, it is unlikely that the presence of the road has resulted in increased harvest.

Predatory Mammal Den Monitoring

- Potential effects due to Project-related activities were not identified to trigger monitoring of predatory mammal dens. Monitoring of predatory mammal dens were conducted informally in 2021 through observations recorded during other monitoring programs.

Raptor Nest Monitoring

- Raptor nest monitoring in 2021 occurred in all quarries along the WTHR and AWAR. Raptor activity and potential nest locations were also noted on other surveys including road surveys, viewshed surveys, freshet monitoring, and on-site environmental monitoring. Eight previously established peregrine falcon nests were identified and monitored.
- Raptor nest management plans were not developed at the active nest sites, as Mine-related activity was already restricted within the quarries where Falcons were observed.

Waterbird Nest Monitoring

- Trent University, in collaboration with Environment and Climate Change Canada (ECCC) and Agnico Eagle, conducted a research study to investigate mitigation options to minimize flooding-related impacts to birds in the Whale Tail South area.
- Studies in 2021 indicated that the average number of nests and bird density increased from 2019 to 2021 in upland control plots, and nest density declined in flood zone plots, potentially indicating a movement of nesting sites to adjacent areas, however this was not supported by mark-re-sighting surveys. Further discussion of the 2021 field program is provided in the '2021 Migratory Bird Protection Report' (Appendix C).

Breeding Bird Monitoring

- Agnico Eagle is finalizing a collaboration agreement with Environment and Climate Change Canada, with focus on contribution to regional bird monitoring programs. This includes commitment to 48 PRISM plots selected by CWS over 10 years (2021 to 2031), and completion of AWAR and WTHR Breeding Bird Survey (BBS) routes opportunistically when qualified individuals are on site. At a minimum, these BBS routes will be conducted every 3 years during the operations, closure, and post-closure phases of the project. PRISM and BBS are scheduled to restart in 2022.

Non-Native Plant Surveys

- Two non-native plant species were identified during surveys in 2021. Recommendations for management of non-native plants are provided.

Special Studies

- A pilot snow study was implemented in 2020 and 2021 to evaluate the effectiveness of the survey techniques and to guide future monitoring activities but sampling targets have not been met to date. Year one of a three-year monitoring program is planned for 2022, which will aim to collect a full suite of data from 36 survey locations along the WTHR and AWAR.
- Agnico Eagle continued a caribou behaviour study that focussed on measuring different behaviour activities of caribou in relation to mine-related activities (Appendix L).

Table of Contents

1.0	INTRODUCTION	1-1
1.1	Background	1-1
1.2	Project Description	1-1

1.0 INTRODUCTION

1.1 Background

The Agnico Eagle Mines Limited (Agnico Eagle) Meadowbank Mine (the Project) is located in the Kivalliq Region of Nunavut (Figure 1) and received a Project Certificate No. 004 from the Nunavut Impact Review Board (NIRB) in 2006. The subsequent Water Licence, Government of Nunavut (GN) and Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) Land Lease, and Kivalliq Inuit Association (KIA) Land Use Production Lease, allowed for the construction of a gold mine and ancillary facilities including an All-weather Access Road (AWAR), barge unloading facilities, lay-down area, and a fuel tank farm near the Hamlet of Baker Lake. The Whale Tail Pit Project, an extension of the Meadowbank Mine, received a Project Certificate No. 008 from NIRB in 2018.

Up to 2017, annual reports were based on the Terrestrial Ecosystem Management Plan (TEMP) developed by Cumberland Resources (Cumberland 2006). The TEMP was a requirement of the Meadowbank Project Certificate No. 004, Condition 54 and Whale Tail Pit Project Certificate No. 008, Condition 28. Since 2018, the TEMP Version 7 has incorporated the Whale Tail component of the Project and reflects changes in management and monitoring approaches since 2006 (Agnico Eagle 2019). The revised TEMP also benefitted from collaborative input from the Government of Nunavut Department of Environment (GN), the Kivalliq Inuit Association (KivIA), and the Hunters and Trappers Organization (HTO) of Baker Lake through annual report reviews, technical reviews, workshops, and discussions within the Terrestrial Advisory Group (TAG). The April 2020, Version 8 TEMP was prepared and reviewed by the TAG and to serve as the basis for the 2020 Annual Report. However, due to uncertainties and on-going discussions with TAG over TEMP Version 8 updates, Version 7 of the TEMP continued as the basis for 2021 monitoring and mitigation. The scope of the TEMP is to report on monitoring of the Mine during construction, operation, maintenance, reclamation, and closure.

This annual report includes data collected in 2021, the 12th year of Mine operation, and is the 16th of a series of annual Wildlife Monitoring Summary Reports for the Project. The purpose of this report is to summarize 2021 data collected from wildlife monitoring programs, and to describe natural variation and potential Mine-related changes in wildlife populations within and adjacent to the Meadowbank Gold Mine (including the approved Whale Tail Project). The 2021 Annual Report describes monitoring objectives and methods, historical and current year results, mitigation activities, and management recommendations based on 2021 monitoring results. Furthermore, comments received from various intervenors through the NIRB review of the 2020 annual report were incorporated, where possible, into analyses and reporting in this document.

1.2 Project Description

The Meadowbank Gold Mine is located approximately 90 km north of the community of Baker Lake. The Whale Tail Pit extension, with an expected operating life of seven (7) years (2019 to 2025), is located approximately 180 km north of Baker Lake. The Whale Tail Pit extension is an open-pit mine connected to Meadowbank Mine by a 64 km all season haul road. The local physiography is characterized by numerous lakes and low, rolling hills covered mainly by lichen/rock complexes, and heath tundra.

Environmental baseline studies were conducted prior to Meadowbank and Whale Tail Mine approvals and integrated into Project designs according to the Cumberland (2006) and Agnico Eagle (2019) TEMPs. Wildlife Valued Ecosystem Components (VECs) for the Meadowbank Project were identified in consultation with regulatory agencies and Baker Lake residents, and considered criteria such as conservation status, relative abundance within the Project study area, importance in subsistence lifestyle and economy, importance in predator-prey systems, habitat requirement size and sensitivity, and contribution to local area concerns. Based on

these selection criteria, key terrestrial VECs determined for the Meadowbank Project were wildlife habitat, ungulates, predatory mammals, small mammals, raptors, waterbirds, and upland breeding birds. Because of limited evidence that small mammals were affected by the Project, this VEC was not included in the Whale Tail Project or revised TEMP. Further details can be found in the Final Environmental Impact Statements (FEIS) for the Meadowbank Project (Cumberland 2005) and the Whale Tail Pit Expansion Project (Golder 2016; Golder 2018).

Construction of a 106.8 km AWAR between the community of Baker Lake and the Meadowbank Mine was completed in March 2008 and provides Mine site access and re-supply, while on-site Mine haul and access roads connect open-pit areas to ancillary facilities. Meadowbank Mine site facilities include a mill, power plant, maintenance facilities, tank farm for fuel storage, water treatment plant, sewage treatment plant, airstrip, and accommodations. Mine components include open pits, waste rock storage facilities, and a tailings storage facility.

In 2008, construction of numerous camp infrastructure facilities was completed, while in 2009, the principal Mine site construction commenced. Mine operation commenced in early 2010. Mining at Goose Pit was finished in 2015 while Agnico Eagle continued ongoing mining operations at Portage and Vault pits and investigated expansion of the Vault area into Phaser Lake. In 2018, an expansion was made in pit E (Portage) to extend mining and mill feed to bridge the gap between the end of mining activities in Meadowbank and the start of mining activities at Whale Tail Pit. As a result, mining activities at Meadowbank in 2021 were only ongoing in Whale Tail Pit with ore from this pit being processed at the mill at the Meadowbank site.

To extend Mine operations and milling at Meadowbank Mine, Agnico Eagle has developed the Whale Tail Pit and Haul Road Project, approximately 55 km north of the Meadowbank Mine, on a satellite deposit located on the Amaruq property in the Kivalliq Region of Nunavut. The Amaruq Exploration Access Road (AEAR) was built in 2016 and 2017 to access the Amaruq exploration site from the Meadowbank complex. The AEAR was modified into the WTHR (enlargement) following regulatory approval and was completed in 2018. Construction of the Whale Tail Dike in 2018 allowed for Whale Tail Lake North Basin dewatering starting in Q1, 2019, the pre-stripping of future Whale Tail Pit, and the construction of major infrastructures including the permanent camp, with accommodation and kitchen facilities, sewage treatment plan, tank farm for fuel storage, and freshwater intake. Open-pit mining operation at the Whale Tail deposit began in Q3 (September 30th), 2019. Commercial operations at the IVR pit commenced on 31 December 2021. Commencement of underground mining operations at the IVR pit is planned for 2022. Permitting to expand the Whale Tail operation and extend the Mine life to 2026 was approved in February 2020 (refer to Project Certificate No. 008, Amendment 001. Expansion of the WTHR for widening to allow two-way haul traffic was assessed under this Project Certificate Amendment 001. Widening of the Haul Road has not been completed to date.

1.3 Study Area Boundaries

1.3.1 Meadowbank Mine, Vault Pit, and AWAR

The Meadowbank Mine Local Study Area (LSA) includes a 5 km radius area centred on the Mine Site and a 5 km radius around the Vault Site creating an elliptical shape with a total area of 194 km². The AWAR LSA consists of a 3 km wide corridor centred on the AWAR between Baker Lake and the Meadowbank Mine. The Regional Study Area (RSA) encompasses an area that includes a 25 km radius area around the Meadowbank Mine and Vault sites and a 50 km wide corridor along the AWAR for a total area of 5,106 km² (Figure 1).

1.3.2 Whale Tail Pit and Haul Road

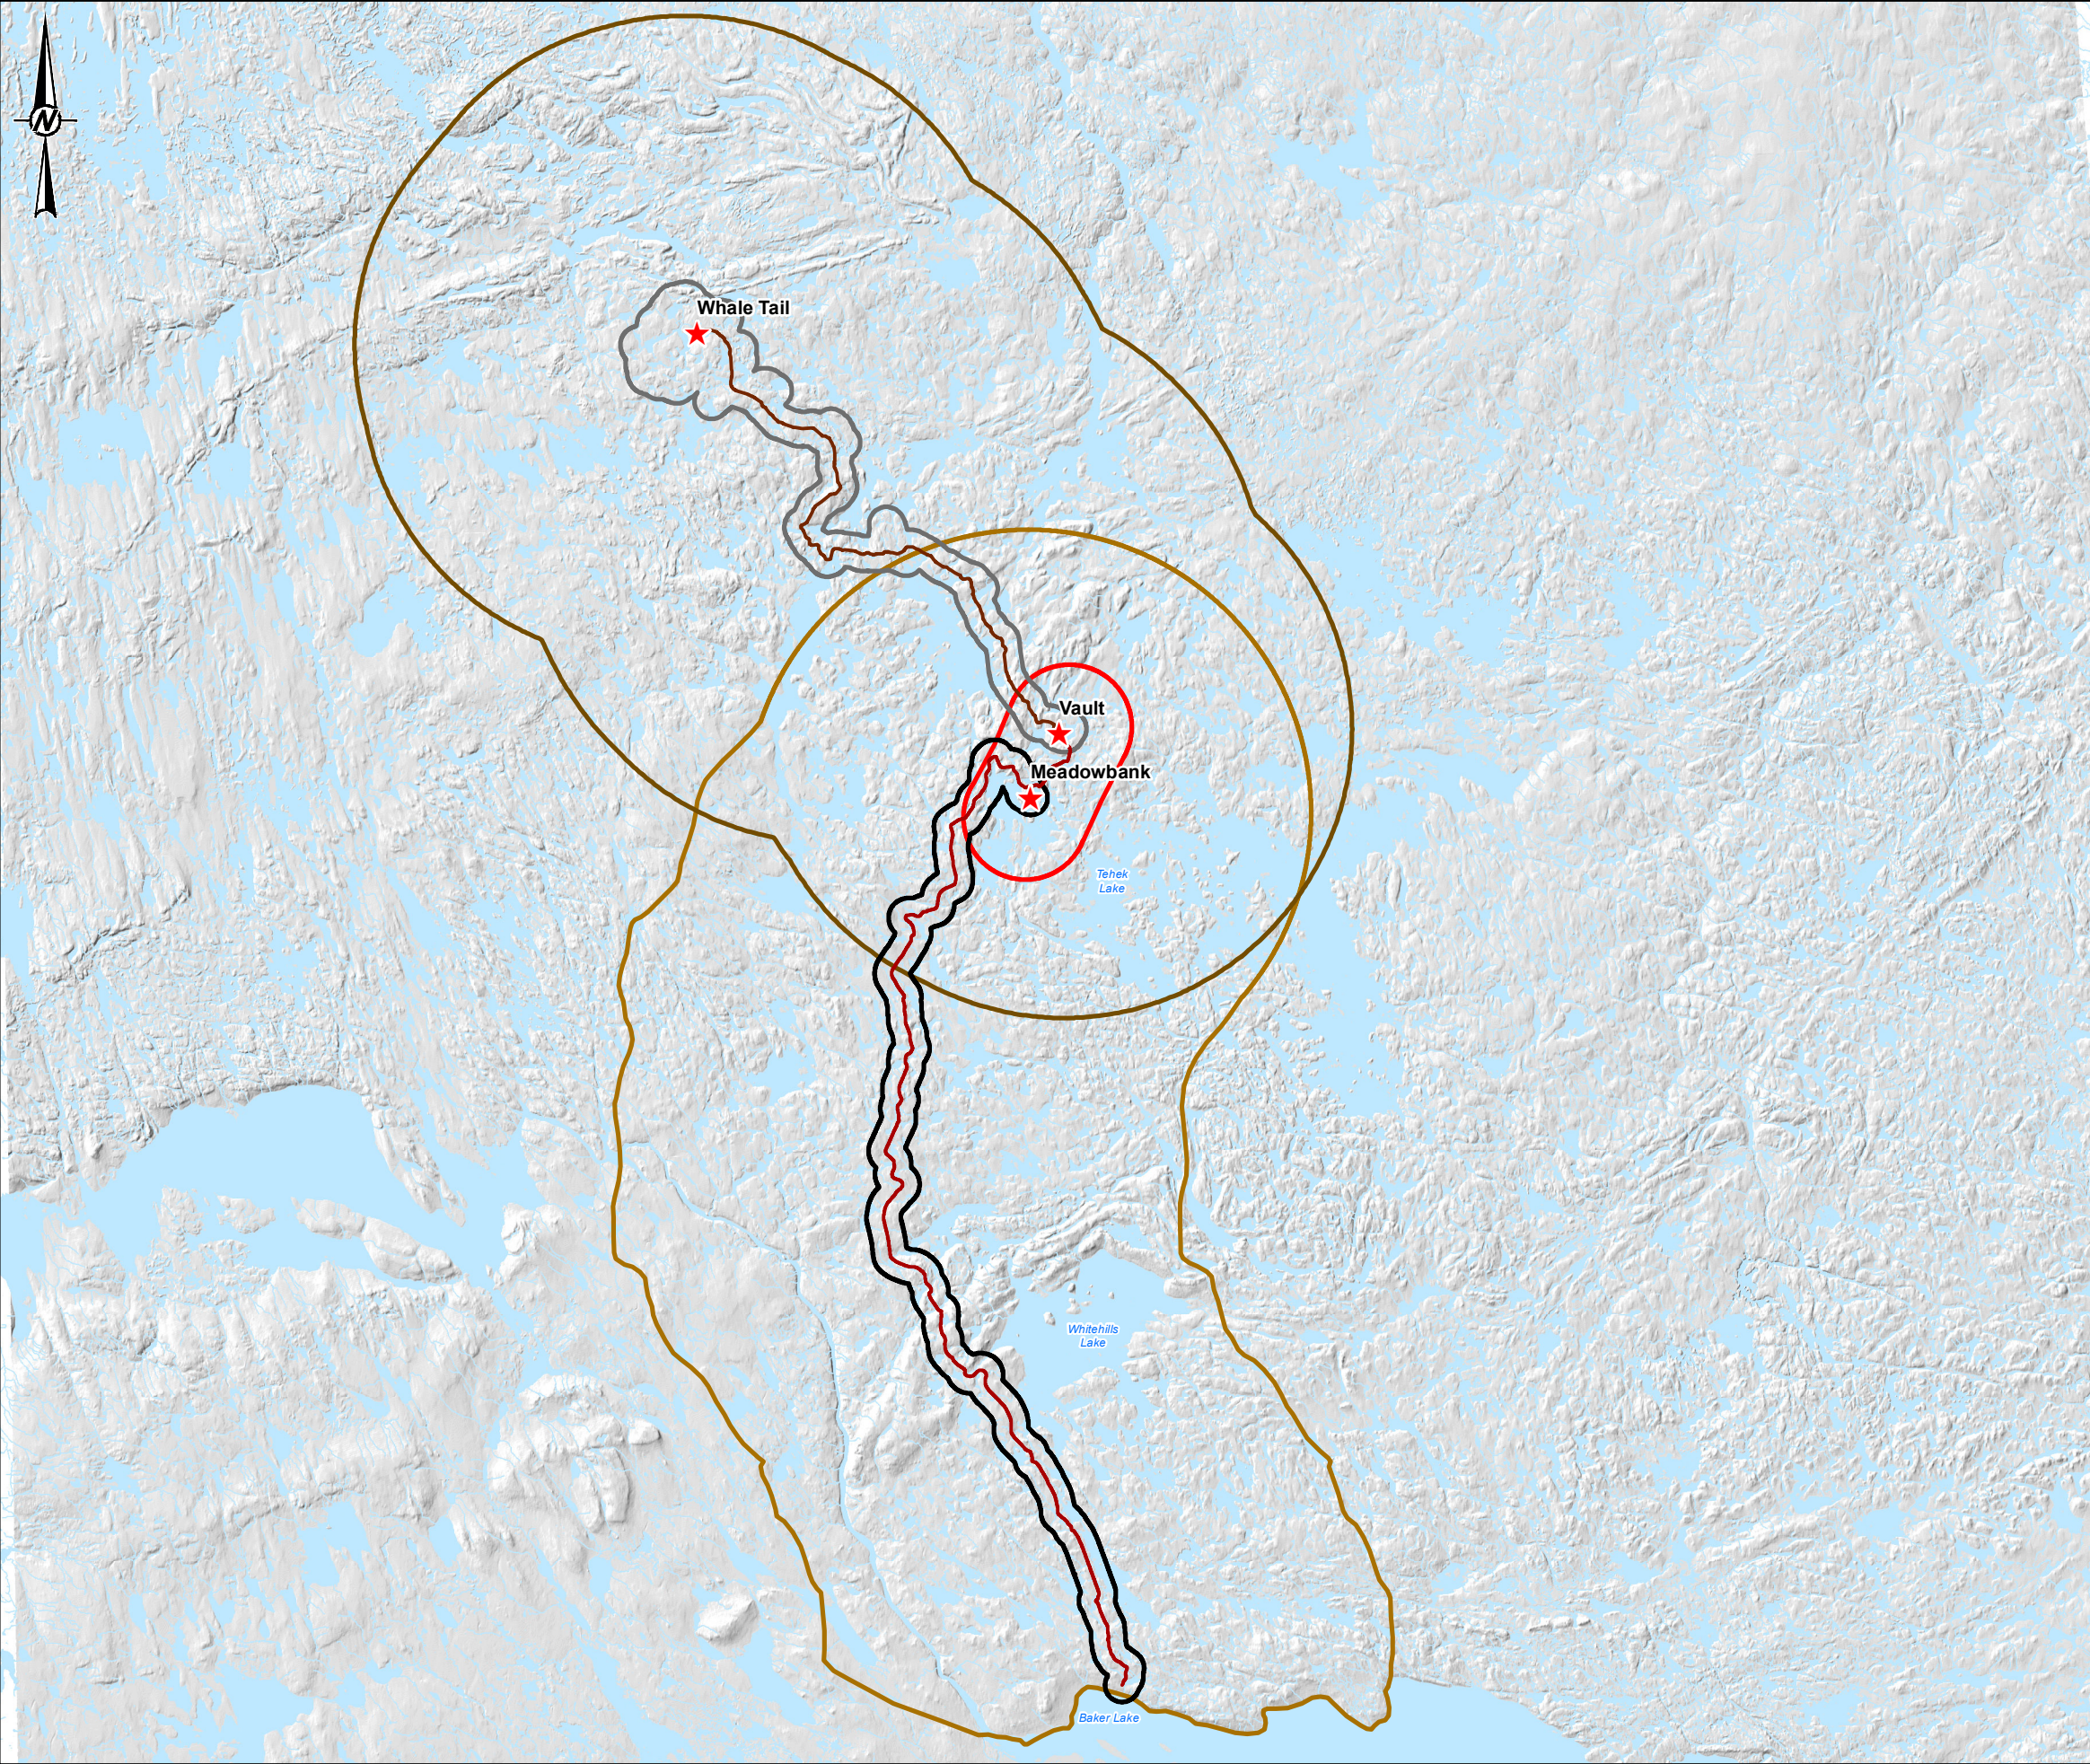

The Whale Tail LSA is a 3 km corridor centered on the WTHR and borrow site access roads (i.e., 1.5 km on either side of the road and 1.5 km around borrow areas) and includes an approximate 1.5 km buffer around development areas at the Whale Tail Pit area, for a total area of 282 km². The Whale Tail RSA is a 50 km corridor centred on the WTHR alignment (i.e., 25 km on either side of the WTHR and borrow site access roads, and 25 km around borrow areas), with a total area of 5,017 km² (Figure 1).

1.4 Monitoring Approach

Wildlife monitoring is an essential tool in protecting and maintaining wildlife occurring near the Project. A comprehensive monitoring strategy, along with quantitative monitoring indicators, has been implemented and as required, is adapted to evaluate the accuracy of impact predictions and to meet the objectives of the management strategy set out in the TEMP (Agnico Eagle 2019). Version 7 of the TEMP (Agnico Eagle 2019) is the current version implemented. Monitoring programs are designed to assess Project-related impact predictions and the effectiveness of mitigation measures. Measures on the effectiveness of mitigation will inform on whether monitoring or mitigation require adaptive management. Adaptive management is an on-going process of learning by doing that evolves throughout the life of the Project. Outcomes of adaptive management include increasing or decreasing, or no change, to mitigation or monitoring. Further study intended to better understand Mine-related effects may also be an outcome based on requests from individual stakeholders or the TAG. Ongoing review of the TEMP and annual Wildlife Monitoring Summary Reports (which provide results of TEMP monitoring programs) by regulatory agencies, technical reviewers, and stakeholders will further support that local and regional concerns have been adequately addressed.

Environmental staff monitor wildlife near Project facilities (i.e., Meadowbank Mine and Whale Tail Pit) and along the AWAR and WTHR on a regular basis (Section 3.6). Where unacceptable risks to wildlife are observed, mitigation measures are implemented to avert animals from site activities and hazards in accordance with the TEMP (Agnico Eagle 2019). The decision trees used as mitigation and monitoring framework for caribou (*Rangifer tarandus groenlandicus*) and muskox (*Ovibos moschatus*) are outlined in Section 2.0. Detailed reporting protocols (e.g., a dangerous animal occurrence, monthly wildlife reports submitted to the GN, road closure notification to GN, KIA, HTO, etc.) are established and implemented by on-site environmental staff. During these events, Agnico Eagle representatives communicate any issues directly with the GN Department of Environment (DoE) Conservation Officer, KIA, and the local HTO.

1.5 Report Objectives

The primary objectives of the 2021 Wildlife Monitoring Summary Report are to:

- Report the results of the 2021 wildlife monitoring programs.
- Summarize the monitoring strategy implemented over the course of the year.
- Evaluate the function and validity of implemented monitoring strategies.
- Summarize adaptive management strategies.
- Provide management recommendations for 2022.
- Allow regulators to contribute toward improvements of wildlife mitigation and monitoring.
- Include a summary of all caribou-related monitoring, mitigation, and Project management actions in one consolidated section.

1.6 Inuit Involvement

Since 1999, local Inuit from the community of Baker Lake have been involved in all wildlife-related baseline and monitoring surveys. The average number of Inuit involved in surveys varies annually. Programs with previous Inuit involvement include the LSA and RSA aerial survey, breeding bird plots and transects, waterfowl nest surveys, waterbird nest surveys for the Whale Tail expansion, raptor nest surveys, road surveys, viewshed surveys, habitat mapping, and phenology plots. Local harvesters participate in the Hunter Harvest Study (Section 10.0).

Three Inuit workers were under the employment of the environmental department and were involved in the monitoring programs in 2021. Due to the COVID-19 pandemic, integration of the Nunavummiut workforce only started in July for the Environment Department. Agnico Eagle currently employs three environmental Inuit workers that are involved in wildlife programs including caribou behavior monitoring, road surveys, viewshed surveys, and wildlife deterrence on site when required. A Baker Lake Hunters and Trappers Organization (HTO) wildlife monitor completed road surveys regularly throughout the year.

As required by the Inuit Impact Benefit Agreement (IIBA), “Anything done by Agnico in order to implement the TEMP [...] shall incorporate Inuit Qaujimanituqauit”; therefore, Indigenous Traditional Knowledge or IQ has been incorporated in this annual report.

1.7 Terrestrial Advisory Group

As per Project Certificate No.008, Condition 27 of the Whale Tail Pit Final Environmental Impact Statement (FEIS) Addendum (Golder 2016), Agnico Eagle has established a Terrestrial Advisory Group (TAG) consisting of representatives from Agnico Eagle, the Government of Nunavut Department of Environment (GN-DoE), the KivIA, and the HTO.

An MOU and Terms of Reference has been developed and signed by all parties in July 2019. Agnico Eagle provided a summary of TAG meeting outcomes to the NIRB since 2019.

The purpose of the TAG is to:

- Measure the relevant environmental effects of the Project on terrestrial wildlife.
- Confirm that the Project and mining activities are carried out within the terms and conditions of the Project Certificates No.004 and No.008 relating to the protection of terrestrial wildlife.
- Assess the accuracy of the predictions contained in the final environmental impact statement filed by Agnico Eagle with NIRB.
- Identify and select appropriate target species, indicators, and linkages for monitoring.
- Evaluate the effectiveness of mitigation measures and to support any required adaptive management of those measures.
- Identify any unforeseen Project-related effects.
- Provide an early warning mechanism to identify any Project-related effects.
- Determine and identify any cause-and-effect interactions between the Project and the environment.

TAG meetings were held on February 9th, March 16th, and September 16th in 2021. Discussions included 2020 Wildlife Monitoring Summary Report comments, for potential improvement to data collection and reporting in 2021. Report sections influenced by these discussions include the tolerant caribou observations (Section 3.6.8), road convoy (Section 3.6.7), pit and mine site ground surveys (Section 4.0), helicopter activity (Section 4.5.9), viewshed survey (Section 7.0), blast monitoring (Section 9.0), and snow study (Section 17.1) sections. Caribou group size thresholds (GST) (Section 2.4), including calculation methods were discussed and agreed upon with the TAG.

1.8 Mitigation Audit

A mitigation audit is an annual requirement outlined in the 2019 TEMP (Agnico Eagle 2019). Mitigation approaches applied at the Project stem from current practices at existing mines or were suggested during the environmental assessment review process. However, an auditing system supports evaluation on the use and effectiveness of the mitigation consistent with the principals of adaptive management and may identify or recommend changes to mitigation or monitoring. As an example, per Project Certificate No.008, Condition 32, Agnico Eagle engages with the Baker Lake HTO and other relevant parties to ensure that safety barriers, berms, and designed crossings associated with Project infrastructure, including the WTHR, are constructed and operated as necessary to allow for the safe passage of caribou and other terrestrial wildlife.

The audit is to be undertaken annually and summarized in the annual report and will focus specifically on mitigation listed in Section 4.1 of the TEMP Version 7 (Agnico Eagle 2019). The audit will evaluate:

- what mitigation was implemented;
- which mitigation is perceived or shown to be effective;
- whether new mitigation has been implemented in response to new issues; and
- whether some mitigation is redundant or unnecessary.

2.0 CARIBOU MANAGEMENT DECISION TREE

2.1 Overview

The 2019 TEMP Version 7 (Agnico Eagle 2019) describes the use of decision trees or charts that outline adaptive monitoring and mitigation for ungulates for each of five phases: 1) caribou and mining operations; 2) caribou and Whale Tail Haul Road; 3) caribou and the AWAR; 4) caribou and blasting; and 5) muskox and Operations (see Agnico Eagle 2019).

2.2 Objectives

The monitoring objectives are to:

- 1) Detect if effect thresholds have been exceeded.
- 2) Test the efficacy of mitigation.
- 3) Understand Project-related effects to ungulates. For ungulates, the decision trees are also an objective to manage sensory disturbance to caribou approaching the Project. Monitoring to detect caribou intensifies as caribou approach the Project and mitigation intensifies to reduce sources of sensory disturbance.

Monitoring activities for ungulates will be carried out prior to, during, and following construction. The use of decision trees for managing disturbance to ungulates is an ongoing and continuous monitoring strategy for the life of the Project. Monitoring intensity is increased as ungulates approach the Project.

2.3 Duration

Monitoring activities for ungulates were carried out prior to, during, construction and operations. The use of decision trees for managing disturbance to ungulates is an ongoing and continuous monitoring and mitigation strategy for the life of the Project. Monitoring and mitigation intensity is increased and decreased as ungulates approach the Project in accordance with the decision trees.

2.4 Methods

The approach involves monitoring the number of ungulates in close proximity to mining operations through various monitoring tools including caribou collaring data, Viewshed surveys, AWAR and Whale Tail Haul road surveys, and pit and Mine site ground surveys. Depending on the number of ungulates observed (i.e., caribou GST), proximity to the road, and time of year, different mitigation and monitoring levels are triggered (i.e., Level 1, Level 2, Level 3). For example, triggers may result in pit and Mine site ground surveys and/or haul road surveys increased up to every two days, and caribou satellite data reviewed daily. Example mitigations include daily site-wide notifications, road closures to non-essential vehicles, and speed restrictions.

For the purposes of monitoring, a “group of caribou” is defined as: “An aggregation of caribou that are sufficiently close together that they can see and react to another animal’s behaviour, and have the potential of responding should one or more animal in the aggregation become startled.” Updated caribou GSTs by season used for Meadowbank in 2021 were developed based on instructions provided by the GN (Table 1; GN 2021). A GST of 13 muskox is used year-round, and mitigation and monitoring related to muskox is performed according to Figure 10 of 2019 TEMP Version 7 (Agnico Eagle 2019). For further details on the reasoning behind caribou GSTs and the decision chart approach, refer to the 2019 TEMP Version 7 (Agnico Eagle 2019). The GST approach and monitoring/management outcomes is reviewed by the TAG on a regular basis to determine whether an acceptable balance has been achieved between mining operations and conserving caribou populations. As

GSTs are the main trigger for mitigation and management, understanding their efficacy for overall herd protection is of high importance.

Table 1: Caribou Group Size Thresholds by Season (2021).

Season	Dates	Group Size Threshold
Spring	1 April to 25 May	34
Summer	26 May to 21 September	25
Fall	22 September to 15 December	112
Winter	16 December to 31 March	25

2.5 Results

The decision trees were used throughout 2021. Data collection methods were implemented in 2021 to link individual observations to mitigations, through use of field tablets linked to a customizable EQUIS Collect database. Paper data forms are carried in case issues arise with field tablets. All wildlife observations, and associated mitigations are provided in Appendix A (Wildlife Observations) and Appendix G (Blast Monitoring Surveys). Summaries of wildlife survey results are discussed in their respective sections. A summary of AWAR and WTHR closure are discussed in Section 3.6.6. The majority of mitigations were implemented based on road survey observations (Section 3.0; Appendix A). Few mitigations were implemented based on other survey types, including pit and mine site ground surveys (Section 4.0; Appendix A).

2.6 Accuracy of Impact Predictions

An objective of the decision tree approach is to reduce sensory disturbance to caribou approaching the Project. The objective is not linked to an impact prediction as the monitoring is to trigger mitigation rather than to test a prediction.

2.7 Management Recommendations

Wildlife observations should continue to be documented using approaches implemented in 2021 that allow individual observations to be linked to mitigations, providing evidence of use of decision trees.

3.0 ROAD SURVEYS

3.1 Overview

A systematic ground survey monitoring program for the AWAR, and WTHR has been designed to evaluate sensory disturbance for wildlife, particularly caribou (*Rangifer tarandus*), muskoxen (*Ovibos moschatus*), and predatory mammals utilizing habitats adjacent to the roads. The program also monitors incidental mortality of species as they are encountered within the Project infrastructure, but in particular near the roads. In previous years, the Vault Road has been surveyed and reported on separately from the WTHR, but since 2020 the Vault Road observations are considered part of the WTHR observations and results.

3.2 Objectives

The primary objectives of the road ground survey monitoring program are to:

- 1) Document wildlife utilization along the AWAR and WTHR corridors.
- 2) Evaluate wildlife trends along the road corridors, including identifying areas where higher densities of wildlife are observed.
- 3) Inform on the need for adaptive mitigation, such as temporary road closures during peak caribou migration periods.
- 4) Inform whether mortality thresholds for wildlife are exceeded.
- 5) Monitor road-related injuries or mortalities of caribou. The Project-wide threshold mortality level for ungulates is two (2) individuals per year (as per TEMP Version 7).
- 6) Monitor road-related injuries or mortalities of predatory mammals. The Project-wide threshold mortality level for predatory mammals is two (2) individuals per year (as per TEMP Version 7).

3.3 Duration

The AWAR and WTHR systematic ground surveys are ongoing over the operational phase of the Mine and are scheduled to be conducted a minimum of once per week throughout the year, twice per week during the sensitive season (i.e., contingent on weather and road access), and daily if caribou or muskox Group Size Thresholds (GST) are exceeded (see Figures 7 and 8 in TEMP). Agnico Eagle is committed to conducting a minimum of 75 road surveys per year along the AWAR and WTHR. Monitoring of vehicle collisions and wildlife mortality is continual along all road segments.

3.4 Methods

Road surveys were expanded beyond the AWAR to include the Vault Haul Road, beginning in 2017, the WTHR beginning in 2018, and then the Vault and Whale Tail segments combined as the WTHR beginning in 2020. Agnico Eagle has signed an MOU with the Baker Lake HTO for a wildlife monitor on the road beginning in October 2018. An amended MOU was signed in February 2022, retroactive to 8 November 2021, to hire a second wildlife monitor that will work on the AWAR and WTHR. In 2021, the monitor was primarily on the AWAR due to COVID restrictions.

The survey team typically includes two observers (one is the driver) in a vehicle. The terrain on both sides of the road (to a maximum horizontal distance of approximately 1 km perpendicular from the road edge, or as far as the observer can see pending site conditions) is surveyed as the vehicle progresses at a maximum speed of 30 km per hour. For each sighting, the vehicle is safely parked in a road pullout and UTM coordinates are recorded along with the estimated distance of the animal(s) from the road, nearest road marker, species, number, direction of travel and a variety of other information (e.g., behavior). All data are recorded electronically in tablet forms. Where animals are sighted close to roads and a risk of collision with vehicles is possible, the environmental monitor/observers report the number of animals, location, and direction of travel to the Mine radio dispatcher who informs all vehicle operators. In addition, all vehicle operators report ungulates and predatory mammals seen along the road to the dispatcher.

Regular data provided to Mine site personnel from the caribou satellite-collaring program are also used to track caribou movement and potential interactions with roads and Project facilities.

3.5 Historical Results

Ground surveys commenced shortly following the onset of AWAR construction in 2007. Sampling intensity has been comparable along the entire length of the AWAR since 2009. Surveys along the Vault Haul Road have been irregular since its completion but were included as part of regular AWAR surveys in 2016 and conducted separately beginning in 2017. Since beginning surveys in 2007, surveys along the AWAR have been conducted every 2.1 to every 6.1 days with an average survey frequency of every 4.9 days (Table 2). Surveys along the WTHR began in 2017 and have been conducted every 2.0 to every 7.7 days with an average survey frequency of every 4.0 days (Table 4).

3.6 2021 Results

3.6.1 AWAR Surveys

The number of AWAR surveys completed each season in 2021 is provided in Table 2. The number of systematic road surveys completed in 2021 ($n=177$) is higher than the number of surveys completed the previous year ($n=132$) and considerably higher than the annual goal of 75 surveys. In 2021, surveys were conducted on average every 2.1 days, and were conducted between 01 January and 31 December. Survey frequency was highest in the fall and lowest in winter. By month, the highest numbers of surveys were conducted in April, May, November, and December, generally corresponding with higher numbers of caribou observed within the LSA.

A Baker Lake Hunters and Trappers Organization (HTO) wildlife monitor completed road surveys regularly throughout the year (Section 1.6). Electronic recording of observations began in October 2019 and written data forms are no longer used.

A total of 37,825 caribou were detected across 177 AWAR road surveys (i.e., 213.7 caribou per survey), and caribou were recorded in all months except January. The highest average caribou observed per survey occurred in April and December (Table 3). Record numbers of average caribou per survey were observed for April and December 2021 (Table 3).

Table 2: Details of All-Weather Access Road Wildlife Surveys from 2007 to 2021

Year	Annual range of surveys	Average Frequency ^(A)	Number of AWAR surveys				
			Spring ^(B)	Summer ^(B)	Fall ^(B)	Winter ^(B)	Annual Total
2007	Mar 01 - Dec 31	4.1 days	13	24	8	33	78
2008	Jan 02 - Dec 29	3.9 days	15	7	15	57	94
2009	Jan 09 - Dec 16	6.1 days	15	10	8	25	58
2010	Jan 21 - Dec 17	5.6 days	9	9	12	36	66
2011	Jan 10 - Dec 30	6.0 days	10	9	11	33	63
2012	Jan 04 - Dec 29	4.7 days	14	13	12	38	77
2013	Feb 02 - Dec 27	6.0 days	9	13	10	31	63
2014	Jan 12 - Dec 30	5.5 days	11	7	11	38	67
2015	Jan 03 - Dec 18	4.7 days	17	16	11	32	76
2016	Jan 02 - Dec 27	4.7 days	10	14	16	38	78
2017	Jan 03 - Dec 29	4.3 days	19	16	14	36	85
2018	Jan 03 - Dec 29	5.0 days	9	12	16	35	72
2019	Jan 04 - Dec 27	2.6 days	37	39	39	22	137
2020	Jan 17 - Dec 26	2.6 days	26	54	41	11	132
2021	Jan 01 - Dec 31	2.1 days	43	42	69	23	177

A) Frequency refers to the average number of days between surveys over the year

B) Spring = Apr 1 to May 25, Summer = May 26 to Sep 21, Fall = Sep 22 to Dec 15, Winter = Dec 16 to Mar 31

Table 3: Monthly Averages of the Number of Caribou Observed per Survey Trip Along the All-Weather Access Road from 2007 to 2021

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

2020	0	0	107.6	263.2	430	52	0	185.2	483.9	485.7	556	2.3
2021	0	3	34.6	414.7	226.6	26.4	0.3	161.3	30.7	64.5	35.6	553.5
Average	4.5	9.1	19.7	65.5	56.8	10.7	1.4	30.8	43.2	95.8	118.6	74.4

Data show the average number of caribou observed for a month of the year, including data from all road surveys completed that month. Data are based on the observed number, which might be more inaccurate for larger groups or groups that are further away.

3.6.2 WTHR Surveys

Survey routes were separated into the Vault and Whale Tail segments of the WTHR until 2019 but were analyzed as a single unit (WTHR) in 2020 and 2021. In 2021 there were 144 surveys conducted between 10 January and 31 December with a survey being conducted every 2.5 days on average (Table 4). The number of surveys conducted in 2021 was lower than the number conducted in 2019 and 2020, but much higher than the number of surveys in 2017 and 2018. The decrease in survey effort on the WTHR from 2020 to 2021 is due to differences in the timing and location of caribou observations because survey effort is determined based on caribou observations. More surveys were conducted in spring and summer compared to fall and winter (Table 4).

A total of 11,928 caribou were detected across 144 WTHR surveys (i.e., 82.8 caribou per survey) in 2021. The majority of caribou sightings were observed in the spring months of April and May, and there were no caribou sightings along WTHR in February or March 2021 during road surveys (Table 5). The average number of caribou observed along the WTHR in 2021 was lower in January, February, March, October, November, and December compared to the average across years, but the 2021 average was higher in May, June, and August compared to the average across years (Table 5).

Table 4: Details of Whale Tail Haul Road Surveys from 2017 to 2021

Year	Annual range of surveys	Average Frequency*	Number of WTHR surveys				
			Spring	Summer	Fall	Winter	Annual Total
2017	Jan 03 - Dec 29	7.7 days	9	7	7	24	47
2018	Jan 30 - Dec 30	5.7 days	4	1	7	47	59
2019	Jan 08 - Dec 23	2.0 days	62	39	45	27	173
2020	Jan 07 - Dec 26	2.2 days	47	50	32	32	161
2021	Jan 10 - Dec 31	2.5 days	49	48	26	21	144

Spring = Apr 1 to May 25, Summer = May 26 to Sep 21, Fall = Sep 22 to Dec 15, Winter = Dec 16 to Mar 31

* Frequency refers to the average number of days between surveys over the year

Table 5: Monthly Averages of the Number of Caribou Observed per Survey Trip Along the Whale Tail Haul Road (WTHR) from 2007 to 2021

Year	Location	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2017	Vault	0	5	9	5	0	0	0	0	3	0	6	0
2018	Whale Tail	0	0	0	120.4	0	0	8.4	0	15.2	104.7	18.3	13.5

Data show the average number of caribou observed for a month of the year, including data from all surveys completed that month. Data are based on the observed number, which might be more inaccurate for larger groups or groups that are further away.

3.6.3 Caribou Counts along AWAR and WTHR

The total number of caribou observed in 2021 along the AWAR were similar to 2019 and 2020 numbers, and the total number of caribou observed along the WTHR was similar to 2020 counts but much lower than 2019 counts (Figure 2). Note, total counts across years are not corrected for differences in sampling effort (i.e., the number of surveys), meaning that increases in caribou total counts may be a direct result of increasing the number of surveys conducted annually.

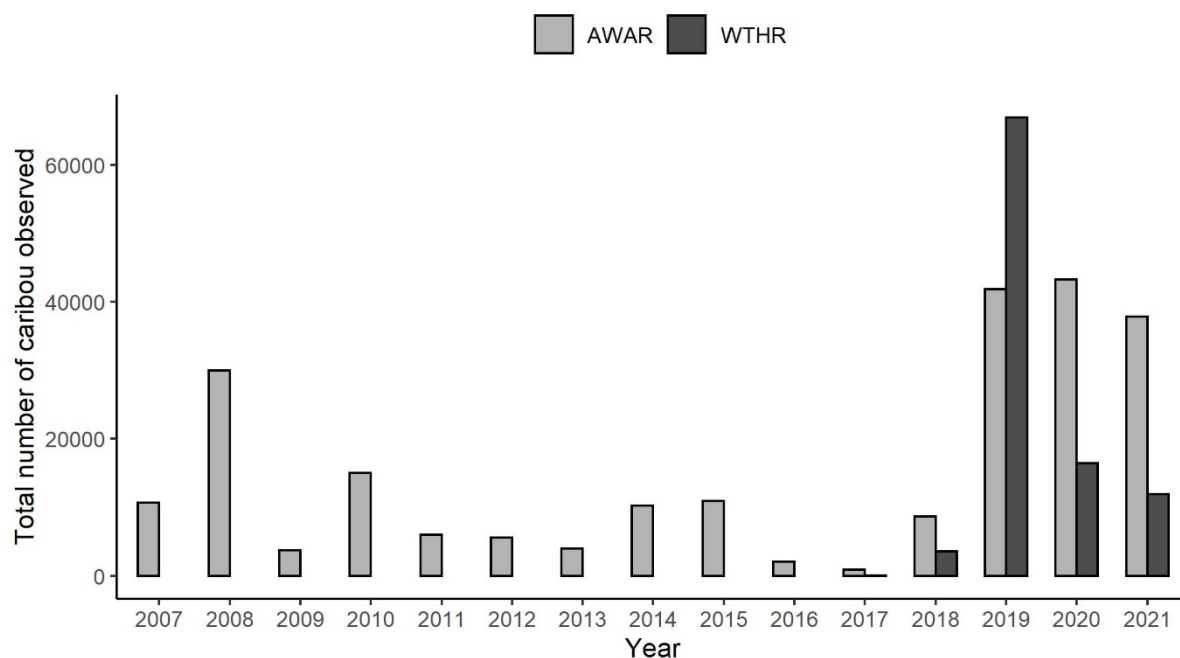

Figure 2: Total Number of Caribou Observed Each Year During All-Weather Access Road (AWAR) and Whale Tail Haul Road (WTHR) Surveys.

Maps were produced to depict the spatial variation of caribou counts along the AWAR and WTHR, summarized as the total number of caribou for each KM segment of road. Note, survey effort was not equal between the AWAR and WTHR in 2021 (177 AWAR surveys and 144 WTHR surveys), so caution should be taken when making comparisons between the two roads. Additionally, caribou observations determine the location and influence the frequency of road surveys. Caribou counts are shown for each segment of the AWAR and WTHR for 2021 for five different time intervals including year-round counts (Figure 3), spring and summer counts (Figure 4), and fall and winter counts (Figure 5). Considering both the AWAR and WTHR, caribou migration paths appear different across seasons with spring migration occurring on both the AWAR and WTHR, and fall migration occurring further south, primarily on the AWAR.

Year-round caribou counts along the AWAR varied substantially with totals ranging between 0 to 2,163 caribou for each one-kilometer section of road, though the majority of kilometer sections had intermediate caribou counts ranging between 150 and 750 caribou (Figure 3). Along the AWAR, caribou counts were lowest near Baker Lake with caribou count annual totals ranging between 0 and 146 caribou from KM 1 to 18. The highest counts were observed between KM 48 to 54, which is consistent with 2020 observations. During the spring months, caribou counts were low along the AWAR but were observed consistently along the north half of the AWAR, with few

sightings near Baker Lake (Figure 4). During the summer months, caribou counts were relatively low along the AWAR, but caribou were still observed in the majority of 1-km segments (Figure 4). During the fall, caribou counts were higher between KM 27 to 65, with a high-density pocket between KM 48 to 56 (Figure 5). Low caribou counts persisted near the Meadowbank LSA during the fall. Caribou counts were very low along the AWAR during the winter, with scattered observations on the northern half of the AWAR and no observations south of KM 38 (Figure 5).

Caribou distributions along the AWAR have changed compared to previous years. The 2019 analysis revealed that from 2008 to 2019 the highest cumulative caribou counts along the AWAR occur in areas closest to the community of Baker Lake and south and north of Whitehills Lake (Agnico Eagle 2020b). Road survey results from 2020 found a similar pattern of year-round distribution along the AWAR and identified the stretch of road from KM 14 to 18 along the AWAR as a high-density congregation area for caribou, particularly in the summer and fall. The 2021 road survey data shows the opposite pattern with the lowest cumulative caribou counts occurring near Baker Lake (Figure 3).

Caribou counts along the WTHR ranged between 0 and 553 with caribou detections in almost every 1-km segment of road (Figure 3). Caribou counts were generally higher along the southern half of WTHR, especially between KM 117 to 124. This observation is consistent with a high-density pocket observed during 2020 road surveys from KM 118 to 120 within the Meadowbank complex. Caribou counts along the WTHR were highest in the spring (Figure 4). Summer counts were fairly consistent along WTHR in the summer, and while lower than spring, caribou were still detected in almost every 1-km segment of road (Figure 4). Conversely, caribou detections were very low in fall and winter along the WTHR and only occurred at a few spots along the road (Figure 5).

3.6.3.1 Group Size Threshold Calculation

Spring and fall Group Size Thresholds for 2022 were calculated using 2021 caribou road survey data as well as historical data. A Group Size Threshold (GST) is defined as the group size at, or above which, 75% of caribou observed interacting with Project infrastructure are expected to occur (Agnico Eagle 2019). Observations of caribou within 250 m of the road or greater than 1000 m away from the road were excluded, based on methodology provided by GN (GN 2021). Spring and fall 2021 caribou road survey observations were grouped by season and observations were pooled between the AWAR and WTHR. The number of groups (i.e., number of observations), average group size, group size range, and 75th percentiles were summarized per season in Table 6. Spring and fall GSTs for 2022 were calculated by averaging GSTs for the corresponding season across all years with at least 100 caribou groups observed for that season. Variation due to low samples sizes may result in biased GSTs, and GST estimates were considered accurate (unbiased) if there were at least 100 groups observed for a season. There were five years of spring data with at least 100 caribou group observations (2008, 2018, 2019, 2020, 2021), and spring GSTs were averaged across those five years to calculate a spring 2022 GST of 35 caribou (Table 6). There were two years of fall data with at least 100 caribou group observations (2008 and 2019), and fall GSTs were averaged across those two years to calculate a fall 2022 GST of 112 caribou (Table 6). For the purpose of calculating thresholds, GSTs were rounded down to the nearest whole number. Fall 2021 road survey data were not used in the calculation for 2022 GSTs because the number of caribou groups observed did not meet the minimum number of observations required.

Table 6: Caribou GST summaries for spring and fall based on 2021 data

Season ^(A)	Number of Observations ^(B)	Average group size	Group size range	Group size 75 th percentile	Calculated GSTs for 2022 ^(C)
Spring	464	32.0	1-476	40	35
Fall	96	94.4	1-700	138	112

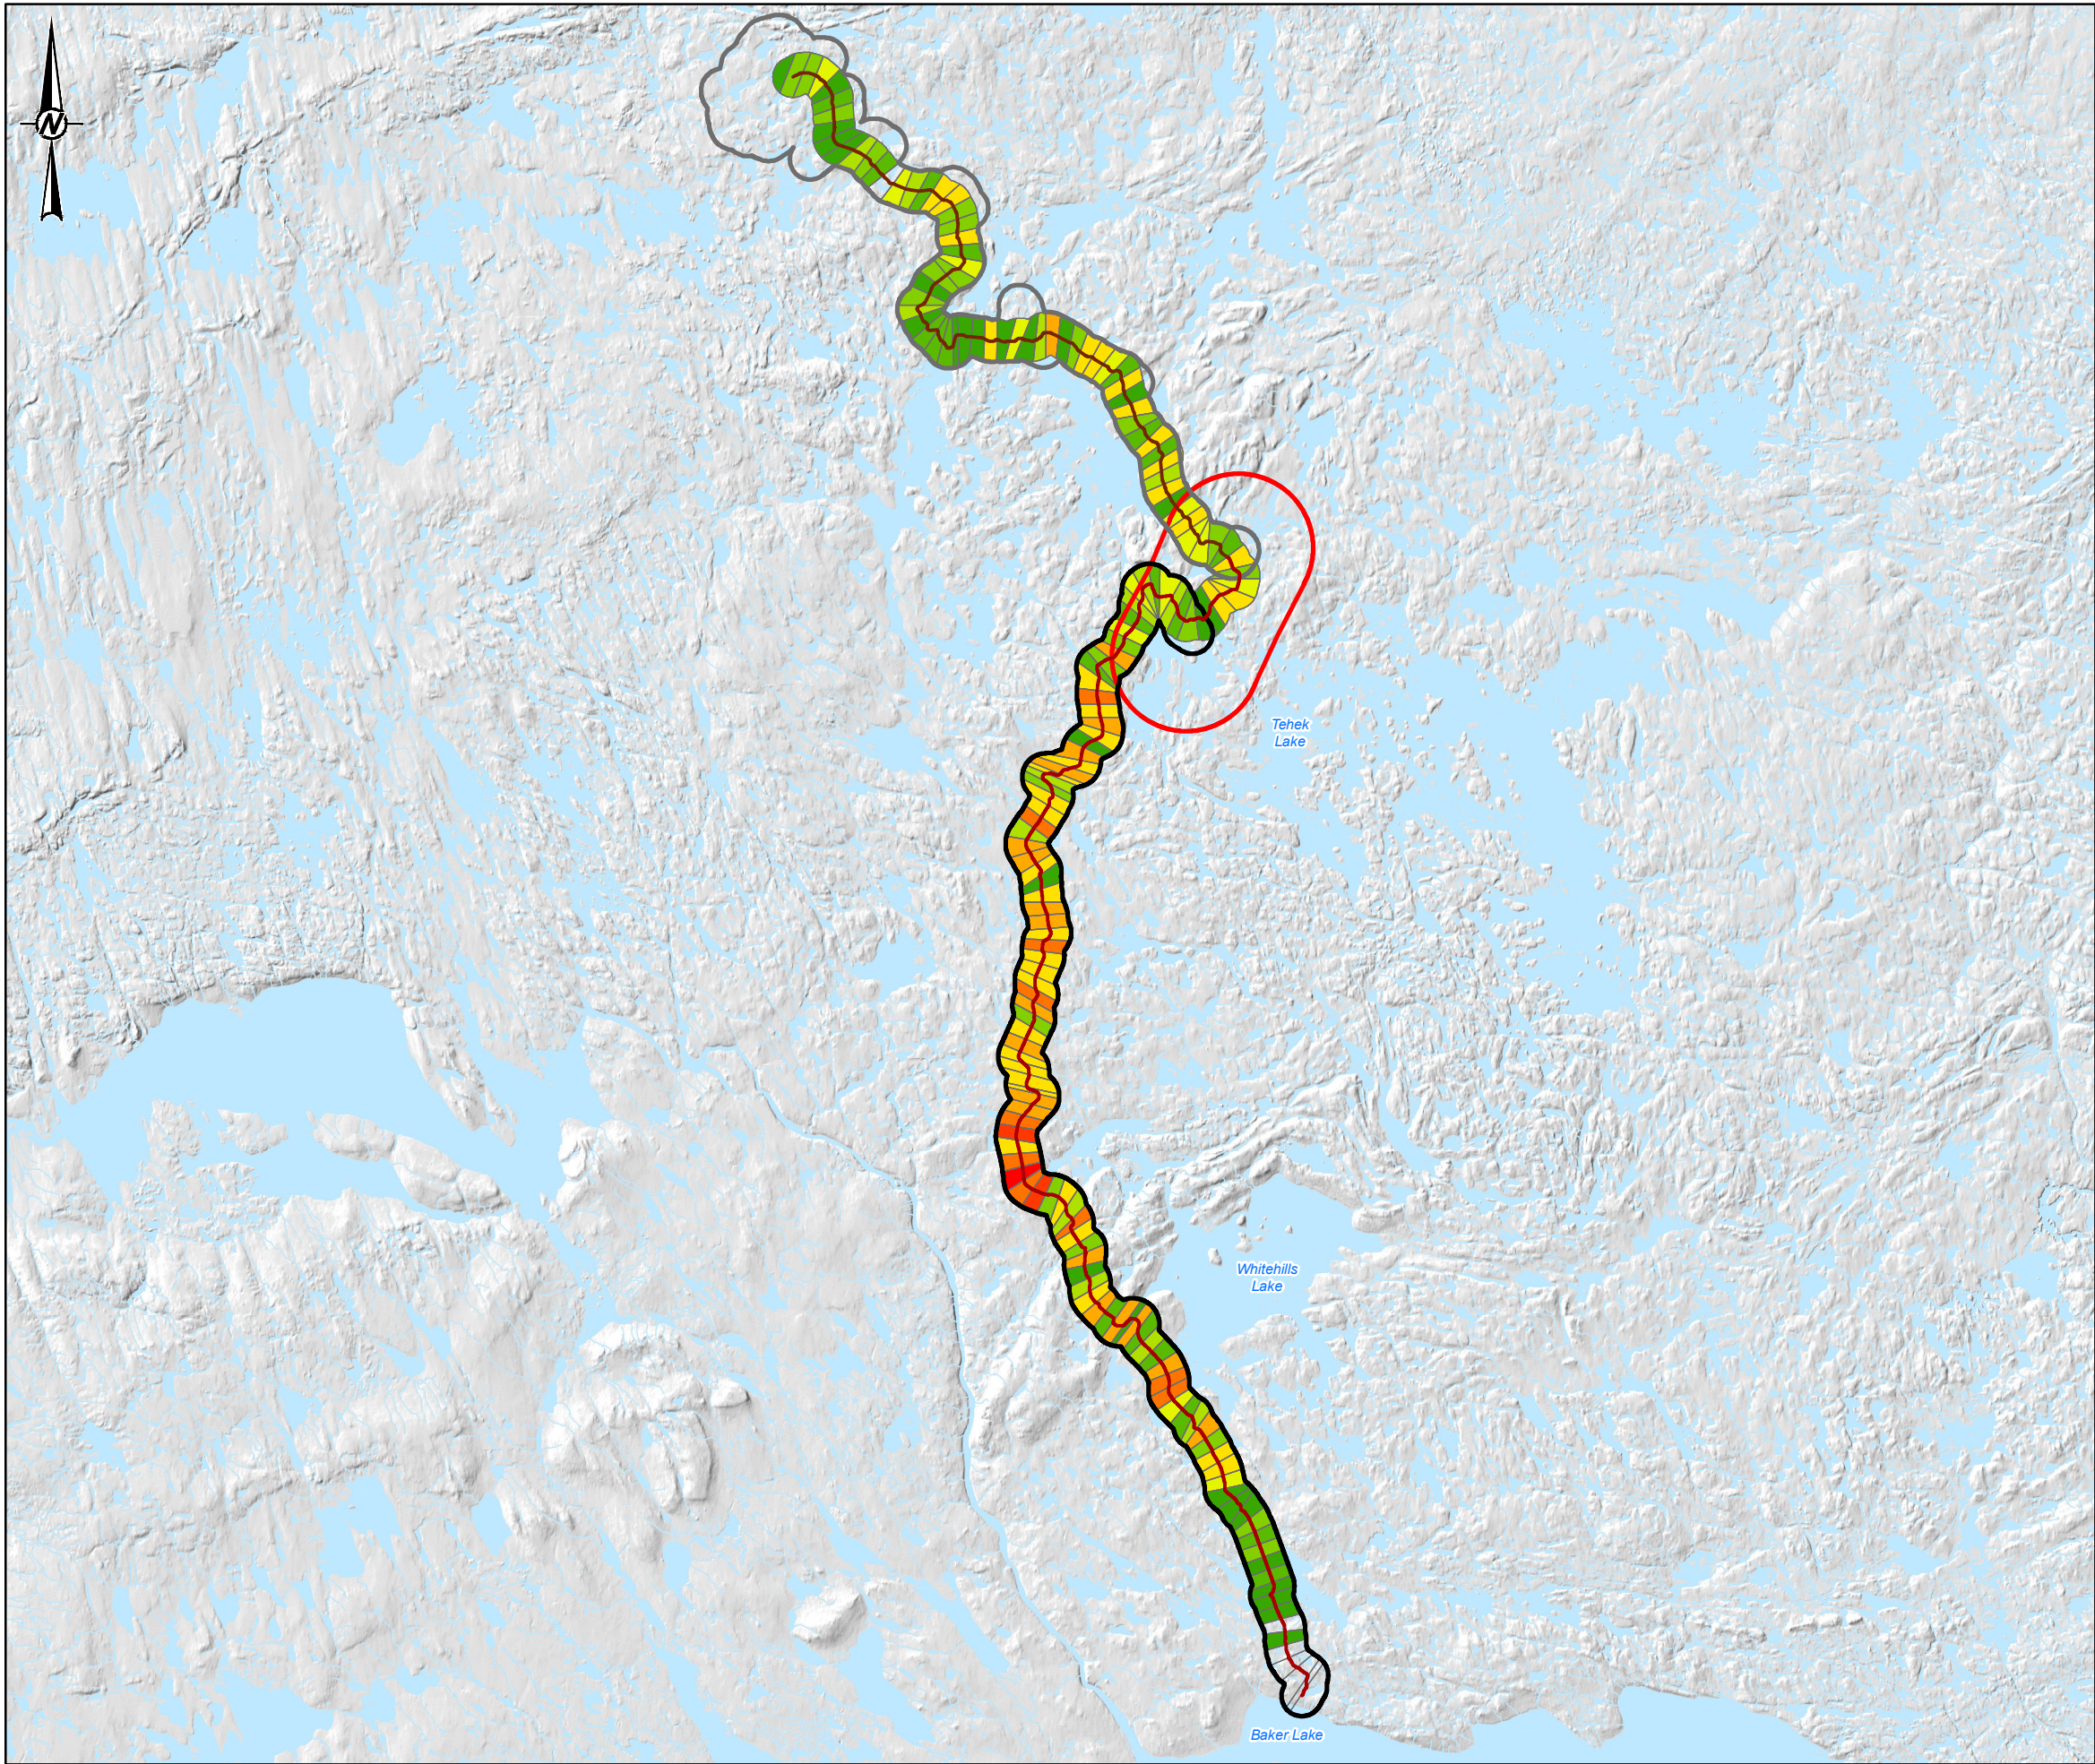

(A) 2021 caribou observations were summarized for the two sensitive seasons, spring and fall;

(B) GSTs are considered unbiased when calculated using observations of at least 100 caribou groups;

(C) GSTs for 2022 were calculated by taking the average of all group size thresholds across years for a given season that meet the minimum sample size requirement (n=100);

GST = group size threshold.

3.6.4 Wildlife Observations from Road Surveys

Eight mammalian species and ten avian species were detected and identified during road surveys in 2021 (Table 7). Arctic fox (*Vulpes lagopus*), Arctic ground squirrel (*Urocitellus parryi*), Arctic hare (*Lepus arcticus*), caribou, grey wolf (*Canis lupus*), muskox, and wolverine (*Gulo gulo*) were all detected along both the AWAR and WTHR, and one red fox (*Vulpes vulpes*) was detected along the AWAR. American crow (*Corvus brachyrhynchos*), Canada goose (*Branta canadensis*), common raven (*Corvus corax*), greater white-fronted goose (*Anser albifrons*), ptarmigan sp. (*Lagopus* sp.), rough-legged hawk (*Buteo lagopus*), sandhill crane (*Antigone canadensis*), and snow goose (*Chen caerulescens*) were detected on both the AWAR and WTHR (Table 7). Additionally, bald eagle (*Haliaeetus leucocephalus*), long-tailed jaeger (*Stercorarius longicaudus*), and peregrine falcon (*Falco peregrinus tundrius*) were detected along the AWAR.

Eight mammalian species and six avian species were detected and identified incidentally on the AWAR and WTHR in 2021 (Table 8). Arctic fox, Arctic ground squirrel, Arctic hare, caribou, grey wolf, grizzly bear (*Ursus arctos horribilis*), muskox, and wolverine were all detected along both the AWAR and WTHR, as well as a small mammal on the AWAR that was not identified. Rough-legged hawk were detected on both the AWAR and WTHR (Table 8). Bald eagle, common raven, sandhill crane, and snowy owl (*Bubo scandiacus*) were observed on the AWAR, and peregrine falcon were detected on WTHR (Table 8). Ptarmigan sp. and swallow sp. (*Hirundinidae* sp.) were observed on the AWAR.

AWAR = All Weather Access Road, WTHR = Whale Tail Haul Road.

3.6.5 Road-related Mitigation

Road-related monitoring and mitigation were implemented according to Figures 7 and 8 of the TEMP version 7 (Agnico Eagle 2019). Collar location maps were instrumental in assessing the need for increased road monitoring. Road-related mitigation related to caribou presence in 2021 resulted in road closures and a corresponding reduction in total vehicle movements (Section 0). Road closures were implemented, or vehicle movements were restricted (e.g., light vehicles only, speed limited enforced) in response to high caribou numbers. Convoys were organized by Environment staff, who had the training to decide whether vehicles could continue along the road when caribou were sighted, and at times assisted by the BLHTO or the KivIA.

Regular wildlife warnings were dispatched based on observation and monitoring data. The road supervisors and operators also ensured protection of wildlife by assisting in surveillance and closing roads as needed. Radio notices reminding operators of the appropriate speed limit were made frequently by dispatchers. During caribou peak migration, notices were sent to all road occupants, regulatory agencies, local groups, and wildlife consultants were notified, and road survey efforts were increased.

3.6.6 AWAR and WTHR Closures

Significant movements of caribou occurred along the AWAR throughout April and early May, and through much of December, resulting in multiple closures to Project-related traffic. The AWAR was fully closed on 49 days, and partially closed on 9 days (including days identified as Partial Closure and days identified as Close/Open) and had speed restrictions applied for 39 days (Table 9). In total, there were 97 days with restrictions related to ungulate activity in 2021. Restrictions were generally due to presence of caribou, and all wildlife related closures were due to the presence of caribou. Mitigation measures such as reduced speeds were instituted due to the presence both muskox and caribou herds throughout the year (Table 9).

Significant movements of caribou occurred along the Meadowbank Whale Tail Haul Road in spring during April and early-May 2021 resulting in multiple closures and speed restrictions (Table 9). The WTHR was fully closed on 13 days, partially closed on 1 day, and had speed restrictions applied for 29 days for a total of 43 days with restrictions related to ungulate activity in 2021. All closures and the one partial closure were due to the presence

of caribou, however reduced speeds were instituted due to the presence of both muskox and caribou herds throughout the year (Table 9). Table 9 shows a summary of the number of ungulate related restrictions implemented in 2021. Full summaries of road restrictions are available in Appendix B for both AWAR (Appendix B, Table B-1) and WTHR (Appendix B, Table B-2).

The percentage of caribou that encountered the AWAR when closed ranged from 65% of caribou observations in winter (1,813 of 2,805 caribou observed in winter) to 94% of caribou observed in fall (15,716 of 16,744 caribou observed in fall; Table 10). The percentage of caribou that encountered the WTHR when closed ranged from 0 in fall and winter when there were no road closures to 81% during the spring (10,640 out of 13,099 caribou observed in spring; Table 10). Percentages were calculated based on the sum of caribou observations on each road based on closure status (i.e., open versus closed/partial closure).

Table 9: Number of Road Restrictions Implemented Due to Ungulate Activity Along the All-Weather Access Road (AWAR) and Whale Tail Haul Road (WTHR), 2021.

Road	Closure Status	Cause	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total

AWAR = All Weather Access Road, WTHR = Whale Tail Haul Road.

3.6.7 Traffic Data

Total one-way traffic along the AWAR in 2021 included 173 heavy equipment, 15,084 medium equipment, and 14,259 light equipment vehicles for a total of 29,516 vehicles (Table 11). Total traffic along the WTHR included 54,532 long-haul, 3,341 medium equipment, and 4,164 light equipment vehicles, for a total of 62,037 vehicles (Table 12). Total traffic along the AWAR was about 31% higher in 2021 than the 2020 total of 22,516 vehicles, and traffic along the WTHR was 23% higher in 2021 compared to the 50,441 vehicles in 2020 (Golder 2021). Monthly vehicle traffic for the AWAR and WTHR fluctuated throughout the year (Figure 6). Lowest traffic rates on the AWAR occurred in July, and highest traffic rates occurred in August (Table 11; Figure 6). On the WTHR, lowest traffic rates were recorded in February, and highest rates were recorded in June and July when caribou are not as abundant (Table 12; Figure 6). There were 71 convoys between April 17 and December 18 along the AWAR, and 21 convoys between April 9 and May 3 along the WTHR in 2021 (Table 13). Note, convoys were included as one-way trips, meaning a round trip on a single day would be considered two separate convoys. Convoys occurred during road closures, but convoys did not occur on all days where roads were closed. Excluding environmental staff vehicles (n=85), the most common vehicle types during convoys were fuel tankers (n=311), pick-up trucks (n=57), and buses (n=36; Table 13).

3.6.8 Caribou Responses to Mitigation

Caribou Crossings

The frequency of road surveys in 2021 demonstrate Agnico Eagle's commitment to preventing impacts to caribou from the AWAR, WTHR (including Vault Haul Road). Mitigation measures such as reduced speeds, convoys, and multiple road closures function to minimize road-related effects including mortality, injury, and reduced caribou passage. Incidental sightings in 2021 recorded in the Wildlife Log (Appendix A) and road surveys showed that caribou crossed roads throughout the year, with especially high numbers during spring and fall migration (Table 14).

A total of 5,196 caribou were observed crossing the AWAR and 824 caribou were observed crossing the WTHR in 2021. The greatest number of caribou were observed crossing the AWAR during fall migration in December (3,875 observed crossings), and a much smaller increase was observed during spring migration in April and May (Figure 7). The greatest number of caribou crossing the WTHR was observed during spring migration in April and May with 743 caribou crossings observed across both months. There were no observed caribou crossings on the AWAR in January, February, July, and October, and there were no observed caribou crossings on the WTHR during January, February, March, and December (Figure 7). Caribou movement patterns continue to require close monitoring and analysis in 2022.

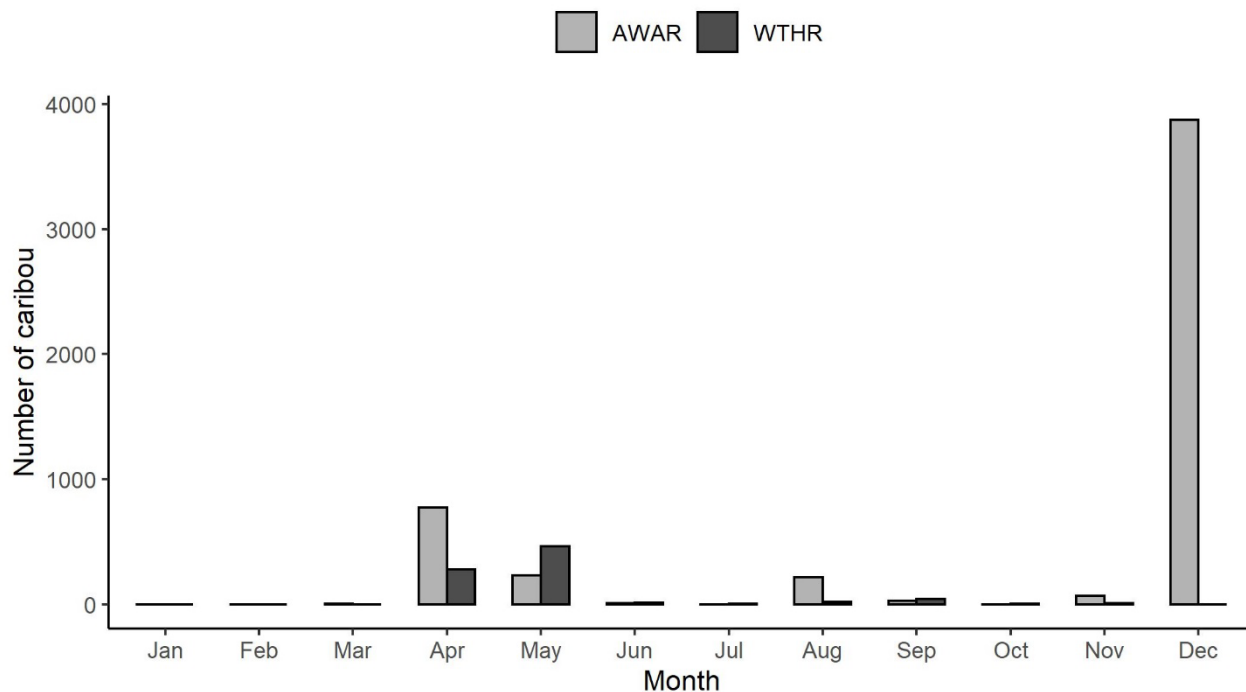

Figure 7: Average Number of Caribou Crossings Observed per Survey Each Month During All-Weather Access Road (AWAR) and Whale Tail Haul Road (WTHR) Surveys in 2021

Tolerant Caribou Observations

Observations of tolerant caribou along the AWAR and WTHR contribute to assessing risk and the success of mitigation measures. The TEMP Version 7 defines Project tolerant caribou as:

“An animal or group of animals (i) observed within a mitigation distance buffer for greater than 72 hours during the winter or 48 hours during other season; and (ii) not visibility disturbed by the Project”

On five occasions, caribou were determined to be Project tolerant as defined in TEMP Version 7 (Agnico Eagle 2019) (Table 15). Three caribou were identified as Project tolerant at Whale Tail and 14 tolerant caribou were recorded along the WTHR, totalling 17 tolerant caribou. There were no observations of Project tolerant caribou along the AWAR. Note, identification of project tolerant caribou did not impact the decision tree process or relax mitigation measures in place.

Table 15: Observations of Tolerant Caribou in 2021

Date	Survey Type	Location	Closure Status	KM Marker	Distance	Number of caribou	Tolerance
2021-09-28	Incidental	Whale Tail	N/A	N/A	N/A	3	Yes - Same as the group seen on the 2021-09-26. All males with big antlers

2021-11-11	Road	WTHR	Open	160	1000	9	Yes – A male seen yesterday by the HLT driver at the same place

WTHR = Whale Tail Haul Road

3.6.9 Road-related Wildlife Mortality

The following wildlife mortalities, associated with the AWAR, and WTHR were recorded in 2021 (Table 16). No project related caribou mortalities were associated with the AWAR, or WTHR in 2021. Mortality reports are included in Appendix D.

Upon discovery of any unreported roadkill remains, Environment staff and/or road supervisors reminded employees of road rules and the need to enforce these rules. All employees are regularly reminded at toolbox meetings that all Project-related incidents are to be reported and that wildlife have the right-of-way at all times. Mine staff are required to stop vehicles and wait for wildlife to cross roads. No feeding wildlife and waste management practices are also regularly reviewed with employees. There were no road-related grizzly bear, wolverine, or wolf mortalities in 2021. Mine site related mortalities are described in Section 4.5.8.

Table 16: Wildlife Mortalities Related to the All-Weather Access Road, and Whale Tail Haul Road and Non-Mine Related Mortalities in 2021

Date	Species	Count	Project Related	Location	Comments

3.7 Accuracy of Impact Predictions

The summary of the impact predictions identified in the TEMP Version 7 (Agnico Eagle 2019) are listed in Table 18. The 2021 AWAR and WTHR survey data were compared to the impact prediction thresholds to evaluate adherence to the impact predictions and the provision of adaptive management, as either a necessary or proactive measure. None of the thresholds were exceeded in 2021.

Table 18: Accuracy of Impact Predictions - Sensory Disturbance and Mortality along the All-Weather Access Road and Whale Tail Haul Road in 2021

Potential Effect	Threshold	Threshold Exceeded (2021)	Adaptive Management Implemented	Monitoring Methods
Sensory Disturbance	No threshold but Decisions Trees followed when caribou are seen near mine facilities	Not Applicable	Yes. Multiple road closures and notices, good engagement of Wildlife Log by site staff. Use of Decision Tree for Management and Monitoring.	AWAR and WTHR Surveys, Wildlife Log, Mortality Reporting. Satellite-collaring data
Project-related Mortality (ungulates)	Threshold level of mortality is two (2) individuals per year.	NO	NO	AWAR and WTHR surveys Satellite-collaring data surveys
Project-related Mortality (predatory mammals)	Predatory mammals (i.e., grizzly bear, wolverine, wolf) will not be killed or injured by vehicle collisions. Threshold level of mortality is two (2) individuals per year.	NO	NO	AWAR, and WTHR surveys
Project-related Mortality	Raptors or waterbirds will not be killed along Project roads. Threshold is one (1) individual due to vehicle collision per year.	NO	NO	AWAR and WTHR surveys

3.8 Management Recommendations

The AWAR and WTHR survey data are important for documenting sensitive periods when the area near the road is utilized by various wildlife species and for evaluating the need, if any, to adaptively manage mitigation (e.g., temporary road closures and radio announcements). Mitigation actions linked to individual wildlife observations (Appendix A) should continue to be recorded. No other management mitigations are recommended at this time.

4.0 PITS AND MINE SITE GROUND SURVEYS

4.1 Overview

The Mine site ground survey monitoring program (i.e., for Meadowbank/Vault, and Whale Tail) has been designed to verify that impacts to wildlife in and around the Project LSA are not occurring. The program has a strong emphasis on monitoring mortality and disturbance of various wildlife groups utilizing habitats near the Project. In addition, the Mine site ground survey monitoring program is an integral component of the monitoring strategy for evaluating sensory disturbance indicators for caribou.

4.2 Objectives

The primary objectives of the Mine site ground surveys are to:

- 1) Use Decisions Trees when caribou are seen near Project facilities to determine the level of adaptive management (e.g., suspending activities) required.
- 2) Confirm that caribou will not be killed through other Project-related mortality such as falling in pits, tailings sludge, or other means. The cumulative Project threshold level of mortality is two (2) individuals per year.
- 3) Verify that measures are in place such that grizzly bears, wolverines, or wolves will not need to be destroyed at the Project site. The threshold level of mortality for predatory mammals is two (2) individuals per year.
- 4) Verify that disturbance to high value habitats (e.g., sedge meadows) and nesting migratory birds is avoided, and all activities within 100 m of a migratory bird nest site be monitored, if deemed necessary.

4.3 Duration

The Mine site ground surveys are to be conducted regularly by Agnico Eagle environmental personnel over the operation and closure phases of the Project to verify that changes to habitats around the Project do not cause effects to wildlife and their use of habitat.

4.4 Methods

In 2021, environmental personnel conducted regular Mine site inspections focusing on waste management, spills, hazardous waste management, and wildlife monitoring. Formal Mine site inspections were carried out at least weekly as part of broader environmental on-site management. During these inspections, if non-conformities were identified they are rapidly addressed by the responsible department.

Weekly inspections included:

- Regular monitoring of all wildlife species near the facilities. Large mammal presence within the Project is documented during daily and weekly (formal) inspections. Any issues related to safety or proximity effects are identified and the appropriate mitigation is implemented. If risks to animal health are perceived, efforts are made to avoid the wildlife and provide them the right-of-way. In 2021, Mine-site ground survey inspections were conducted at minimum once per week.
- Regular monitoring of all large mammals in the Project LSA.
- Regular monitoring of breeding birds (especially in the spring), raptors, and nests located in the Project LSA.
- Inspections of waste management areas, bins, and hazardous material storage.

Environment Department inspections and wildlife ground surveys focus on migratory birds, ungulates, Arctic fox, wolf, grizzly bear, and wolverine. Through these observations and those of other Agnico Eagle employees (i.e., incidental observations), and incidence reports provided to the Environment Department, technicians follow up as needed to ensure the protection of wildlife near the Project. Monthly summary reports and wildlife observation data are submitted to the GN and KivIA, and quarterly reports are submitted to the KivIA.

4.4.1 Incidental Mine Site Wildlife Observations

All Mine site personnel, including construction and support staff, are required to document and report wildlife observed within the LSA of the Project as well as ancillary areas (e.g., AWAR and WTHR). The protocol involves notifying staff in the Environment Department, which is intended to ensure that potential problem animals are identified. Pertinent data, and daily and weekly Mine site inspection reports are consolidated and entered into an electronic database (EQuIS). Monthly summary reports and wildlife observation data are submitted to the GN and KivIA. Quarterly reports are submitted to the KivIA.

4.5 2021 Results

4.5.1 Pit and Mine Site Ground Surveys

The number of surveys completed at Meadowbank Mine and Whale Tail each month in 2021 is provided in Table 19. Note, for the majority of 2021 formal and incidental Mine and Pit surveys were combined into one category, referred to as “Formal/Incidental” in Table 19. Weekly mine inspections at Meadowbank and Whale Tail include a wildlife observation component and are also included in this count. Starting in October 2021, surveys were identified as either formal Mine and Pit surveys (“Formal” in Table 19) or incidental surveys (“Incidental” in Table 19), which included the weekly mine inspections.

Including all survey types, Meadowbank had 125 surveys in 2021, including 100 combined Formal/Incidental surveys between 4 January and 27 September, 12 formal Mine surveys between 3 October and 25 December, and 13 incidental surveys between 3 October and 28 December (Table 19). Whale Tail had 120 surveys in 2021, including 83 combined Formal/Incidental surveys between 31 March and 29 September, 16 formal surveys between 3 October and 25 December, and 21 incidental surveys between 1 October and 28 December (Table 19). The average frequency of surveys at Meadowbank was approximately one survey every 2.9 days for all survey types from 4 January to 27 December, and one survey every 7.0 days for the formal Mine and Pit ground surveys that took place between 3 October and 25 December. The average frequency of surveys at Whale Tail was approximately one survey every 2.3 days for all survey types between 31 March and 28 December, and one survey every 5.3 days for the formal Mine and Pit ground surveys that took place between 3 October and 25 December.

Table 19: Number of Formal and Incidental Pit and Mine Site Ground Surveys by Month

Location	Survey Type	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total
Meadowbank	Formal/Incidental	16	12	13	6	7	5	20	16	5	-	-	-	100
	Formal	-	-	-	-	-	-	-	-	-	3	4	5	12
	Incidental	-	-	-	-	-	-	-	-	-	4	3	6	13
	Total	16	12	13	6	7	5	20	16	5	7	7	11	125
Whale Tail	Formal/Incidental	4	4	5	8	4	6	11	29	12	-	-	-	83
	Formal	-	-	-	-	-	-	-	-	-	5	4	7	16
	Incidental	-	-	-	-	-	-	-	-	-	9	5	7	21
	Total	4	4	5	8	4	6	11	29	12	14	9	14	120

4.5.2 Wildlife Observations from Pit and Mine Surveys

Wildlife observations from formal Pit and Mine surveys conducted between October and December of 2021 are shown in Table 20. In addition to the species summarized in Table 20, there were four unidentified birds observed in October at Whale Tail. Wildlife observations from incidental surveys as well as Pit and Mine surveys that took place prior to the separation of formal and incidental surveys are summarized in Section 0 and Table 21.

Table 20: Wildlife Observations from Formal Pit and Mine Site Ground Surveys by Month 2021

Location	Species	Oct	Nov	Dec	Total
Meadowbank	Arctic fox	0	3	1	4
	Wolverine	0	0	1	1
Whale Tail	Arctic fox	1	4	2	7
	Arctic hare	1	0	0	1
	Muskox	0	0	1	1

Mine site incidental observations were consolidated from all incidental reports at Meadowbank and Whale Tail. Observations were used by Environment personnel to monitor wildlife activity within the Project and to identify potential problematic or sensitive animals requiring deterrence.

Five mammal species were reported as incidental sightings at Meadowbank in 2021 including Arctic fox, caribou, wolves, muskox, and wolverine (Table 21). One peregrine falcon and one rough-legged hawk were recorded in incidental surveys at Meadowbank during 2021. Caribou sightings were highest from January to May, with another peak in observations during July and August. Muskox sightings were highest in April, July, August, and September.

Six mammal species were reported as incidental sightings at Whale Tail in 2021 including Arctic fox, Arctic hare, caribou, wolves, muskox, and wolverine (Table 21). The highest caribou sightings took place in April, June, and August through October. Muskox sightings were highest in summer between June and August. Arctic fox and Arctic hare each had one incidental observation at Whale Tail, with one Arctic hare detected in April and one Arctic fox detected in December. Ptarmigan sp. were observed in April, bald eagles were observed in July, and one snowy owl was observed in November.

4.5.3 Bird Nests

An exemption permit was obtained on 17 May 2021 from the GN for removal of a common raven nest that posed risk to proper maintenance of the fuel tank and could possibly result in fire hazard. A second exemption permit was obtained on 5 July 2021 for removal of a passerine sp. nest located on a pipe fusing machine, and an American robin (*Turdus migratorius*) nest on a parked haul truck. These nests also prevented proper maintenance and could result in fire hazard. Exemption permits are provided in Appendix M.

A decoy was deployed at the Baker Lake tank farm to discourage bird nesting. Deterrents were also applied to Quarries 20 and 22 to discourage raptor nesting.

4.5.4 Wildlife Deterrent Records

Wildlife deterrents are implemented when habituated or problematic wildlife pose a threat to the wildlife or Mine personnel through human-wildlife conflict. Necessary deterrent strategies are determined and implemented by the Environment Department based on the severity of risk and the nature of the interaction. Each deterrence event is reported using the EQuIS database.

Wildlife deterrents were used and reported throughout 2021 at the Project. A total of 37 deterrence activities were reported from interactions with four species of mammals: caribou, muskox, wolf, and wolverine (Table 22, Table 23). In some cases, deterrent actions were taken in response to the same animal over multiple days, as was the case with one caribou observed in close proximity to mine infrastructure at Whale Tail in April 2021.

The total number of deterrence actions was lower in 2021 compared to 2020 (43 deterrence events recorded), and similar to previous years (31 deterrence activities in 2019, 32 in 2018, and 21 in 2017). Deterrence actions in

the winter months were primarily related to wolverine and wolf, whereas in the spring and summer deterrence actions were related mostly to caribou. There were four muskox deterrence events, which occurred in July and September.

All wolf and wolverine deterrence action were taken at Meadowbank, while caribou action was taken at both Meadowbank and Whale Tail. All muskox deterrence occurred at Meadowbank and along the AWAR near the airstrip, and the muskox were deterred due to presenting a safety risk (Table 22, Table 23). Of the 37 deterrence actions taken, 34 were classified as successful deterrence, two were classified as unsuccessful deterrence, and one instance was classified as fatal deterrence. The fatal deterrence involved a wolverine next to the coreshack at Meadowbank (Table 22, Table 23). The individual was injured during deterrence by a rubber bullet fired by an Environment Technician, and later euthanized to prevent further suffering. Additional details on the mortality are provided in Section 4.5.7 and Appendix D.

Table 22: Details of Deterrence Activities for 2021

Date	Species	Number	Location	Behaviour	Deterrence Reason/Context	Method	Deterrence Outcome	Comments
2021-01-05	Wolverine	1	Meadowbank	Running	Avoid wildlife acclimation to human activities leading to health and safety issues	Flair deterrent	Successful deterrence	Portage Rock Storage Facility - Landfill
2021-01-14	Wolverine	1	Meadowbank	Running	The wolverine walked along the snowbank, direction north / Avoid wildlife acclimation to human activities leading to health and safety issues.	Whistles	Successful deterrence	Camp - Incinerator
2021-01-25	Wolf	1	Meadowbank	Running	Avoid wildlife acclimation to human activities leading to health and safety issues	Bangers were used from the 6mm pistol.	Successful deterrence	Camp - West road/primary crusher intersection
2021-01-28	Wolverine	1	Meadowbank	Running	Upon arriving to the landfill, the environmental employee observed the Wolverine near the berm / Avoid wildlife acclimation to human activities leading to health and safety issues	Honked	Successful deterrence	Portage Rock Storage Facility - Landfill area
2021-01-29	Wolverine	1	Meadowbank	Running	Avoid wildlife acclimation to human activities leading to health and safety	The environmental employee used 6mm pistol with bangers to deter the wolverine	Successful deterrence	Tailings & Landfill
2021-02-05	Wolverine	1	Meadowbank	Running	The Wolverine was reported near the Core Shack, then behind the control tower, then crossing the air strip going toward south cell.	Banger and rubber bullets	Successful deterrence	Tailings Storage Facility - South cell ramp near land farm
2021-02-08	Caribou	1	Meadowbank	Walking	There was a caribou that was on the MBK airstrip prior to plane arrival	Banger	Successful deterrence	Airstrip
2021-02-14	Wolverine	1	Meadowbank	Dead	At approximately 16:00, Environment was called to a Wolverine sighting on the airstrip. The wolverine was reported crossing the airstrip and moving towards the refer pad	Shotgun and 12g slug	Fatal deterrence	Project related mortality - Camp - Core Shack / See the mortality report attached for more detail.

Table 22: Details of Deterrence Activities for 2021

Date	Species	Number	Location	Behaviour	Deterrence Reason/Context	Method	Deterrence Outcome	Comments
2021-04-15	Caribou	1	Whale Tail	Feeding	Caribou in unsafe location. Caribou was in sector 1, trapped between the dike construction and the mining road.	Honking and environmental staff walking to guide the caribou out of the area	Successful deterrence	Caribou was in sector 1, trapped between the dike construction and the mining road, but did not appear stressed. Dike construction was stopped until caribou was safely escorted out. Caribou ignored honking but responded to two environmental workers walking.
2021-04-17	Caribou	1	Whale Tail	Feeding	Caribou in unsafe location. Report of caribou eating/digging just beside a 5kV cable	Bangers and walking	Successful deterrence	Caribou lifted its head in response to bangers and then kept eating. After two failed attempts team tried walking approach to move caribou away from dangerous area. Walking was effective.
2021-04-21	Caribou	1	Whale Tail	-	Caribou in unsafe location inside the secondary fuel containment.	Bangers and walking	Successful deterrence	Caribou was trapped inside the fuel tank secondary containment. We interrupted traffic on the haul road and directed the caribou to cross the road and head off into the tundra. We tried using bangers again to no success, and had to walk out to guide him.
2021-07-16	Muskox	2	Meadowbank	Alert	Between airstrip and AWAR, close to fresh water barge road.	Use of bangers 3 times in order to make them leave the area. They went in the tundra, near fresh water barge road. Use of honking several times without results before using bangers. Mother not bothered by honk noise.	Successful deterrence	Between airstrip and AWAR, close to fresh water barge road. Mother and calf feeding. Calf was alert. Use of bangers 3 times in order to make them leave the area. They went in the tundra, near fresh water barge road. Use of honking several times without results before using bangers. Mother not bothered by honk noise.
2021-07-17	Muskox	2	Meadowbank	Foraging	2 muskoxen (1 female, 1 calf) were close to the airstrip	Clapping hands et bangers were used.	Successful deterrence	2 muskoxen (1 female, 1 calf) were close to the airstrip. Environment were call to take actions before the plane. Clapping hands et bangers were used. The muskoxen

Table 22: Details of Deterrence Activities for 2021

Date	Species	Number	Location	Behaviour	Deterrence Reason/Context	Method	Deterrence Outcome	Comments
								walked slowly away from the airstrip.
2021-07-18	Muskox	1	Meadowbank	Foraging	Muskox 10m to the airstrip.	Environment staff clapped their hands and use bangers.	Successful deterrence	"Muskox 10m to the airstrip.
2021-07-28	Wolf	1	Meadowbank	Resting	The wolf was laying down on the east dike road and did not seem to be concerned by the presence of pick-ups. Since workers are nearby, decision taken to deter the wolf toward the tundra.	Banger & Whistle	Successful deterrence	
2021-07-29	Caribou	1	Meadowbank	Feeding	Caribou was around operations at FGL / Avoid wildlife acclimation to human activities leading to health and safety	Used 4 bangers and 3 whistlers	Successful deterrence	
2021-07-29	Caribou	1	Meadowbank	Running	The caribou was seen at first around the powerhouse. It was going towards maintenance. We saw it a little later on the airstrip. We then used some deterrents.	Auditive Banger	Deterrents did not succeed	
2021-08-17	Caribou	2	Meadowbank	Resting	The two caribous were lying on the tailings.	Honking, clapping, shouting, banners	Successful deterrence	
2021-08-24	Caribou	1	Whale Tail	Running	The caribou was going towards the phase 1 ramp.	Pick-up, clapping, wide movements	Successful deterrence	Came back at least 3 times during the day
2021-08-24	Caribou	1	Whale Tail	Trotting/running	Caribou was going in phase 2 ramp. We went to push it out of there before the blast	Pick-up, clapping, noise	Successful deterrence	
2021-08-24	Caribou	2	Meadowbank	Walking	They were close to the airstrip while the plane was preparing to leave.	Bangers and whistlers	Successful deterrence	
2021-08-24	Caribou	2	Whale Tail	Trotting/running	Env. Department got called because 2 caribou were heading down open pit.	Pick-up, clapping, noise	Successful deterrence	
2021-08-24	Caribou	2	Whale Tail	Running	The caribous wanted to go on the mine road near the Whale Tail Open Pit, so env. Department push them away with the pick-up.	Pick-up, clapping, wide movements	Successful deterrence	

Table 22: Details of Deterrence Activities for 2021

Date	Species	Number	Location	Behaviour	Deterrence Reason/Context	Method	Deterrence Outcome	Comments
2021-08-24	Caribou	1	Whale Tail	Trotting/running	Caribou was running toward the mine road.	Pick-up	Successful deterrence	
2021-08-24	Caribou	2	Whale Tail	Trotting/running	Caribou were in pad C with a lot of heavy vehicles in circulation.	Pick-up, clapping, noise	Successful deterrence	
2021-08-24	Caribou	3	Meadowbank	Standing	Caribou were on site, between the rows in transit area.	Deterrents, banger and whistlers	Successful deterrence	
2021-08-25	Caribou	1	Whale Tail	Trotting/running	Caribou was going toward the road to phase 2 ramp	Pick-up	Successful deterrence	
2021-08-25	Caribou	3	Whale Tail	Trotting/running	2 caribou were in the ramp going up the waste dump, making it dangerous for haul truck	Pick-up	Successful deterrence	
2021-08-26	Caribou	1	Whale Tail	Trotting/running	The caribou was in the of the traffic, making it dangerous for itself	Pick-up	Deterrents did not succeed	
2021-08-27	Caribou	2	Whale Tail	Trotting/running	Caribou were in a heavy traffic location	Pick-up	Successful deterrence	
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in a dangerous place with a lot of traffics	Pick-up, clapping	Successful deterrence	
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in a dangerous place with a lot of traffics	Pick-up	Successful deterrence	
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in a heavy traffic area with a lot of haul truck	Pick-up	Successful deterrence	
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in an area with heavy traffic and movement. It was also between sea can that could be moved	Pick-up	Successful deterrence	
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in an unsafe area, both for it and the workers	Pick-up, whistlers	Successful deterrence	Whistlers had little to no effect.
2021-08-27	Caribou	1	Whale Tail	Trotting/running	Caribou was in the open pit, near heavy equipment	Pick-up	Successful deterrence	
2021-09-16	Muskox	6	AWAR	Feeding	There was a plane at 9:55, it overshot because the muskox was too close to the airstrip	Use Banger, whistlers, pyro-knatterpatronen	Successful deterrence	

"-" indicates the Deterrence Reason/Context was not specified

Table 23: Summary of Deterrence Events in 2021

Location	Species	Number of Deterrence Events			
		Successful	Unsuccessful	Fatal	Total
AWAR	Muskox	1	0	0	1
Meadowbank	Caribou	5	1	0	6
	Grey wolf	2	0	0	2
	Muskox	3	0	0	3
	Wolverine	5	0	1	6
Whale Tail	Caribou	18	1	0	19
Totals		34	2	1	37

4.5.5 Waterbird Monitoring

Waterbird monitoring is completed to minimize accidental waterbird confinement around the Meadowbank and Whale Tail sites, entrapment in the tailings, and mortality, regular inspections were completed throughout the migratory period and during weekly or daily inspections, as deemed necessary by Environment personnel. Further discussion of the 2021 field program is provided in Appendix C.

4.5.6 Raptor Monitoring

Raptor monitoring was conducted as part of routine Mine site inspections of the pit and other areas to ensure adequate bird protection and management. In addition to observations part of the raptor nest monitoring (Section 13), peregrine falcons were observed incidentally along the AWAR in September. Rough-legged hawks were observed on six occasions in May, July, and September along the AWAR, WTHR, and Goose Pit. Other raptor species observed include bald eagle (July to September), and snowy owl (May, November, and December).

4.5.7 Predatory Mammal Deterrence and Protection

Improved practices for waste segregation and incineration, the use of enclosed food waste facilities, and skirting around buildings have improved Arctic fox protection and decreased fox-human interactions (Table 24).

Table 24: Summary of Deterred Predatory Mammals at the Meadowbank Mine and Whale Tail Sites from 2015 to 2021

Species	2015	2016	2017	2018	2019	2020	2021
Arctic fox	6	6	2	0	4	1	0
Red fox	1	0	0	0	0	0	0
Wolf	1	4	9	14	9	5	2
Wolverine	5	3	10	17	16	17	6
Totals	23	37	21	31	31	43	8

Wolverines were regularly observed around the Project particularly during the winter months in 2021 (Table 21). Deterrence actions for wolverines, which followed the Wildlife Protection and Response Plan (Appendix C in 2019 TEMP), were required on 16 occasions at the Meadowbank site, but no deterrence actions were required at Whale Tail for wolverines (Table 23). One wolverine was dispatched on 14 February. The individual was dispatched prior to contacting the GN DoE to avoid further suffering. The GN DoE was contacted immediately after the dispatching (Appendix D). Well-defined food-handling practices and employee awareness programs have minimized wolverine fatalities or wolverine-human interactions, and the number of deterrence efforts were lower in 2021 than previous years (Table 24).

Wolves were also regularly observed around the Meadowbank and Whale Tail sites primarily in the winter and summer months (Table 21). Deterrence actions were required on two occasions, one in January and one in July (Table 22). Notices are sent to Meadowbank employees regarding the presence of wildlife, waste management procedures, and requesting all sea cans and doorways be closed when a non-conformity occurs.

Arctic fox were observed at Meadowbank and Whale Tail in 2021 (Table 21), but no deterrence action was required.

4.5.8 Wildlife Mortality – Meadowbank and Whale Tail Sites

One wildlife project-related mortality, a wolverine, was observed around the Meadowbank and Whale Tail sites in 2021 (Table 25). This mortality was related to deterrence (4.5.4) and attributed to Mine-related activities.

Road-related mortalities are tabulated and discussed in Section 3.6.9. Mortality reports are included in Appendix D.

Table 25: Wildlife Mortalities at Meadowbank Mine and Whale Tail in 2021

Date	Species	Count	Project Related	Location	Comments
14-Feb	Wolverine	1	Yes	Meadowbank Camp Core shack	Shot with a rubber bullet to deter, wounded animal and was euthanized.

Table 26: Summary of Project-Related Wildlife Mortality Records for Caribou and Predatory Mammals (2007 to 2021)

Year	Caribou	Grizzly Bear	Wolverine	Wolf
2007	0	0	0	0

A) Naturally injured wolf that needed to be euthanized.

B) Wolf died at Mine site of head injuries; did not need to be dispatched

4.5.8.1 Caribou

No caribou mortalities related to Project activities were reported at the Project in 2021.

4.5.8.2 Predatory Mammals

All incident reports, observations, deterrence activities, and environment team responses to predatory mammal sightings are included in Appendix D.

One wolverine mortality associated with the Mine site was reported in 2021. On 14 February, a wolverine was sighted on the Meadowbank airstrip, moving towards the Nova Camp and Core Shack where workers were present. Rubber bullets were utilized to try to deter the animal away from the area. The second rubber bullet hit the animal in front of the hind leg, badly injuring the animal and causing heavy bleeding. The wolverine could not get up after falling over and the Environmental Coordinator authorized the dispatch of the animal. The carcass was removed and incinerated. Details of these incidents are contained in Appendix D.

4.5.8.3 Other Wildlife

No Arctic fox mortalities associated with the Mine site were reported in 2021.

4.5.9 Helicopter Activity

Helicopters are utilized at the Project for various reasons including transport, exploration, surveying, monitoring, and reconnaissance. Pilots are required to review an air traffic management procedure that includes flight restrictions:

- Long-range flights are a minimum of 650 m above ground level, except for take off and landing.
- Short-range flights are a minimum of 300 m above ground level, except for take off and landings.
- Notification of caribou, muskox or other wildlife sightings within 1 km of the helicopter pad.
- Caribou groups of 50 or more animals, and muskoxen of 10 or more animals must be avoided by a minimum of 1,000 m vertically and 1,500 m horizontally. Flocks of migratory birds must be avoided by 1,100 m vertically and 1,500 m horizontally. Flying over known raptor nests will be avoided.
- Harassing wildlife (flying below 300 m) is expressly forbidden unless animals pose an immediate danger to humans.

Track logs and altitudes are recorded using the Honeywell Skyconnect Tracker II, which runs on the Iridium satellite network. This product provides two-way satellite voice communication, ground to asset texting, and asset to ground location tracking service. Spatial location, altitude, and speed of helicopters are collected throughout flights. Up to five months of previous tracking data are stored online by Honeywell.

All raw helicopter track and summary data are provided in Appendix E. Spatial data of helicopter flights were not available from 2017 to 2019, due to consultant data retention time of six months. Data were provided for flights between 2017 and 2019 (Table 27; Table E-1 in Appendix E). A summary of start and end times and locations of flights performed in 2020 during summer and fall (June to October) is provided in Table 28, and raw data are provided in Table E-2 in Appendix E. Helicopter track data, including altitude data were available for three months (August to October) in 2020 (Table 28; Table E-3 in Appendix E). Spatial representation of helicopter flights in 2020, including calculation of flight distance, is based on the summary data (i.e., start and end times and locations), rather than the track data, due to greater temporal coverage (Figure 8, Figure 9). Two trips that extended far outside the RSA were not included in data summaries.

Summary of 2021 helicopter activity, including flight length, is based on helicopter track data from six months (May to October) in 2021 (Table 29; Figure 10 to Figure 12; Table E-4 in Appendix E). Data from 2020 and 2021 were summarized based on unique trip number. Trips longer than 24 hours in duration were assumed to be erroneous and were not included in data summaries. Trips occurring outside the RSA, and trips to or from site from other locations (e.g., Rankin Inlet) were not included in data summaries. The average altitude throughout the entire trip (i.e., excluding departure and arrival), and average maximum altitude across all trips were calculated for 2020 and 2021. The average maximum altitude was calculated by averaging the maximum altitude of each trip. Maximum altitude was included to avoid bias of ascent and descent altitudes in calculation of averages but is not expected to be representative of altitude throughout the entire trip.

The number of flights, and flight hours were highest in the summer in each year (Table 27 to Table 29). The average distance of flights was 20.48 ± 28.15 nautical miles (nm) in the spring, and 16.36 ± 19.91 nm in the fall. Average maximum altitudes were below 300 m in spring and fall 2021 (Table 29). Some flights for environmental monitoring require lower altitudes, including flights to visually inspect water quality of the water bodies around bridges and roads, inspection of various mine infrastructure for runoffs, lake water sampling, and raptor surveys. Meteorological conditions and visibility may limit flight altitudes. Flights with maximum altitudes less than 300 m excluding departure and arrival in 2021 are displayed on Figures 10 to 12. In the spring, some flights with altitudes less than 300 m are concentrated between the Meadowbank and Vault sites, however some flights extend northwest of the Whale Tail site (Figure 10). In the fall, flights with altitudes less than 300 m appear concentrated around the Meadowbank and Vault sites (Figure 12).

Pilots are made aware to avoid caribou and muskox by 1,000 m vertically and 1,500 m horizontally, flocks of migratory birds by 1,100 m vertically and 1,500 m horizontally, and to avoid known raptor nests. Locations of these flights in relation to caribou and other wildlife was not assessed in 2021. Point locations of caribou and other wildlife from road surveys, pit and mine site surveys, and viewshed surveys may be too coarse to assess in relation to helicopter flight tracks. Helicopter flight tracks would ideally be assessed in relation to caribou satellite collar data, to assess avoidance of caribou by the required setback distances. However, caribou satellite collar locations would not necessarily represent groups of caribou of 50 individuals or larger.

Helicopter use varies across years based on operations, including establishment of remote camps and the amount of exploration. Different data sources and availability prevent accurate comparison of helicopter traffic between years. In future years, contractors will provide helicopter track data in a similar format to 2020 and 2021 data. Variation in altitude and length of some trips suggests that some unique trip numbers represented more than one departure and arrival. Where possible, unique trip numbers should represent a single arrival and departure. Future Wildlife Monitoring Summary Reports could present helicopter flights in relation to caribou satellite collar locations to demonstrate avoidance of caribou by the required 1,000 m vertical and 1,500 m horizontal distance.

Table 27: Helicopter Flight Summary, 2017 to 2019.

Year	Season	Flight Days	Total Flights	Total Flight Hours
2017	Winter	67	447	243.19

4.6 Accuracy of Impact Predictions

A summary of the impact predictions identified in the TEMP Version 7 (Agnico Eagle 2019) that are evaluated, in part, by the Mine site ground surveys is presented in Table 30. Specifically, the 2021 Mine site ground survey monitoring data were compared to the impact prediction thresholds to evaluate adherence to the impact predictions and the provision of adaptive management, as either a necessary or proactive measure. None of the thresholds were exceeded in 2021.

Table 30: Accuracy of Impact Predictions – Mine Site Wildlife Disturbances

Potential Effect	Threshold	Threshold Exceeded? (2021)	Adaptive Management Implemented	Monitoring Methods
Sensory Disturbance	No threshold but Decisions Trees followed when caribou are seen near mine facilities	Not Applicable	YES. Use of Decision Tree for Management and Monitoring.	Satellite-collaring data Road surveys Daily and weekly pit and Mine-site ground surveys Incidental wildlife reporting
Disturbance to Nesting Raptors	Raptor nest failures will not be caused by Project-related activities. Threshold is one (1) nest failure per year.	NO	YES. Mine-related activity restricted within quarries with nesting activity.	Daily and weekly pit and Mine-site ground surveys Incidental wildlife reporting Dedicated raptor nest surveys Road surveys
Disturbance of Nesting, Roosting or Moulting Waterfowl	Mine facilities and activities will not affect the breeding success of waterbirds occurring in the area or disturb large concentrations of roosting or moulting waterbirds. Threshold level is one (1) nest failure per year.	NO	NO	Daily and weekly pit and Mine-site ground surveys Waterbird nest surveys Incidental wildlife reporting
Project-related Mortality	Destruction of two (2) problem grizzly bear, wolverine, or wolf per year.	NO. One wolverine mortality in 2021.	YES. All crews were reminded on wildlife procedures, right-of-way and reporting incident reporting requirements	Daily and weekly pit and Mine-site ground surveys Wildlife deterrents and mortality reporting
Project-related Mortality	Two (2) caribou or muskoxen mortality per year because of Project-related activities (e.g., falling into pits, tailing, sludge or other means)	NO	NO	Daily and weekly pit and Mine-site ground surveys Incidental wildlife reporting Wildlife mortality reporting
Project-related Mortality	Raptors and waterbirds will not be killed at the Mine site. Threshold is one (1) individual per year.	NO	NO	Daily and weekly pit and Mine-site ground surveys

4.7 Management Recommendations

The 2021 Mine site ground surveys were an effective source of monitoring to address the impact predictions for managing ungulates, predatory mammals, nesting raptors, and Project-related mortalities. The following are specific management recommendations for the Mine site ground survey monitoring program:

- Continue to distinguish between formal surveys and incidental observations, as implemented in October 2021.
- Complete wildlife incident reports, according to the TEMP Version 7, including deterrence events (Agnico Eagle 2019). All wildlife deterrence events are currently submitted to the EQuIS database.
- Continue to conduct formal weekly pit and Mine surveys to document wildlife activity and to verify that effects to wildlife are not occurring from Project-related activities.
- Continue raptor nest monitoring within the Meadowbank and Whale Tail LSAs, and along the AWAR and WTHR.
- Continue to document the use of deterrents to prevent habituation of wildlife near the Project or to relocate problematic wildlife.
- Continue to apply the Wildlife Protection and Response Plan (Appendix C, 2019 TEMP Version 7), which includes waste provisions, training, incident reporting, and protocols for problem wildlife. Efforts should be taken to ensure all perishable garbage is directed to the incinerator.
- Continue training and education to ensure that incidental wildlife reporting is completed by all Mine site personnel so that Environment personnel can remain informed of pertinent wildlife-related activity near the Mine site.
- Monitor tailings ponds daily during the waterbird migration period, beginning in mid-May. Increase the frequency of deterrent use if required.
- Gather detailed information (e.g., sex, age, photos) on deceased animals and include in incident reports, when possible.

5.0 WILDLIFE HABITAT MONITORING

5.1 Overview

The wildlife habitat mapping monitoring program was developed to describe the overall area of different Ecological Land Classification (ELC) units lost due to Mine-related activities (i.e., during construction, operation, decommissioning, and post-closure phases) at three primary locations: Meadowbank Main and Vault sites (which together encompass the Mine site), the AWAR, and the Whale Tail Pit and WTHR.

The initial strategy in the impact assessments for Meadowbank and Whale Tail was to compare predicted habitat losses due to Mine development to actual losses (i.e., from the environmental assessments); however, regular infrastructure extensions and expansions, changes to the Project, and subsequent regulatory approvals, made this approach difficult to implement. The current approach is to compare habitat losses from development to permitted areas, which encompass all proposed development. Habitat mapping monitoring is completed every three years post-construction, or if changes are greater than 25% of the overall Mine site footprint from the previous evaluation. The last comprehensive analysis was completed in 2018, therefore comprehensive analysis is scheduled for this 2021 reporting year.

5.2 Objective

The primary initial objective of the habitat mapping monitoring program was to confirm that habitat losses identified in the TEMP (Agnico Eagle 2019) and the Whale Tail Pit FEIS Addendum (Golder 2018) for the Mine sites, haul roads, and AWAR, plus any subsequent approved extensions, have not exceeded threshold limits. This approach was difficult to execute due to regular Mine plan changes and subsequent approvals; therefore in 2018, habitat losses are compared to permitted areas, which encompass Mine development areas. A summary of each monitoring parameter, predicted losses, permitted areas, and thresholds for the Meadowbank Mine and Whale Tail components is included in Table 31 and Table 32, respectively.

Table 31: Habitat Mapping Monitoring Parameters, Predicted Footprint Losses, Permitted Areas, and Thresholds for the Meadowbank Mine, All-Weather Access Road

Monitoring Parameter	Mine Site Predicted Loss	Mine Site Permitted Area	AWAR Predicted Loss	Threshold
Wildlife Habitat	1,130 ha	1,532 ha	180 ha ^(A)	>5% Predicted
Ungulate – High Suitability Habitat	372 ha (growing) 280 ha (winter)	531 ha (growing) 407 ha (winter)	4 ha (growing) 30 ha (winter)	>10% Predicted
Small Mammals – High Suitability Habitat	Given the minimal effects associated with the Meadowbank Project, habitat loss effects on Small Mammals were screened out during the FEIS (Golder 2016)			
Waterbirds – High Suitability Habitat	274 ha	417 ha	3 ha	>10% Predicted
Breeding Birds – High Suitability Habitat	590 ha	736 ha	29 ha	>10% Predicted

A) Permitted areas along the AWAR is 455 ha.

Table 32: Habitat Mapping Monitoring Parameters, Predicted Footprint Losses, Permitted Areas, and Thresholds for the Whale Tail Pit and Haul Road

Monitoring Parameter	Whale Tail Predicted Loss	Whale Tail Permitted Area	Threshold
Wildlife Habitat	775 ha	1,505 ha	>5% Predicted
Ungulate – High Suitability Habitat	21 ha (growing) 561 ha (winter)	56 ha (growing) 1,057 ha (winter)	>10% Predicted
Small Mammals – High Suitability Habitat	Given the minimal effects associated with the Meadowbank Project, habitat loss effects on small mammals were screened out during the FEIS (Golder 2016)		
Waterbirds – High Suitability Habitat	Given the minimal effects associated with the Meadowbank Project, habitat loss effects on waterbirds were screened out during the FEIS (Golder 2016)		
Breeding Birds – High Suitability Habitat	Given the minimal effects associated with the Meadowbank Project, habitat loss effects on breeding birds were screened out during the FEIS (Golder 2016)		

Habitat suitability rankings are summarized in Table 33. Further description of these rankings are provided in Dougan & Associates (2015).

Table 33: Habitat Suitability Rankings for VECs.

ELC Habitat	Caribou Growing	Caribou Winter	Muskox Growing	Muskox Winter	Waterbirds	Breeding Birds
Water	-	Low	-	Low	High	Low
Sand	Medium	Low	Low	Low	Medium	Medium
Boulder/Gravel	Medium	Low	Low	Low	Medium	Medium
Wet Graminoid	High	Medium	High	High	High	High
Graminoid Tundra	High	Medium	High	High	High	High
Graminoid/Shrub Tundra	High	Medium	High	High	Medium	High
Shrub Tundra	Medium	Low	Medium	Medium	Low	High
Shrub/Heath Tundra	Medium	Medium	Medium	Medium	Low	High
Heath Tundra	Medium	High	Medium	Medium	Low	High
Heath Upland	Medium	High	Medium	Medium	Low	High
Heath Upland/Rock Complex	Medium	High	Low	Low	Low	Medium
Lichen Tundra	Low	Medium	Low	Low	Low	Medium
Lichen/Rock Complex	Medium	High	Medium	Medium	Low	Medium

5.3 Duration

The total area of habitat disturbance associated with Mine site and ancillary facility construction was mapped following significant construction completion (2010) and was to be mapped annually during the operation phase as detailed in the TEMP (Agnico Eagle 2019). At the end of 2010, a detailed ELC habitat loss analysis found that habitat losses to date were substantially lower than predicted and that no habitat loss thresholds for VECs were exceeded. Given this outcome, another detailed ELC habitat loss analysis was not provided until the 2012 report, which had similar conclusions as those in 2010. The 2014 habitat analysis determined that habitat losses were

still below predicted losses but that some of the thresholds were being reached. A partial analysis was conducted in 2017 while a full and thorough analysis using a revised approach was completed in 2018.

The current habitat mapping monitoring program is intended to be completed every three years post-construction or if changes are greater than 25% of the overall Mine site footprint from the previous year evaluation. This frequency may be reduced during the operation phase if the amount of new disturbance and reclamation areas is relatively unchanged. Following decommissioning, vegetation mapping will be conducted in the first two years post-closure and every three years thereafter until Year 11 post-closure to verify that thresholds have been met.

5.4 Methods

Monitoring of habitat loss will occur at three primary locations: Meadowbank Mine (includes Vault Pit and Haul Road), AWAR (including quarry sites), and Whale Tail Pit and Haul Road (includes borrow/quarries sites and access roads). The calculation of impacted ELC units is based on Agnico Eagle as-built mine and road construction drawings and reports, aerial photographs and satellite imagery, and ground investigations. Newly disturbed areas are delineated using Global Positioning System (GPS) and Geographic Information System (GIS) mapping. Calculated losses were then subtracted from the permitted lease areas to ensure actual disturbances are within the lease area boundaries. For the Meadowbank Mine and AWAR locations, thresholds are disturbance of 5% above permitted areas of 1,532 and 455 ha, respectively. For the Whale Tail and Haul Road location, threshold is disturbance of 5% above a permitted area of 1,505 ha.

5.5 Historical Results

5.5.1 Meadowbank Mine Site

In 2014, construction of the Main Site construction was almost complete, including most of the infrastructure for the Vault Pit area, although much of the pit and waste rock storage area had not yet been disturbed. ELC results for the Mine site footprint, based on as-built drawings from 2014, were compared to predicted ELC unit losses from the 2005 FEIS, plus approved extensions. Measured habitat loss for the Mine site in 2014 was calculated to be 775.7 ha, which was 91.1 ha (10.5%) less than the predicted total habitat loss of 866.8 ha for the Mine site. Differences between predicted and actual habitat losses were greatest in heath tundra, birch and riparian shrub, and lichen ELC units, all of which are high suitability habitat for ungulates during the winter season. Although no thresholds (>5 to 10% above predicted losses) for the loss of high suitability habitat were exceeded for any VECs, threshold levels for the Mine site were almost reached in 2014. Consequently, commitments were made to remove the material stored in the NPAG extension area (which was approved by Nunavut Water Board [NWB]) and use it for capping of the North Cell Tailings Storage Facility during the closure/reclamation phase of the Mine.

In 2017, the Mine development footprint had changed substantially since the 2014 analysis. The Vault Pit was fully operational and had expanded into the Phaser Lake area. Although the Phaser Lake extension was completed with approval from the NIRB and the NWB, the size of the extension area was not available for habitat calculations in the 2017 report. Measured habitat loss for the Mine site in 2017 was calculated to be 1,021 ha, which was 154 ha (17.8%) more than the predicted total habitat loss of 867 ha for the Mine site. The difference between predicted and actual habitat losses was primarily attributable to the final extent of the Vault waste dump, the Phaser Lake extension of the Vault Pit area (i.e., these were not included in the 867 ha calculation), and the as-built layout of the Non-potentially Acid Generating (NPAG) expansion of the Portage Waste Rock Facility. Differences between predicted and actual habitat losses were greatest for the sedge, and birch and riparian shrub ELC units, both of which are High suitability habitat for ungulates during the winter season. Greater than 10% differences between predicted and actual habitat losses were also observed in heath tundra, lichen, lichen-rock,

and rock and boulder ELC units. Additionally, losses of high suitability habitat exceeded established thresholds for ungulates (growing and winter season), small mammals, and other breeding birds.

For the 2018 habitat analysis, the approach was revised to compare habitat losses to total area within Agnico Eagle's permitted areas, which also encompasses future approved work. For all ELC units combined, overall measured habitat losses (i.e., 1,129 ha) were 26% less than the habitat available within permitted areas (i.e., 1,532 ha) of the Meadowlark Mine site; therefore, thresholds were not surpassed. Similar to the measured habitat loss assessment, high suitability habitat losses for ungulates, small mammals, waterbirds, and other breeding birds were all well below available high suitability habitats within permitted areas, also not surpassing any thresholds.

5.5.2 AWAR

The ELC results for the AWAR had not changed since the 2010 analysis, and habitat loss analyses were not required. The 2010 ELC results for the AWAR were compared to ELC unit losses predicted in the 2005 EIS report. Construction of the AWAR required 38.4% less area (173 ha) than predicted in the 2005 FEIS (281 ha) and for each ELC unit, actual habitat losses were less than predicted. ELC habitat loss values for the AWAR in 2010 were compared to predicted high suitability habitat losses for ungulates (growing and winter season), waterbirds, other breeding birds, and small mammals. In all cases, the measured high suitability habitat losses were significantly less than predicted losses and no thresholds (i.e., >5 to 10% above predicted losses) were exceeded.

5.5.3 Whale Tail Pit and Haul Road

The Whale Tail Pit was last assessed in 2020 (Golder 2021). The area of the proposed footprint from 2018 was assessed as 5.04 km², and the area of the 2020 footprint of the Whale Tail Pit was assessed as 5.20 km². The Whale Tail Lake, borrow areas, and WTHR present in the proposed 2018 footprint were excluded from comparison with the 2020 footprint. Change in footprint for the Whale Tail Pit (3.2%) in 2020 was assessed as less than 25% since 2018.

5.6 Results

5.6.1 AWAR

The ELC results for the AWAR have not changed since the 2010 when it was reported as 173 ha in size. The current footprint of the AWAR and quarry sites is 180 ha. This increase in size is a result of changes in boundary classifications and is not a result of additional development on the AWAR. The AWAR habitat losses are well below the permitted area of 455 ha.

5.6.2 Meadowbank Mine Site

Change in ELC units for Meadowbank Mine Site is summarized in Table 34 and Figure 13. The highest amount of ELC losses are in the water, sedge and birch and riparian shrub ELC units representing 365 ha, 229 ha and 142 ha respectively.

Table 34: Meadowbank Mine Site Footprint ELC Unit Totals

ELC Unit	Permitted Areas [ha]	Calculated ELC Unit Losses 2021 [ha]	Difference between Losses and Permitted Areas
Birch and Riparian Shrub	202.91	142.43	-60.49
Heath Tundra	145.51	116.65	-28.86
Lichen	175.07	119.9	-56.07
Lichen-Rock	86.45	43.67	-42.78
Ridge Crest / Esker / Avens	0.19	0.18	-0.01
Rock and Boulder	185.13	113.15	-71.98
Sedge	328.03	229.05	-98.98
Water	408.33	365.13	-43.19
Total Area	1,531.63	1,130.16	-402.37

Change in high suitability habitats compared to predicted losses is summarized in Table 35.

Table 35: Meadowbank Mine Site Predicted and Actual High Suitability Habitat Losses

Habitat	Predicted Loss [ha] ^(A)	2021 Loss [ha]	% of Predicted Loss	Threshold (above predicted losses)
Terrestrial Habitat	1,532	1,130	74	5%
Ungulate Growing Season	531	372	70	10%
Ungulate Winter Season	407	280	69	10%
Waterbirds	417	274	66	10%
Breeding Birds	736	594	81	10%

A) Predicted loss in 2021 is based on permitted area and not EIS predicted areas plus approved extensions.

5.7 Accuracy of Impact Predictions

The 2021 habitat loss data were compared to permitted areas (i.e., rather than EIA predicted areas and extensions) to evaluate adherence to the impact predictions and the provision of adaptive management, as either a necessary or proactive measure. Actual habitat loss as result of mine site construction and AWAR/WTNR development to date is significantly less than habitat available within permitted areas (Table 38).

Table 38: Accuracy of Impact Predictions - Habitat Loss

Measurable Parameter	Threshold (Compared to Permitted Areas	Threshold Exceeded (2021)	Adaptive Management Implemented	Status
Habitat Loss	Terrestrial Habitat Meadowbank = 1,532 ha AWAR = 455 ha Whale Tail = 1,505 ha Threshold is >5% habitat loss of permitted area	No	None required	Ground Surveys Mapping and GIS analyses – ELC habitat mapping
	Ungulates Meadowbank Growing = 33 ha Winter = 650 ha Whale Tail Growing = 56 ha Winter = 1,057 ha	No	None Required	
	Small Mammals Waterbirds Breeding Birds	Given the minimal effects associated with the Meadowbank project, habitat loss effects were screened out during the EA (Golder 2016)		
	Following mine closure and reclamation activities (except for tailings, waste rock facilities and exposed pit slopes) will see revegetation rates of >20% (year 2 post-closure), >40% (year 5), >60% (year 8) and >80% (year 11)	Not yet applicable		

5.8 Management Recommendations

Calculated habitat loss for the project are well below habitats available within the permitted areas, as are high suitability habitat losses for wildlife VECs. The next wildlife habitat monitoring analysis will be presented in the 2024 TEMP unless there are significant changes to the planned Project footprint.

6.0 CARIBOU SATELLITE-COLLARING PROGRAM

6.1 Overview

Agnico Eagle intends to continue collaboration with the GN DoE caribou satellite-collaring program that includes data collected within the Meadowbank Complex RSA. The GN biologists discuss collar deployments with hunters and Elders and get approval prior to proceeding. Daily collar location maps are provided by GN DoE during the sensitive seasons to inform locations of caribou in relation to the Meadowbank Complex.

6.2 Objectives

The satellite-collaring program was developed to provide information on the distribution of caribou occurring within the Meadowbank RSA and contribute data to ongoing satellite-collaring programs for the Ahiak, Qamanirjuaq, and other herds that are used by the GN for herd management. The satellite-collaring program, along with GN DoE regional data, is an important monitoring and management tool that provides a regional perspective on caribou activity near Mine operations. Another key objective of the program is to provide timely information for the caribou management and monitoring strategy at the Meadowbank and Whale Tail sites (i.e., Decision Tree approach; see 2019 TEMP [Agnico Eagle 2019]).

6.3 Duration

The satellite-collaring program was initially designed to continue for five consecutive years in accordance with the original TEMP (Cumberland 2006), but collar deployments have continued beyond this period as part of a long-term caribou monitoring strategy for the region. Caribou in the Baker Lake area were first collared in May 2008, and the program has continued for more than a decade. Monitoring of collars continued in 2021 and is expected to continue through 2022.

6.4 Methods

Caribou collaring methods and deployment are administered by the GN. Caribou are carefully netted by the contracted satellite-collaring crew via helicopter and fitted with either an Advanced Research and Global Observation Satellite (ARGOS) GPS Type IV or Iridium satellite-collar. Collar data are regularly¹ retrieved electronically via satellite and distributed to GN DoE and Nunavut Environmental personnel by CLS America, the data-management company.

Deployed collar data were included in a population distribution analysis completed for the GN (Nagy et al. 2011). The clustering and movements of each collared caribou are examined and assigned to the sub-population (i.e., Ahiak, Beverly, Lorillard, Qamanirjuaq, and Wager Bay herds) that best fits the animal's movement characteristics.

Collar data collected between 2005 and 2019 was analyzed in 2021 to assess inter-annual trends in migration timing, comparison between telemetry and ground survey observations in 2018 and 2019, and the effect of WTHR construction on spring and fall migration patterns.

The WTHR and AWAR do not have a straight north-south alignment and therefore cannot be used to standardize the timing of migration. In contrast, a straight north-south reference line does standardize timing because it occurs at the same point in space regardless of where a caribou encounters it. One north-south reference line was

¹ Data are often retrieved on a daily basis but may vary depending on signal strength and weather conditions.

placed at the most western point of the WTHR and AWAR to capture migration of caribou from western wintering grounds to eastern calving grounds (i.e., the spring reference line). A second north-south reference line was placed at the most eastern point of the WTHR and AWAR to capture migration of caribou from eastern calving grounds to western wintering grounds (i.e., the fall reference line).

Inter-annual variation in migration trends was also estimated using linear mixed-effects models, where caribou ID was included as a random intercept to account for correlated migration behaviour of the same animal, and year was included as a fixed effect. A one-way analysis of variance (ANOVA) assuming Type II error was used to test inter-annual variation in migration trends (i.e., the fixed effect of year). Post-hoc comparisons (i.e., Tukey Contrasts) were completed between pairs of years to determine statistically significant differences in migration trends over time.

Full methodology of 2005 to 2019 collar analysis is included in Appendix F.

6.5 Historical Results

Collaring was originally scheduled to commence in 2007 but was postponed for one year due to logistical constraints. Seven deployments, with a total of 115 collars, have been completed in the area around Baker Lake since Agnico Eagle became involved in the collaring program. historical collar data have all been assigned to one of the five major sub-populations (Nagy et al. 2011). The following numbers of collars were successfully deployed since 2008:

- 9 collars (Agnico Eagle) in May 2008;
- 21 collars (shared by Agnico Eagle and AREVA) in November 2009;
- 13 collars (Agnico Eagle) in April 2011;
- 15 collars (shared by Agnico Eagle and AREVA) in April 2013;
- 10 collars (Agnico Eagle) in April 2015;
- 13 collars (Agnico Eagle) in May 2016; and
- 34 collars (Agnico Eagle) in April 2018

6.6 Caribou Migration Patterns

Based on analysis of collar data from 2005 to 2019, the estimated date of spring migration pooled across all years was Julian day 121, or 1 May, and 96% of all spring migrations, occurred between 11 April and 20 May. Spring migration timing distribution differed significantly across all years. However, pairwise comparisons between years found that 83% of years were statistically similar, and only 17% of years differed significantly. When years with low sample sizes were removed, large changes to migration timing, duration, and pooled absolute differences were not observed. However, the number of year-to-year comparisons of distributions that were statistically similar was reduced.

In 2018, the date at which approximately 50% of caribou were estimated to have migrated across the spring reference line, based on ground observations, was Julian day 108 (18 April), which was 13 days earlier than the date estimated by telemetry data (i.e., Julian day 120 or 1 May). The estimated date of spring migration was later in 2019 (i.e., Julian day 114 or 24 April vs. Julian day 108 or 18 April) based on ground observations. Telemetry data for 2019 indicated that the estimated date of spring migration was also 24 April.

Because fall migration appeared to be multimodal (i.e., caribou interacted with the fall reference line in multiple waves), the fall season was split into an early and late period, and inter-annual variation in fall migration was considered for each period separately. Based on 14 caribou, the mean early fall migration date for 2018 was Julian day 256 (13 September), and 96% of early fall migrations, occurred between 30 August and 27 September in 2018. The mean late fall migration date was Julian day 312 (8 November), and 96% of late fall migrations, occurred between 11 October and 7 December. Late fall migration distributions differed significantly across years. Pairwise comparison of years indicated that 33% of years were statistically similar and 67% of years were statistically different.

In 2018, the estimated date at which approximately 50% of total caribou were recorded from ground observations was Julian day 286 (13 October), which was 22 days later than the date estimated by 50% of telemetry data (i.e., Julian day 264 or 21 September) and inclusive of both early and late fall periods. Comparisons between ground and telemetry observations could not be made for 2019, due to collar data being unavailable at the time of analysis.

Spring migration distributions did not vary pre- and post-WTHR construction, nor did late fall migration distributions. Early fall pre-and post-WTHR construction distributions were not compared because the within year trend for 1999, 2000 and 2001 are characterized by a single collared animal and would limit the temporal comparison to a single pre-construction (2016) and post-construction 2018 year.

Full results of the 2005 to 2019 collar data analysis are provided in Appendix F.

6.7 2021 Results

Agnico Eagle intends to continue collaboration with the GN DoE caribou satellite-collaring program. Collar data were not available to complete the 2020 and 2021 analysis.

6.8 Accuracy of Impact Predictions

Could not be completed for the 2021 monitoring year. Collar data were not available to complete the analysis at the time of reporting.

6.9 Management Recommendations

Future collar data analysis should be discussed with the TAG. Recommendations based on analysis of 2005 to 2019 collar data include further exploratory analysis aimed at explaining annual differences in the timing of spring and fall migration may be completed with environmental covariates such as snow conditions (Mallory et al. 2020) or weather (Gurarie et al. 2019). If differences can be explained by readily available information such as weather, then it may be possible to forecast when mitigation should be applied annually. Further analyses can be carried forward with additional comparisons to ground observations during both seasons as collar data becomes available.

7.0 VIEWSHED SURVEYS

7.1 Overview

Viewshed surveys were implemented in 2020 to survey standardized and readily accessible survey locations along the WTHR that would maximize detection of approaching caribou because topography around the WTHR is variable. The viewshed surveys serve as an early warning system for caribou approaching the WTHR to support mitigation measures during migration. The existing height-of-land (HOL) surveys were completed from 2017 through to February 2020 and then replaced by the viewshed surveys for the remainder of 2020. In 2019, Agnico Eagle advanced the idea of using viewshed survey points instead of HOL locations because of safety and logistical concerns. A viewshed survey analysis (a viewshed analysis) and report were prepared by Golder (2020c) to establish 12 viewshed survey locations along the WTHR that maximized the total habitat around the WTHR that could be surveyed. Agnico Eagle began using the viewshed survey locations in February 2020. In 2021, viewshed survey locations were adjusted based on areas with high caribou use and points of high elevation within areas with high caribou use, and an additional survey location was added. Thirteen viewshed locations were surveyed on 27 occasions in 2021.

7.2 Objectives

The viewshed surveys provide an ‘early warning’ system of the presence of caribou in proximity to the WTHR. The viewshed surveys provide a series of standardized locations to repeatedly and safely survey throughout the year to produce estimates of caribou moving through the Project.

7.3 Methods

From 2017 to 2019, five height-of-land (HOL) locations were surveyed along the WTHR. The locations were within 500 m of the WTHR and provided an unobstructed view of the surrounding terrain. In 2020, the HOL surveys were replaced by viewshed surveys and twelve viewshed survey locations were established along the WTHR in a desktop review to maximize the area around the WTHR that could be surveyed (Golder 2020a). Survey locations were established to cover the length of the WTHR. In 2021, 13 viewshed locations were surveyed as shown in Figure 15. While conducting the viewshed surveys, observers spent 10 minutes surveying for wildlife using a combination of naked eye, binoculars, and spotting scopes to maximize sighting distance. If a caribou group is observed, the observer estimates the number of individuals, direction from observer, distance from road, behaviour, direction of travel, and habitat. These results are then used to determine if a Group Size Threshold has been reached and if mitigation action is required.

7.4 Historical Results

A total of 12 species were observed during HOL surveys in 2019; six species were only observed during the summer caribou season (Table 39). The highest number of caribou was observed during the spring caribou season, followed by the fall and then summer seasons (Table 39). No caribou were observed during the winter caribou season.

In 2020, 163 viewshed surveys were completed across 19 dates: five in spring, eight in summer, one in fall, and five in winter. Three mammal species were observed during viewshed surveys, including 252 caribou, one Arctic hare, and eight muskox (Table 40). Two bird species were observed including one common raven and one sandhill crane. Only 10 out of 163 surveys (6%) had caribou sightings. Of the 10 sightings, 8 occurred during the spring and 2 during the summer. Caribou were typically sighted to the north or west, and the average sighting

distance was 630 m from the road. In all cases where caribou were observed, the recorded visibility was up to 1 km, indicating these surveys are most effective in good visibility conditions.

Table 39: Total Number of Wildlife Observed during Height of Land Surveys along the Whale Tail Haul Road in 2019

Species	Caribou Seasons

7.5 2021 Results

All thirteen viewshed locations (Figure 15) were surveyed on 27 dates in 2021, though not all locations were surveyed each day. Each location was surveyed a minimum of 15 times each throughout the year, with a maximum of 26 survey visits and a total of 310 surveys conducted. Surveys were conducted between 4 February and 29 December, with the highest survey effort occurring in the fall (54%, Table 41). There were no viewshed surveys conducted in spring of 2021.

Table 41: Viewshed Survey Effort by Season, 2021

Season	Survey Days	Surveys Completed (% of total effort)
Spring	0	0 (0%)
Summer	9	92 (30%)
Fall	14	167 (54%)
Winter	4	51 (17%)
Total	27	310 (100%)

Of the 310 viewshed surveys completed in 2021, only 37 surveys (12%) had caribou sightings, and a total of 190 caribou were reported (Table 42). Only two survey locations, Viewshed 1 and Viewshed 11, had no surveys with caribou detections (Table 42). Three survey locations had only one survey with caribou sightings (Viewshed 2, 3, 11), two survey locations had two surveys with caribou sightings (Viewshed 6, 8), and one survey location had four surveys with caribou sightings (Viewshed 4). Viewshed survey locations 10, 12, and 13 each had five surveys with caribou sightings, and Viewshed 5 had a total of eight surveys with caribou sightings. Of the 37 surveys with caribou sightings, 27 occurred during the summer and 10 occurred during fall (Table 42). The 51 winter surveys did not detect caribou, and there were no viewshed surveys in spring of 2021. In spring 2021, road surveys were the main method used to detect and monitor the presence of caribou, however, upon receiving 2020 GN comments, Agnico Eagle increased viewshed survey effort and will continue this effort in 2022.

Group sizes ranged from 1-24 individuals (Table 43). Caribou were sighted more frequently to the east due to increased surveys in the fall, and the average sighting distance was 1049 m from the road. In all cases where caribou were observed and visibility was recorded, the visibility was at least 1 km, indicating these surveys are most effective in good visibility conditions.

Other mammals recorded during viewshed surveys include Arctic fox, Arctic ground squirrel, Arctic hare, muskox, and bird species recorded include Canada goose, common raven, ptarmigan sp., sandhill crane, and snow goose (Table 44).

Table 42: Viewshed Surveys Completed and Number of Caribou Observed per Season in 2021

7.6 Management Recommendations

The viewshed surveys were implemented to improve logistics and health and safety conditions for observers, as well as long-distance monitoring of caribou. Twenty-seven days of viewshed surveys were conducted in 2021, while the majority of monitoring along the WTHR was conducted using the standard road surveys (Section 3.0). Agnico Eagle increased viewshed survey effort prior to fall migration, based on comments on the 2020 annual report. Analysis comparing the effectiveness of viewshed surveys and road surveys at detecting caribou approaching the WTHR, based on known locations from satellite collar data has been requested by the GN. Completion of this analysis is planned in 2022 following the spring migration.

8.0 REMOTE CAMERA PROGRAM

8.1 Overview

The initial remote camera study design (October 2018 to November 2019) was intended to collect general trends on caribou crossing events and traffic or road activities on the WTHR, to inform fine scale traffic mitigation. An updated study design was implemented in November 2019, to examine the permeability of the WTHR to caribou movement as those interactions relate to the physical parameters of the road. The 2020 remote camera data were previously analyzed for the 2020 Wildlife Monitoring Summary Report (Golder 2021). Results from the 2019 to 2021 remote camera program are summarized below.

8.2 Objectives

The primary objective of the remote camera program is to monitor caribou behavioural interactions with the WTHR, and adapt management practices (i.e., traffic mitigation) as required. The current remote camera program allows for comparisons to determine if caribou crossing locations along the WTHR are related to the physical parameters of the road (i.e., backfill height, slope and material grain size) and traffic rates (Golder 2019).

8.3 Duration

The use of remote cameras will continue throughout the year, but camera results will be analyzed and discussed at TAG meetings to ensure that the monitoring objectives are being achieved.

8.4 Methods

8.4.1 Camera Deployment and Settings

Locations of remote cameras have varied across program years (Table 45; Figure 16 to Figure 18). Ten camera pairs were active in 2019 and 2021, and eight camera pairs were active in 2020. The locations of the paired remote cameras along the WTHR were selected based on high-frequency caribou crossing locations, and stratified across road height categories (i.e., <1.5 m, 1.5 to 3 m, and >3 m; Table 45). Road heights in 2019 were determined from spatial data, and road heights in 2020 and 2021 were determined in the field. Backfill material and slope at camera locations were determined from construction surveys (WSP 2019). Backfill slope along the WTHR is typically 2:1. In areas where backfill height exceeds 3 m, slope was recontoured to 4:1 for safety purposes, and to facilitate wildlife crossings (WSP 2019).

The program uses Reconyx HyperFire 2 Professional Covert IR Camera OD Green cameras. In the pilot program, at each location, the first camera in the pair was typically placed facing the WTHR, and the second camera was placed facing away from the WTHR. In November 2019, camera locations were updated so that at each location, the first camera in the pair was placed facing parallel to the WTHR (i.e., recording observations of caribou crossing the road) in one direction (e.g., north). The second camera in the pair was placed facing parallel to the road in the opposite direction of the first camera (e.g., south). Cameras were placed in close proximity to the road (within 5 m, approximately 1 m above ground level), to provide a field of view that would capture road traffic and caribou interactions with the road. The majority of camera positions were adjusted for 2021 to encompass both sides of the road to better document caribou crossing events and vehicle traffic. Camera timing was set to the continuous motion-triggered setting, with additional timed interval photos occurring in thirty minute or one hour intervals. Maintenance checks were performed approximately every one to two months, and weekly during the sensitive seasons to back up photographs and remove dust, snow, or ice accumulated on cameras.

> = greater than; < = less than; KM = kilometre; m = metre; UTM = Universal Transverse Mercator

a) Locations moved to 2020 locations in November 2019, part way through fall season.

b) Determined from spatial data.

c) Camera not active in spring 2020.

d) Camera likely has crossing event but could not be determined.

8.4.2 Photograph Review

Photograph review was limited to the sensitive period where caribou are likely to interact with the WTHR (spring: 1 April – 25 May; fall: 22 September – 15 December). The program Timelapse2 was used to review photographs (Greenberg and Godin 2015).

Analysis of 2020 data found that the majority of caribou detections were from time lapse images, rather than motion-triggered images (Golder 2021). Due to the open nature of the habitat along the WTHR, caribou infrequently walk directly in front of cameras, and so, infrequently activate motion-triggered images. Therefore, data from time-lapse, and not motion-triggered images were summarized across the three program years.

Individuals were not considered separate detections until either an hour had passed or until there was a distinguishable difference between separate individuals triggering the camera. Caribou behaviours (e.g., crossing, deflection, stressed, neutral, or calm) were recorded where applicable (Table 3, Appendix K, Agnico Eagle 2020a). When caribou crossing events (i.e., caribou observed on both sides of the road) were documented, the time since previous vehicle and type of previous vehicle was recorded (e.g., haul truck, heavy duty, light duty). Both time-lapse and motion-triggered images were used to determine the time of previous vehicle. The data underwent a QA/QC process, whereby caribou occurrences were reviewed to determine if species and number of individuals observed were identified correctly.

8.4.3 Data Analysis

Sampling effort or number of days each camera was considered active was determined at each camera based on time-lapse photographs. Photographs with obstructed field of view (e.g., covered with snow) were flagged and excluded from analysis and calculation of active days. An overall caribou detection rate was calculated, based on the number of individuals observed, divided by the camera station sampling effort in days for spring and fall.

A caribou crossing rate was also calculated, based on the number of individuals observed crossing the road, divided by the camera station sampling effort in days for spring and fall. To prevent double counting caribou at camera pairs, the maximum caribou and caribou crossing rate at each camera pair is presented by season.

Across years, camera pairs differed in their ability to capture caribou crossing events and traffic rates due to placement in relation to the road. In other words, some camera pairs were positioned to capture large volumes of vehicle images, while others were better positioned to capture wildlife activity adjacent to the road and captured fewer vehicle images. For this reason, there were few instances where caribou behaviour could be assessed in relation to WTHR traffic. Only events where caribou were photographed on the road, or individuals of a group were observed on either side of the road were considered crossing events. Time between caribou crossing events and vehicles detected on remote cameras was calculated.

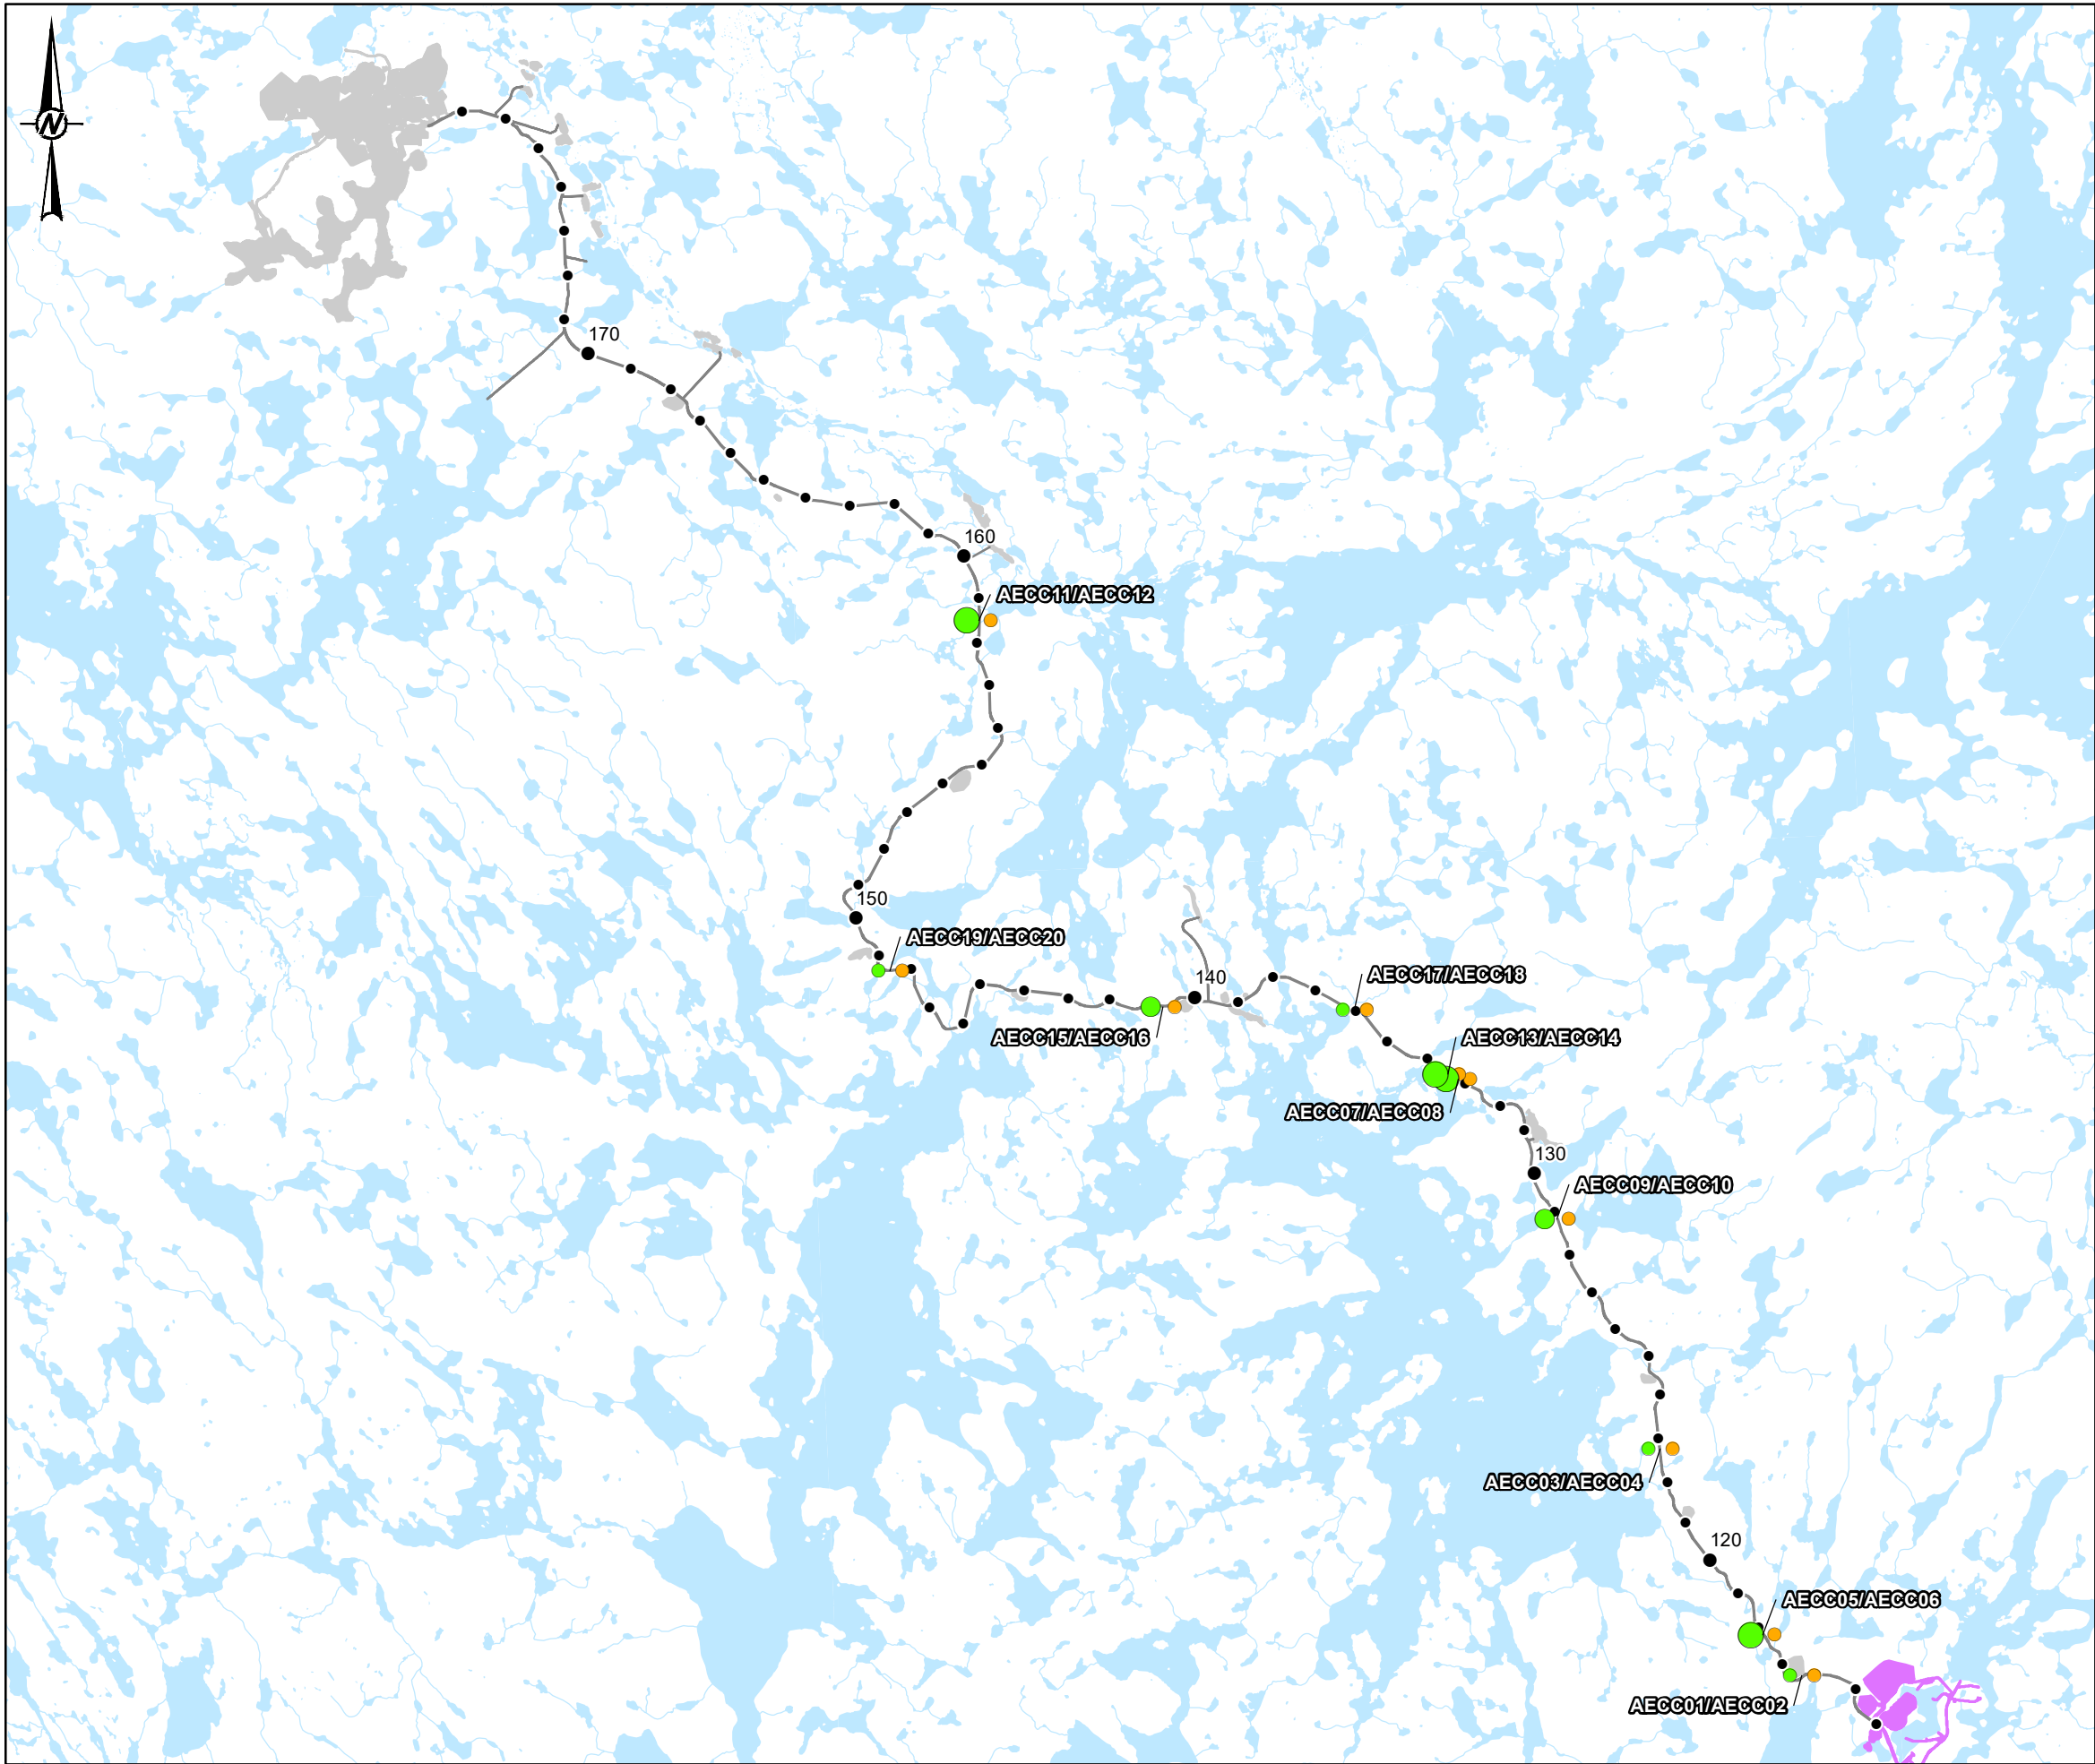

8.5 Results

Caribou were detected on time-lapse images in the spring between 10 April and 20 May 2019, 2 April and 24 May 2020, and 15 April and 25 May 2021 (Figure 19). Three caribou (0.08 caribou/day) were detected in fall 2019 at camera pair 8. There were 10 crossing events in 2020, and 3 in 2021 (Table 46). The highest caribou rates were detected in 2019, however no crossing events were observed in time-lapse images in 2019 (Table 45). Cameras in 2019 were deployed to face towards, and away from the road, and therefore had less opportunity to detect crossing events. Cameras facing away from roads contributed to high caribou rates. Crossing events were detected on the southern portion of the road closer to the Meadowbank Mine Site (Figure 18)

The majority of crossing events occurred during road closure (Table 46). The average time between crossing events and previous vehicle, including during road closures, was 23:09 hours, ranging from 2:30 to 85:10 hours. Too few crossing events were detected to statistically compare crossing rates between different road heights, backfill materials, and backfill slopes. However, crossing events occurred on cameras of all road heights, and both backfill slope categories (Table 45). Crossing events were detected on rock and esker backfills, but not mixed backfills (Table 45).

The drawbacks only analyzing time-lapse images is that caribou on motion triggered images were missed, and caribou counts may be subject to error due to distance of caribou groups from cameras. Caribou groups had to be detected on both sides of the road to count as crossing events, and some crossing events in the distance were likely missed due to the interval between time-lapse images. Adjustment of camera positions between 2019 and 2020 improved detection of crossing events, but decreased overall caribou detection rates. Adjustments made between 2020 and 2021 appeared to reduce detection of caribou crossing events on time-lapse images (Table 45).

A) Could not be identified due to lighting conditions, only vehicle lights observed.

B) Approximate count, caribou far from camera location.

8.6 Management Recommendations

The number of detections across the three program years did not allow statistical analysis of the time between vehicle disturbance and caribou road crossing events, or differences in crossing rates across road attributes. Remote cameras are suitable method for determining caribou response to vehicle traffic, however, detections of caribou on remote cameras have been relatively low across years.

Crossing events from road surveys or incidental observations could also be linked to road attributes to increase understanding of how road heights, backfill materials, and backfill slopes influence road crossing locations. Information collected during caribou behaviour surveys can be used to inform caribou response to vehicle disturbance, however these surveys do not specifically target time between vehicle traffic and road crossing.

The future of the remote camera program should be discussed with the TAG. The remote camera program is unlikely to contribute to adaptive management, unless many more cameras are deployed across the WTHR, and potentially the AWAR to increase the number of caribou crossing event detections. This would require significantly more effort to deploy and maintain cameras and to review camera photos. Motion triggered images could potentially be reviewed to identify caribou detections and crossing rates that occur close to cameras.

9.0 BLAST MONITORING

9.1 Overview

The purpose of the blast monitoring program is to measure vibration and overpressure from explosive blasts at the Whale Tail Pit and to understand how blasting vibration relates to caribou behaviour. The program aims to establish site-specific relationships between vibration and overpressure levels and blasting parameters (e.g., charge mass, charge depth), environmental conditions (e.g., seasonal variation), and propagation distances. The program includes monitoring of caribou sensory disturbance related to blasting.

Blasting is required to be delayed when caribou or other wildlife are observed within the blast danger zone (typically 600 m from the blast centre). According to the TEMP, blasting is also delayed when caribou GST is observed within 4 km during the sensitive season, or within 5 km during the calving period, or when muskox GST is observed within 1 km (Agnico Eagle 2019). Following discussion with the TAG, the distance was relaxed to 3 km for caribou during the sensitive season, and 5 km during the calving period, to better understand effects to caribou from blasting. The Environment Department performs monitoring prior to each blast to ensure no caribou groups exceeding GST are present within these setback distances.

9.2 Objectives

The purpose of the blast monitoring program is to determine if blasts conducted at the Whale Tail Pit exceed vibration annoyance or damage thresholds, understand blasting vibration and overpressure attenuation and to characterize the behavioural response of caribou to blasting.

9.3 Duration

Blast measurement data collected in 2021 were used to determine site-specific relationships between overpressure and vibration and blasting parameters. Caribou behaviour monitoring will continue until a sufficient sample size of caribou behaviour at different distances from blasting is collected and assessed in relation to blasting parameters.

This report presents analysis of blast measurement data collected between December 20, 2020 and August 6, 2021. Blast measurement data collected from 11 blasts performed in 2020 are presented in Golder (2021).

9.4 Methods

9.4.1 Blast Monitoring and Data Analysis

Vibration and overpressure from explosive blasting was analyzed using two measurement parameters:

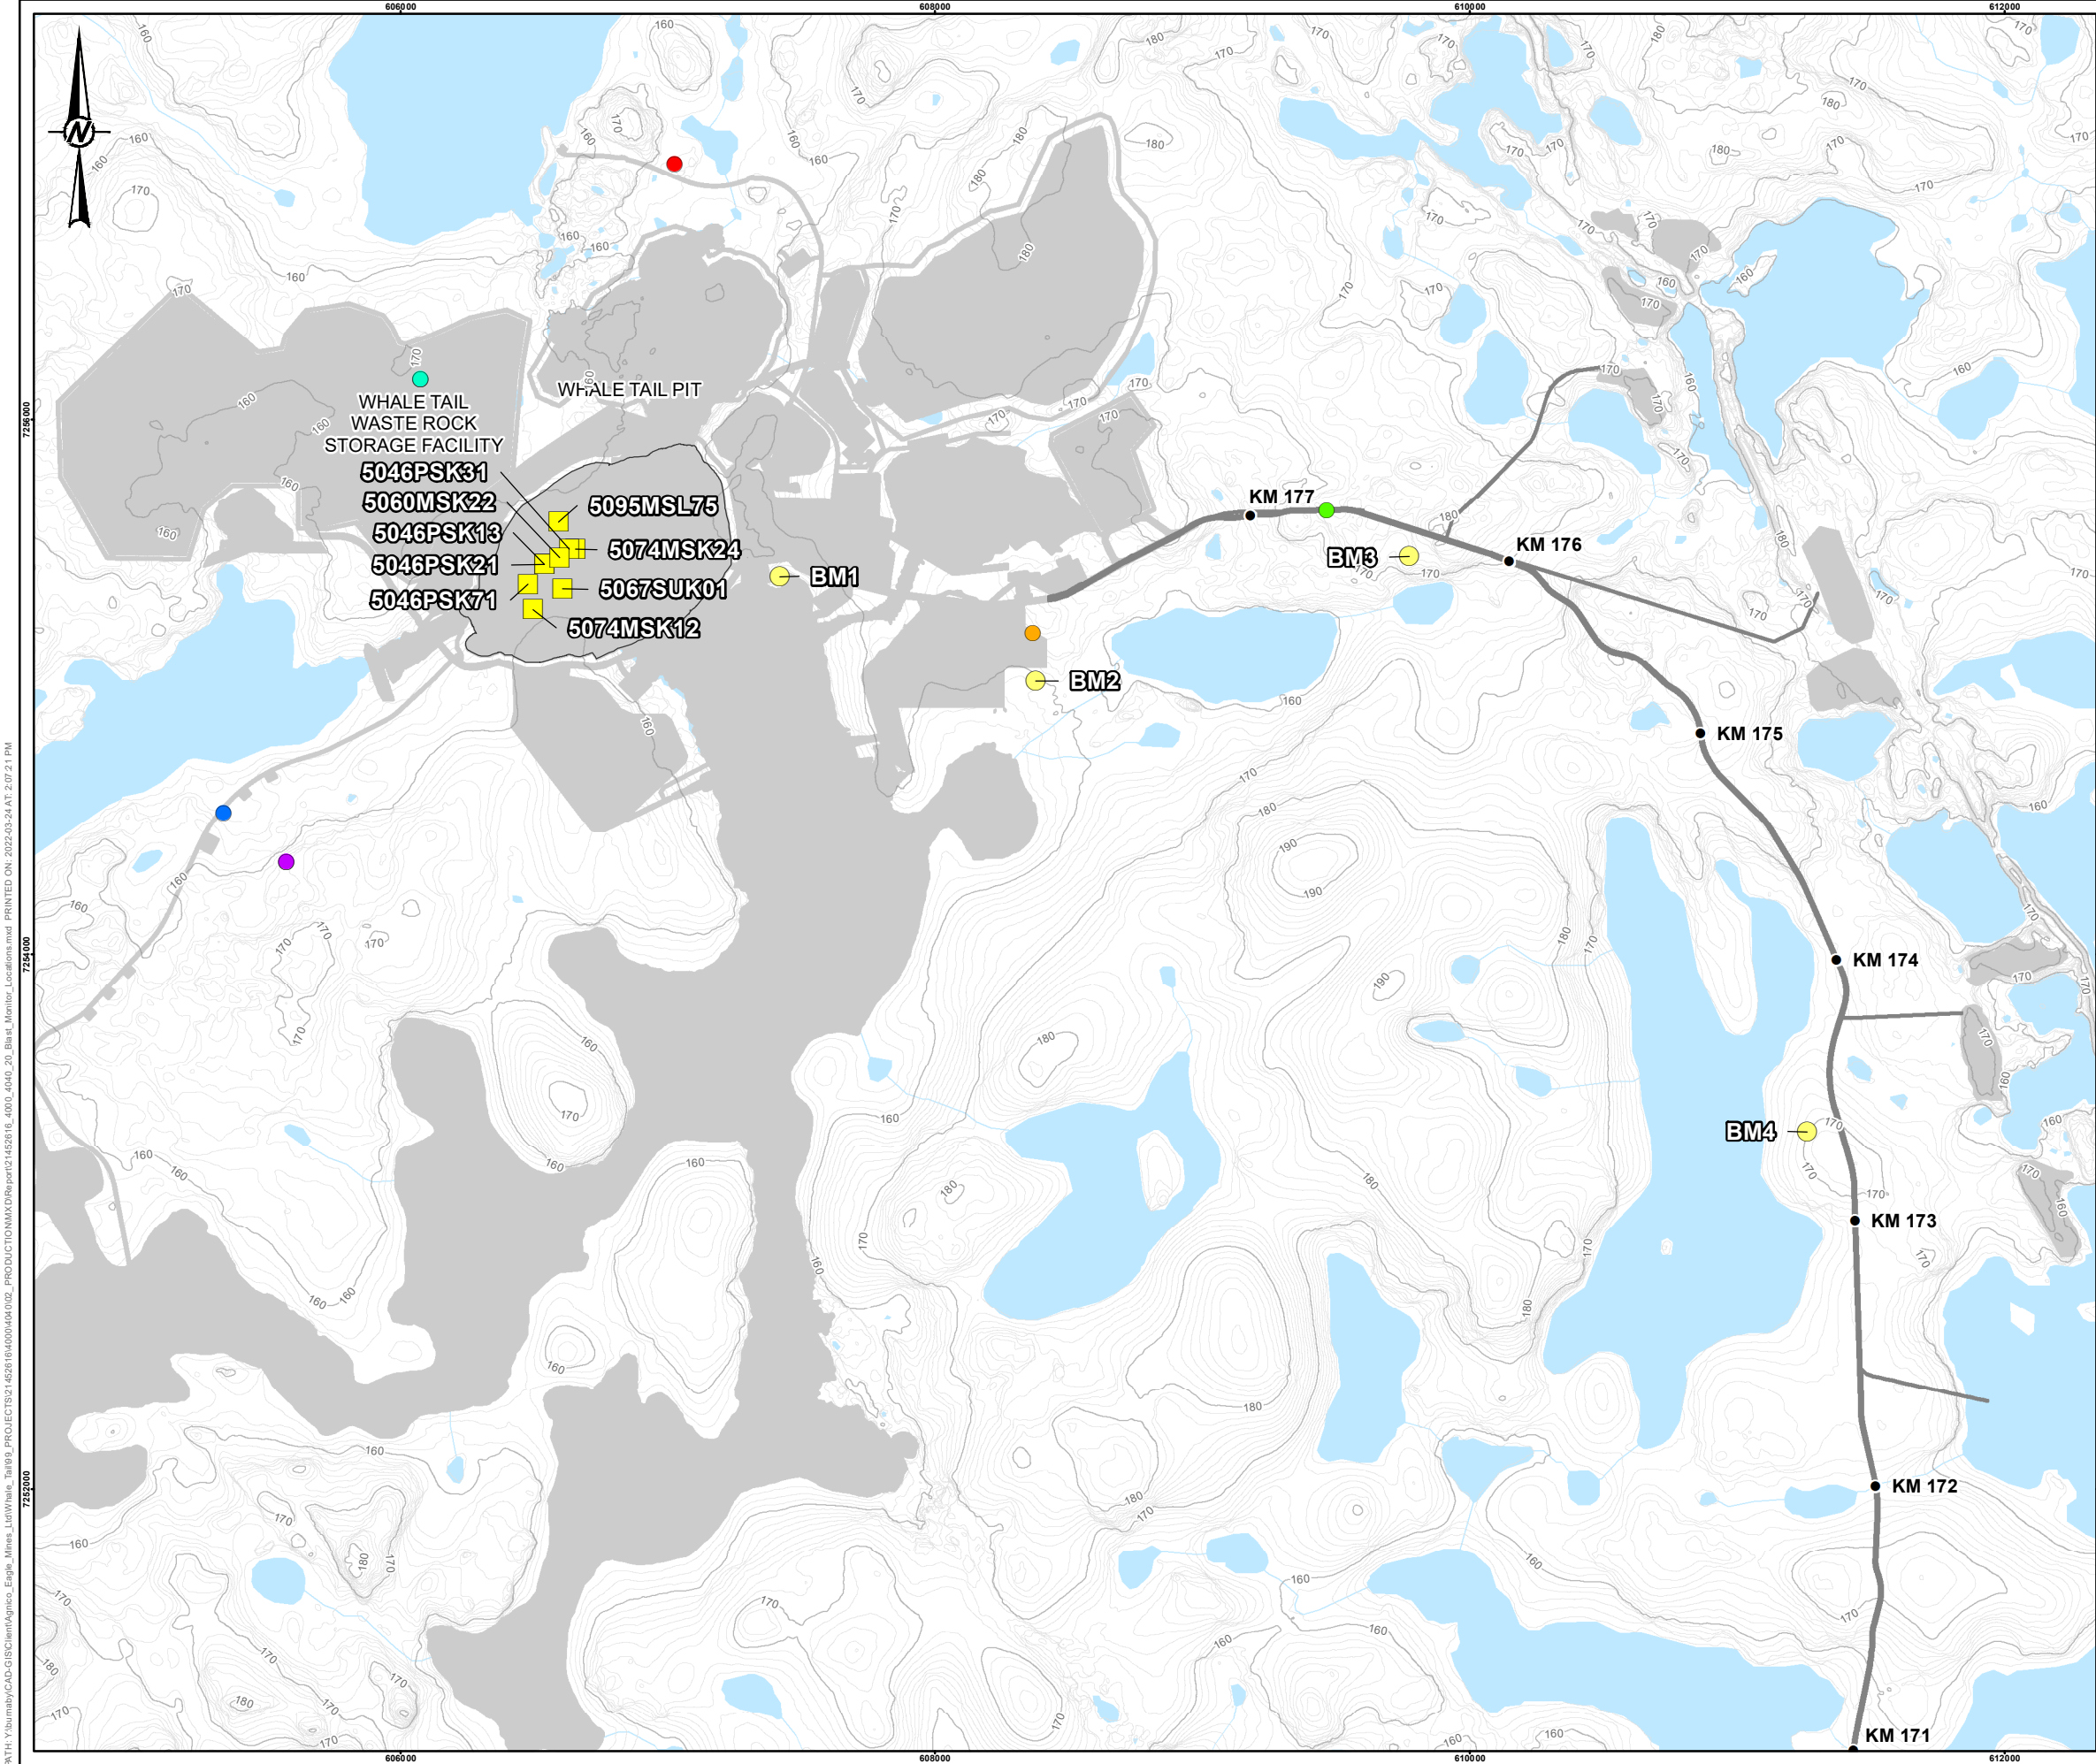

- Peak Particle Velocity (PPV), which characterizes ground vibration (i.e., physical shaking of the ground as a result of an explosive blast). PPV values were measured in millimetres per second (mm/s).
- Peak Pressure Level (PPL), which characterizes airblast overpressure (i.e., movement of air as a result of an explosive blast). PPL values were measured in linear decibels (dBL).

The blast monitoring program used InstanTel Minimate® units (Model No. 716A3001) to measure vibration levels during blasting. The Minimate® units used triaxial geophones to measure PPV (for the characterization of ground vibration) and linear microphones to measure PPL (for the characterization of airblast overpressure).

The blast monitors were deployed at four different locations around the Whale Tail Pit to characterize attenuation in blasting vibration levels with propagation distance. Table 47 presents location information for the four blast monitors. The locations of blast monitors are also shown in Figure 15. Monitoring locations were selected to be generally downwind from the Whale Tail Pit, based on prevailing wind conditions in the area. Downwind conditions tend to enhance propagation of airborne pressure waves, so using monitoring locations downwind from the blast site is a conservative approach to characterizing airblast overpressure.

Table 47: Blast Monitoring Locations

Blast Monitor	Universal Transverse Mercator Coordinates [Zone 14]		Approximate Distance to Centre of Whale Tail Pit [m]
	Easting [m]	Northing [m]	
BM1	607418	7255413	500
BM2	608376	7255023	1,500
BM3	609772	7255489	3,000

PROJECT NO.	CONTROL	REV.	FIGURE
21452616	4000/4040	0	20

The general relationship between ground vibration (PPV; mm/s), charge mass (Q; kg), and propagation distance (D; m) is expressed by the following formula, where k_1 is a unitless “site constant” and e_1 is a unitless “site exponent” (Richards and Moore 1995). The k_1 and e_1 parameters are used to represent site-specific conditions that can influence the propagation of ground vibration.

$$PPV = k_1 \left(\frac{D}{\sqrt[3]{Q}} \right)^{-e_1}$$

Representative site-specific values for k_1 and e_1 were established by application of statistical regression to PPV measurement data collected between December 20, 2020 and August 6, 2021. The regression analysis was first applied to the complete PPV data set to obtain general estimates for the k_1 and e_1 parameters. To investigate potential seasonal differences in the propagation of ground vibration, the full PPV data set was split according to season and the regression analysis repeated to obtain separate estimates of the k_1 and e_1 parameters for each season. Similarly, to investigate potential differences in ground vibration based on charge depth, the full PPV data set was split into “shallow” charges and “deep” charges, and the regression analysis was repeated to obtain separate estimates of the k_1 and e_1 parameters for shallow-charge and deep-charge blasting scenarios.

The general relationship between airblast overpressure (PPL; dBL), charge mass (Q; kg), and propagation distance (D; m) is expressed by the following formula, where k_2 is a unitless “site constant” and e_2 is a unitless “site exponent” (Richards and Moore 1995). The k_2 and e_2 parameters are used to represent site-specific conditions that can influence the propagation of airblast overpressure.

$$PPL = 20 \log_{10} \left(k_2 \left(\frac{D}{\sqrt[3]{Q}} \right)^{-e_2} \right) + 94$$

Representative site-specific values for k_2 and e_2 were established by application of statistical regression to PPL measurement data collected between December 20, 2020 and August 6, 2021. The regression analysis was first applied to the complete PPL data set to obtain general estimates for the k_2 and e_2 parameters. To investigate potential seasonal differences in the propagation of airblast overpressure, the full PPL data set was split according to season and the regression analysis repeated to obtain separate estimates of the k_2 and e_2 parameters for each season. Similarly, to investigate potential differences in airblast overpressure based on charge depth, the full PPL data set was split into “shallow” charges and “deep” charges, and the regression analysis was repeated to obtain separate estimates of the k_2 and e_2 parameters for shallow-charge and deep-charge blasting scenarios.

There are few if any guidelines intended to address sensory disturbance to wildlife from explosive blasting. In the absence of wildlife-specific threshold or limits, guidelines for damage and human annoyance due to blasting were used as a starting point for assessment of potential impacts to caribou. The caribou hearing threshold for low frequency noise is higher than humans, meaning that humans may be able to detect blasting related PPL at greater distances than caribou (Agnico Eagle 2019). According to IQ, caribou may be able to detect blasting vibrations at greater distances than humans.

Most guideline limits on PPV and PPL from blasting are intended to protect against minor cosmetic damage to buildings and other structures. For example, the Environment and Climate Change Canada (ECCC) *Environmental Code of Practice for Metal Mines* (Environment Canada 2009) recommends that PPV be limited to 12.5 mm/s and PPL be limited to 128 dBL at nearby receptors. Another document commonly referenced in blasting assessments is the Australian and New Zealand Environment Council (ANZEC) *Technical Basis for*

Guidelines to Minimise Annoyance Due to Blasting Overpressure and Ground Vibration (ANZEC 1990). To protect against human annoyance, the ANZEC document recommends that PPV be limited to 5 mm/s and PPL be limited to 115 dBL at nearby receptors.

9.4.2 Caribou Behaviour Monitoring

The same general approach to caribou behaviour monitoring for blast monitoring was used as for other caribou behaviour monitoring for Meadowbank (Section 17.2). Surveys were opportunistic in nature, and required groups of caribou to be present during blast events. The overall method for blasting monitoring was to identify caribou groups in proximity to blasting locations prior to blast events, and recording behaviours of individuals every 3 minutes for 30 minutes before blasting, and a 30-minute period beginning at the blast. The behaviour categories were feeding, lying down, standing, alert, walking, and trotting or running. In the case that a different form of disturbance event occurred during the survey, such as a vehicle driving on the road, the time and type of disturbance was recorded. Videos were recorded during blast events to document changes in caribou behaviour.

Due to challenges locating caribou groups that could be monitored near blasts for long enough periods, not all surveys had data collected before, during, and after blasts. Behaviour surveys were time corrected to align before, during, and after blasts with blast timing. For example, if a blast was performed 3 minutes into a 30-minute survey, the 3-minute interval would be corrected to 0 minutes (i.e., during blast), and subsequent minutes would be reclassified as after the blast. Therefore, full thirty-minute monitoring periods were not available on all survey days where behaviour monitoring was performed. Proportions of the caribou groups performing different behaviours were summarized by the three-minute periods before, during, and after blasts. Three-minute intervals alone may not represent the entire caribou response to blasting, however this interval was chosen to increase sample size of comparisons, and standardize comparisons across days.

For days where blasting events could be tied to caribou behaviour monitoring surveys, the proportion of caribou performing each behaviour in thirty-minute behaviour monitoring surveys following blasts were assessed in relation to modelled PPL and PPV levels. Locations of caribou groups that could be linked to blast events are shown in Figure 20.

9.5 Results

9.5.1 Historical Results

Blasting measurements were collected using four InstanTel Minimate units in August, September, and December 2019 (Golder 2020a). Only two of the four Minimate units were outfitted with linear microphones per available equipment, therefore PPL could only be measured at 2 locations (R1 and R2). All measured PPV values were below the 12.5 mm/s damage threshold (Environment Canada 2009) and well-below the 5 mm/s annoyance threshold (ANZEC 1990). All but one of the measured PPL values were below the 128 dBL damage threshold (Environment Canada 2009). Seven of the 12 blasts measured during the first year of the program resulted in PPL values above the 115 dBL annoyance threshold (ANZEC 1990) at the measurement location approximately 500 m from the edge of the Whale Tail Pit. This suggests that airblast overpressure may result in annoyance impacts at receptors in close proximity to the blast site. Recommendations from the 2019 program included procurement of linear microphones to allow collection of PPL at all four locations, use of external power sources that would allow for deployments to log data from multiple blasts, and enclosing units in rugged outdoor cases that would protect them from the elements. Future PPL measurements at more distant locations were recommended to characterize the maximum distance to which PPL-related annoyance impacts may extend.

The 2020 blast monitoring program was limited due to COVID-19 (Golder 2021). Eleven blast events were monitored at two locations by Agnico Eagle in December 2020. Caribou were observed sporadically during pre-blast monitoring in spring and fall 2020. There was one instance where blasting was canceled (4 April 2020) due to observation of 25 caribou approximately 2 km from the Whale Tail Pit.

Two blasts in 2020 exceeded the PPV annoyance threshold of 5 mm/s (ANZEC 1990), and one blast exceeded the 12.5 mm/s damage threshold (Environment Canada 2009) at the measurement location closest to the Whale Tail Pit. This suggests that ground vibration from blasting may result in annoyance impacts at receptors close to the blast site. Results from 2020 contrast results from 2019, where no blasts exceeded annoyance or damage thresholds.

All blasts measured resulted in PPL values below the 128 dBL damage threshold (Environment Canada 2009). However, the 115 dBL annoyance threshold (ANZEC 1990) was exceeded for 5 of the 11 blasts at the measurement location 193 m from the Whale Tail Pit, and 2 of the 11 blasts for the measurement location 569 m from the Whale Tail Pit. This suggests that airblast overpressure from blasting may result in annoyance impacts at receptors in close proximity to the blast site as the monitoring locations (193 m and 569 m from pit edge) are closer to the blast site than the 4 km caribou distance threshold. Results from 2020 are similar to 2019 results, with the exception of a single blast exceeding damage thresholds in 2019 (Golder 2020a).

9.5.2 Blast Monitoring

Vibration measurements were collected for 139 blasts between December 20, 2020 and August 6, 2021 within the scope of the blast monitoring program, resulting in a total of 247 individual PPV measurements and 174 individual PPL measurements suitable for analysis. Note the number of individual measurements is less than the 556 data points that might be expected given four monitoring units measuring vibration from 139 blasts (i.e., $4 \times 139 = 556$). This primarily is because the monitoring units were configured to collect measurements when PPV or PPL exceeded a trigger level, and the trigger level had to be set high enough to avoid a large number of “false positives” (i.e., measurements collected in response non-blasting events/activities). Consequently, the more-distant monitors (i.e., BM3 and BM4) did not log measurements in response to some blasts because the PPV or PPL at these locations was too low to trigger the monitoring unit.

Table 48 presents a summary of the individual PPV and PPL measurements collected between December 20, 2020 and August 6, 2021. Table 48 presents the total number of PPV and PPL measurements, as well as a seasonal and depth-based breakdown of the measurement data. The specific breakdown for the seasonal analysis of blast data was established for consistency with the caribou activity periods (Table 1). The depth-based breakdown used a charge depth of 70 m below grade as a threshold for separating “shallow” blasts and “deep” blasts. Any charge detonated less than 70 m below grade was classified as “shallow” and any charge detonated more than 70 m below grade was classified as “deep”. The selection of 70 m as a depth threshold was established to divide the PPV dataset approximately in half.

Table 48: Blast Measurement Summary

Measurement Parameter	Number of Measurements						
	Total – All Blasts	Seasonal Breakdown				Depth Breakdown	
		Spring Migration (Apr. 1 to May 25)	Summer (May 26 to Sep. 21)	Fall Rut / Migration (Sep. 22 to Dec. 15)	Winter (Dec. 16 to Mar. 31)	Shallow Charge (<70 m Below Grade)	Deep Charge (>70 m Below Grade)
PPV (ground vibration)	247	59	90	11	87	110	137
PPL (airblast overpressure)	174	49	42	11	72	69	105

Table 49 presents k_1 and e_1 parameter values established through regression analyses of the PPV measurement data. Parameter values are presented for a regression analysis on all blasts and for seasonal and depth-based regression analyses. Table 49 also presents the upper and lower 95% confidence interval (CI) on each k_1 and e_1 estimate. Figure 21 and Figure 22 present graphs of PPV versus propagation distance for a charge mass of 40,000 kg, which is the approximate average of all 139 blasts measured between December 20, 2020 and August 6, 2021. The curves plotted in Figure 21 and Figure 22 were established using the k_1 and e_1 parameter values from Table 49 and the PPV formula from Section 9.4.1.

Table 49: Site Constants and Site Exponents for Ground Vibration Formula

Analysis Scenario	Breakdown	Site Constant for Ground Vibration Formula: k_1			Site Exponent for Ground Vibration Formula: e_1		
		Best Fit	Lower 95% Confidence	Upper 95% Confidence	Best Fit	Lower 95% Confidence	Upper 95% Confidence
All Blasts		10.290	7.712	13.729	0.968	1.096	0.840
Seasonal	Spring	16.264	9.131	28.968	1.454	1.724	1.185

	Deep Charge	14.656	9.468	22.688	1.105	1.299	0.911

Figure 21: Ground Vibration versus Distance - Seasonal Analysis

Figure 22: Ground Vibration versus Distance - Depth Analysis

Figure 21 presents a PPV versus distance curve estimated based on all blast measurements alongside PPV versus distance curves estimated based on the seasonal breakdown. The curves in Figure 21 suggest there may be seasonal differences in the way PPV propagates into the environment, especially for locations relatively close to the blast site (e.g., within about 500 m of the blast). In close proximity to the blast site, PPV levels appear to be higher during the spring and winter seasons than during the summer and fall seasons.

Figure 22 presents a PPV versus distance curve estimated based on all blast measurements alongside PPV versus distance curves estimated based on the depth-based breakdown. The curves in Figure 22 suggest there may be depth-based differences in the way PPV propagates into the environment. For locations relatively close to the blast site, PPV levels from deep charges appear to be higher than PPV levels from shallow charges.

Table 50 presents k_2 and e_2 parameter values established through regression analyses of the PPL measurement data. Parameter values are presented for a regression analysis on all blasts and for seasonal and depth-based regression analyses. Table 50 also presents the upper and lower 95% CI on each k_2 and e_2 estimate. Figure 23 and Figure 24 present graphs of PPL versus propagation distance for a charge mass of 40,000 kg, which is the approximate average of all 139 blasts measured between December 20, 2020 and August 6, 2021. The curves plotted in Figure 23 and Figure 24 were established using the k_2 and e_2 parameter values from Table 50 and the PPL formula from Section 9.4.1.

Table 50: Site Constants and Site Exponents for Airblast Overpressure Formula

Analysis Scenario	Breakdown	Site Constant for Airblast Overpressure Formula: k_2			Site Exponent for Airblast Overpressure Formula: e_2		
		Best Fit	Lower 95% Confidence	Upper 95% Confidence	Best Fit	Lower 95% Confidence	Upper 95% Confidence
All Blasts		74.305	36.414	151.620	0.539	0.733	0.345
Seasonal	Spring	220.720	62.223	782.944	0.785	1.129	0.441
	Summer	73.536	16.005	337.869	0.510	0.920	0.099
	Fall	90.565	0.447	18364.040	0.632	2.157	-0.892
	Winter	40.805	14.107	118.030	0.421	0.710	0.132
Charge Depth	Shallow Charge	75.028	31.141	180.762	0.532	0.772	0.292
	Deep Charge	71.660	20.487	250.649	0.544	0.882	0.205

**Figure 23: Airblast Overpressure versus Distance - Seasonal Analysis**

Figure 24: Airblast Overpressure versus Distance - Depth Analysis

Figure 23 presents a PPL versus distance curve estimated based on all blast measurements alongside PPL versus distance curves estimated based on the seasonal breakdown. The curves in Figure 23 do not suggest a seasonal difference in the way PPL propagates into the environment.

Figure 24 presents a PPL versus distance curve estimated based on all blast measurements alongside PPL versus distance curves estimated based on the depth-based breakdown. The curves in Figure 24 do not suggest a depth-based difference in the way PPL propagates into the environment.

The largest blast measured between December 20, 2020 and August 6, 2021 had a charge mass of 178,665 kg. Figure 25 presents a PPV versus distance curve for this maximum charge mass, calculated using the “all blasts” k_1 and e_1 parameter values from Table 49. For reference, the ECCC threshold for cosmetic damage (12.5 mm/s) and the ANZECC threshold for human annoyance (5 mm/s) are also plotted in Figure 25. The PPV curve falls below the ECCC threshold approximately 350 m from the blast site and falls below the ANZECC threshold approximately 900 m from the blast site. This suggests that human receptors located more than 900 m from the Whale Tail Pit are unlikely to be annoyed by ground vibration from even the largest blasts.

Figure 25: Ground Vibration versus Distance for the Largest Blast Measured On-Site

Figure 26 presents a PPL versus distance curve for the maximum charge mass measured on-site (178,665 kg), calculated using the “all blasts” k_2 and e_2 parameter values from Table 50. For reference, the ECCC threshold for cosmetic damage (128 dBL) and the ANZECC threshold for human annoyance (115 dBL) are also plotted in Figure 26. The PPL curve falls below the ECCC threshold approximately 125 m from the blast site and falls below the ANZECC threshold approximately 1,900 m from the blast site. This suggests that human receptors located more than 1,900 m from the Whale Tail Pit are unlikely to be annoyed by airblast overpressure from even the largest blasts.

Figure 26: Airblast Overpressure versus Distance for the Largest Blast Measured On-Site

9.5.3 Caribou Behaviour Monitoring

Pre-blast surveys for caribou were performed on 165 days between 3 January to 16 December 2021 (Table 51; Appendix G). Dates of pre-blast surveys are provided in Appendix G. Of the 165 surveys, 132 surveys yielded no species. Caribou were observed on 36 surveys, and Muskox were observed during one survey. No blasts had to be cancelled due to caribou GST exceedance in proximity to the Meadowbank Complex. One blast was cancelled, on 11 September 2021, due to six caribou present within 600 m of the blast.

Table 51: Number of Pre-blast Caribou Surveys Performed in 2021.

Month	Number of Surveys
January	11
February	12
March	19
April	12
May	17
June	16
July	17
August	18
September	17
October	13
November	9
December	8
Total	169

Caribou behaviour monitoring occurred during 14 blast days between 6 May 2021 and 22 October 2021. Three monitoring sessions were performed in spring, nine in summer, and two in fall. Precise locations of caribou could be linked to blast locations on six days (Table 52). Recorded locations of the remaining monitoring events were too imprecise for analysis. The modelled PPV and PPL values for each blast are presented in Table 52. All modelled values were below the annoyance thresholds of PPV of 5 mm/s. All modelled values for PPL were below the annoyance threshold of 115 dBL, however the upper 95% confidence interval overlapped the annoyance threshold for all blasts (Table 52). Two blasts occurred on 6 May, 22 August, and 28 September 2021. Of these three days with two blasts, the largest combined modelled PPL was observed on 22 August (112.2 dBL, 95% confidence interval = 99.1 – 125.3 dBL), and the largest combined modelled PPV was observed on 6 May (0.940 m/s, 95% confidence interval = 0.51 – 1.72 m/s).

Table 52: Blasting Events with Caribou Behaviour Monitoring Data Available.

Blast Date	Blast Number	Quantity Explosive (kg)	Blast Elevation (m)	Caribou Group Size	Distance Between Caribou Group and Blast (m)	Predicted PPV (m/s) and 95% Confidence Interval ^(A)	Predicted PPL (dBL) and 95% Confidence Interval ^(A)
6 May 2021	5067SUK01	14,701	67	20	2,873	0.49 (0.25 – 0.98)	109.2 (95.0 – 123.4)
6 May 2021	5074MSK12	41,186	74	20	2,991	0.78 (0.42 – 1.47)	110.7 (97.0 – 124.3)

A) Based on models using all blasts

The proportion of caribou group behaviours thirty-minutes following blasts for the six surveys that could be linked to blast data are shown in Figure 27. On 6 May 2021, when two blasts were performed at the same time, walking and alert behaviours increased following blasts. However, several vehicle disturbances were also recorded that appeared to elicit changes in caribou behaviour on this day. On 19 August, alert behaviours were observed in the three-minute period immediately following the blast. On the four other survey days, primarily feeding and lying behaviours were observed following blasting.

Figure 27: Caribou Behavioural Response Following Blasting Events

9.6 Management Recommendations

The number of behaviour monitoring sessions that could be linked to blast events did not allow statistical analysis of behaviour change in relation to modelled PPL and PPV levels. When sample size allows, future analysis could determine the relationship between proportion of stress behaviours (i.e., alert, walking, trotting), and PPL and PPV levels. If increased proportions of stressed behaviours are observed following blasts, the time for behaviour to return to pre-blast levels should be assessed.

During behaviour monitoring, the exact time of blast within thirty-minute surveys should continue to be recorded to allow time correction of surveys where necessary. Accurate locations of caribou groups (i.e., distance and bearing from observation location) should be recorded on all behaviour monitoring surveys.

10.0 HUNTER HARVEST STUDY

10.1 Overview

As outlined in the TEMP (Cumberland 2006) and as a requirement of NIRB Project Certificate No. 004 Terms and Conditions 51 and 54, the Baker Lake Hunter Harvest Study (HHS) was initiated in March 2007 by Agnico Eagle in association with the Baker Lake HTO to monitor and document the spatial distribution, seasonal patterns, and harvest rates of hunter kills and angler catches within the Meadowbank RSA.

After low participation during the first year of the study, methods were strategically adapted, participation increased steadily, and valuable information on harvest patterns in the Baker Lake area was collected. The HHS, through regular visits, contributed to developing a strong relationship with local harvesters, the HTO, and GN DoE. Data were provided annually in monitoring reports from 2007 to 2015. The HHS was suspended for three years (2016 and 2018) to develop new approaches and direction.

Following consultation with the HTO, KivIA, GN, and other agencies in November 2016 (Winnipeg) and June 2017 (Ottawa), Agnico Eagle reinitiated the HHS in March 2019, which for the first time also encompassed the Whale Tail RSA as part of the Meadowbank Complex. The study approach was similar to previous years, but suggestions and guidance received during the consultation period were incorporated into the study. The study was conducted through 2020 and 2021 and continues into 2022.

The full 2021 HHS report is provided in Appendix H.

10.2 Objectives

The primary objective of the HHS is to monitor potential Project-related effects on harvesting of wildlife by residents of Baker Lake. This objective is achieved by estimating the following key metrics:

- 1) The distribution of caribou, muskox, and wolverine harvest by residents of Baker Lake; and
- 2) The total level (or an index of) caribou, muskox, and wolverine harvest by residents of Baker Lake.

Other objectives of the HHS established in consultation with TAG or other participants include:

- Supporting creel surveys by gathering information on Arctic char (*Salvelinus alpinus*), lake trout (*Salvelinus namaycush*), lake whitefish (*Coregonus clupeaformis*), and Arctic grayling (*Thymallus arcticus*) catch rates and Inuit-use patterns in the Baker Lake area.
- Understanding regional distribution of hunting and fishing activity.
- Investigating seasonal timing of hunting and fishing activity.
- Determining whether increased harvest and catch rates are associated with the AWAR and WTHR.

As discussed during consultation with stakeholders, HHS will further seek to: a) increase and maintain the hunter participant rate in the future of the program; b) improve resource protection; c) improve hunter awareness and education; d) increase the integration of Inuit Qaujimajatuqangit and Traditional Knowledge; f) increase availability of data to support a collective approach to understanding wildlife harvest; and g) assist Agnico Eagle in mitigative actions and the GN in management decisions.

10.3 Methods

The wildlife species that are the focus of the HHS are caribou, muskox and wolverine; however, harvest data on other species, such as wolf, Arctic fox, geese and other birds is also collected. The few species in the study were deliberately chosen to make data entry and collection as simple as possible. To support creel surveys, data on fish harvest (Arctic char, lake trout, lake whitefish, and Arctic grayling) are also collected.

Inuit and non-Inuit residents, at least 16 years of age, are eligible to participate in the harvest survey. Harvest calendars are provided on a household basis rather than an individual basis in order to simplify data entry and collection, and reflect household hunting patterns. The harvest calendar is attractive and consists of local photographs of wildlife and Baker Lake residents (Appendix H). Space is provided for each calendar day where harvest details can be documented. A map is provided at the end of the calendar that delineates a 4 km² UTM grid within the Baker Lake and Meadowbank areas. Each grid has a unique code to facilitate recording of information. When calendars are issued, participants or participating households are encouraged to write harvest details (e.g., number of animals, sex, age and location [i.e., grid code]) for the appropriate date on the calendar.

Participants were interviewed in person three times during the year (i.e., June 2021, October 2021, and January 2022) by the harvest study coordinator. During the January 2022 interviews, remaining data from 2021 were collected. The purpose of the interviews is to ensure all harvest data are recorded on the calendars and to collect incidental information to compliment calendar data, including notable caribou movements, aggregations, and unique observations. Between interview periods, participants were often contacted by phone or social media to encourage recording of harvest data.

Features of the 2021 HHS included: 1) building long-term relationships between participants and researchers; 2) increasing engagement with participants on social media platforms such as Facebook and Instagram; and 3) increasing incentives for participating in the study (e.g., gas vouchers and prizes).

10.4 Results

The HHS included 55 participants by the end of 2021, which is lower than the 64 participating in 2020 because of several older hunters indicating that “they don’t hunt anymore”. Of the 2021 participants, Caribou harvest data had been collected from 39 participants, which is higher than the 28 participants that reported Caribou harvests in 2015, and slightly lower than the number of hunters reporting harvests in 2019 (42) and 2020 (43).

Based on the previous discussion of total numbers of hunters in the Hamlet of Baker Lake, there were 389 potential hunters within the Baker Lake community in 2008. The number is comparable to the comprehensive 5-year Nunavut Wildlife Harvest Study (NWMB 2005) in which 336 Baker Lake hunters were contacted and interviewed. Discussions with Baker Lake HTO members in 2019 suggest the total number of hunters is over 300. Given the historical and current number of hunters in Baker Lake, an estimate of 300 to 350 active hunters is used in this analysis. Based on these numbers, the 39 hunters reporting Caribou harvest in 2021 conservatively represent from 11 to 13% of total hunters in the community.

Between 1996 and 2001, 18% of Caribou harvests were estimated to be within 5 km of the AWAR (prior to construction) and 67% of harvests occurred within the Meadowbank RSA (NWMB 2005). In the first year of the HHS study (2007), prior to completion of the AWAR, 34% of harvests were reported within 5 km of the AWAR alignment and 79% were recorded within the Meadowbank RSA. The HHS data (2007 to 2015 and 2019 to 2020) fluctuated between 34 and 54% of reported harvest within 5 km of the AWAR, and between 64 and 85% within the Meadowbank RSA. The 2021 HHS data indicated that 43% of reported harvest occurred within 5 km of the

AWAR, and 71% occurred within the Meadowbank RSA. As was the case in other years, threshold levels of 20% set for monitoring the effects of the Meadowbank mine development on the distribution of caribou harvest were not exceeded.

In 2021, three Caribou were harvested within 5 km of the WTHR, which compares to no reported harvest during the NWMB harvest study and five Caribou harvested in 2019 (no harvests were reported in 2020). Overall harvest numbers were too low to determine whether harvests have increased following construction of the WTHR. Within the Whale Tail RSA (note – overlaps with the Meadowbank RSA), a total of 48 harvests were reported in 2021, which is above the average across the first 11 years of the study but lower than reported harvests in 2011 (103 Caribou), 2015 (53), and 2019 (85). Given the low numbers of reported harvests close to the WTHR and the prohibition of the public from the WTHR, it is unlikely that the presence of the road has resulted in increased harvest.

The number of fishermen reporting successful fishing trips in 2021 was 27, which is higher than the average of 23 fisherman from 2007 to 2015 and in 2019 to 2020 (11 years), and the highest number of fisherman reporting success since 2012. The most common fish species captured, Lake Trout, represented 67% of the total catch in 2021, which was the same as in 2020 but higher than the average of 55% from 2007 to 2015 and 2019 to 2020. Lake Whitefish were also captured at reasonably high numbers.

10.5 Accuracy of Impact Predictions

A summary of the impact predictions identified in the TEMP Version 7 (Agnico Eagle 2019) that are evaluated by the HHS is presented in Table 53.

Table 53: Accuracy of Impact Predictions - Baker Lake Hunter Harvest Study

Potential Effect	Threshold	Threshold Exceeded (2021)	Adaptive Management Implemented	Status
AWAR				
Hunting by Baker Lake Residents	The AWAR will not result in significant changes in the spatial distribution, seasonal pattern, or harvest levels of caribou by Baker Lake hunters. Changes will not exceed 20% of historical harvest activities within the RSA	NO	Future discussion with HTO and GN representatives required to identify management options	Hunter Harvest Study (including the Creel Survey)
WTHR				
Hunting by Baker Lake Residents	No change in harvest	NO	None required. Access by hunters is restricted in the growing season and very limited hunting occurs in the winter.	Hunter Harvest Study Satellite-Collaring Program

10.6 Management Recommendations

The Baker Lake HHS and Creel Survey should be continued on an annual basis to monitor the hunting and fishing patterns of Baker Lake residents, and the potential effects of the Meadowbank Complex Mine. Meetings with participants every four months (3 times/year) in 2022 are particularly important in maintaining contact, building relationships, expanding the study, and collecting good harvest data. Participation rates can be maintained by continuing to use social media platforms such as Facebook and Instagram, expanding connections on these platforms, ensuring that all participants are visited during the three scheduled field visits, and continuing with distribution of the well-received year-end prizes while in the community. An effort should be made to bring on younger participants in 2022 to replace the attrition of older hunters in 2021.

11.0 INTEGRATED CARIBOU MONITORING RESULTS

Various caribou monitoring programs have been developed (Sections 2.0 to 10.0) to understand and manage Mine-related effects on caribou. This section summarizes caribou monitoring data collected in 2021 and lists potential Mine-related effects.

11.1 Integrated Results

Table 54 summarizes results from each of the nine programs that monitored caribou activity and responses to Mine-related activity in 2021, while Table 55 summarizes potential Mine-related effects on caribou in 2021.

Table 54: Summary of Caribou Monitoring Activities and Management Responses in 2021

Monitoring Program	Summary of 2021 Monitoring Results	Summary of 2021 Management Responses
Caribou Management Decision Tree (Section 2.0)	Decision tree used when caribou were close to Project facilities as outlined in the TEMP Version 7.	Decision tree process uses data from the road, Mine site, viewshed surveys, and satellite collaring to determine the scale of caribou monitoring and management required.
Road Surveys (Section 2.0)	A total of 177 surveys completed on the AWAR, and 144 on the WTHR. High caribou numbers observed along the AWAR in April and December. High numbers of caribou observed along the WTHR in April, and May.	The AWAR was fully closed on 49 days, and partially closed on 9 days. The WTHR was fully closed on 13 days, partially closed on 1 day, and had speed restrictions applied for 29 days. The majority of mitigations resulted from observations made during road surveys. A total of 318 caribou observations from road surveys were tied to mitigations (Appendix A).
Pits and Mine Site Ground Surveys (Section 4.0)	Mine site surveys conducted on a weekly basis at minimum, and incidental observations recorded. Caribou were observed throughout the year, with highest numbers reported in January at Meadowbank, and September at Whale Tail.	Deterrent actions were implemented to keep wildlife, including caribou safe from site hazards. Road crossing data thoroughly collected throughout the year to support mitigation decisions. One caribou observation resulted in speed restriction (9 June 2021) at the Whale Tail site, and six observations at the Meadowbank site resulted in increased monitoring (Appendix A).
Wildlife Habitat Monitoring (Section 5.0)	Comprehensive analysis completed in 2021. Loss of high suitability ungulate habitats are below thresholds.	Not Applicable.
Caribou Satellite-Collaring Program (Section 6.0)	Agnico Eagle intends to continue collaboration with the GN DoE caribou satellite-collaring program. Collar data were not available to complete the 2020 and 2021 analysis.	Data were not accessible at the time of reporting. Daily satellite collar maps still received during sensitive seasons and used to assess need for increased monitoring.
Viewshed Surveys (Section 7.0)	Of the 310 viewshed surveys completed, 37 surveys (12%) had caribou sightings, and a total of 190 caribou were reported. Survey effort was focused in the fall season in 2021.	Viewshed surveys informed road closure by acting as an early warning system for caribou approaching the WTHR. No caribou groups exceeding GST were observed on viewshed surveys, therefore no mitigations were implemented directly as a result of these surveys.
Remote Camera (Section 8.0)	Remote cameras were deployed at 10 locations along the WTHR. Caribou were detected at six locations, and road crossings were identified at two locations.	No management response based on remote camera program in 2021.
Blast Monitoring (Section 9.0)	Comprehensive analysis of blast measurement data. Caribou monitoring conducted prior to blasts throughout 2021.	One blast postponed due to presence of caribou in the vicinity of the Whale Tail Pit.

Table 54: Summary of Caribou Monitoring Activities and Management Responses in 2021

Monitoring Program	Summary of 2021 Monitoring Results	Summary of 2021 Management Responses
Hunter Harvest Study (Section 10.0)	For AWAR, 71% of harvest in RSA in 2021 compared to 67% baseline; average of 76% of harvest within RSA since 2007. For WTHR, only 3 harvests recorded within 5 km of the Whale Tail Haul Road; harvests within the WTHR RSA were lower than some other years, including preconstruction	The Hunter Harvest Study results support that harvest was less than threshold. Management actions are not required.

AWAR = All Weather Access Road, GN DoE = Government of Nunavut Department of Environment, RSA = Regional Study Area, WTHR = Whale Tail Haul Road.

Table 55: Summary of Mine-related Effects on Caribou in 2021

Monitoring Program	Potential Effect	Threshold	Threshold Exceeded (2021)	Adaptive Management Implemented
Caribou Management Decision Tree (Section 2.0)	Sensory Disturbance	No threshold but Decisions Trees followed when caribou are seen near mine facilities	Not Applicable	YES. Multiple road closures and notices. Use of Decision Tree for Management and Monitoring.
Road Surveys (Section 2.0)	Sensory Disturbance	No threshold. Decisions Trees followed when caribou are seen near mine facilities.	Not Applicable	YES. Multiple road closures and notices, good engagement of Wildlife Log by site staff. Use of Decision Trees for Management and Monitoring.
	Project-related Mortality	Caribou or muskoxen will not be killed or injured by vehicle collisions. Threshold level of mortality is two (2) individuals per year.	NO	NO
Pits and Mine Site Ground Surveys (Section 4.0)	Sensory Disturbance	No threshold. Decisions Trees followed when caribou are seen near mine facilities.	Not Applicable	YES. Deterrent actions were used to keep wildlife, including caribou safe from site hazards. Use of Decision Tree for Management and Monitoring.
Wildlife Habitat Monitoring (Section 5.0)	Habitat Loss	10% above total loss of high suitability habitat.	NO	Not Applicable
Caribou Satellite-Collaring Program (Section 6.0)	Sensory Disturbance	No threshold. Decisions Trees followed when caribou are seen near mine facilities.	Not Applicable	YES. Multiple road closures and notices. Use of Decision Tree for management and monitoring.
Viewshed Surveys (Section 7.0)	Sensory Disturbance	No threshold. Decisions Trees followed when caribou are seen near mine facilities.	Not Applicable	YES. Multiple road closures and notices. Use of Decision Tree for Management and Monitoring.
Remote Camera (Section 8.0)	Sensory Disturbance	No threshold.	Not Applicable	Not Applicable
Blast Monitoring (Section 9.0)	Sensory Disturbance	NPC-119 criteria. Monitoring is continuous, but with increasing intensity as caribou approach the blasting site.	NO	YES. Blasting postponed on one occasion due to caribou presence. Use of Decision Tree for management and monitoring.
Hunter Harvest Study (Section 10.0)	Hunting by Baker Lake Residents	The AWAR will not result in significant changes in the spatial distribution, seasonal pattern, or harvest levels of caribou kills by Baker Lake hunters. Changes will not exceed 20% of historical harvest activities within the RSA.	NO	NO. Future discussion with HTO and GN representatives required to identify management options.
		No change in harvest along the WTHR	NO	

AWAR = All Weather Access Road, GN = Government of Nunavut, NPC = Noise Pollution Control, RSA = Regional Study Area, WTHR = Whale Tail Haul Road.

12.0 PREDATORY MAMMAL DEN MONITORING

Predatory mammals, representing a valued ecosystem component (VEC), occur and are known to den in the vicinity of the Meadowbank and Whale Tail Project facilities. Sensory disturbances near active dens such as blasting, vehicles and, most significantly, ground personnel, may negatively impact denning success by inducing stress responses in the adult mammals, which can result in den abandonment.

Predatory mammal den monitoring is applicable to four species: grey wolf (natal dens), grizzly bear (natal/overwintering dens), Arctic fox (natal dens), and wolverine (natal dens).

12.1 Objectives

The purpose of the predatory mammal den monitoring program is to identify and monitor active dens in close proximity to mining operations in order to protect any detected dens from disturbance.

12.2 Methods

Data will be collected on predatory mammal abundance and behaviour during ground surveys, vehicle surveys, and Viewshed surveys. Active den sites identified during baseline studies will also be monitored. If a wildlife technician suspects or confirms that an active den is present within the active footprint and vicinity of Project facilities or roads, a den management plan will be prepared. The plan will include consultation with the GN with respect to obligations under *The Wildlife Act*, SNU 2003, c. 26. Ground personnel and vehicle access will be restricted in the vicinity of the den as needed to minimize disturbances at the den. The den management plan outlines a monitoring schedule (dependent on seasonal timing) and will inform further mitigation strategies as required. See Figure 13 and Appendix I of the 2019 TEMP Version 7 (Agnico Eagle 2019) for den management and protection plan components.

12.3 Results

Monitoring of predatory mammal dens were conducted informally in 2021 through observations recorded during other monitoring programs. Potential effects due to Project-related activities were not identified to trigger monitoring of predatory mammal dens. No predatory mammal dens were observed or monitored in 2021.

12.4 Accuracy of Impact Predictions

A summary of the impact predictions identified in the TEMP Version 7 (Agnico Eagle 2019) is provided in Table 56; however, no impacts to denning predators were observed in 2021.

Table 56: Accuracy of Impact Predictions - Disturbance to Denning Predatory Mammals for the Meadowbank and Whale Tail Projects

Potential Effect	Threshold	Threshold Exceeded	Adaptive Management Implemented	Monitoring Methods
Disturbance to Denning Predators	Predatory mammal den failures will not be caused by Mine-related activities. Threshold is one den failure per year.	NO	NO	Road Surveys, daily and weekly systematic pit and Mine site ground surveys, viewshed, incidentals and vehicle encounter

12.5 Management Recommendations

When an active den site is identified in close proximity to Project facilities, a den management plan should be developed that outlines a monitoring schedule and appropriate mitigation strategies.

13.0 RAPTOR NEST MONITORING

13.1 Overview

The raptor nest monitoring program is designed to determine Project-related effects, and the success of mitigation strategies to prevent disturbance to nesting raptors. Within the Meadowbank LSA and AWAR LSA, peregrine falcons have previously nested in quarries along the AWAR, the Portage Pit, and Goose Pit. Monitoring of peregrine falcon nests in quarries along the AWAR has been conducted since 2009. The Portage, Goose, Vault, Whale Tail, and IVR Pits are inspected for peregrine falcon activity daily prior to and during the nesting season and managed under the Peregrine Falcon Management and Protection Plan (Appendix E, Agnico Eagle 2019).

Surveys from 2015, 2016, 2017, and 2019 identified 58 raptor nesting sites in the Whale Tail RSA. Peregrine falcon and rough-legged hawk nesting sites were located within 1.5 km of Project facilities in the Whale Tail LSA. Annual monitoring of these nests was recommended, however, these nests are not expected to be directly impacted by the Project due to their distance from Mine activity (Appendix L, Agnico Eagle 2020b).

Monitoring in 2021 included surveys for nests associated with pits and quarries along the AWAR and WTHR. Raptor activity and potential nest locations were also noted on other surveys including road surveys, viewshed surveys, freshet monitoring, and on-site environmental monitoring. In addition, a research program was conducted by Arctic Raptors in 2021, to determine the relationship between nest success and Mine activity (Appendix I).

13.2 Objectives

The objectives of the raptor nest survey monitoring program are to monitor disturbance to nesting raptors, and Project-related mortality to raptors. Nest management plans are developed for nests in proximity to the Project. One mortality, and one nest failure are thresholds for the Project.

13.3 Duration

Raptor nest monitoring will continue throughout operation and closure stages of the Mine to evaluate if mitigation measures to prevent disturbance to nesting raptors are successful.

13.4 Methods

13.4.1 Nest Monitoring (2021)

Raptor nests within 1.5 km of the active footprint and Project facilities require monitoring from 1 May to 15 September. Daily monitoring is required for nests within the active footprint, or within 500 m of Project facilities (i.e., the area of concern; Agnico Eagle 2019), and weekly monitoring is required for nests outside the area of concern. Nest management plans are developed as required, in consultation with subject matter experts and the GN, which include establishment of no-disturbance buffers in accordance with BC Guidelines for Raptor Conservation or TAG recommendations. If raptor nesting activity is detected in the Portage, Goose, Whale Tail, and IVR Pits, the Environment Department is notified, and these pits are then inspected daily for nesting activity from 25 May to 1 July. Management and mitigation approaches for peregrine falcon nests in proximity to pits and facilities are outlined in the 'Peregrine Falcon Management and Protection Plan on the Meadowbank Gold Project Site (Appendix E, Agnico Eagle 2019). Raptor activity is also noted on other surveys including pit and Mine site inspections, road surveys, and Viewshed surveys.

Raptor nest monitoring in 2021 included monitoring of raptor nests in quarries along the AWAR and WTHR. Peregrine falcons have nested in quarries along the AWAR since 2009, and surveys of these quarries have been performed since 2010. Quarries along the WTHR were also checked regularly for raptor nesting evidence.

Quarries along the AWAR (listed in Table 57) were visited on an approximately weekly basis between 27 May April and 16 September in 2021. Raptor activity and potential nest locations were also noted on other surveys including road surveys, viewshed surveys, freshet monitoring, and on-site environmental monitoring. Surveys in pits or other areas were conducted when raptors were observed during Mine site inspections or incidental observations. In addition to monitoring completed by Agnico Eagle technicians, Arctic Raptors completed ground-based surveys, and two helicopter surveys for nesting raptors in May and August 2021. Surveys were focused on nesting habitat along the AWAR and WTHR (Appendix I).

Nest sites are monitored using non-disruptive techniques, which include monitoring from vehicles within the quarry or from the road, to ensure that active nests are not approached by Agnico Eagle personnel. Presence of aggressive adults, eggs, and chicks are used to identify active nests. To minimize direct disturbance to nesting birds and as per recommendations, intensive monitoring, which would require approaching nests by foot, is not conducted. Deterrents were applied to Quarries 20 and 22 in 2021 to discourage raptor nesting.

13.4.2 Nest Occupancy Analysis

Arctic Raptors analyzed data from raptor nest surveys performed in years 2015 – 2017, 2019, and 2021 at 134 locations considered to be raptor nesting habitat. Occupancy modelling was used to determine nest occupancy across years for peregrine falcons (56 nest sites) and rough-legged hawks (26 nest sites). Insufficient data were available to complete models for gyrfalcon (*Falco rusticolus*; 9 nest sites). Annual occupancy probabilities were used to determine average rate of change in occupancy (λ) for peregrine falcons and rough-legged hawks. A λ value greater than one indicates population increase, and a λ value less than one indicates population decrease. The number of young that hatched at each nest were used to estimate reproductive success. Full methods for the analysis are included in Appendix I (Arctic Raptors 2022).

13.5 Results

13.5.1 Nest Monitoring (2021)

Fourteen peregrine falcon nesting sites have been recorded in the Meadowbank LSA and AWAR LSA since nest monitoring began in 2009 (Table 57). Eight peregrine falcon nests were documented in Quarries 2, 3, 5, 7, 9, 16, 18, and 22 in 2021. Nests have previously been identified in all these quarries, except Quarry 5 (Table 57). Quarries 19 and 21 have previously had nests, but did not in 2021. In addition to the eight active nest sites in 2021, peregrine falcon activity was observed at Quarries 4, 21, and 35 during the monitoring program. No raptor nesting evidence was observed in quarries along the WTHR in 2021, however one peregrine falcon was observed at Quarry 35 on 4 July. No other nests were identified during pit checks or incidentally during other surveys in 2021.

A summary of observations made at the peregrine falcon nests along the AWAR in 2021 is detailed in Table 58. Raptor nest management plans were not developed at the active nest sites, as Mine-related activity was already restricted within the quarries, with the only disturbance being traffic on the nearby AWAR. Intensive monitoring, which would include approaching nests by foot, was not conducted. Nest locations are not publicized to prevent inadvertent disturbance by curious Mine employees.

Table 57: Record of Peregrine Falcon Nesting between 2009 and 2021

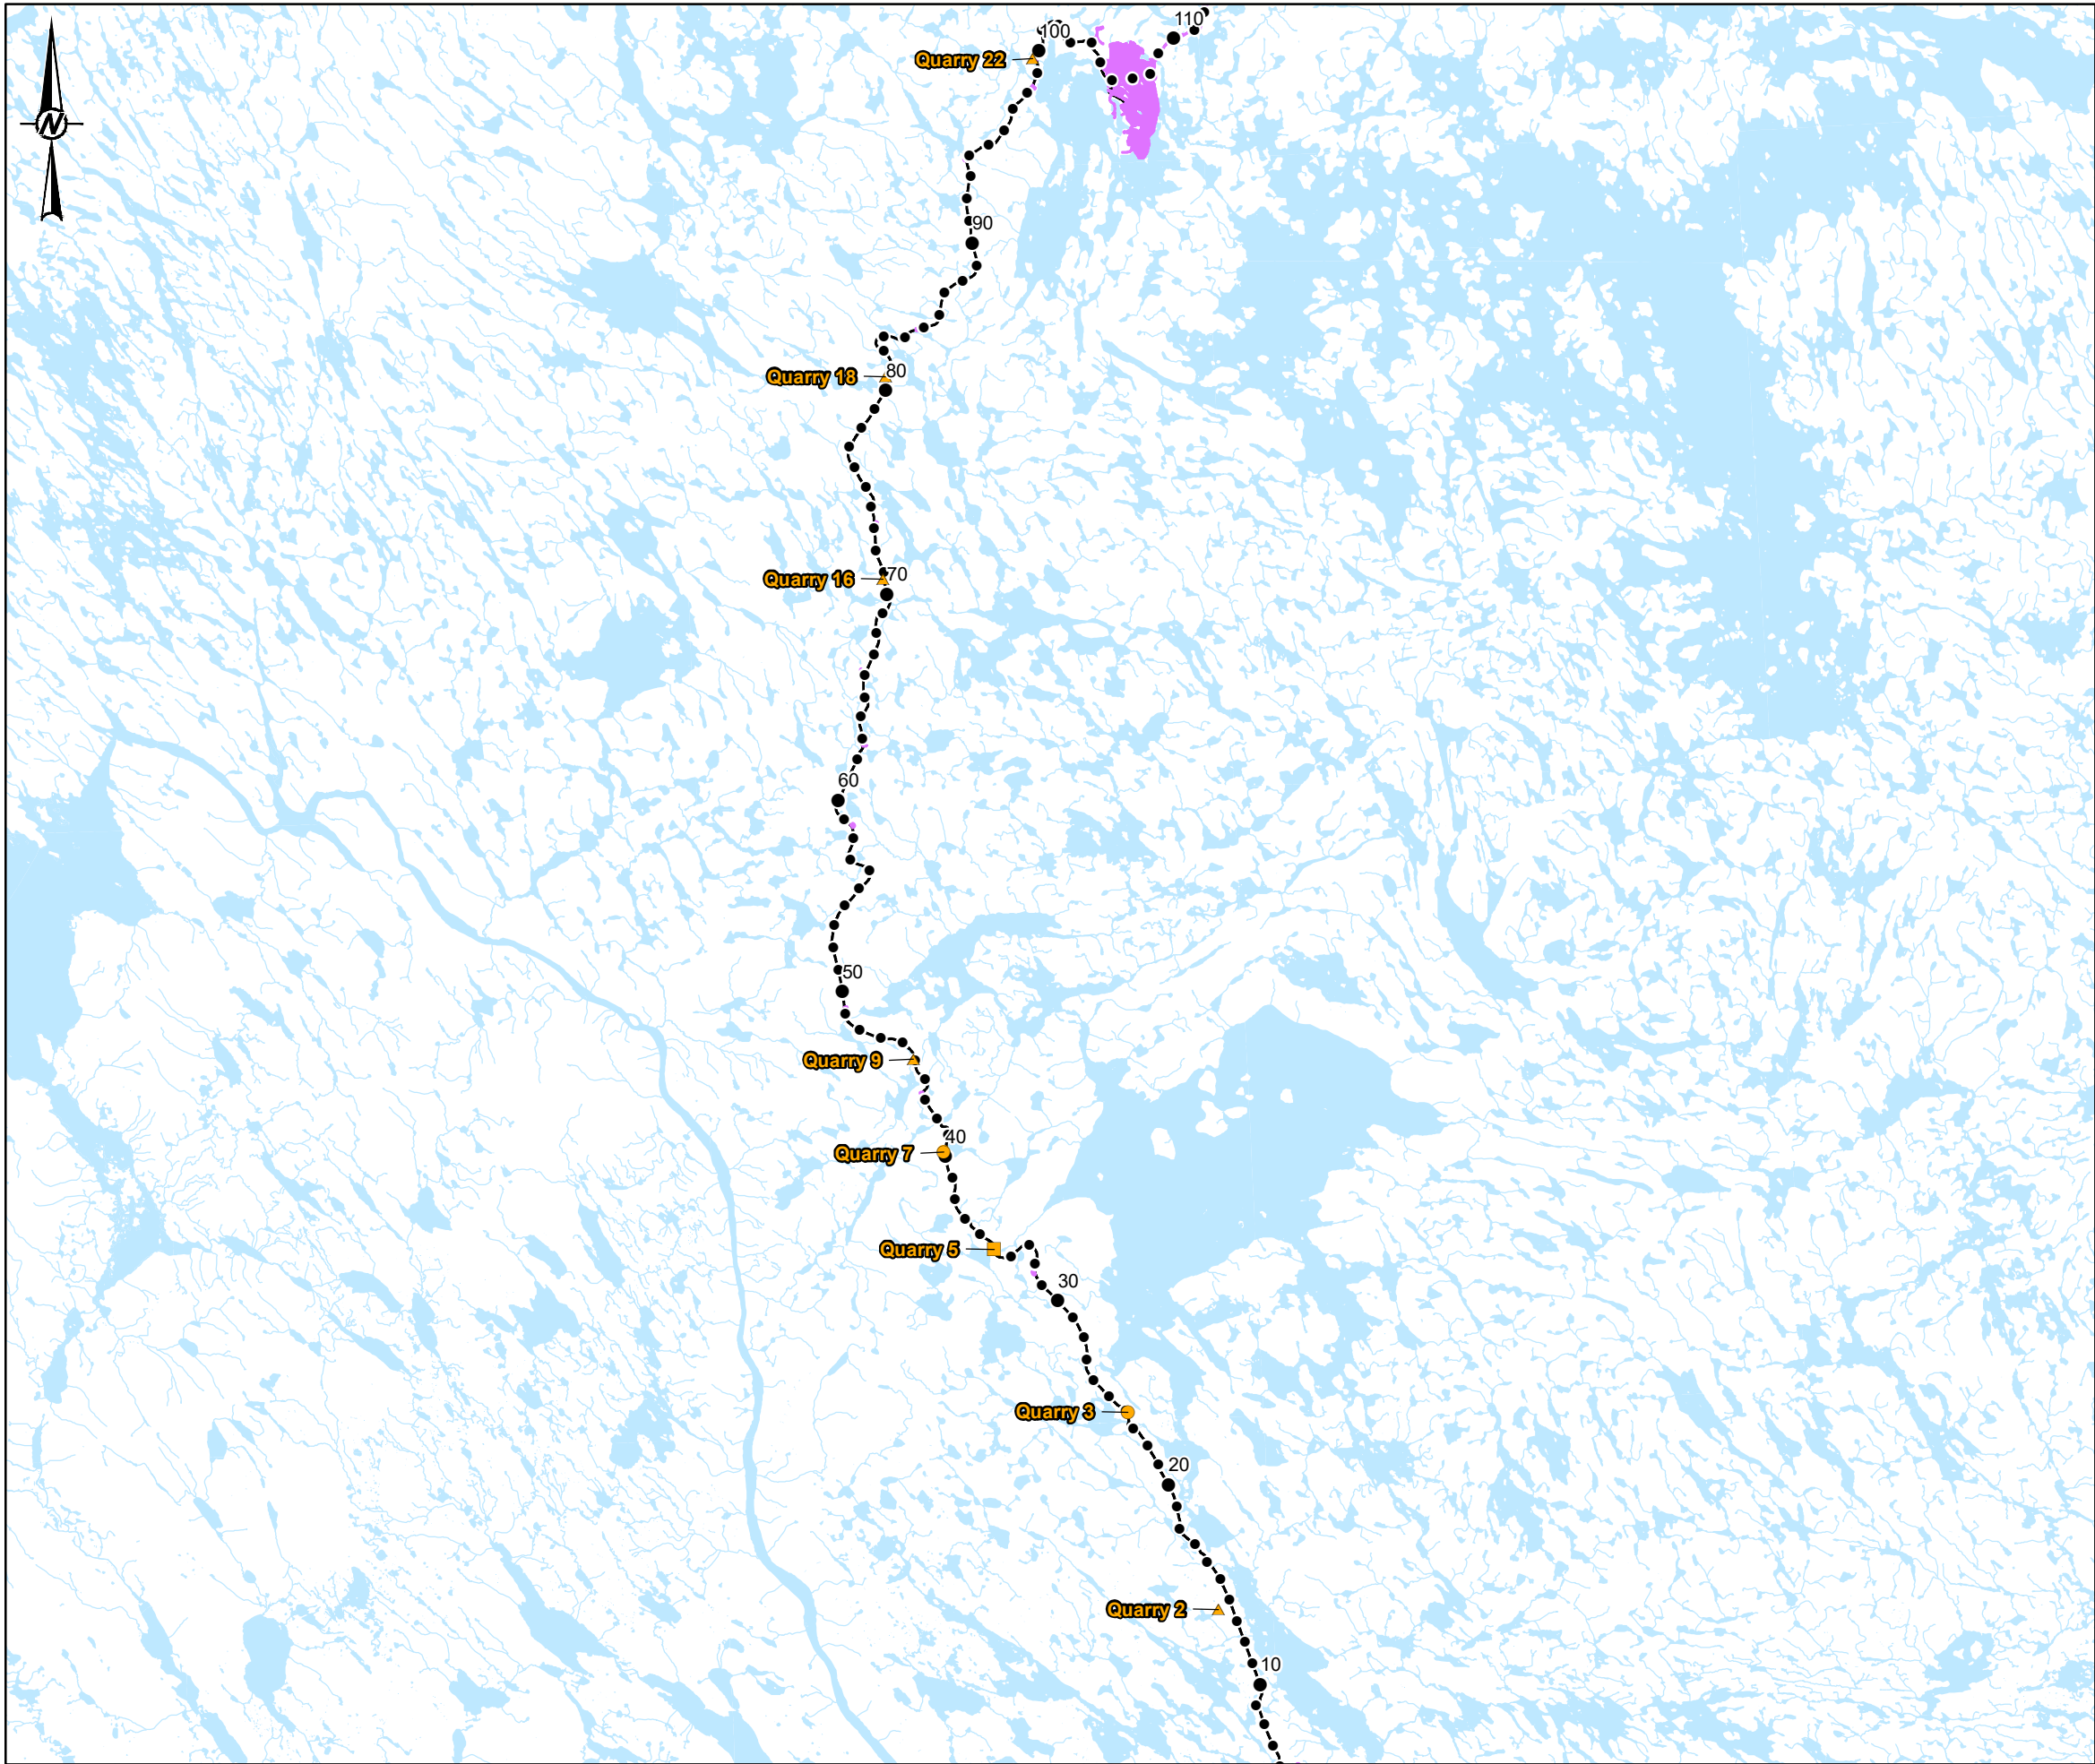

Location	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	Comments (2021)
Quarry 1	No	No	No	No	No	No	No	No	No	No	No	No	No	Whitewash observed; likely occupied in spring

13.5.2 Nest Occupancy Analysis

Results of the analysis did not indicate project-related effects on rough-legged hawk occupancy ($\lambda = 1.25 \pm 0.25$ [mean \pm standard error]). Although the value is positive, the standard error overlaps one, indicating that the population is unlikely to be increasing or decreasing (i.e., likely stable). Marginal decrease in peregrine falcon occupancy was observed ($\lambda = 0.95 \pm 0.02$). However, results may be related to inconsistent monitoring (e.g., monitoring that ensures minimal disturbance) and lack of statistical power to determine project-related effects. Full results of the nest occupancy analysis are included in Appendix I (Arctic Raptors 2022).

13.6 Accuracy of Impact Predictions

A summary of the impact predictions identified in the TEMP Version 7 (Agnico Eagle 2019) is provided in Table 59. Five nest failures occurred in 2021 (Table 57). Results of the nest occupancy analysis indicate that there has been a marginal decrease in peregrine falcon nest occupancy. However, results may be related to inconsistent monitoring and lack of statistical power to determine project-related effects (Appendix I).

Table 59: Accuracy of Impact Predictions to Nesting Raptors and Raptor Mortality

Potential Effect	Threshold	Threshold Exceeded (2021)	Adaptive Management Implemented	Monitoring Methods
Disturbance to Nesting Raptors	Raptor nest failures will not be caused by Mine-related activities. Threshold is one nest failure per year.	NO	YES	Active raptor nest monitoring Daily and weekly systematic pit and Mine site ground surveys
Raptor Mortality	One (1) individual	NO	Not Applicable	AWAR and WTHR surveys Daily and weekly systematic pit and Mine site ground surveys Incident and vehicle encounter reports

13.7 Management Recommendations

Agnico Eagle will continue to monitor raptor nests in accordance with the TEMP Version 7 (Agnico Eagle 2019). This includes annual raptor nest surveys of quarries along the AWAR, WTHR, pits, and waste rock piles; development of nest management plans; and implementation of the Peregrine Falcon Management and Protection Plan when required. Active nests will be monitored throughout the season to determine nest success or failure. Agnico Eagle will continue to document raptor observations during other programs (e.g., road surveys, Viewshed surveys).

Starting in 2021, multiple surveys will be completed each year by a third party expert (Arctic Raptors), to allow estimation of nest detection error. Recommendations were made to apply deterrents to quarries in early May, regular monitoring of viewshed quarries, and signage to identify nesting raptors to limit disturbance (Appendix I; Arctic Raptors 2022).

14.0 WATERBIRD NEST MONITORING

14.1 Overview

The Whale Tail expansion required the construction of two dykes within Whale Tail Lake to divert water from the proposed pit to surrounding lakes and tributaries, resulting in flooding that with potential impacts to migratory birds and their nests. Trent University, in collaboration with Environment and Climate Change Canada and Agnico Eagle, conducted a research study to investigate mitigation options to minimize flooding-related impacts to birds in the Whale Tail South area. The objectives of the study were to:

- Determine the effectiveness of audio and visual deterrents for prevention of flood-zone nesting.
- Estimate the number of nests and species composition lost due to flooding.
- Examine the behavioural response of birds to flooding (i.e., whether birds re-nested after flooding) and deterrents (i.e., impact on duration of nesting).

Visual and audio deterrents tested in the 2018 and 2019 programs were not recommended as effective mitigation measures for preventing bird nest loss. Nest densities observed from 2018 and 2019 were used to estimate nest displacement during 2018 to 2020. Nest displacement to date was estimated to be lower than FEIS Addendum predictions (Appendix C). The 2020 field program intended to determine behavioural response to flooding (i.e., nest density and recolonization time in the area post-flooding) but was not completed due to COVID-19. Follow-up studies in 2021 indicated that the average number of nests and bird density increased from 2019 to 2021 in upland control plots, and nest density declined in flood zone plots, potentially indicating a movement of nesting sites to adjacent areas, however this was not supported by mark-re-sighting surveys. Further discussion of the 2021 field program is provided in the '2021 Migratory Bird Protection Report' (Appendix C).

15.0 BREEDING BIRD MONITORING

15.1 Overview

The breeding bird PRISM (Program for Regional and International Shorebird Monitoring) plot and bird transect monitoring programs were designed to evaluate potential Project-related changes in breeding bird species abundance, richness, and diversity over time. The program is one component of the larger monitoring strategy to evaluate the success of mitigation measures implemented to minimize the amount of vegetation (i.e., bird habitat) removed or degraded (e.g., dustfall) by the Project, and whether certain Mine activities such as the Mine site or AWAR have resulted in reduced or compromised habitat function or effectiveness (i.e., zone of influence) for breeding birds.

For the breeding bird transects, data analysis in 2011 and 2015 indicated that no road-related effects had occurred to date, and thresholds had not been exceeded; therefore, annual transect surveys were permanently suspended after 2015. In 2020, Agnico Eagle sent ECCC the comprehensive 2003-2015 analysis of all PRISM and breeding bird transect data (Agnico Eagle 2020c).

15.2 Management Recommendations

Results of the comprehensive analysis determined there were no significant effects of the Project or Mine-related infrastructure on bird abundance, diversity or community composition, which supports that mitigation is effective. Agnico Eagle is finalizing a collaboration agreement with ECCC, with focus on contribution to regional bird monitoring programs. This includes commitment to 48 PRISM plots selected by CWS over 10 years (2021 to 2031), and completion of AWAR and WTHR Breeding Bird Survey (BBS) routes opportunistically when qualified individuals are on site. At a minimum, these BBS routes will be conducted every 3 years during the operations, closure and post-closure phases of the project. PRISM and BBS are scheduled to restart in 2022.

16.0 NON-NATIVE PLANT SURVEYS

16.1 Overview

This section includes the methods, results, and mitigation measures to minimize the spread of non-native invasive plant species resulting from Project construction. The Government of Nunavut (GN) and Environment and Climate Change Canada (ECCC) define a non-native species as ‘an organism that is not normally found in a region’ (CESCC 2010). Additionally, according to Section 91 of *The Wildlife Act*, SNU 2003, c 26, invasive species shall not be released into a habitat in which that species does not belong or never naturally occurred. Any introductions of non-native plant species must be promptly reported to the GN Department of Environment. In 2019, Agnico Eagle initiated a non-native plant monitoring study to assess and monitor the potential introduction of non-native plant species, including weeds or invasive species (Golder 2020b). Subsequent monitoring events occurred in July 2020 and 2021. Surveys will continue to be completed annually as per the TEMP Version 7 (Agnico Eagle 2019).

16.2 Methods

The Canadian Endangered Species Conservation Council (CESCC) lists 17 species not normally found in Nunavut with a potential for becoming established, 14 of which are vascular (non-native) plants to the region (CESCC 2010; Table 1). These species were included as targets for the non-native plant surveys. Additionally, any species known to be non-native to Nunavut were also included as targets for non-native plant surveys, to meet requirements of Section 91 of *The Wildlife Act*, SNU 2003, c 26.

Surveys at the Meadowbank Complex were conducted by a Golder vegetation ecologist between July 23 to August 2, 2021. The Meadowbank Complex area includes the AWAR, WTHR, Baker Lake tank farm, Whale Tail site, and Meadowbank Mine site areas.

Species were documented as they were encountered. Non-native plant surveys consisted of targeted surveys focused within high-priority or high-potential areas within the Project footprint. The high-potential areas were identified as the Project area perimeter, highly trafficked areas (e.g., fuel station), areas surrounding buildings, shipping containers, along existing roads/trails or areas of disturbance within the Project area, as well as adjacent to the AWAR and WTHR road. High potential areas also included survey locations from 2019 and 2020 where non-native plants were observed. In areas where non-native species were observed, meander surveys were conducted outside of the disturbance footprint to determine if these species had established in the native tundra. Given the length of the AWAR and WTHR, the roads were travelled via vehicle at slow speeds, while observers looked for obvious signs of weed infestations along road margins. Periodic stops were undertaken to complete meanders in areas with high potential (e.g., pull-outs, work areas, road-side quarries, and other areas with disturbed substrates). A GPS was used to collect a track file of the meander route and point locations of surveys conducted. A total of 202 individual locations were surveyed for non-native plants in 2021 (Table 60).

When non-native or invasive plant species were encountered, the following information was recorded: site ID; surveyor name; GPS coordinates; photos of the occurrence / infestation; species name; estimated area of infestation; estimated number of plants (e.g., <10, 10 to 100, 100 to 1,000, >1,000) of each species; estimated cover of bare ground; growth stage (i.e., seedling, in bud, seed set, expired); recommended action for each species; and record of any hand pulling completed.

16.3 2021 Results

No non-native plants, as identified by the CESSC, were recorded along the AWAR, WTHR, Baker Lake tank farm, Whale Tail and Meadowbank Mine sites. Although not listed as a non-native species by the CESSC, populations of two species not endemic to the Arctic, flixweed (*Descurainia sophia*) and scentless chamomile (*Tripleurospermum inodorum*), were observed at several of the 2021 surveyed locations. Table 60 provides a summary of the non-native plant survey findings from the 2021 surveys at locations shown on Figure 29.

Table 60: Summary of 2021 Non-Native Plant Survey Effort

Location of survey	Total number of survey locations	Number of survey locations with flixweed	Number of survey locations with scentless chamomile
AWAR	14	12	1
AWAR quarry	24	9	2
Baker Lake tank farm	4	1	1
Meadowbank Mine site	104	53	1
Whale Tail site	36	0	0
WTHR	10	0	0
WTHR Esker/Quarry	10	0	0
Total	202	75	5

Table 61 provides a summary of historical results compared to the 2021 survey results. The survey efforts have increased year over year since the program began. The first year of monitoring in 2019 was a shorter program and could not cover the entire mine footprint which explains the fewer number of non-native species observed. Some of the 2021 flixweed observation locations were combined in 2021 as populations merged which explains the reduction in flixweed observation locations. However, each of the 176 locations monitored in 2020 were revisited in 2021. Appendix J includes a comparison of estimated plants observed in 2020 compared to 2021 at each survey location.

Table 61: Historical Non-Native Plant Survey Results

Non-Native Species Observed	2019 Survey Locations ^(A)	2020 Survey Location ^(A)	2021 Survey Locations ^(A)
Flixweed (<i>Descurainia sophia</i>)	28	92	75
Scentless chamomile (<i>Tripleurospermum inodorum</i>)	1	7	5
Alsike clover (<i>Trifolium hybridum</i>)	0	1	0
Lamb's quarters (<i>Chenopodium album</i>)	0	1	0
No non-native species observed	78	76	119
Total Survey Locations	107	176	202

A) Note the sum of the survey locations may not equal the total as some survey locations had multiple species observed.

Flixweed (*Descurainia sophia*) is an introduced agricultural weed from Europe, Asia and North Africa (Dickinson 2006; ABMI 2009) and is non-native to Nunavut. In Alberta, flixweed is classified as a nuisance weed, indicating it is very abundant across the province and near impossible to eradicate (ABMI 2009). Flixweed was observed on the Meadowbank Mine site, along the AWAR and at the Baker Lake tank farm. It was not observed at the Whale Tail Mine site or along WTHR (Figure 29, Appendix J). Infestations of flixweed were found to be most dense

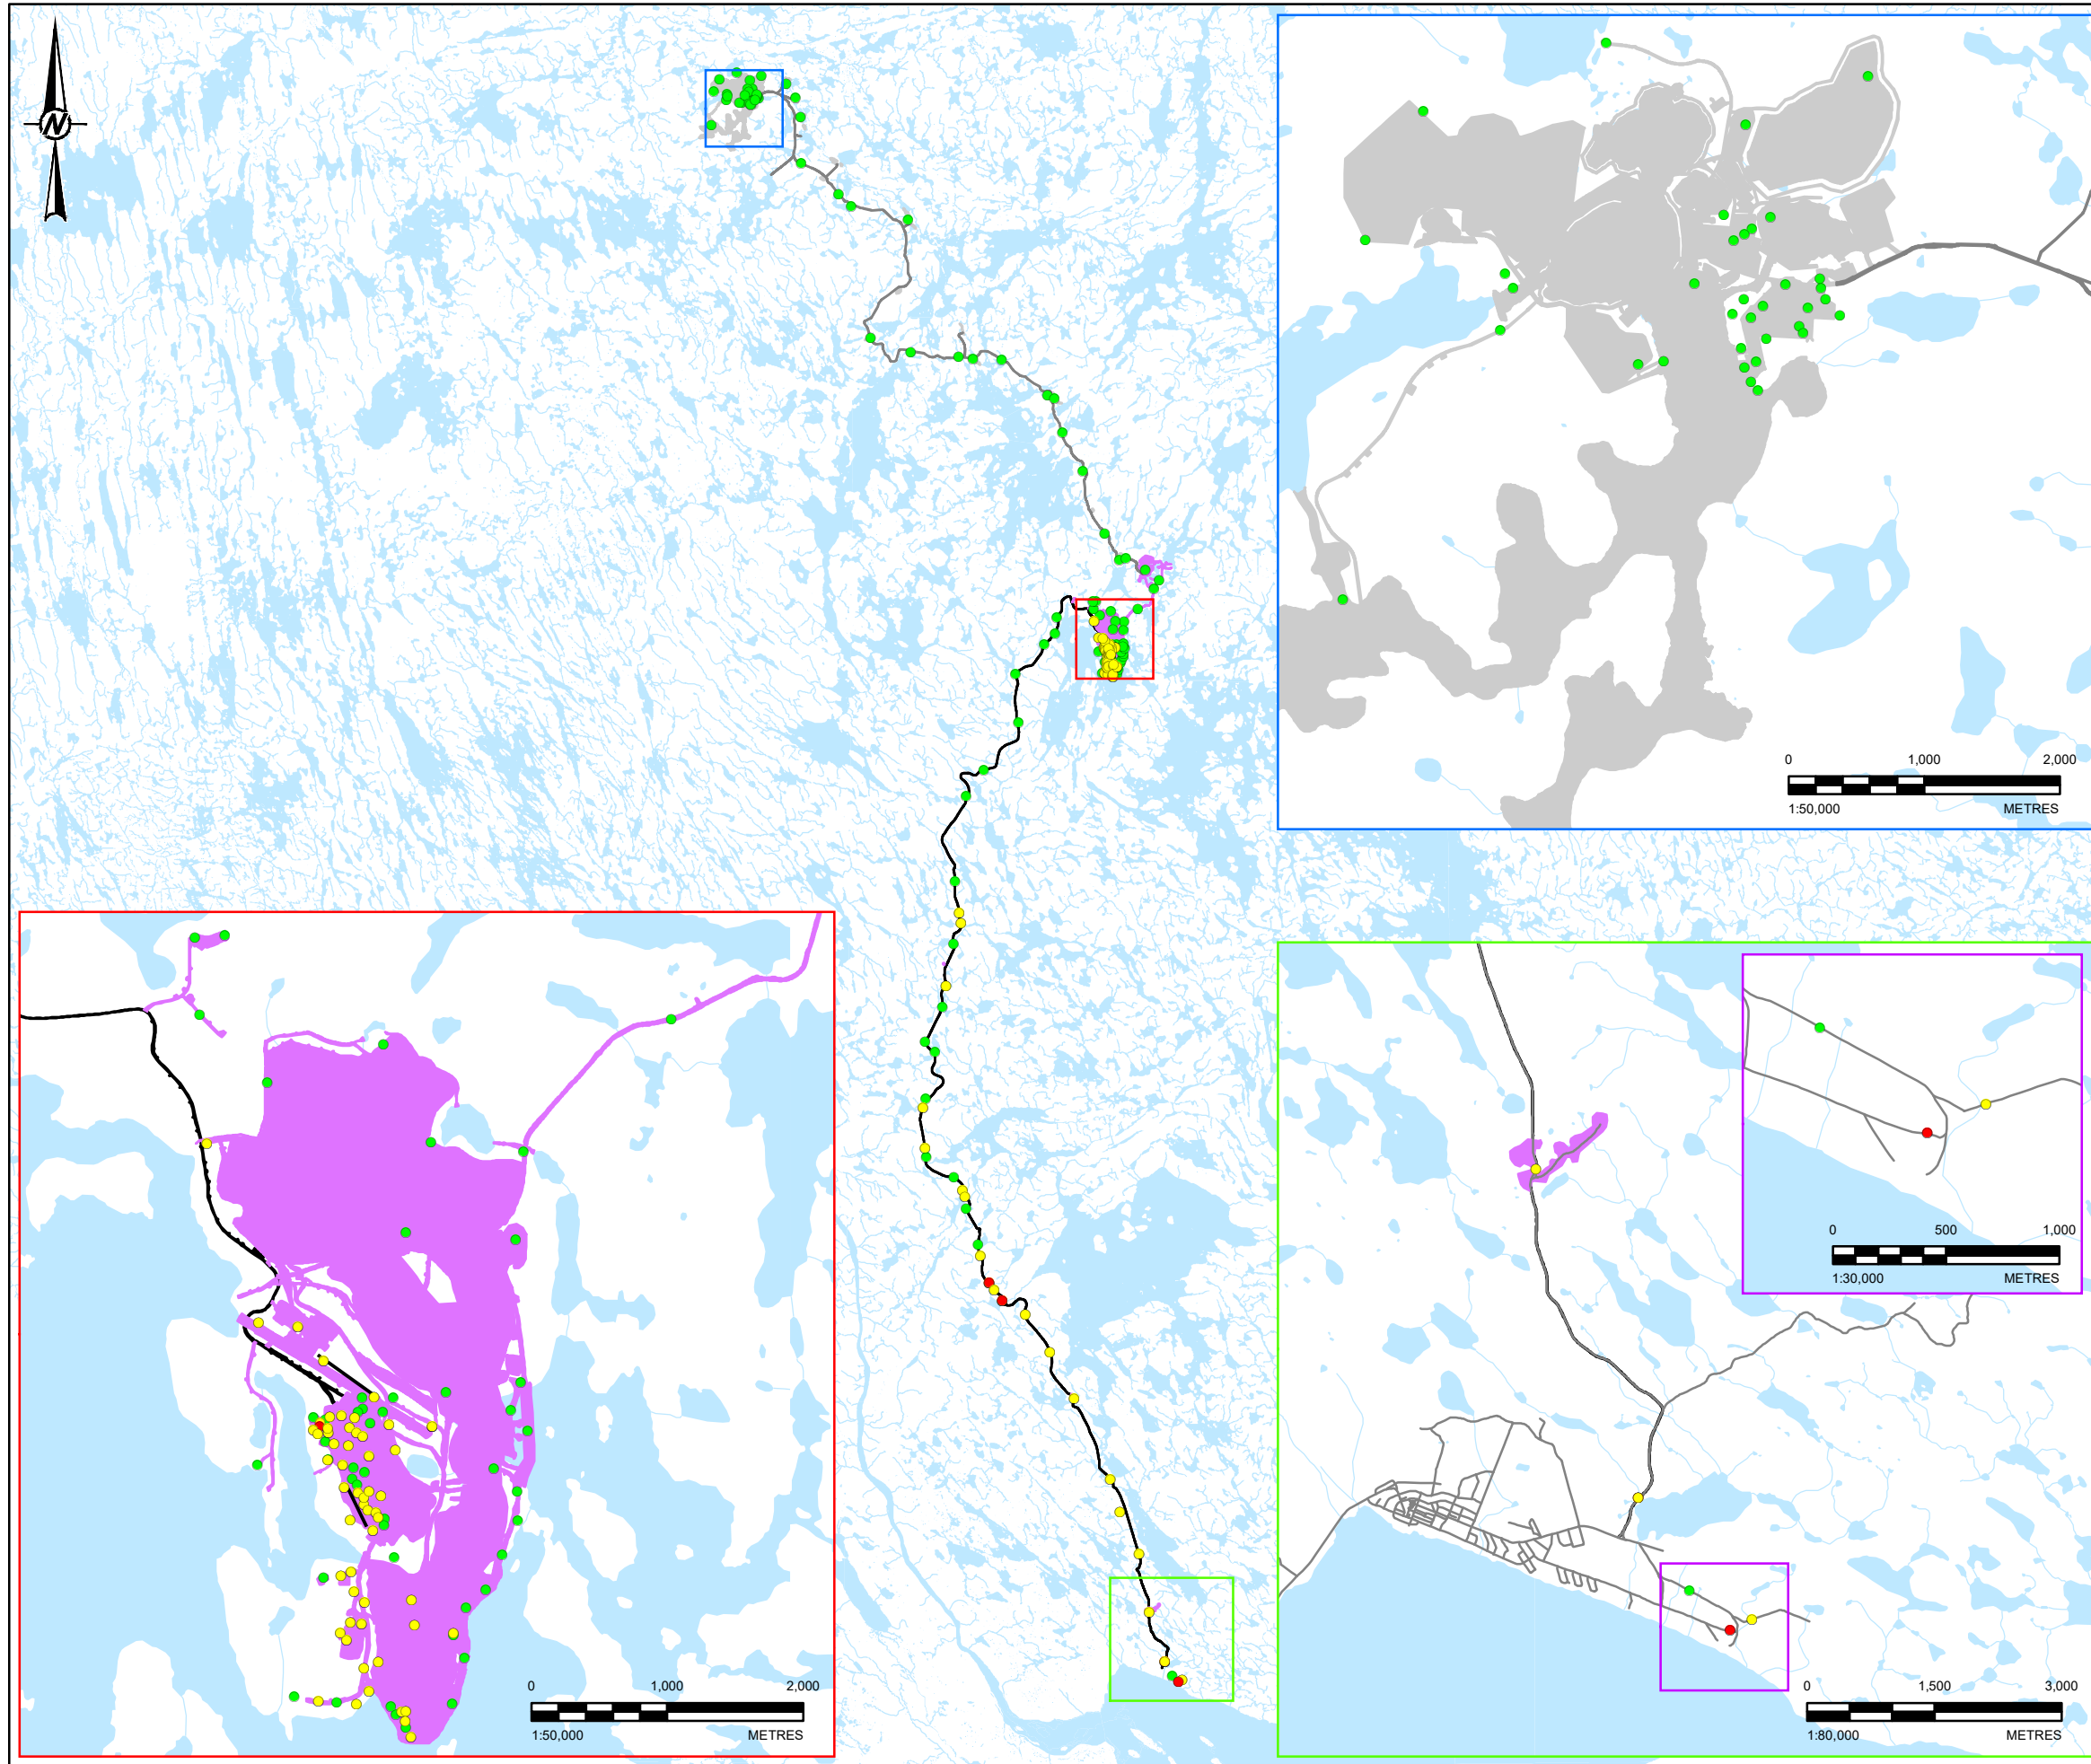

around the most traveled areas of the Meadowbank Mine site including the airstrip, camp, processing plant, shipping container storage areas and laydown areas. It was also found along the viewshed in many locations on the AWAR. When flixweed populations were observed on the edges of disturbance, surveys were extended into the tundra to determine if flixweed has become established outside of disturbed areas associated with the Meadowbank Complex. Observed flixweed populations have not encroached onto the tundra, and all observations were limited to disturbed areas. Flixweed is considered a “pioneer species” meaning it thrives on bare soil and has difficulty surviving in areas with high native plant cover such as the tundra (AMBI 2009).

Trials of flixweed eradication were implemented in July 2021 at the Meadowbank Mine site. In total 19 sites underwent trials involving a combination of geotextile placement, hand pulling and mechanical removal. Results of these trials are pending a further growing season to determine efficacy. Photos taken during the 2021 trials will be used to compare to future years to determine efficacy.

In late 2021, it was proposed by a botanist at the Canadian Museum of Nature (P. Sokoloff, personal communication, September 26, 2021) that the species being classified as flixweed could possibly be the native species, northern tansymustard (*Descurainia sophioides*). Both flixweed and northern tansymustard are very similar in appearance and habitat and therefore fill similar ecological niches. The best way to distinguish the two species is based on the shape of the hairs, visible under magnification. Because it was too late in the growing season in 2021 to obtain a viable sample for identification, the plant cannot be definitively identified until the next growing season in 2022. More details on these two species are provided in the risk assessment in Appendix K.

Although not listed as a non-native species by the CESSC, populations of scentless chamomile (*Tripleurospermum inodorum*), which is non-endemic to the Arctic, were observed at five of the surveyed locations. Of the five populations, four were considered large populations (>100 individuals), two at viewshed quarries along the AWAR, one along the AWAR road near the community of Baker Lake and one at the Baker Lake tank farm. Scentless chamomile was also observed in one small population near the geology shack at the Meadowbank Mine site. See Figure 29 and Appendix J for locations. Hand pulling is an effective method of control for small populations of scentless chamomile (GOA 2007). Golder and Agnico Eagle staff pulled the populations by hand with the exception of the population near the community of Baker Lake due to COVID-19 restrictions around the community. The plants were collected in garbage bags and incinerated. Three of the five observed locations with scentless chamomile in 2021 had been hand-pulled in 2020 indicating the populations may have already gone to seed before the hand-pulling occurred. Follow up at these locations next year will be needed to assess how effective hand pulling has been.

IF THIS MEASUREMENT DOES NOT MATCH WHAT IS SHOWN, THE SHEET SIZE HAS BEEN MODIFIED FROM: ANSI B

16.4 Management Recommendations

The 2021 survey was the third consecutive year of non-native species monitoring for the Meadowbank complex. Comparison of sizes of populations between years is difficult due to many factors including the merging of once distinct populations, challenges in estimating large numbers of individuals, potential surveyor bias and changes in weather and timing of surveys between years. Comparison of photographs year over year may be one way to combat this subjectivity, however the challenge remains in measuring potential spread over time. A comparison of population estimates from 2020 to 2021 survey locations is included in Appendix J. Two non-native species observed in 2020 (lamb's quarters [*Chenopodium album*] and alsike clover [*Trifolium hybridum*]) were not observed at any survey locations in 2021.

Flixweed is present in large populations at the Meadowbank Mine site, the Baker Lake tank farm, and along the AWAR. Although it has not yet been observed at the Whale Tail mine site, without management or mitigation, it is probable that it will migrate along the WTHR and into the Whale Tail mine site. Flixweed is not on the CESSC species list, and it is not considered a noxious weed in any province or territory in Canada with the exception of Manitoba, which considers flixweed as a Tier 3 noxious weed (GoM 2020). A Tier 3 noxious weed has to be controlled if the weed's uncontrolled growth would have a negative impact on the economy or environment. Flixweed should be controlled to contain the infestation to the Meadowbank Mine site and AWAR and prevent spread north to new locations. Flixweed reproduces mainly by seed, with seeds germinating in the fall and new plants establish quickly after snow melt (ABMI 2009). During the 2021 growing season, trials of control measures for flixweed were implemented at the Meadowbank Main site by Agnico Eagle staff. Control methods implemented included mechanical removal (weed eater), removal by hand, and placement of geotextile fabric over populations. Results of these trials to determine if the measures were successful at reducing the size and slowing the spread of flixweed populations will not be available until at least the next growing season.

The Government of Nunavut (GN) has recommended that Agnico Eagle produce a risk assessment examining the potential for the species to colonise undisturbed habitats beyond the disturbed areas of the Meadowbank-Whale Tail complex; the impact of this species on efforts to revegetate disturbed areas of the complex with species and plant communities endemic to Nunavut, as required under term and condition 26; and the risk of this species to wildlife such as caribou. This risk assessment has been included in Appendix K.

Although not listed as a non-native plant by the CESSC, scentless chamomile is listed as Secondary Noxious and Noxious in the Canadian Weed Seeds Order (GOC 2016). The Government of Alberta states that noxious weeds have the ability to spread rapidly, degrade habitats and reduce biodiversity, and must be controlled to prevent further establishment and spread (GOA 2010). Four of the five observed populations of scentless chamomile were removed by hand. Areas that are known to have populations of scentless chamomile should be continually monitored and controlled to prevent further infestations. Hand removal and disposal via incineration for scentless chamomile is an appropriate management method at this time because the populations are not widespread across the Meadowbank Complex.

Efforts for non-native plant management, including identified non-endemic species, should continue and added diligence should be undertaken with regards to areas of high traffic from equipment. Continued and thorough cleaning of equipment and materials prior to entering the site, per the TEMP Version 7, will prevent seed of non-native species from being introduced. Surveys for the 14 non-native plant species identified by CESSC as well as other species not native to Nunavut should continue to be completed annually. Mechanical control such as mowing or hand pulling, as appropriate for the site setting, is recommended for any identified non-native plant species.

Chemical herbicide treatments are not recommended to be used at this point as the tundra is a very sensitive ecosystem. As a further measure of prevention, the CESSC (2010) has developed posters that show non-native species in Nunavut. We recommend that these be displayed at the Meadowbank Complex and incorporated into staff on-boarding materials, which could be used to supplement non-native plant information and posters used on-site. These materials can also be displayed at the Agnico office/crew house in Baker Lake and potentially in other areas within the community.

A management plan for non-native plant species employing adaptive management may be implemented if the non-endemic and other non-native plant species continue to be observed and/or are observed to spread further within the Meadowbank Complex area. A non-native plant management plan would describe the methods for the eradication, control and/or minimization of the encroachment of non-native plant species into new areas and outline additional measures such as on-boarding and training in the identification of non-native plant species for the area.

17.0 SPECIAL STUDIES

17.1 Snow Study

17.1.1 Overview

Collared caribou from the Lorillard herd have historically interacted with the AWAR and WTHR during their spring and fall migrations. The following sections focus exclusively on characterizing snow conditions and caribou interaction along the WTHR (see Section 3.6 for information on caribou interaction with the AWAR).

The direction of travel for these animals crossing the WTHR has always been from the west to the east in the spring. Snow is removed periodically from the WTHR to promote safe driving conditions for the transport of Meadowbank Mine staff and supplies and mined ore between Whale Tail pit and the Meadowbank Mine site. Snow is removed or redistributed from the road surface to areas adjacent to the roads. The snow is redistributed in a way to minimize the size of any snow berms formed on the side of the roads (i.e., snow is pushed to the eastern, downwind side of the road).

Per Whale Tail Expansion Project commitment 9 from the TAG Meeting held in Baker Lake June 11-13, 2019, Agnico Eagle committed to complete a three-year snow monitoring program as part of the TEMP that measures snow conditions adjacent to the WTHR. The goal of the snow monitoring is to determine whether changes to snow resulting from snow removal along the WTHR result in conditions that potentially inhibit caribou movements. The primary questions to be answered by the snow study monitoring were:

- 1) How do snow conditions within the managed snow area where caribou are crossing the WTHR differ from the snow conditions in adjacent portions of the berm where crossing did not occur?
- 2) How do snow conditions and caribou track characteristics differ between areas within the snow berm and areas beyond the berm where snow conditions have not been altered by snow removal activity?

An annual sample goal of 36 plots was originally proposed over three years. Snow condition monitoring data collected in 2020 and 2021 are presented below. These data represent preliminary results of snow condition monitoring.

17.1.2 Methods

Five survey locations in May 2020, and three locations in April 2021 were established along the WTHR. Surveyors established six plots at each survey location and collected data on the snow depth, snow hardness, caribou track depth, as well as the height and slope of the snow-managed berm that occurred adjacent to the WTHR. Snow and caribou track depth were measured using a metre stick while snow hardness was measured using a mechanical dynamometer (i.e., push-pull gauge; Lundmark and Ball 2008). Three plots were established on the upwind side of the WTHR (i.e., the side of the road that the prevailing wind blows from - the west) and three plots were established on the downwind side of the WTHR (i.e., the east side of the road).

The three survey plots on each side of the road included a “use” plot, a “snow-management control” plot and a “unmanaged control” plot (Figure 30). The use plot occurred within the snow-managed berm in an area where caribou had left tracks while crossing the WTHR. The snow-managed control plot occurred approximately 5.0 m from the use plot, within the snow-managed berm but in a portion of it that did not contain caribou tracks. The unmanaged control plot occurred beyond the snow-managed berm and in an area where caribou tracks were present (Figure 30).

Figure 30: Survey Plot Configuration Used During Snow Survey Monitoring Along the Whale Tail Haul Road

17.1.3 Results

The targeted number of plots was not met in 2020 (5 plots) or 2021 (3 plots). Challenges in meeting the targeted number of plots were related to locating fresh caribou tracks before they were filled with snow, or no longer reflected the snow conditions when caribou travelled through. Apart from caribou track depth data in unmanaged control plots, a full suite of data was collected at six plots per survey location. Information on caribou track depth in the unmanaged control plots was not collected due to errors in datasheet printing.

Table 62 provides a summary of snow depth and snow hardness measurements recorded in the use and control plots during the 2020 and 2021 survey periods. Across all survey plots sampled, snow depth was similar between, the upwind (west) side of the haul road (24.63 ± 7.28 cm [± 1.0 standard error]) than the downwind (east) side of the road (23.64 ± 7.31 cm) (Table 62; Figure 31). Average snow depth in use plots on the upwind side of the road (24.50 ± 10.65 cm) was similar to the average snow depth in the snow-managed control plots (i.e., plots within the berm but not used by caribou) on the upwind side of the road (24.77 ± 10.68 cm). Downwind use plots (18.12 ± 8.13 cm) had slightly lower average snow depths compared to snow-managed control plots (29.17 ± 12.43 cm).

The snow hardness, as measured using the push-pull gauge, was higher at plots on the downwind side (13.49 ± 2.24 Newtons [N]) of the WTHR compared to plots on the upwind side of the road (8.37 ± 1.27 N). On both the

upwind and downwind sides of the WTHR, average snow hardness was lower (i.e., softer snow present) in use plots compared to the two types of control plots (Table 62; Figure 32).

Table 62: Snow Measurement Metrics Collected at Survey Plots on the Upwind and Downwind Side of the Whale Tail Haul Road

Sampling Location	Average Snow Depth \pm 1 SE (cm)	Average Snow Hardness \pm 1 SE (N)
Downwind Plots (East)		
Snow-management Control	29.17 + 12.43	17.49 + 5.67
Unmanaged Control	-	12.36 + 2.90
Use Plot	18.12 + 8.13	10.61 + 2.27
All Downwind Plots	23.64 + 7.31	13.49 + 2.24
Upwind Plots (West)		
Snow-management Control	24.77 + 10.68	9.07 + 2.44
Unmanaged Control	-	8.22 + 2.35
Use Plot	24.50 + 10.65	7.81 + 2.05
All Upwind Plots	24.63 + 7.28	8.37 + 1.27

Note: SE = standard error; cm = centimetre; N = Newtons of force

Figure 31: Snow Depth Measurements Collected at Survey Plots on the Upwind and Downwind Side of the Whale Tail Haul Road.

Figure 32: Snow Hardness Measurements Collected at Survey Plots on the Upwind and Downwind Side of the Whale Tail Haul Road.

17.1.4 Management Recommendations

For any future data collection using the current study design, the caribou track depth information should be collected in the use plot and in the unmanaged control plot to facilitate comparison between the snow conditions in the berm and beyond the berm. The 2020 and 2021 monitoring years acted as a pilot study to evaluate the effectiveness of the survey techniques and to guide future monitoring activities. The three-year monitoring program will begin in 2022, and additional resources have been allocated for completion of the snow study.

17.2 Caribou Behaviour

The following is a summary of the Meadowbank Gold Mine Caribou Behaviour Study, 2021, completed by ERM Consultants Canada Ltd. (ERM 2022; Appendix L).

17.2.1 Overview

As part of the Nunavut Impact Review Board (NIRB) Project Certificates #004 and #008, Agnico Eagle is required to study and report on the effects of the Project on caribou. The TEMP (Agnico Eagle 2019) includes behaviour monitoring for caribou.

During 2020, Agnico Eagle retained ERM to update the field protocols used for behaviour monitoring. ERM adapted standard methods for caribou behaviour monitoring developed by the Government of Northwest Territories Department of Environment and Natural Resources (GNWT ENR). Following the first year of data collection in 2020 and comments from the TAG, GN, and KivIA, the protocols were updated for the 2021 season to improve the quality of the data collected.

Based on guidance from the TEMP (Agnico Eagle 2019), the overall objective of the caribou behaviour monitoring program is to determine if caribou activity budgets change with distance from the mine, and to document caribou response to stressors.

The detailed objectives of the 2020 and 2021 combined study were:

- 1) To conduct a study using the Government of Northwest Territories Department of Environment and Natural Resources (GNWT ENR 2017) behaviour survey methodology at the Project site to estimate how the AWAR, WTHR, and site infrastructure contribute to the effects of the Project on caribou.
- 2) To collect a set of 100 samples of caribou behaviour each year.
- 3) To use information from the surveys to determine what factors predict caribou behaviour, specifically comparing:
 - near vs. far;
 - large groups of caribou vs. small groups;
 - surveys with and without disturbances;
 - road open vs. closed; and
 - upstream vs. downstream side of the road (east or west side, as determined by dominant direction of travel in each season).

17.2.2 Methods

17.2.2.1 Field Surveys

Field surveys were conducted primarily during spring and fall migration in 2020 and 2021 by the Agnico Eagle environmental technicians. These technicians were trained and were dedicated to conducting behaviour surveys. Each survey lasted 30 minutes, with scan samples conducted every three minutes. In the case that a disturbance event occurred during the survey the time and type of disturbance was recorded.

Alert behaviour and trotting or running were considered disturbance “response behaviours” and were grouped together in the subsequent data analysis. In this report, alert and running behaviours are referred to collectively as

response behaviours, but it is important to note that this is irrespective of whether or not there were disturbances recorded. Caribou may exhibit these behaviours without a disturbance occurring. Walking was also assessed as a response behaviour in some analyses, which are specifically noted in the results.

Following recommendations from the TAG in 2021, an additional set of longer surveys was completed to specifically look at the behavioural response to convoys of vehicles. These surveys were 90 minutes each, consisting of a “before convoy”, “during convoy” and “after convoy” survey. Observers sought out caribou that were likely to remain within view for 90 minutes, such as caribou that were feeding or laying down. Nine surveys were completed using this extended methodology. These are explored visually in the results, but were not analysed in a separate statistical analysis due to the small sample size.

17.2.2.2 Data Analysis

The objective of the data analysis was to quantify trends in the survey data, and determine whether factors such as distance to Project infrastructure (road), group size, or the disturbances could be used to explain caribou behavior. The primary hypothesis was that caribou closer to the road would demonstrate a stronger response to disturbances.

Following the 2020 analysis, there was a suggestion from the TAG to explore whether the proportion of walking caribou changed as a response to disturbance. This was done to see if walking would be better categorized as a response behaviour or a non-response behaviour. For the analysis, walking data was still kept separate from running or alert behaviours (the previous response behaviours), because the proportion of caribou walking was substantially higher at any given time than the proportion exhibiting alert or running behaviour. Grouping the three “response” behaviours together would risk washing out the potentially higher stress behaviours of alert and running.

Generalized linear mixed-effects models were used to assess the differences in the proportion of response behaviours in surveyed animals as a function of various controlling variables, including the occurrence of disturbances. This regression framework provides a means to control for habitat, environmental variables, repeated measurements, and spatial correlation.

Statistical analyses were conducted using the data from each three-minute time interval in each survey. Three dependent variables were tested:

- 1) Proportion of response behaviours in each time interval.
- 2) Proportion of walking behaviour in each time interval.
- 3) The number of minutes it took caribou to return to background behavior levels every time there was a disturbance.

The three dependent variables were modelled against a suite of potentially important variables to determine if there was any statistical relationship with response behaviour. The variables included in this analysis were group size, distance to road, temperature, wind speed, season and side of the road (upstream/downstream), the roads status (closed or open), and whether or not a disturbance occurred in the survey. Season and side of the road were included as an interaction term, because direction of travel is seasonally dependent. A random effect was included for survey ID, because the three-minute intervals within each 30-minute survey are interrelated.

Full methods used for the caribou behaviour monitoring program are presented in Appendix L.

17.2.3 Results

The behaviour monitoring data from 2021 were combined with data from 2020, and all results outlined in this report use both years, unless otherwise stated. The program and combined data resulted in several key findings:

- The standard monitoring protocols adapted from the GNWT ENR worked well at the Project site.
- 134 surveys were conducted in 2021, compared to 116 in 2020; 114 surveys occurred during spring migration from March to May, 15 occurred during calving and summer from June to August, and five occurred during fall migration from September to December.
- Caribou mostly exhibited the non-response behaviours of standing, laying, feeding, and walking.
- Observations were well distributed across a range of caribou group sizes from 1 to 2 individuals to >1,000.
- Larger groups of caribou tended to be recorded further from the road. Only two groups larger than 100 individuals were recorded within 100 m of the road at the start of the survey, both in 2021.
- Caribou group size was not linked to response behaviour or walking behaviour in statistical analyses.
- Statistical analysis indicated that there is a trend for caribou at greater distance from the road (>1,000 m) to have a lower proportion of response behaviours (alert and running) than caribou within 100 m of the road.
- Approximately 70% of the surveys included a disturbance event; typically, haul traffic and light trucks from the mine, and occasionally all-terrain vehicles (ATVs) from Baker Lake on the AWAR for travel and harvesting.
- Following a disturbance event, the proportion of response behaviours in a group of caribou was significantly higher, but generally returned to baseline behaviours within one or two sampling intervals (i.e., three or six minutes).

In response to comments from the KivIA, the behaviour of “walking” was investigated for whether it may be an “alert” behaviour instead of a non-response behaviour, however, disturbances did not statistically affect the proportion of caribou walking.

- Surveyors conducted special 90-minute surveys during convoys to assess whether the response to convoys was similar to that of other vehicles. Caribou responded similarly to convoys but possibly for longer than for other vehicles. More convoy surveys are needed to analyse the data statistically.
- During periods when large groups of caribou are present, the AWAR and WTHR are closed following a decision tree in the Meadowbank Mine TEMP, reducing the potential to record interactions between vehicles and caribou. Road closure status did not affect behaviour in the statistical analysis, possibly due to it having less explanatory power than the other variables included.
- Groups of caribou were observed on both the east and west sides of the road in all seasons, but were more commonly observed on the west side during spring migration (a.k.a. upstream of the dominant direction of travel). Statistical analysis found that side of road and season did not affect response behaviour (alert/running), but that caribou were significantly more likely to be walking on the upstream side of the road. The dominant behaviour on the downstream side was feeding or laying down.

Full results of the caribou behaviour monitoring program are presented in Appendix L.

17.2.4 Management Recommendations

The updates applied to the survey protocol in 2021 used feedback from the first year of data and analysis, and were helpful in improving the overall quality and accuracy of the data. Even with some changes to the protocol between 2020 and 2021, the trends in the results were highly consistent between the two years of data. This increases the confidence that trends are repeatable year to year. Overall, the results of the statistical analysis provided support for the key hypothesis that caribou tend to respond to disturbances, particularly when they are close to the road. However, the analysis also found that disturbances did not have a detectable effect on caribou behaviour after three to six minutes. Additional data collection in fall and during convoys would bolster the sample size and improve the likelihood of detecting statistically significant effects.

18.0 SUMMARY

The 2021 Annual Report describes the data collected to date from the various monitoring programs associated with the TEMP Version 7 (Agnico Eagle 2019). The 2021 Annual Report describes natural and Project-related effects on wildlife populations and plant communities occurring near the Project.

In 2021, monitoring efforts focused on areas immediately around the Meadowbank Mine and Whale Tail sites, along the AWAR and the WTHR. Surveying and monitoring efforts focused on evaluating current habitat losses, monitoring nesting success of raptors, and monitoring and managing wildlife presence, particularly caribou, near the Project facilities and infrastructure. A summary of potential Project effects, threshold levels, and the 2021 monitoring results is provided in Table 63.

18.1 Accuracy of Impact Predictions

Table 63: Potential Project Effects, Thresholds, and Results of Monitoring in 2021

Potential Effect	Thresholds	Monitoring Methods	Frequency	Completed in 2021	Threshold Exceeded (2021)
Vegetation (Wildlife Habitat)					
Habitat Loss (Compared to Permitted Areas)	Meadowbank = 1,532 ha AWAR = 455 ha Whale Tail = 1,505 ha Threshold is >5% habitat loss of permitted area	Ground Surveys; Mapping and GIS analyses – ELC habitat mapping	Every three years	YES	NO
Habitat Reclamation following Mine Closure	NA	Ground Surveys; Mapping and GIS analyses – ELC habitat mapping	Every three years to 11 years post-closure	NO	Not Applicable
Ungulates					
Habitat Loss and Degradation (Compared to Permitted Areas)	Meadowbank Growing = 531 ha Winter = 407 ha Whale Tail Growing = 76 ha Winter = 602 ha	Ground Surveys; Mapping and GIS analyses – ELC habitat mapping	Every three years	YES	NO
Sensory Disturbance	No threshold but Decisions Trees followed when caribou are seen near mine facilities	AWAR, Vault Haul Road, and WTHR surveys; Satellite-collaring data; Viewshed surveys; Daily and weekly pit and Mine-site ground surveys; Incidental wildlife reporting	Daily / weekly	YES	Not Applicable
Project-related Mortality - Vehicle Collisions	2 individuals (cumulative across Project)	AWAR and WTHR surveys; daily and weekly pit and Mine-site ground surveys; collision reporting system	Mine site – daily AWAR and WTHR – up to every two days at peak migration	YES	NO
Hunting by Baker Lake Residents	20% Change in Harvest Patterns in RSA from Historic	Hunter Harvest Study	Yearly	YES	NO

Table 63: Potential Project Effects, Thresholds, and Results of Monitoring in 2021

Potential Effect	Thresholds	Monitoring Methods	Frequency	Completed in 2021	Threshold Exceeded (2021)
Other Project-related Mortality	2 individuals (cumulative across Project)	Daily and weekly pit and Mine-site ground surveys; collision reporting system	Daily	YES	NO
Predatory Mammals					
Disturbance to denning predators	1 den failure	Den site surveys	As required	NO	NO
Project-related Mortality	2 individuals (cumulative across Project)	AWAR and WTHR surveys; daily and weekly pit and Mine-site ground surveys; collision reporting system	Mine site – daily AWAR and WTHR – up to every two days at peak migration	YES	NO. One wolverine mortality in 2021.
Raptors					
Disturbance of Nesting Raptors	1 Nest Failure	Daily and weekly pit and Mine-site ground surveys; Incidental wildlife reporting; Dedicated raptor nest surveys; AWAR, Vault Haul Road, and WTHR surveys	Nests within 200 m - daily Nests from 200 to 1000 m - weekly	YES	NO
Project-related Mortality	1 individual (cumulative across Project)	AWAR, Vault Haul Road, and WTHR surveys; Daily and weekly pit and Mine-site ground surveys; Collision reporting system	Mine site – daily AWAR and haul roads – up to every two days at peak migration	YES	NO
Waterbirds					
Disturbance of Nesting Waterfowl	1 Nest Failure	Daily and weekly pit and Mine-site ground surveys; Waterbird nest surveys	Yearly - for active nests within 200 m	YES	NO
Project-related Mortality	1 individual (cumulative across Project)	AWAR, Vault Haul Road, and WTHR surveys; Collision reporting system	Mine site – daily AWAR and WTHR – up to every two days at peak migration	YES	NO
Other Breeding Birds					
Changes in Breeding Bird Populations	20% Change from Natural	PRISM Plots and Breeding Bird Surveys	PRISM – 48 PRISM sites over ten years (2021 to 2031) Breeding Bird Surveys – at minimum every three years	Not Applicable	Not Applicable

AWAR = All Weather Access Road, ELC = Ecological Land Classification, GIS = geographic information systems, ha = hectares,
 RSA = Regional Study Area, WTHR = Whale Tail Haul Road

Incidental	2021-08-23	2021-08-23 23:55	Wolf	1	Injured	NW		166	West	Yes	*Call for an injured wolf 2021-08-23 at midnight KM 166, to our understanding, it needed to be dismissed because it was badly injured but I went there with security and the wolf that was initially close to the road had moved further and we couldn't see it. The long haul had stopped all traffic for 30 minutes and we resumed operations. There was no other call after. The wolf was described to be limping pretty bad, possible broken leg and blood was observed on the hip. He walked on the road in front of a long haul truck for a good distance before going in the tundra, KM 166 West, the animal seemed to be an adult, white with a bit of grey/darker color on the back. Nobody reported any impact of vehicle with the animal	-96.488193	65.325287			Not Exceeded

Incidental	2021-09-29	2021-09-29 14:00	Caribou	1	Dead		450	175			Non-project related - The environment department was notified of the presence of 8 wolves near the WTHR at km 177. An Agnico Eagle Environment Technician was sent to the area for assessment. Upon arrival, the employee observed and confirmed the presence of the 8 wolves and all traffic was stopped. The animals travelled south parallel to the road down to KM 175. One caribou was sighted in the area by the predators. The wolves started to track the caribou who ran west side of the road. A wolf started to chase and managed to reach the caribou about 450m from the road. Afterwards, the rest of the wolves regrouped around the caribou. For safety reason, the environment department was not able to assess the carcass due to the low visibility (fog condition) in the area in the past 36 hours.	-96.602970	65.383404			Not Exceeded

Incidental	2021-08-27	2021-08-27 16:53	Caribou	2	Standing	N/A		NA			Pilot of helicopter says he often saw caribou while deploying the dust suppressant on the tailings	-96.076667	65.039167			Not Exceeded	
Incidental	2021-08-28	2021-08-28 6:45	Caribou	4	Feeding	N/A		NA			The cyanide convoy was going on the FGL pad and a caribou was on the road. Env was called. When I arrived there were 4 caribou on the pad. I tried to chase them away with the pickup but they were doing circles around me. After 15 minutes, 3 of them went in the tundra and one stayed. The cyanide was all unloaded so I left him there. I think it is the same group that's been hanging around the Goose pit.	-96.069722	65.011667			Not Exceeded

Incidental	2021-08-11	2021-08-11 16:00	Wolf	1	Injured		N/A		NA			IVR Ring Road / While performing a freshet inspection ENV workers observed an injured wolf walking along the IVR ring road. The workers followed the wolf until it crossed a berm and headed towards Nemo Rd. Workers contacted the ENV coordinator and followed the wolf from a safe distance to Nemo Rd. The Conservation Officer was contacted. Wolf limping continued NE into the tundra. No deterrents were required.	-96.691475	65.414668			Not Exceeded	No action required

APPENDIX C

Waterbird Mitigation Project

MEADOWBANK COMPLEX

2021 Migratory Bird Protection Report

In Accordance with NIRB Project Certificate No.008

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Complex

March, 2022

EXECUTIVE SUMMARY

Through collaboration with Trent University and ECCC, research studies were initiated in 2018 to determine the effectiveness of planned mitigation measures for migratory birds during flooding of the Whale Tail South area. This study was conducted over three field seasons (2018, 2019, 2021) - before, during and after flooding. The three objectives of this study were to:

1. Determine the efficacy of various audio and visual deterrents in preventing flood-zone nesting.
2. Estimate the number of nests and the species composition lost due to the flooding.
3. Examine the behavioural response of birds to:
 - a. deterrents (e.g., impacts to duration on the nest) and
 - b. flooding (determine whether birds re-nested nearby after the flooding events).

Complete methods and results for Objectives 1, 2, and 3a are published and available online in the Trent University MSc Thesis "*Assessing and Mitigating the Impacts of Mining-Induced Flooding on Arctic-Nesting Birds*" (Holmes, 2022). Complete methods and results related to Objective 3b are provided in Appendix A of this report, with further data analysis to be included in one of two manuscripts encompassing methods and results for all objectives, expected to be submitted for publication in a peer-reviewed journal in 2022.

Briefly, efficacy of various audio and visual bird deterrents was assessed in a non-flooded tundra test area between the Meadowbank and Whale Tail sites in 2018, and in the Whale Tail South flood zone in 2019 during flooding. In both years, nesting density and behavioural responses of birds were surveyed in study plots with and without deterrents throughout a 6-week (approx.) period during the breeding season. Results indicated that the tested mitigation methods were ineffective in deterring nesting birds, and their continued use under similar conditions was not recommended by the Trent/ECCC research team.

Holmes (2022) found no statistically significant differences in average nest or territory density between flood zone and adjacent upland control plots prior to flooding (2018) and during flooding (2019), indicating no significant evidence of birds' territory packing into habitats adjacent to flooded areas. Follow-up studies in 2021 (Appendix A) did indicate average number of nests and bird density increased from 2019 to 2021 in upland control plots, and nest density declined in flood zone plots, potentially indicating a movement of nesting sites to adjacent areas. However, this was not supported by results of mark-re-sighting surveys. Supplemental analyses of these data are planned as part of manuscripts to be submitted for publication in 2022, and updated results will be provided in the 2023 Wildlife Monitoring Summary Report.

With approximately 0.60 km² ultimately flooded during the nesting season of June 8 to July 26, 2019, between 23 and 42 nests are estimated to have been lost due to flooding in the Whale Tail South area. Despite the loss of some nests due to inundation, there was no significant difference in overall nest survival rates between flood zone and adjacent upland plots (assessed for passerines only) suggesting that nest losses due to flooding were minor compared to other factors leading to nest failure, such as abandonment or predation.

Both the FEIS for the Whale Tail Pit Project (Agnico Eagle, 2016) and the FEIS Addendum for the Whale Tail Expansion Project (Agnico Eagle, 2018) made predictions for the number of nest sites estimated to be impacted by flooding in the vicinity of the Project site, including the Whale Tail South flood area and the Northeast Diversion flood zone. Actual nest impacts were re-calculated here using

nesting densities observed by the research team in the flood year (2019), along with observed nesting dates and measured change in water levels during nesting. Based on these calculations, final measured impacts of flooding on nesting birds (31 – 50 nests impacted for both areas combined) were lower than FEIS Addendum predictions for Whale Tail South alone (89 nests).

SECTION 1 • INTRODUCTION

1.1 BACKGROUND

In 2018, Agnico Eagle Mines Ltd. (Agnico) was issued NIRB Project Certificate No. 008 for the Whale Tail site, a satellite deposit at the Meadowbank Mine. Two water diversions were constructed as part of water management activities for this project, resulting in terrestrial flooding and potentially impacting migratory bird nesting success in shoreline areas.

The Whale Tail flood zone (Figure 1) was initiated during the spring freshet of 2019, following construction of the Whale Tail and Mammoth Dikes. The rise in water levels from baseline (~152.5 masl) to the FEIS-predicted maximum of 156.00 masl of this area was planned to occur primarily in 2019 and 2020, causing approximately 148.5 ha of terrestrial flooding (Agnico Eagle, 2018).

The Northeast diversion consisted of construction of the Northeast Dike to divert Lake A46 and tributary lakes through Lake C44 in the Lake C38 (Nemo Lake) watershed. The main construction activities for the Northeast Dike were carried out from September 2018 to February 2019. Flooding of this area occurred in spring 2019, and the estimated total flooded terrestrial area was 18 ha. In 2020, the formerly flooded waterbodies in this area were fished out and dewatered to permit development of the Whale Tail Pit Expansion Project. No future flooding in this area is planned as part of the Expansion Project.

Flooding of these two areas was determined to have the potential for incidental disturbance and destruction of migratory birds and their nests. As per Nunavut Impact Review Board (NIRB) Project Certificate No.008 Condition 34, the Migratory Birds Protection Plan (the Plan) describes how these impacts were planned to be mitigated through use of visual and audio bird deterrents, and regular sweeps by personnel to discourage nesting. Mitigation was planned to be focused between 2018 and 2020, or until water levels reached their maximum flood plain.

Since the effectiveness of deterrents used in discouraging nesting was largely unknown for the resident bird species prior to 2018, a research study was initiated to install deterrent measures, assess their effectiveness, and additionally assess impacts of flooding on nesting birds. This study was developed in collaboration with Environment and Climate Change Canada (ECCC) and Trent University.

1.2 OBJECTIVES

This report describes:

- Actual measured water levels prior to, during, and after completion of flooding (2018 – 2021),
- The mitigation measures (deterrents) that were implemented according to the Plan and as part of the Trent University research study,
- A summary of methods and results of the research study as they relate to the following primary study objectives:
 1. Determine the efficacy of various audio and visual deterrents in preventing flood-zone nesting.
 2. Estimate the number of nests and the species composition lost due to the flooding.
 3. Examine the behavioural response of birds to:
 - a) deterrents (e.g., impacts to duration on the nest) and

b) flooding (determine whether birds re-nested nearby after the flooding events).

Complete methods and results for Objectives 1, 2, and 3a are published and available online in the Trent University MSc Thesis “*Assessing and Mitigating the Impacts of Mining-Induced Flooding on Arctic-Nesting Birds*” (Holmes, 2022). Complete methods and results related to Objective 3b are provided in Appendix A of this report. Two manuscripts encompassing methods and results for all objectives are expected to be submitted for publication in a peer-reviewed journal in 2022.

SECTION 2 • WATER LEVELS

2.1 WHALE TAIL SOUTH

In-water construction of the Whale Tail Dike was complete in September, 2018, and dewatering of Whale Tail Lake (North Basin) began in March, 2019, initiating the planned flooding of the Whale Tail South flood zone (Figure 1 and 2).

FEIS Addendum predictions (Figure 2) indicated that following initial flooding in the fall of 2018, the majority of flooding would occur following freshet in 2019, with another minor increase in 2020. Because of operational delays, flooding was not initiated until 2019. Due to record rainfall, peak water levels in 2019 exceeded predictions in July of that year, but did not reach the maximum predicted final flood level of 156.0 masl. Following discussions with NWB, Agnico temporarily pumped non-contact water from the Whale Tail South (WTS) flood zone directly to Mammoth Lake, from October 21 to December 18, 2019. Construction of the South Whale Tail Channel (SWTC) to connect Whale Tail South to Mammoth Lake was complete prior to freshet in 2020. This channel now passively manages water levels in Whale Tail South.

In 2020, mean monthly water levels in Whale Tail South were predicted in the FEIS Addendum to remain near the peak flood level of 156 masl following freshet. However, just prior to its construction in early 2020, the final design of the South Whale Tail Channel was changed to reduce its inlet invert elevation by 0.5 m (to 155.3 masl), to better preserve integrity of the Whale Tail Dike. Operational water levels are therefore now expected to be lower than the 156.0 masl prediction.

Based on recorded water levels as shown in Figure 2, flooding was complete and peaked in 2019. Since the end of dewatering of Whale Tail North Basin and the construction of the SWTC in early 2020 to passively manage flows, flood zone water levels have followed a natural seasonal pattern, with freshet-related steep peaks in June and July, and a slower decline in water elevations over the fall and winter seasons.

Figure 2. Measured and FEIS-predicted (monthly mean) water levels in Whale Tail South. Measured water levels are single point elevations by GPS survey or 3-h interval measurements by piezometer installed in the Whale Tail Di, as indicated. Predicted monthly mean water levels from FEIS Addendum for the Whale Tail Pit Expansion Project, Appendix 6-O, Table D-14.

2.2 NORTHEAST DIVERSION

No changes to this section of the report have been made in 2021. Northeast Diversion flooding occurred in 2019, and the area was dewatered in 2020 to permit development of the Whale Tail Pit Expansion Project. For continuity, the following text and figure are from the 2020 report:

The Northeast Dike was constructed from September 2018 to February 2019. Maximum FEIS-predicted water levels in the Northeast flood zone are shown in Figure 3, along with measured peak flood levels in 2019, and final water levels (December, 2019). Whale Tail FEIS (Agnico Eagle, 2016) water management plans indicated that this flood water would increase to the maximum elevation of 156.6 masl, and then flow naturally through a tundra pond system to Nemo Lake. The maximum predicted flood level in this area (156.6 masl) was reached on July 6, 2019. At that point, it was observed that the topography toward Nemo Lake would not allow water to overflow naturally before overtopping the dike liner. As a result, following approval by NWB (see 2019 Annual Report for further details), non-contact water was pumped out of that area beginning in July, 2019, to maintain safe water operating levels against the Northeast Dike. Water was pumped from July to October 2019, and June to July 2020 towards the watershed of Nemo Lake.

Waterbodies in this area were then fished out and dewatered to permit construction of the Whale Tail Pit Expansion Project (IVR Pit area), and the Northeast Dike was dismantled. This area will undergo mine development activities, and no future flooding is planned.

SECTION 3 • MITIGATION MEASURES

According to the Migratory Bird Protection Plan (Version 1; July, 2018), the following mitigation measures were planned to be implemented in 2018 - 2020 to deter nesting of waterbirds in the Whale Tail Lake and Northeast water diversion areas during flooding:

- Deploying visual and audio bird deterrents,
- Regular sweeps by Agnico Eagle staff to discourage nesting through human activity, and to move the visual and audio deterrents;
- While Agnico may in the future consider the feasibility of using habitat modification or exclusion techniques within the flood zone in consultation with ECCC and academic institutions, these methods are not part of the primary mitigation plan.

In the 2018 nesting season, no flooding had yet occurred (Figure 2), so no measures were implemented.

During the 2019 nesting season, mitigation measures were implemented as part of the research collaboration with academic partners at Trent University and ECCC. The crew from Trent University deployed audio and visual deterrents throughout study plots within the Whale Tail South flood zone (Appendix A) between June 16 and 17, 2019. Although the crew was onsite beginning May 27, these were the earliest dates logistically feasible to begin surveys, based on weather conditions (primarily due to a late storm and the need to wait for snowmelt). At this time, water levels were already flooded, at 154.68 masl in Whale Tail South Basin, or approximately 2 m above baseline levels. Deterrents consisted of 20 x 20 m flash tape grids, and audio deterrents. Flood-zone plots were swept and surveyed every four days between June 16 and July 14, for a total of 148 hours of sweeps within the flood zone during the 2019 nesting season. No deterrents were deployed within the Northeast flood zone, since water levels were already near their maximum predicted elevation (156.6 masl) at the beginning of the nesting season (156.0 masl on June 14, 2019).

In March, 2020, the Migratory Bird Protection Plan was updated (Version 3) according to the results of the Trent/ECCC research study in 2018 and 2019. The tested methods were found to be ineffective in deterring nesting birds, and their continued use was not recommended by the Trent/ECCC research team. Therefore, in accordance with the updated Plan, and because flooding was identified to have peaked in 2019¹, these mitigation measures were not implemented in 2020 or subsequent years.

No additional flooding for operational purposes is planned.

SECTION 4 • RESEARCH STUDY SUMMARY

4.1 INTRODUCTION

In order to determine the effectiveness of the mitigation methods aimed at reducing impacts of Whale Tail site flooding on waterbirds, Agnico Eagle conducted a 3-year study in partnership with Environment and Climate Change Canada (ECCC) and Trent University. Through this project, Agnico is also contributing to advancing the scientific understanding of conservation methods for at-risk species.

The objectives of the research study are primarily to:

1. Determine the efficacy of various audio and visual deterrents in preventing flood-zone nesting.
2. Estimate the number of nests and the species composition lost due to the flooding.
3. Examine the behavioural response of birds to:
 - a) deterrents (e.g., impacts to duration on the nest) and
 - b) flooding (determine whether birds re-nested nearby after the flooding events).

4.2 METHODS

A complete summary of research methods is provided in Holmes (2022) and the annual study reports prepared by the research team, appended to previous versions of this report. The 2021 study report is provided here as Appendix A.

Yearly activities are summarized here.

4.2.1 2018 Field Studies

The objective of the 2018 field study was to collect preliminary data to assess the effectiveness of visual deterrents in changing bird behaviour during nesting, prior to flooding within the Whale Tail area. This portion of the study was carried out at test plots without flooding near the Whale Tail Haul Road (Objective 1). Researchers also collected baseline data on nest abundance in the Whale Tail South flood zone and Northeast Diversion flood zone (Objective 2).

Objective 1 – Effectiveness of Deterrents

The field team assessed 21 plots along the Whale Tail Haul Road between the Amaruq Camp and kilometer 163 (formerly km 48) over a 6-week period, beginning June 4, 2018. Plots were chosen with the use of Ecological Land Classification maps and ground truthing. Plots are 200 x 300 meters (6 ha), covering a mix of low-lying wet sedge habitat types representative of the habitats that will be flooded around Whale Tail Lake. The purpose of the plots was to allow spatially-independent samples in which to test deterrents.

Deterrents were planned to be set up prior to bird arrival, to assess differences in nesting between sites, but delays in shipment meant they were not erected until late June. As a result, changes in behaviour of individual birds after set-up of deterrents was assessed. Due to delays in shipment of audio deterrents, their effectiveness could not be assessed in 2018.

Objective 2 – Whale Tail Flood Zone Impact Assessment

Research teams surveyed five general areas the eventual flood zones over 8 days during peak incubation (June 24 – July 2, 2018). Within the Northeast Diversion flood zone, a total of 15 nests were found over 2 days of surveying the 18 ha flood zone, and within the Whale Tail South Diversion flood zone a total of 35 nests were found over 4 days of surveying a zone of 223 ha (see figures in 2018 Migratory Bird Protection Report).

Out of the 50 nests, 30 individual birds of 4 species were banded with individual markers so that they could be identified in the 2019 or subsequent field seasons, to determine if they breed nearby once they are prevented from returning to their breeding territories by flooding.

4.2.2 2019 Field Studies

Field studies in 2019 included repeating the study from 2018, and installing and assessing the effectiveness of deterrents in the Whale Tail flood zone, during flooding.

Objective 1 - Effectiveness of Deterrents

At the beginning of the 2019 study season (June 5 – 14), audio and visual deterrents were placed in the same experimental plots established in 2018 along the Whale Tail Haul Road (n = 15 plots). Experimental plots (300 m x 200 m) were divided into two types of treatment and control plots. Treatment 1 consisted of audio deterrents playing a mix of predatory and distress calls paired with a 20 x 20 m grid of Mylar® flash tape and a Jackite© hawk kite effigy. Treatment 2 consisted of audio deterrents with the use of Jackite© (a hawk kite effigy) only. Control plots had no deterrents present.

Nest and territory densities were compared between 2018 and 2019 using a before-after control-impact design.

Objective 2 - Whale Tail Flood Zone Impact Assessment

During the 2019 field season, sixteen (16) 6-ha plots within four study locations (Figure 4) were assessed for migratory bird presence in relation to active flooding and presence of deterrents. Deterrents were placed in the treatment plots (n = 4) within the active flood zone between June 16 – 17, 2019, and nest surveys were conducted every four days until July 14.

Objective 3 – Behavioural Responses

In 2019, monitoring was also conducted to assess behavioural responses to deterrents for the four main study species (Lapland Longspur, Horned Lark, Semipalmated Sandpiper, and Least Sandpiper). Behavioural response metrics included nest fate/success, incubation duration, and distance of nesting relocation.

4.2.3 2020 Field Studies

Field studies were planned to continue in 2020. However, due to COVID-related restrictions, this field season was postponed. Analyses of data collected in 2019 by the Trent research team continued, particularly to assess observed behavioural responses to deterrents.

4.2.4 2021 Field Studies

A complete summary of 2021 field studies prepared by the research team from Trent University is provided in Appendix A. The field study this year focused on the behavioural response objective 3(b), to determine the re-colonization of birds impacted by the flood (data required for objectives 1, 2, and 3a were collected in 2018 and 2019).

Objective 3 - Behavioural Responses

From approximately June 9 – July 12, nest and territory densities were assessed weekly in the previously selected 16 plots surrounding Whale Tail Lake (Figure 4). Surveys were conducted by a crew of 5, spaced 10-20 m walking in a line perpendicular to shore. Crew members recorded points using a handheld GPS for each bird sighted and stopped to find nests. Along with these points notes were recorded about the sex and behaviour of each bird, whether they were displaying, feeding, flyovers, or other.

In all study years nesting birds around Whale Tail were captured opportunistically, on the nest. They were then banded with a standard Canadian Wildlife Service numbered metal band and colour bands (Lapland Longspur, Least Sandpiper, and Horned Lark) or coded white leg flags (Semipalmated Sandpipers) with individual codes or colour combinations for identification.

If bird nesting was affected by the flood, then we expected to see lower nest and territory densities in the previously flooded areas in those plots. If the birds relocated further uphill into neighbouring non-flooded areas, then we expected to see the control plots (not subject to flooding) with higher nest and territory densities post flooding.

Figure 4. Map of Whale Tail Lake study area, including the maximum water levels measured in 2019, the water line walked in the plot areas at the start of the nesting season in 2021 (red) and the outlines of plots. Plots next to lake are partially flooded while adjacent control plots did not experience flooding (S. Bonnett).

4.3 RESULTS

4.3.1 Objective 1 – Effectiveness of Deterrents

Complete results describing the effectiveness of the tested deterrents are provided in Holmes (2022). These results demonstrate that the deterrents had limited success in dissuading birds from nesting, were relatively cost- and labour-intensive, and posed possible risks to other wildlife from entanglement. As a result, continued use of the deterrents is not recommended for the Whale Tail site.

4.3.2 Objective 2 - Whale Tail Flood Zone Impact Assessment

Data collected by the Trent research team and presented in Holmes (2022) and Appendix A has been collated here to calculate and discuss impacts of Whale Tail South flooding on migratory bird nesting success.

Flood Impact on Nest Survival

As shown in Figure 2, flooding of the Whale Tail South area was complete in 2019, with no additional increase in water elevations in 2020 as originally predicted. Loss of nests due to inundation was therefore estimated for 2019, based on observed nest losses, nest densities and nesting dates reported in Holmes (2022) and Appendix A, and water levels measured by Agnico Eagle using piezometers installed in the Whale Tail Dike (Section 2). Methods used here were applied in consultation with the Trent University researchers.

In 2019, the Trent crew was onsite from May 23 – July 19. According to Holmes (2021), the average nest initiation date was June 15, and by July 19, nesting success could be determined (fledging of passerines, or hatch of shorebirds). On average offspring leave the nest the second week of July for passerines and shorebirds in the study area (Holmes, per. obs.). Nests are therefore most vulnerable to flooding from mid-June (egg-laying) to mid-July (fledging). Within flood zone plots (those planned to incur flooding) the crew observed an overall average nest density of 68.8 nests/km² in 2019 (Appendix A).

Conservatively extending the observed nesting period by two weeks, from June 8 – July 26, 2019, water levels were measured to increase by 1.05 m during this time, from 154.40 masl to 155.46 masl. This increase in water level flooded approximately 0.60 km² of former terrestrial area (FEIS Addendum, Appendix 6-F, Figure A-2) during the nesting period. Based on observed average nest densities within flood zone plots in 2019, 42 nests are estimated to have been inundated and lost due to flooding (68.8 nests/km² * 0.60 km²), since deterrents were considered ineffective.

During the 2019 field season, the crew directly observed the loss of 6 nests due to rising water in the survey plots, so estimated a minimum nest loss of 37.5 nests/km² flooded. With 0.60 km² ultimately flooded between June 8 and July 26, 2019, a minimum of 23 lost nests would have been estimated by that method.

Depending on nest location within the plots, it is therefore estimated that the total number of nests lost to inundation is between 23 and 42 nests. According to species data collected by the Trent crew, 69% of nests in the flood zone plots were Lapland Longspur, 22% were Semipalmated Sandpiper, 6% were Savannah Sparrow, and 3% were Horned Lark.

Despite this loss of some nests due to flooding, overall daily nest survival was not significantly different between flood zone and adjacent upland control plots (assessed for passerines only). This assessment suggests that losses incurred due to flooding were minor compared to other factors leading to nest failure, such as abandonment or predation.

4.3.3 Objective 3 – Behavioural Responses

Behavioural Responses to Deterrents (Holmes, 2022)

Behavioural responses of nesting birds to deterrents were assessed using temperature probe data collected in 2019. Results from temperature probe data suggested that, after controlling for environmental and temporal variation in incubation behaviour, birds exposed to deterrents had a significantly increased frequency of breaks in incubation (“off bouts”) compared to birds in control plots, but no difference in the total proportion of time spent off the nest per 12 hour period (i.e., more and shorter incubation recesses). This suggests that birds in treatment plots were disturbed and pushed off their nest more often than birds nesting in control plots. However, despite these behavioural responses to disturbance from the deterrents, birds did not abandon nests, nor was their nest success impacted in comparison to birds nesting in control plots.

Dispersal Distances

Holmes (2022) found no statistically significant differences in average nest or territory density prior to flooding (2018) and during flooding (2019), indicating no significant evidence of birds’ territory packing into habitats adjacent to flooded areas in that year. Follow-up studies in 2021 (Appendix A) did indicate average number of nests and average bird density increased from 2019 to 2021 in non-flooded plots, and nest density decreased in flooded plots, supporting a hypothesis of birds moving their nesting sites to areas adjacent to flooding. However, this conclusion was not supported by evidence from re-sighting surveys. For example, one pair of Semipalmated Sandpipers that was banded in 2019 returned to the same flood zone plot to nest, but subsequently left the study area completely and could not be located.

SECTION 5 • SUMMARY

5.1 COMPARISON TO IMPACT PREDICTIONS

As described in the Whale Tail Pit Project FEIS (Agnico Eagle, 2016), a total of 10 waterbird nests and 88 upland bird nests were predicted to be impacted by flooding of 176 ha in the Whale Tail South and Northeast Diversion areas combined, if no mitigation was undertaken (TEMP Version 5, June 2018; Appendix F, Section 2.1). This prediction was made using nest density from limited shoreline surveys conducted in 2015/2016 ($98 \text{ nests}/1.76 \text{ km}^2 = 56 \text{ nests}/\text{km}^2$ or $0.56 \text{ nests}/\text{ha}$).

Updated assessments in the FEIS Addendum (Agnico Eagle, 2018) refined the estimate for the Whale Tail South flood zone as shown in Table 1 (columns “FEIS Addendum Predictions”). A total of 89 nests, or $0.56 \text{ nests}/\text{ha}$ in 148.5 ha of terrestrial flooding were expected to be impacted based on a maximum water elevation of 156.0 masl, reached in 2021. No impacts were predicted for the Northeast Diversion area, since flooding of this area was no longer planned under the Whale Tail Expansion Project.

These impact predictions were conservatively based solely on total terrestrial area flooded and observed nest densities in the 2015/2016 assessment years (nest density * total flooded area). As described in Section 4.3.2, measured impacts were re-calculated here using nest density for the assessment area during the flood year (2019), and incorporating timing of nesting and flooding (Table 1 - Measured Impacts²). More than 40 ha were inundated prior to initiation of the breeding season, and peak flood levels were lower than predicted, resulting in a reduced area of impact. Based on these calculations (Section 4.3.2), a total of 23 - 42 nests are estimated to have been inundated by flooding in the Whale Tail South area. Impacts did not extend beyond 2019, since flood levels peaked in that year (only freshet-related flooding occurred in 2020 and subsequent years, and it did not extend beyond 2019 flood levels, so no increase in the flood zone has occurred after 2019 – Table 1, “Measured Impacts - Change in Peak Flood Area”). Follow-up surveys in 2021 found no nests within the 2019 high-water mark, indicating birds have adjusted their territories to the new seasonal freshet-related water line changes.

Since flooding of the Northeast Diversion area did occur in 2019 under the Whale Tail Pit Project, prior to permitting of the Expansion Project, estimates of nest impacts are updated here and conservatively compared to FEIS Addendum predictions. For this area, water levels were measured at 156.0 masl prior to nesting in early June 2019, and peak flood occurred during the nesting season on July 6, 2019 (156.7 masl), flooding approximately 9 ha during nesting and potentially impacting an estimated 8 nests based on the nest density observed by the research team in that area in 2018 (15 nests in 18 ha; nest densities were not re-assessed in 2019 for the Northeast Diversion zone). In 2020, no increase in flood levels occurred, as water levels were maintained during June and July for operational purposes, and then this area was dewatered to permit construction of the IVR pit.

Despite the increased nest density in 2019 compared to 2015/2016, and the inclusion of impacts for the Northeast Diversion area, the combined total of 31 – 50 nests estimated to have been lost through flooding is less than the FEIS Addendum prediction of 89 nests (Table 1). As discussed above, this is largely due to the conservative nature of FEIS assumptions and refinements made here to incorporate timing of flooding with respect to the breeding season, based on field observations in the flood year.

Table 1. FEIS Addendum predictions for change in peak flooded terrestrial area and number of impacted nests in the absence of mitigation (from Agnico Eagle, 2018; Table 5.5-11); and measured impacts based on observed 2018/2019 nest densities and measured flood levels. See text for further description of results.

Nesting Year	FEIS Addendum Predictions (2018)			Measured Impacts (2022)		
	Change in Peak Flood Area (ha)	Nests Impacted	Cumulative Nests Impacted	Change in Peak Flood Area (ha)	Nests Impacted	Cumulative Nests Impacted
2018	2.24	3	3	0	0	0
2019	+108.26	+62	65	+147.5	+31 - 50	31 - 50
2020	+34.66	+21	86	+0	0	31 - 50
2021	+3.34	+3	89	+0	0	31 - 50

² The 2019 and 2020 measured impacts in this table have been updated compared to the 2020 Migratory Bird Protection Report, using the final 2019 measured nest density in the flood zone assessment area (reported in Holmes, 2022) and assumptions for timing described in Section 4.3.2. Previously, 2020 measured impacts conservatively included potential nests in the 2020 freshet-related flood zone, which were removed here after 2021 studies found no nests are initiated in this area (Appendix A).

5.2 CONCLUSION

In summary, this project demonstrated that Arctic-nesting birds are not easily discouraged from nesting in their preferred locations and show limited responses to visual and audio deterrents. Based on their limited success, the cost of the equipment and labour required to deploy and maintain them, and the potential for impacts to other wildlife, these deterrent methods were not recommended for mitigating nest loss in the future.

Flood impacts on nesting birds were recalculated using refined nest densities, nesting dates, and flood levels compared to conservative FEIS predictions. Despite increased nest densities in the 2019 flood season compared to baseline data, fewer nests were estimated to have been impacted than predicted in the FEIS Addendum, since significant flooding occurred prior to the breeding season and peak flood levels were ultimately lower than modelled. Further, despite this loss of some nests due to flooding, overall daily nest survival was not significantly different between flood zone and adjacent upland control plots, suggesting that losses incurred due to flooding were minor compared to other factors leading to nest failure, such as abandonment or predation.

While post-flood follow-up monitoring in 2021 indicated that more birds may now be nesting in upland plots adjacent to the flood zone based on increased nest densities in these areas, these results are not corroborated by mark-resighting surveys and are considered inconclusive.

With the completion of flooding in 2019 and as further confirmed by the 2021 follow-up field studies in which no nests were located within the new high-water mark, mitigation measures for migratory birds related to flooding are no longer required in the Whale Tail South flood zone. No further reporting under the Migratory Bird Protection Plan is anticipated. A brief update on final results for the analysis of dispersal distances will be provided in the 2022 Wildlife Monitoring Summary Report, along with references for the anticipated publications.

Introduction

Mining and other forms of resource development frequently result in disturbance to wildlife that is difficult to avoid. Technological options to mitigate these impacts are therefore of great interest to resource developers and conservationists alike. Mining is an important economic driver in the north by providing jobs for people living in northern communities (Cameron and Levitan 2014; Belayneh et al. 2018). In Nunavut alone, 18% of the gross domestic product in 2014 was associated with resource extraction (AMAP 2017). Mineral, oil, and gas exploration is expected to increase throughout the Arctic landscape (A.T. Kearney Inc. 2015), leading to land use changes and disturbance of critical habitat for wildlife (Wilson et al. 2013). Resource extraction can have detrimental impacts on habitat quality through the manipulation of landscapes, increased pollutants, human traffic and infrastructure (Reijnen et al. 1997; Johnson et al. 2005; Hassan 2016). Studies from Hof et al. (2017) have demonstrated that arctic-nesting birds are especially vulnerable to climate change; with the increase of resource extraction in these landscapes leading to loss in nesting habitat there is an even greater chance for species loss (Gajera et al. 2013; Bernath-Plaisted and Koper 2016). Finding a balance between conservation and economic growth is crucial in vulnerable landscapes such as the Arctic, particularly when faced with climatic change (Wauchope 2016).

This project is a collaboration between Trent University, Environment and Climate Change Canada, and Agnico Eagle Mines Ltd., to assess the impact of mining-induced flooding on arctic-breeding birds. This report outlines the objectives fulfilled during the 2021 field season, as well as next steps for analysis and recommendations for the future.

Project Objectives

The objective of this study was to determine the impact of mining-induced flooding on nest loss, success, and dispersal of arctic-nesting birds, by quantifying the timing and distribution of nesting behaviour relative to the timing and distribution of the flooding. This objective will be met through the completion of three activities:

- 1: (COMPLETED 2018)** Census the pre-determined flood zone for active nests of arctic-nesting birds to determine the numbers of nests and the density of breeding birds within the flood zone.
- 2: (COMPLETED 2019)** Document dispersal distance after flooding-induced nest losses as well as the likelihood of re-nesting, and the changes in nest densities in areas adjacent to the flood zone by tracking movements of banded birds.
- 3: (2021)** Determine the timing of post-flooding re-colonization by breeding birds, by documenting nest densities as a function of time post-flooding.

The study in 2021 focused on the third objective to determine the re-colonization of birds impacted by the flood. Nest and territory densities were monitored in the 16 plots within the flood zone surrounding Whale Tail Lake. If bird nesting was affected by the flood, then we expected to see lower nest and territory densities in the previously flooded areas in those plots. If the birds relocated further uphill into neighbouring non-flooded areas, then we expected to see the control plots (not subject to flooding) with higher nest and territory densities post flooding.

2021 Field Season Overview

The field season began on the 9th of June, with the arrival of Sarah Bonnett, MSc Candidate, and technicians Sophie Roy and Tessa Gayer. Tessa is a Co-op student with Trent University's Conservation Biology Co-op program. During the field season to round out the crew we were appreciative to have the help of several members of the Amaruq camp's environment crew including but not limited to: Alice Atikessé, Nadine Blatter, Arielle Girard, Catherine Mercier, and Sarah Swiderski.

At the time that the crew arrived at the site snow had already partially melted and was only estimated to be ~20% of land cover. This meant that we were unable to do thorough territory mapping of Lapland Longspur and Semipalmated Sandpipers since their peak display occurred earlier than our arrival and nesting was well underway.

We noted that the water levels on Whale Tail Lake early in the season were much higher than the pre-flood surveys in 2018, and very similar to the high waterline measured in 2019. The waterline receded after the channel to Mammoth Lake thawed, but still remained high throughout the nesting season.

The field crew remained on site at Amaruq for a total of 41 days with crew leaving on 12 July (Sophie and Tessa), and 19 July (Sarah).

Methods

Surveys

In 2018 the proposed flood area around Whale Tail Lake was surveyed by 5 crew spaced out 10-20m walking a line perpendicular to the shore. Crew members recorded points using a handheld GPS for each bird sighted and stopped to find nests. Along with these points notes were recorded about the sex and behaviour of each bird, whether they were displaying, feeding, flyovers, or other.

In 2019 16 6ha plots were set up for intensive nest searching, and territory mapping. Plots were set up in groups of 4, with two along the shore in the proposed flood zone, and 2 adjacent plots outside the flood area (Figure 1). In 2021 these same plots were visited weekly and surveyed in a similar manner to the 2018 survey.

Source: PGC, UMN, Esri | Earthstar Geographics

Figure 1: Map of Whale Tail Lake study area, including the maximum water levels measured in 2019, the water line walked in the plot areas at the start of the nesting season in 2021 (red) and the outlines of plots. Plots next to lake are partially flooded while adjacent control plots did not experience flooding.

Marking and Re-sighting

In all study years nesting birds around Amaruq were captured opportunistically, on the nest. They were then banded with a standard Canadian Wildlife Service numbered metal band and colour bands (Lapland Longspur, Least Sandpiper, and Horned Lark) or coded white leg flags (Semipalmated Sandpipers) with individual codes or colour combinations for identification. Individuals could be re-sighted both within the same season and between years. Anytime banded birds were resighted a waypoint of their location was saved, using a handheld GPS. Additionally, the colour combination or flag code recorded. When possible, photos were taken to be 100% confident of the resighted bird's flag or colour combinations (Figure 2).

Figure 2: Two birds banded in 2019 and resighted in 2021. A female Lapland Longspur (left), showing her unique colour band combination (pink over federal metal band on left leg and red over mauve on the right leg) and a Semipalmated Sandpiper showing an orange-stained white flag engraved with the code CAC.

Analysis

To filter the points and avoid double counting territories within each year, we removed points with no breeding evidence (groups of birds and single birds feeding), as well as duplicate points for the same birds. Points from the same species were assessed individually in QGIS and Basecamp to assess if birds with breeding evidence (displaying males, alert females, resighted birds, and found nests) were close enough to be within the same territory. Duplicate points were points for the same species from the same survey or different surveys that were within 20m of each other or a nest. This assumption was made based on known territoriality of species and measured average territory sizes for the area from previous visits (average territory size of Lapland Longspur, = $3988.0 \pm 482.3 \text{ m}^2$; Horned Lark = $7258.2 \text{ m}^2 \pm 2185.7 \text{ m}^2$; Semipalmated Sandpiper and Least Sandpiper = $4294.6 \pm 1488.7 \text{ m}^2$) (Holmes 2021).

Bird densities were then calculated using the area of the plots. For the flood plots in 2019 and 2021, the area of the plots used was the area that was not underwater during the survey season. Areas of the flood plots that were underwater were removed in QGIS using the GPS tracks of surveyors from walking the waterline to measure what to remove from plots. This ensured that bird densities of the plots would not be lower because of a large portion of those plots being underwater at the time of nesting. The densities were calculated individually for each plot, and then averaged for all flood and all control plots.

Results

Water Levels and Habitat Change

The water levels at the start of the field season were similar to the measured high-water levels in 2019, and while they did decrease after the channel from Whale Tail Lake to Mammoth Lake thawed, they did not decrease by a large amount. These higher water levels have also caused habitat changes to the tundra: areas that were under water from the high-water levels early in the season later showed vegetation die-off, lichens washed away, more exposed substrate, and an increase in moss carpet (Figure 3). Birds observed in these areas were feeding, and no nests were found in this changed tundra habitat.

Figure 3: An area that was previously flooded (right) with lichens washed away and an increase in moss carpet, and the adjacent tundra (left) that was not flooded with higher amounts of lichen, and herbaceous vegetation. These two photos were taken at the same time with the researcher standing in the same spot.

Nests around Whale Tail Lake

In summer of 2021 we found a total of 87 nests around Whale Tail Lake and surrounding areas, including: 53 Lapland Longspur, 17 Semipalmated Sandpiper, 7 Horned Lark, 3 American Golden-Plover, 3 Least Sandpiper, 2 Rock Ptarmigan, 1 Common Redpoll, 1 Northern Pintail, and 1 Savannah Sparrow. Inside the 16 Whale Tail study plots there was a total of 49 nests. Of importance, no nests were found within area of the high-water line measured in 2019. There were significantly fewer Lapland Longspur nests found in the plots that experiences flooding than plots that did not (Table 1, $t=2.39$, $P < 0.02$).

The flooded plots in 2021 show a decrease in average number of nests (2.25 nests/plot) from 2018 (3.63 nests/plot) and 2019 (4.13 nests/plot). However, there was an increase in average nests found in 2021 (3.75) control plots compared to 2019 (2.75 nests/plot).

70% of Lapland Longspur and 82% of Semipalmated Sandpiper nests around Whale Tail Lake (including flood, control, and nests found outside of study plots) were successful (Table 2). The most common cause of failed nests was predation. The presence of several predators of songbirds, shorebirds, and their nests was recorded including arctic fox, Herring Gull, Glaucous Gull, Peregrine Falcon, and Rough-legged Hawk. No nests were lost due to flooding in 2021 due to the flooding of Whale Tail Lake being finished and the water levels dropping throughout the season.

Table 1: Bird nests found in 2021 in the 6ha study plots around Whale Tail Lake. Plots have been combined into the plots that experienced flooding (F) and the plots that did not (C) with the nest tally for birds outside of the plots combined. Lapland Longspur (LALO), Semipalmated Sandpiper (SESA), Least Sandpiper (LESA), Horned Lark (HOLA), American Golden-Plover (AMGP), Northern Pintail (NOPI), Rock Ptarmigan (ROPT), Common Redpoll (CORE), and Savannah Sparrow (SAVS).

Species	WT1		WT2		WT3		WT4		Out
	C	F	C	F	C	F	C	F	
LALO	8	1	6	3	4	4	5	1	21
SESA	1	1	3	3	1	3	2	-	3
LESA	-	-	-	-	1	-	-	-	2
HOLA	-	-	-	1	-	-	-	1	5
AMGP	-	-	-	-	-	-	-	-	3
NOPI	-	-	-	-	-	-	-	-	1
ROPT	-	-	-	-	-	-	-	-	2
CORE	-	-	-	-	-	-	-	-	1
SAVS	-	-	-	-	-	-	-	-	1

Table 2: Nest fates of the 4 focal species: Lapland Longspur (LALO), Semipalmated Sandpiper (SESA), Horned Lark (HOLA), and Least Sandpiper (LESA). Nests were considered successful (S) when chicks hatched (SESA and LESAs) or chicks fledged the nest (LALO and HOLA). Nests were considered failed (F) when the nest was empty before hatch, fledge, or abandoned. Some nests had fates remain unknown (U) when the birds were still nesting when researchers left, or the space between nest checks was too long to confirm success.

Species	Control			Flood			Out		
	S	F	U	S	F	U	S	F	U
LALO	14	3	6	8	1	-	15	4	2
SESA	3	1	-	7	-	-	4	-	2
HOLA	4	-	-	1	1	-	-	1	-
LESA	1	-	-	-	-	-	2	-	-

Bird densities around Whale Tail Lake

In 2021 the average densities of birds (all species) in the plots around Whale Tail Lake was 167.84 birds/km² in control plots and 96.44 birds/km² in plots that experienced flooding. The bird densities in the flooded plots were lower than the flooded plots in 2018 (131.73

birds/km²) and higher than 2019 (73.39 birds/km²). The bird densities in the control plots were higher than the 2019 (47.66 birds/km²).

Behavioural Responses: Marking and Re-sighting

139 birds were banded in all years including 77 Lapland Longspur (2018, 2019, 2021: 29, 26, 22), 50 Semipalmated Sandpiper (13, 20, 17), 8 Horned Lark (2, 0, 6), and 4 Least Sandpiper (3, 1, 0). Of the 94 birds banded in 2018 and 2019, 19 were resighted in 2021, including 36% of banded Semipalmated Sandpipers and 9% Lapland Longspur, and another 2 individual Lapland Longspur whose colour band combination was not 100% confirmed.

Two of the Semipalmated Sandpipers who were paired in 2019 and successfully nested in the low area of the WT3 plots that were flooded were resighted in the same area on the 15th of June at the start of 2021. At this time the water levels were still near the high-water line measured in 2019 and this area was very wet and not suitable nesting habitat for Semipalmated Sandpipers. These two birds were not sighted again for the rest of the 2021 season, suggesting they did not nest in this area. We were unable to find where this pair did go.

Table 3: Summary of resighted birds in 2021 that were originally banded in 2018 and 2019 at the Whale Tail Lake sites (WT) and the study sites accessible from the Amaruq Road (AR).

Species	2018		2019	
	WT	AR	WT	AR
Lapland Longspur	2	0	3 (+2 possible)	1
Semipalmated Sandpiper	2	1	8	1

Discussion and Conclusions

In the plots that experienced flooding the average number of nests found decreased in 2021 from both 2018 and 2019, however, the average bird density in the plots decreased from 2018 but increased from 2019. Both 2021 and 2019 had lower densities than those measured in 2018, supporting the hypothesis that the flood would affect bird densities around Whale Tail Lake. However, these areas appeared to be used for foraging, rather than nesting. It is important to note that this area that was underwater during the peak flood high-water is no longer suitable nesting habitat for the species we monitored, and as expected, no nests were found.

In the non-flooded plots, the average number of nests, and average bird density, increased from 2019 to 2021, supporting the hypothesis that birds may have moved uphill to areas that were not as flood prone. However, we did not see this in the resighted birds. A pair

that was banded previously and returned to the same area to nest, left the study area completely and we do not know where they went to nest this year.

The habitat that was flooded changed drastically from the high-water levels, including uprooting and removal of lichens, sedges, and grasses, die-off of willows (*Salix* sp.) and dwarf birch (*Betula nana*) which did not leaf-out, and a noticeable reduction in vascular plants flowering, leafing out, or growing. In the future, habitat studies prior to and after flooding to quantify and assess habitat damages and regeneration timelines would be recommended.

APPENDIX D

Wildlife Mortality Reports

Wildlife Incident Report Form

Date:	2021-01-23	Time:	12:55 am
Individuals involved:	Isabelle Couture		
	Emilie Fouilloux		
Species:	Raven		
Number, gender, age:	Adult		
Location (description):	AWAR, km8		
Location (UTM):	14W 643725 7143327		
Digital photo numbers:	2021-01-23 Raven		
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>During a wildlife survey, the environmental team noticed a dead crow on the side of the road (AWAR, km8). – No on scene photo was taken. Photo taken once back on site.</p> <p>Not enough information to determine the exact mortality cause. Cannot confirmed if the raven was dead before vehicle impact or if the death occurred with the impact of a vehicle.</p>			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
<p>N/A.</p>			
Describe any communication with GN-DOE:			
<p>No communication was done.</p>			
What immediate measures were taken to reduce risk or harm?			
<p>The raven carcass was removed from the road to eliminate the risk to attract carnivores close to the road, then the carcass was brought to the incinerator.</p>			
What measures are recommended to prevent future occurrences?			
<p>No specific recommendation.</p>			
Report prepared by:	Isabelle Couture	Reviewed by:	Eric Haley

Wildlife Incident Report Form

Date:	2021-02-14	Time:	16:30
Individuals involved:	Louis Dubois – ENV	Tom Thomson - ENV	
Species:	Wolverine		
Number, gender, age:	1, Female, Unknown		
Location (description):	West of Core Shack Storage		
Location (UTM):	14 W 0637768 7214048		
Digital photo numbers:	See below		
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>Between January 1 and February 14, Environment responded to 15 calls for Wolverine on site.</p> <p>Detering efforts consisted of a pick-up horn, bangers, and rubber bullets when the animal would not flee the area. Inspections of the mine site and camp area are conducted on a weekly basis, no food waste was observed.</p>			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
<p>At approximately 16:00, Environment was called to a Wolverine sighting on the airstrip. The wolverine was reported crossing the airstrip and moving towards the refer pad. Prior to Environment arriving, the wolverine started moving towards the Nova Camp and Core Shack area where employees were working outside. Environment technician arrived on the scene with a shotgun and deterring ammunition. The wolverine skirted the west side of the core shack and proceed towards the main camp. At approximately 20 m from the wolverine, a rubber bullet was fired, the wolverine turned and ran west, a second rubber bullet was fired and hit the animal just in front of the hind leg. The wolverine immediately rolled over, stood up and started staggering. The wolverine only walked for a few meters before falling over. The wolverine did not get up and appeared badly injured.</p> <p>Environmental technician immediately called his supervisor Environment Coordinator Tom Thomson. Both technician and Coordinator returned to the scene, where the wolverine had not moved and was bleeding heavily. Environment Coordinator authorized the dispatch of the animal to prevent further suffering. A single 12g slug was fired to ensure the animal was dead.</p> <p>GPS coordinates and photos were collected along with the carcass. The wolverine carcass will be disposed in the incinerator at Meadowbank.</p>			
Describe any communication with GN-DOE:			
<p>No email exchange had occurred between Meadowbank Environment Coordinators and GN Conservation Officers as of Feb 14th. Current deterring methods of vehicle horns, bangers, and rubber bullets were proving efficient.</p> <p>Only in the past 3 days did the observations become more frequent.</p>			
What immediate measures were taken to reduce risk or harm?			
<p>Respond to sightings immediately.</p> <p>Routine inspections were conducted around the site to ensure no food waste was present.</p>			

What measures are recommended to prevent future occurrences?
Continue to educate departments on Wildlife interactions, food waste and attractants.
Continue to follow problematic Wildlife procedures and ensure good communication with GN Conservation Officers.

Wildlife Incident Report Form

Date:	2020-03-27	Time:	13:00
Individuals involved:	Isabelle Couture		
	Nicolas Saucier		
Species:	Arctic fox		
Number, gender, age:	-unknow		
Location (description):	KM 103 on the AWAR		
Location (UTM):	14 W 635959 7217014		
Digital photo numbers:	20210327-1	20210327-2	20210327-3
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>While performing a wildlife survey going southbound, the environmental technician found a dead in the middle of the road at the km mark 103 on the Meadowbank All-Weather-Access-Road (AWAR). There was visible sign of impact with a vehicle on the carcass.</p> <p>The carcass was recovered and will be disposed of at the incinerator.</p>			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
N/A			
Describe any communication with GN-DOE:			
N/A			
What immediate measures were taken to reduce risk or harm?			
Reminder given at the daily management update meeting to discuss with all crews the rules of the road.			
What measures are recommended to prevent future occurrences?			
Keep informing people of the right of way of wildlife and the importance of reporting any sighting or incident.			
Report prepared by:	Nicolas Saucier	Reviewed by:	Eric Haley

Wildlife Incident Report Form

Date:	2021-05-16	Time:	3:10pm
Individuals involved:	Emilie Fouilloux		
Species:	Arctic hare		
Number, gender, age:	-		
Location (description):	AWAR – km22		
Location (UTM):	No coordinates were taken		
Digital photo numbers:	Arctic hare (1)	Arctic hare (2)	Arctic hare (3)
	Arctic hare (4)	Arctic hare (5)	Arctic hare (6)
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>While performing a wildlife survey, environmental staff observed what appeared to be an arctic hare carcass. It appeared to be roadkill and then scavenged.</p> <p>The remaining carcass were recovered and disposed of at the incinerator.</p>			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
N/A			
Describe any communication with GN-DOE:			
N/A			
What immediate measures were taken to reduce risk or harm?			
N/A			
What measures are recommended to prevent future occurrences?			
Continue to raise awareness regarding wildlife right-of-way. Communication sent out site-wide via the Daily Communicator.

Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>While driving to Baker Lake on September 18th, we recovered a dead arctic hare at KM 32 in the middle of the road. The carcass had obvious sign of roadkill and was eviscerated. It was picked up and brought to the incinerator.</p> <p>Nobody had reported an incident with an animal.</p>			
			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
N/A			
Describe any communication with GN-DOE:			

Email and mortality report sent to wildlife officer			
What immediate measures were taken to reduce risk or harm?			
We removed the Hare from the road to avoid attracting any scavengers and/or predators.			
What measures are recommended to prevent future occurrences?			
A general reminder to all operators of vehicles/equipment to be aware of wildlife presence along the road & right of way			
Report prepared by:		Fanny Laporte	Reviewed by: Tom Thomson

Wildlife Incident Report Form

Date:	2021-10-28	Time:	10:15
Individuals involved:	Louis Dubois		
Species:	Arctic Hare		
Number, gender, age:	Adult		
Location (description):	Middle of the road at km 92		
Location (UTM):	14W 630999 7210703		
Digital photo numbers:			
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
<p>While driving south bound, I saw a dead arctic hare in the middle of the road at km 92. By being on the middle of the road, the hare became a threat to human and wildlife safety since it could attract carnivores and lead to another roadkill. Given the condition and location of the hare, he was the victim of a roadkill.</p>			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
<p>No deterrents were used.</p>			
Describe any communication with GN-DOE:			
<p>Communication with the GN-DOE will be done during the monthly report.</p>			
What immediate measures were taken to reduce risk or harm?			
<p>Hare was removed from the road and brought to the incinerator.</p>			
What measures are recommended to prevent future occurrences?			
<p>Be vigilant on the road.</p>
