The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems
- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province
- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical

Set Pressure Ranges
- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 4 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity
- 120cP is maximum recommended service viscosity

[1] For ChemFlare™ end connectors, consult Chemline.
[2] PP and PVDF spigot ends have DIN dimensions and will butt fuse directly to Chemline PP and PVDF piping systems.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

$P_p \leq P_s$ → valve closed

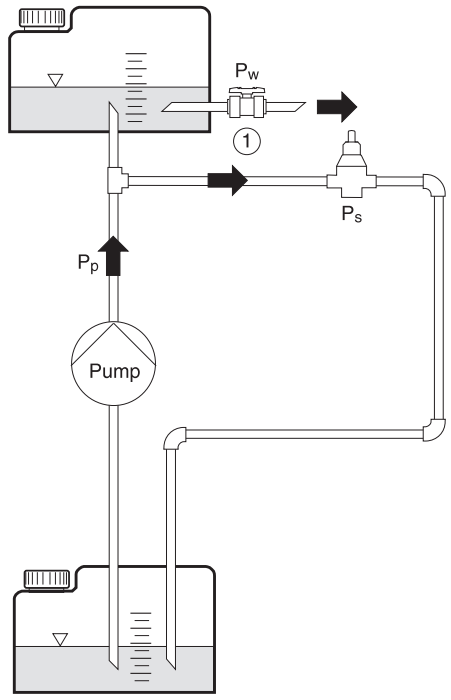
Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF 3 Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

True Union Ends
Easy installation and maintenance

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems
- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

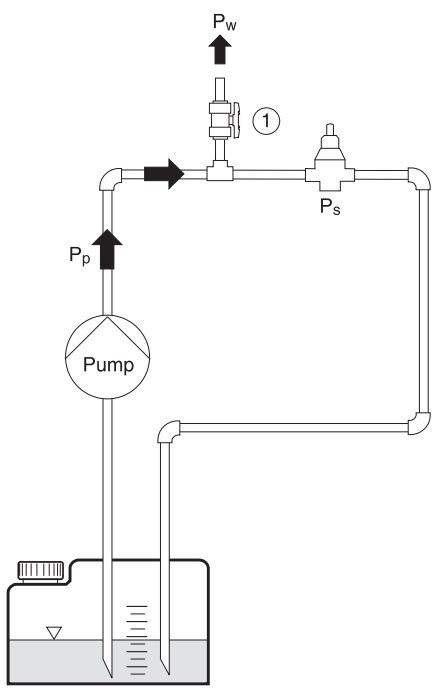
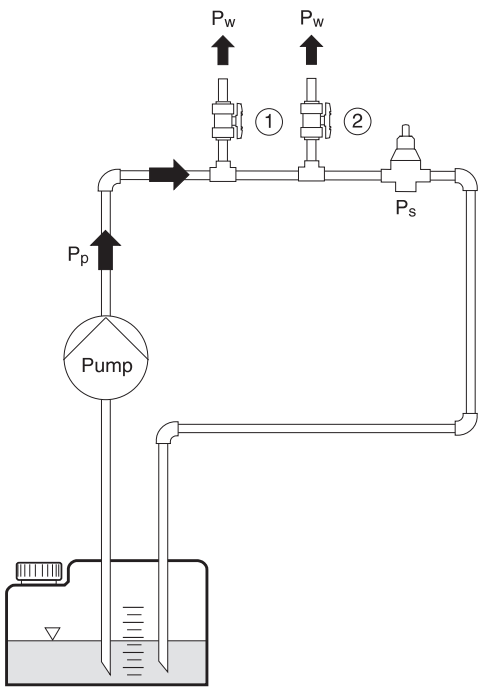
application of pressure relief valves

Constant System Pressure



$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

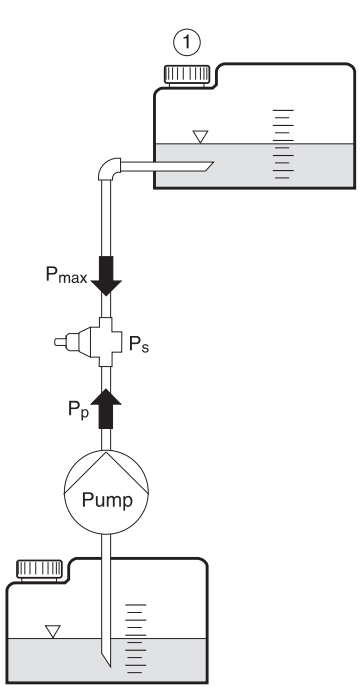
Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve

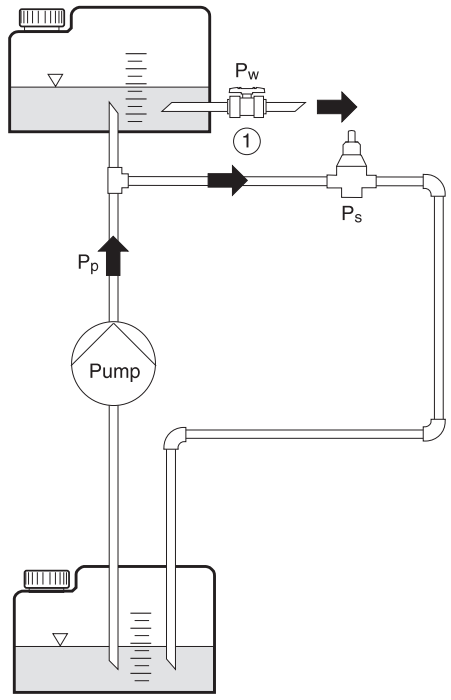
Container 1 is located above the pump



$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

Example: Chemline SB 12 Series, PVC, 1/2" diameter, FPM (Viton®) seals, Union socket ends.
x = 4 for 1/4", **6** for 3/8", **8** for 1/2", **12** for 1" ID tube connections.

OPTIONS

- 4 to 60 psi Pressure Range springs for 2-1/2" to 4" valves
- **Integral Pressure Gauge –** for inlet and/or outlet
- Bodies in 316 Stainless Steel and PTFE

Optional Pressure Gauge

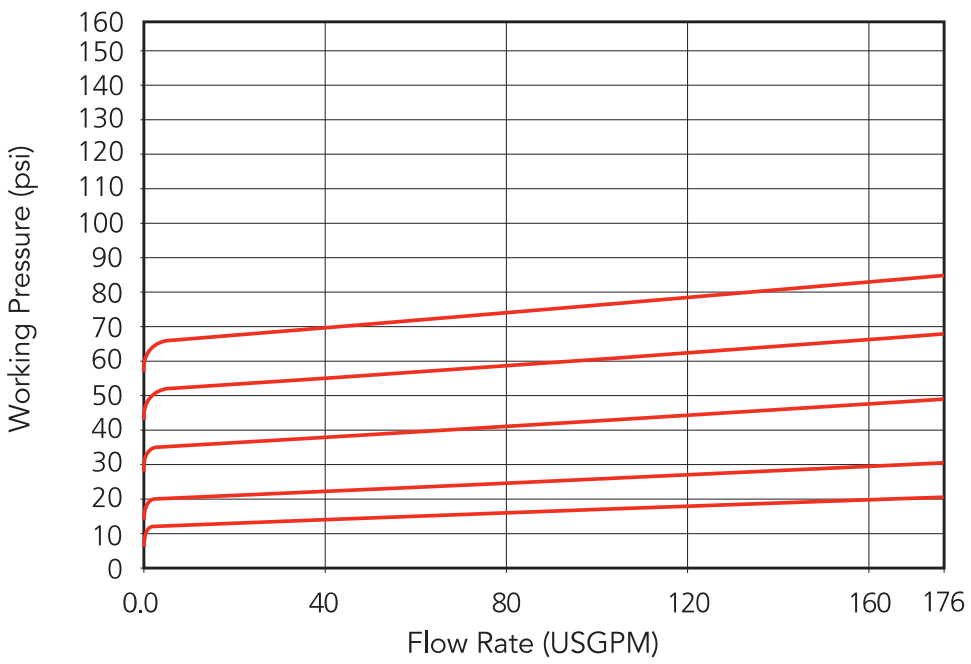
- For inlet and/or outlet

SB12 Series Back Pressure/Relief Valves 2-1/2" to 4"

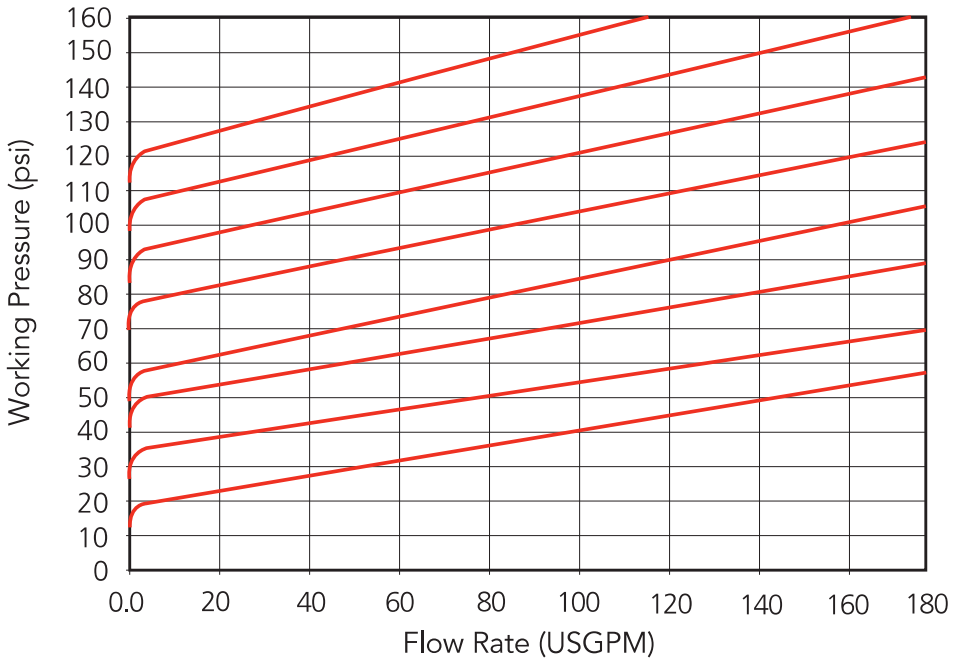
working pressure vs. flow rate

- Whether the pressure is rising or falling, hysteresis is approximately 14.5 psi for 2-1/2" to 4" valves

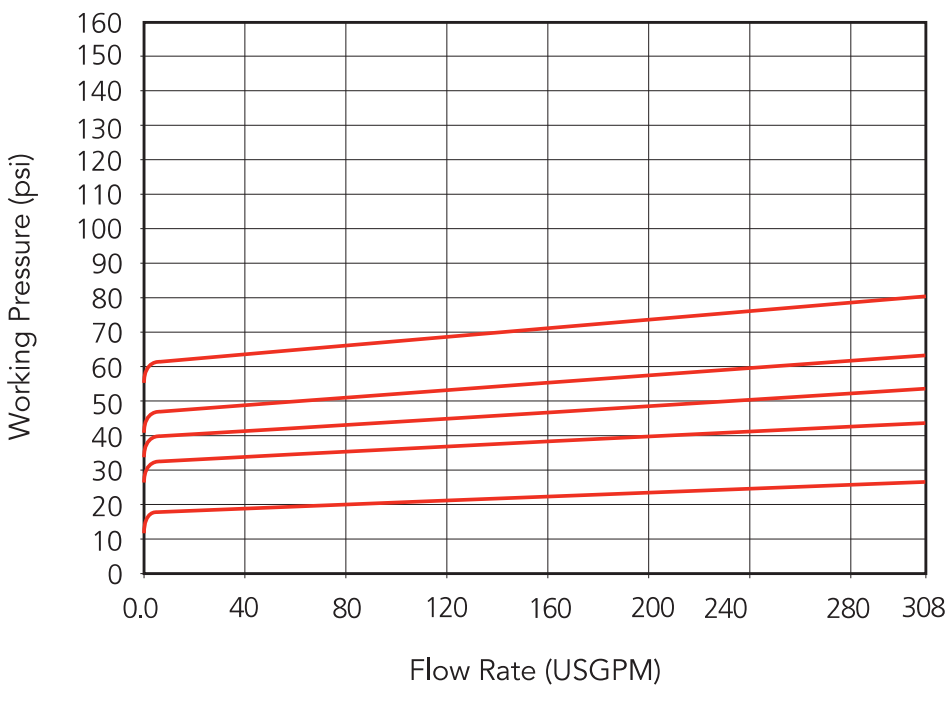
2-1/2" Valves / 4 to 60 psi set pressure range



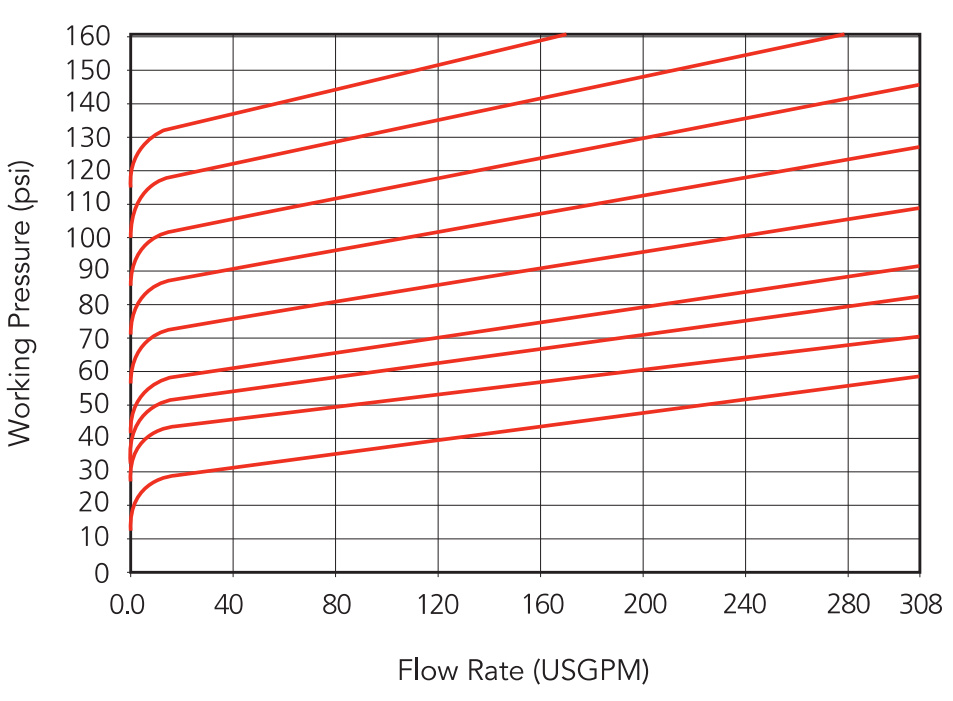
2-1/2" Valves / 7.5 to 150 psi set pressure range



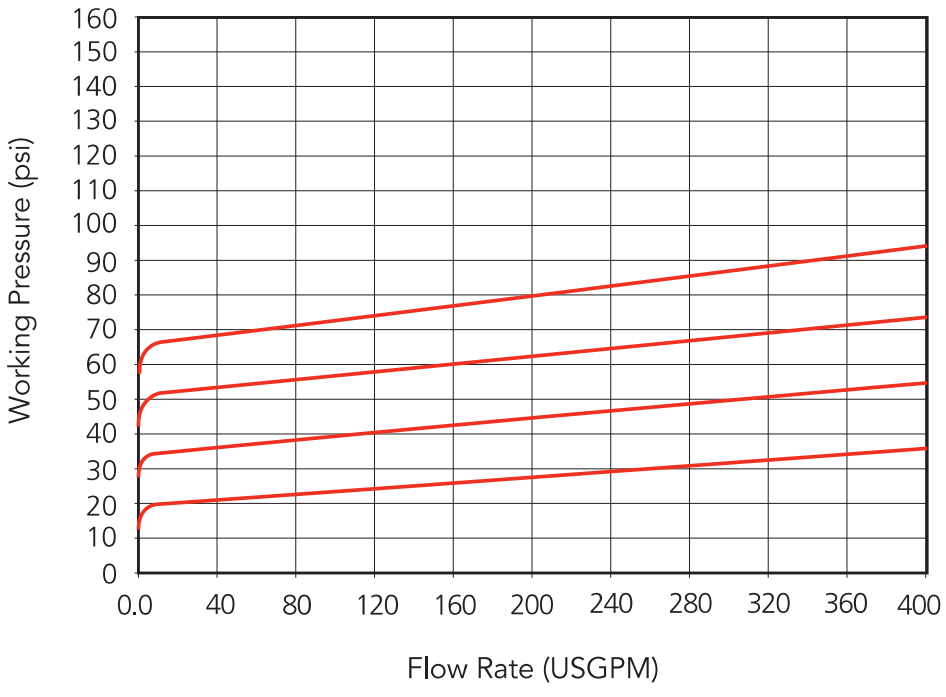
3" Valves / 4 to 60 psi set pressure range



3" Valves / 7.5 to 150 psi set pressure range



4" Valves / 4 to 60 psi set pressure range



4" Valves / 7.5 to 90 psi set pressure range

Gauge Isolators

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: SG

INLET CONNECTION: 1/4" or 1/2" Threaded[1]

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

DIAPHRAGM: PTFE

Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine[2]. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

features

Easy to Mount Gauges

- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port

- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance

- Choice of body materials for a wide range of applications
- PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety

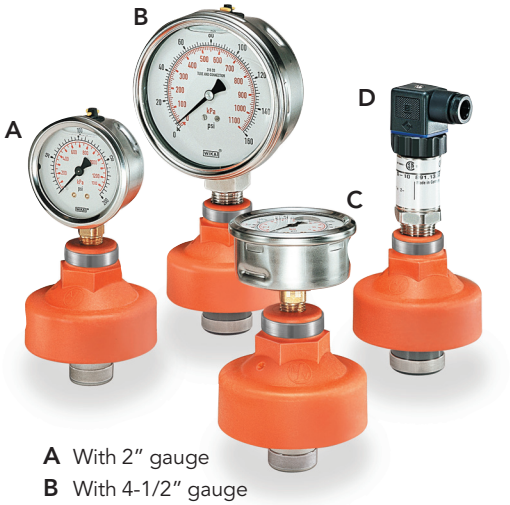
- PPG[3] top chamber
- Heavy wall connection ports

CRN Registration number by province

- Ontario: OH16085.5

Optional Gauges

- Isolators are available alone or with gauge mounted and prefilled with glycol[2]

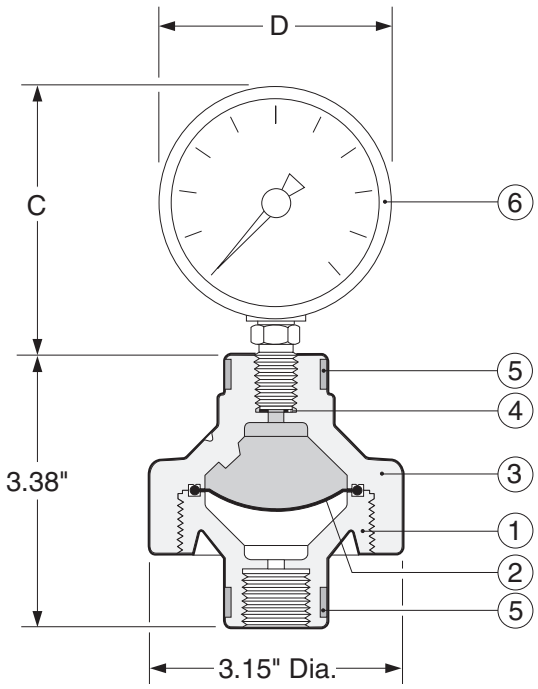


A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

[1] Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
[2] Other fluids are available for special applications such as chlorine service.
[3] Glass reinforced polypropylene.
[4] PVC isolators are certified under NSF/ANSI Standard 61 for contact with drinking water.

06/14 ©Chemline Plastics Limited 2014
Chemline is a registered trade mark of Chemline Plastics Limited

Gauge Isolators



PARTS

No.	Part	Pcs.	Materials
1	Body	1	PVC, PP, PVDF
2	Diaphragm	1	PTFE
3	Bonnet	1	PPG[1]
4	Gasket	1	EPDM
5	Stainless Steel Bands	2	304 SS
6	Optional Gauge	1	See below

[1]PPG = Glass reinforced polypropylene

OPTIONAL GAUGES

- Chemline offers the gauges listed below mounted to isolator and prefilled with glycol, glycerine or special fluid for chlorine applications. These gauges have dials and cases filled with either glycol (standard), glycerine or silicon for corrosion resistance and dampening.
- Chemline SG gauge isolators are not recommended for vacuum applications. They will not affect the gauge accuracy as low as approximately 3 psi. The accuracy depends on the process conditions and the gauge installed on it.

OTHER OPTIONS

- **Flanged** inlet connections
- **Threaded Fill Port** – drilled, tapped and plugged
- Chemline will mount any pressure instrument supplied free issue by customer

DIMENSIONS (Gauge Isolator with optional gauge installed) INCHES

Optional Gauge Ordering No.	Gauge Diameter	Gauge Connection	Housing	Bourdon Tube	Window	Accuracy	Dimensions C	Dimensions D(max.)
P025-xx	2-1/2"	1/4"	316 SS	Brass	Polycarbonate	±1.5% of span	3.1	2.5
P025-xx-SS	2-1/2"	1/4"	316 SS	316 SS	Polycarbonate	±1.5% of span	3.1	2.5
P025-xx-SS/BM	2-1/2" Back Mount	1/4"	316 SS	316 SS	Polycarbonate	±1.5% of span	1.6	2.5
P025-xx-BM	2-1/2" Back Mount	1/4"	316 SS	Brass	Polycarbonate	±1.5% of span	1.6	2.5
P040-xx-SS	4"	1/2"	316 SS	316 SS	Safety Glass	±1% of span	4.5	4.0
P045-xx-SS	4-1/2"	1/2"	PBTP Plastic[2]	316 SS	Acrylic	±0.5% of span	6.3	5.8

xx denotes the maximum gauge pressure i.e., 30, 60, 100, 160 or 200 psi. See data page for recommended working pressures.
[2] PBTP = glass filled polyester.

ACCUDRAW® Calibration Cylinders

Polypropylene

PVC

Glass

- PVC with removable "O" ring sealed top for easy cleaning

- yellow polypropylene level indicator float for high visibility

ACCUDRAW® ***has been developed for the accurate calibration of metering pumps. Standard features include:***

- translucent
- chemical resistant
- break resistant
- threaded, socket or flanged
- colored graduations and lettering
- PVC has dual scale USGPH & ml
- PVC sizes 100 - 20000 ml
- POLY sizes 100 - 4000 ml
- POLY meets ISO standards
- Glass sizes 100 - 20000 ml
- custom designs available

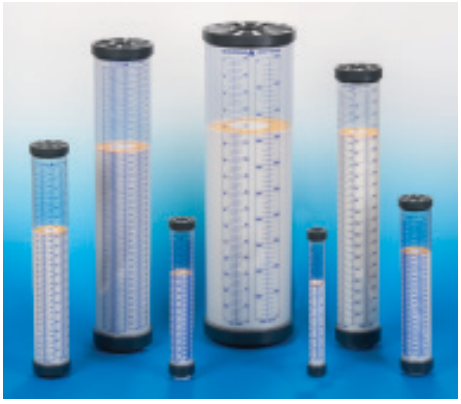
ACCUDRAW® Calibration Cylinders

"For Accuracy That Counts"

For complete product information visit our website: primaryfluid.com

Flanged: Glass, PVC

Flanged: PVC



PV#4

Sizing and Ordering Information:

ACCUDRAW Standard Materials of Construction

AC = All polypropylene construction (see below for options)
PV = All polyvinylchloride construction (see below for options)
ACS = Glass*

Note: Cylinders are NOT pressure vessels

Example: AC#1-1000B
AC = PP (polypropylene)
#1 = Bottom threaded connection only
1000 = 1000 ml
B = BSP Thread

e.g. Part # AC #1 - 1000 B

Type:
AC = Polypropylene
PV = PVC
ACS = Glass

Style:
1 = Bottom threaded conn. only
2 = Top and Bottom threaded conn.
3 = Bottom threaded conn. c/w removable vented dust cap
4 = Top/Bottom threaded conn. c/w removable "O" ring sealed top and float ring level indicator
** **Glass calibration cylinders available in Style 2 only***

Graduation Scale:
PP - ml only
PVC - ml and GPH
Glass - ml only

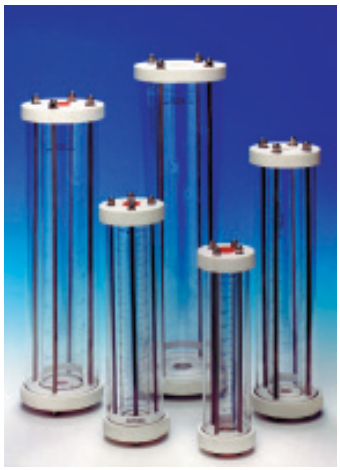
Std. connection is NPT thread
Optional: add suffix as follows
S = Socket weld connection (PVC only)
GTV = Glass/TFE construction
GKV = Glass/PVDF construction
GCV = Glass/CPVC construction
GSV = Glass/SS construction
B = BSP Thread
F = Flanged

Substitute **E** for **V** for **EPDM** wetted "O" ring seal

Sizes:		**Material**
100 =	100 ml (1.6 GPH)	PP, PVC, Glass
250 =	250 ml (4 GPH)	PP, PVC, Glass
500 =	500 ml (8 GPH)	PP, PVC, Glass
1000 =	1000 ml (16 GPH)	PP, PVC, Glass
2000 =	2000 ml (32 GPH)	PP, PVC, Glass
4000 =	4000 ml (64 GPH)	PP, PVC, Glass
6000 =	6000 ml	Glass only
8000 =	8000 ml	Glass only
10000 =	10000 ml (160 GPH)	PVC, Glass
20000 =	20000 ml (320 GPH)	PVC, Glass

Custom sizes and materials available.

ACCUDRAW® Calibration Cylinders



ACCUDRAW® Glass Calibration Cylinders ***are ideal for the calibration of metering pumps, batch systems and for handling hazardous chemicals.***

- volumes calibrated in ml
- construction materials available include TFE, PVDF, CPVC and 316 stainless steel
- sealing "O" rings are Viton and Buna N
- outer shield of acrylic construction
- port connections in NPT, metric or flanged
- standard sizes 100 - 20,000 ml
- custom designs available to your specifications

Sizing and Ordering Information: Glass Construction

Size	Conn.	Model # For TFE End Flgs	Model # For 316 S/S End Flgs	Model # For PVDF End Flgs	Model # For CPVC End Flgs

10000 ml	2" NPT	ACS#2-10000-GTV	ACS#2-10000-GSV	ACS#2-10000-GKV	ACS#2-10000-GCV
20000 ml	2" NPT	ACS#2-20000-GTV	ACS#2-20000-GSV	ACS#2-20000-GKV	ACS#2-20000-GCV

Cylinders are bolted together using stainless steel rods with Viton "O" rings for the glass seal and Buna N "O" rings for the acrylic seal. For EPDM "O" rings, subsititute "E" for "V".

Options available: (may affect price and delivery)

- **different type or size of thread connection, different "O" ring material, different flange material**

Descriptions:

TFE, PVDF and CPVC End Flanges:
Glass cylinder with acrylic outer shield and 3/4" thick (TFE, PVDF or CPVC) end flanges

316 S/S End Flanges:
Glass cylinder with acrylic outer shield and 1/2" thick 316 Stainless Steel end flanges

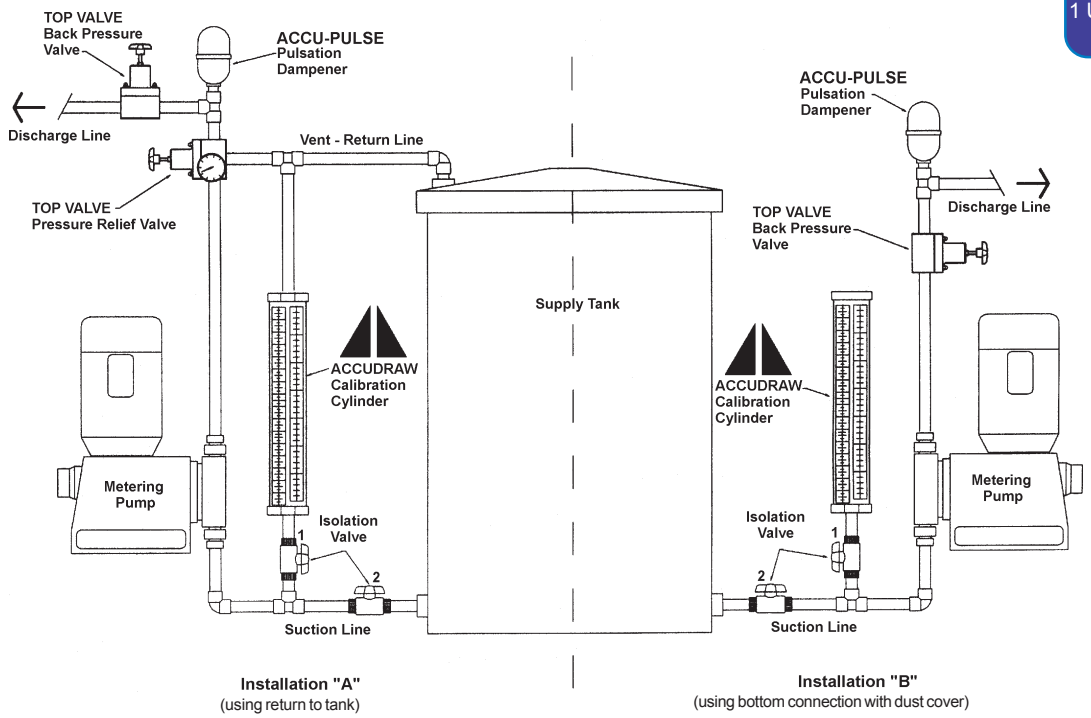
Installations

Conversion Factors
1 ml = 1 cc
1000 ml = 1 liter
ml/sec X 60 = ml/min
1 US gal/min X 0.063 = liters/sec
1 US gal = 3.786 liters



Other available products at www.primaryfluid.com

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 15 - 350 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, Teflon, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes 1/4" - 2" NPT*
- *color coded handles indicate size*
- *higher pressure & temperature available*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

ACCUPULSE Pulsation Dampeners

Designed to remove pulsatingflows from positive displacement pumps.

- *increase system efficiency and pump life; decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes with lightweight, compact design*

ACCU-PULSE
Pulsation Dampeners

ACCU-PULSE Pulsation Dampeners have been developed to remove pulsating flows from positive displacement pumps providing:

- increased system efficiency and pump life
- protection of pipes, meters, valves and instrumentation from pulsation and vibration
- meter accuracy, longevity and repeatability
- prevention of foaming and splashing
- decreased maintenance and costs

Standard Features Include:

- lightweight, compact design
- extensive range of materials and sizes
- easy in-line maintenance
- 2 year warranty

ACCU-PULSE Pulsation Dampeners

Dampener Sizing Guide

Note: Separate sizing guide available for air operated double diaphragm pumps.

Standard Simplex Metering Pumps:

The following are general ranges for sizing ACCU-Pulse Pulsation dampeners for metering pump applications. Models stated are based on 10% pressure fluctuations and a Simplex single acting metering pump. For 5% pressure fluctuation, divide the Capacity per Stroke Range numbers in the chart below by 2.

To calculate cubic inches per stroke: $\frac{\text{gallons per minute}}{\text{strokes per minute}}$ = gallons per stroke

Gallons per stroke X 231 cu inches per gallon = cubic inch per stroke

Example: $\frac{.15}{100}$ = .0015 GPS **Therefore:** .0015 X 231 = 0.3465 Cubic inches per stroke = API Dome Top Dampener

Capacity per Stroke Range	ACCU-Pulse Dampener
0 to 0.22 Cubic Inches	API F Flat Top
0.23 to 0.75 Cubic Inches	API Dome Top
0.76 to 2.71 Cubic Inches	API IIF Flat Top
2.72 to 6.40 Cubic Inches	API II Dome Top
6.41 to 12.96 Cubic Inches	API IIIF Flat Top
12.97 to 27.89 Cubic Inches	API III Dome Top

Note:
For other pump factors, or residual pulsation, contact factory.

Ordering Information

Example: Part # AP - I - PVC - E - 1 - F

ACCU-PULSE
- AP = Standard 150/300 PSIG
- APH = High Pressure 1000/600 PSIG
- APX = High Pressure 4000 PSIG

Series
- I = 10 cu in capacity
- IF = 4 cu in capacity
- II = 85 cu in capacity
- IIF = 36 cu in capacity
- III = 370 cu in capacity
- IIIF = 175 cu in capacity
- IV = 1155 cu in capacity (AP only)
- 8 = 8 cu in capacity (APX only)
- 12 = 12 cu in capacity (APX only)
- 16 = 16 cu in capacity (APX only)
- 24 = 24 cu in capacity (APX only)

Body Material
- PP = Polypropylene
- PVC = Polyvinylchoride (not available in Series IV)
- PVDF = Polyvinylidene Fluoride
- S/S = 316L Stainless Steel
- ALL20 = Alloy 20 (not available in Series IV)
- HAST = Hastelloy C
- CS = Carbon Steel
- CPVC = Chlorinated Polyvinyl Chloride*

* (available in Series I only)

Optional Flanges
Add suffix -F for flanges

Size
- 0 = 3/8" npt(f) series I Std Metal
- 1 = 1/2" npt(f) series I Std Plastic
- 2 = 3/4" npt(f) series II Std All
- 3 = 1" npt(f) series II (Optional)
- 4 = 2" npt(f) series III
- 5 = 3" flanged series IV
- 6 = 4" flanged series IV

Bellows material
- N = Neoprene
- B = Buna-N
- H = Hypalon
- E = EPDM (Nordel)
- V = Viton
- T = Teflon
- S = Santoprene
- P = Polyvinylchloride

APX Series available ONLY with:
Body: 316L Stainless Steel
Size: 1/2" npt(f)
Bellows: Buna-N, EPDM & Viton

Note:
CRN certification available.
Food grade material available.
Other sizes and materials available.
Please contact factory.

SEEPEX.
ALL THINGS FLOW

4/23/2018	**Item 10 (cationic Polymer)**
qty.: 3	**Progressive cavity pump**
	BN 05-12

Application data

Conveyed product	Polymer
Flowability	flowable
Viscosity	low viscosity (<500 cP/mPas)
Solids content	not specified
Size of solids	not specified
Specific gravity	unknown, 1 kg/dm³ assumed
Product temperature	32°F - 113°F
pH value	5-9
Kind of operation	continuous
Operating hours	8h/day
Location	indoor, dry atmosphere
Altitude of installation	up to 1000 m assumed
Surrounding temperature	normal (32-113°F)

Performance data

	Capacity	**Pressure**	**Speed**	
	0.26 USGPM	80 psi	41 rpm	min
	3 USGPM	80 psi	390 rpm	max
Starting torque	30 lb.ft			
Req. power at pump shaft	0.75 HP			
Inlet pressure	flooded suction (up to 0,5bar)			
NPSHr	7 ft			

Tolerances according to SEEPEX standards.

Materials and executions

Installation	vertical, drive on top
Direction of rotation	counter clockwise (left)
Lantern - Design	with cover plates
Lantern - Material	EN-JL 1040 (gci-25)
Suction casing - Design	standard
Suction casing - Material	1.4408 / ASTM A351 grade CF8M
Pressure branch - Design	standard
Pressure branch - Material	1.4408 / ASTM A351 grade CF8M
Position of branch	position 1
Suction connection	1 1/2" NPT
Pressure connection	1 1/4" NPT
Joint - Design	pin joint with joint sleeve, grease filled
Joint - Material	standard
Joint - Universal joint sleeve: material	NBR - Perbunan
Coupling rod - Design	standard
Coupling rod - Material	1.6582 encapsulated
Rotor - Design	standard
Rotor - Material	1.4404 / AISI 316L
Rotor - Coating	ductile chromium coating
Stator - Design	standard with TSE, sensor sleeve 1.4404
Stator - Material	NBR - Perbunan
Shaft sealing	mechanical seal
Code	back-to-back GLRD - LA
Shaft diameter	30 mm
Make	Burgmann
Rotating/stationary seal face	SiC SiC
Elastomers	FPM - Viton

Spring	1.4571 / AISI 316Ti
Metal parts	1.4571 / AISI 316Ti
Type	MG1-G60 Q1Q1 VGG
Casing - material	1.4404 / AISI 316L
Casing - connection standard	NPT
Plug-in Shaft - Design	standard
Plug-in Shaft - Material	1.4404 / AISI 316L
Bolting - Design	completely stainless steel
Painting - Number of colors	single-colored standard
Painting - Painted components	1 complete combination
Painting - Color	Standard Enamel (SEEPEX Blue)

Drive

Type	Gear & Motor at freq. inv.
Make	Nord
Model	SK12VLF/140TC
Mounting position	V1
Ratio (i)	4.49

	Norm	**Min**	**Max**
Speed	401 rpm	41 rpm	390 rpm
Motor speed	1800 rpm	182 rpm	1751 rpm
Frequency	60 Hz	6 Hz	58 Hz

Make	Marathon Motors
Model	145THTN6060
Rated output	2 HP
Rated speed	1800 rpm
Starting	direct on frequency inverter
Explosion proof	Weatherproof
Efficiency class	IE1
Terminal box position acc. to supplier	not specified
Cable entry position acc. to supplier	not specified

Voltage	rated voltage 575V
Frequency	60Hz
Enclosure	TENV
Thermal class	F
Winding protection	Thermostats

The frequency inverter has to follow a linear U/f characteristic curve (constant torque).
It's essential to have a minimum overload capability of 150% for at least 3 seconds. (see technical data sheet)

Baseplate

Design	baseplate for block pump, design with side feet
Material	steel, painted
GPU Type Code	B-ST-LS

Dry running protection device (TSE)

Design	standard design, complete - sensor sleeve fitted to the stator of the pump with integrated temperature sensor - connection head (IP55) - separate TSE control device suitable for mounting inside a control panel
Voltage	110-115V/50-60Hz
Temperature coefficient	NTC

Material sensor sleeve	1.4404
Material connection head	aluminium

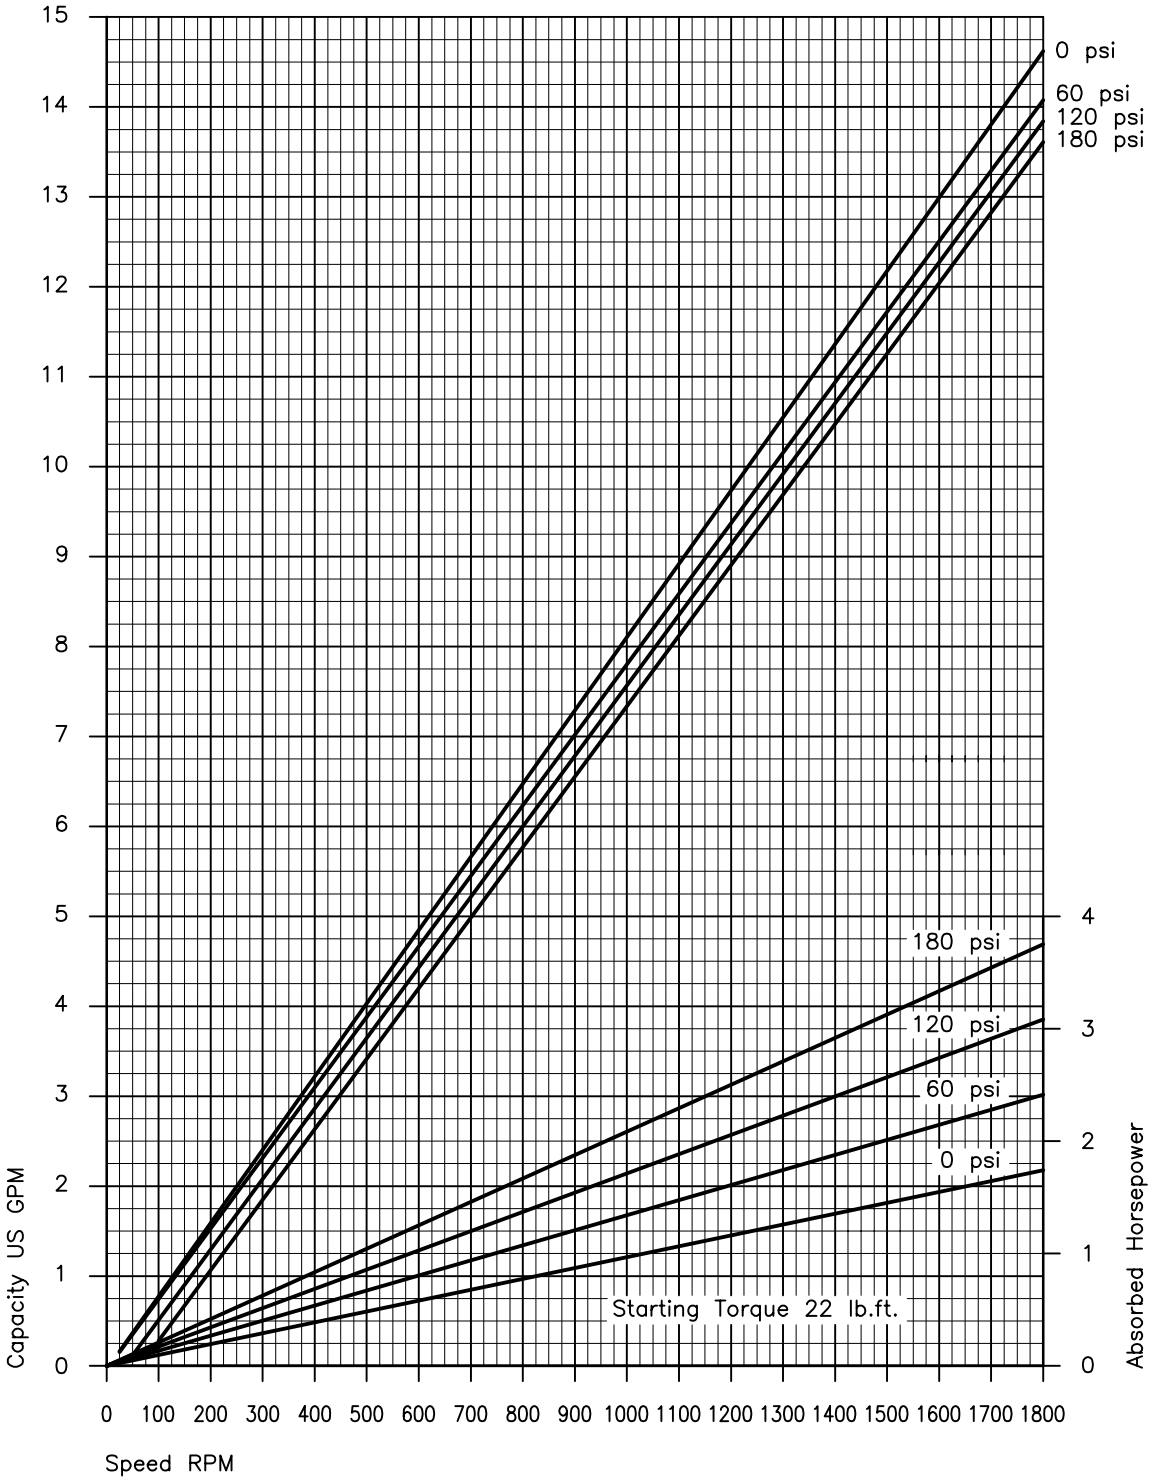
Packing

Type of packing	cardboard box (US)
Type of transport	truck / railway
Quantity of pumps per package	1 pump per package

Optional: Seal flush system

Design	SEEPEX standard double mechanical seal flush system: - Isolation valve - Strainer, 20 mesh - Needle valve - Pressure regulator, 10-125psi adjust - Solenoid valve, 120VAC, NC - ¼" NPT seal water connection plumbed to inlet of gland housing. - ¼" NPT drain connection plumbed to outlet of gland housing. Solenoid and needle valve located on the discharge.
Type	SEEPEX standard double acting mechanical seal flush system
Connection	1/8" NPT connection
Pressure Range	10 - 125 psi
Solenoid valve voltage	120V AC

Characteristic Curves
Size
05–12



Values based upon water 68°F ; For notes on drive selection refer to PER

Type 21 Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline Type 21 True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[4]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[5] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®), CPE[3]

features

Pressure rated to 230 psi[4]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] CPE=Chlorinated Polyethylene.
[4] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[5] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

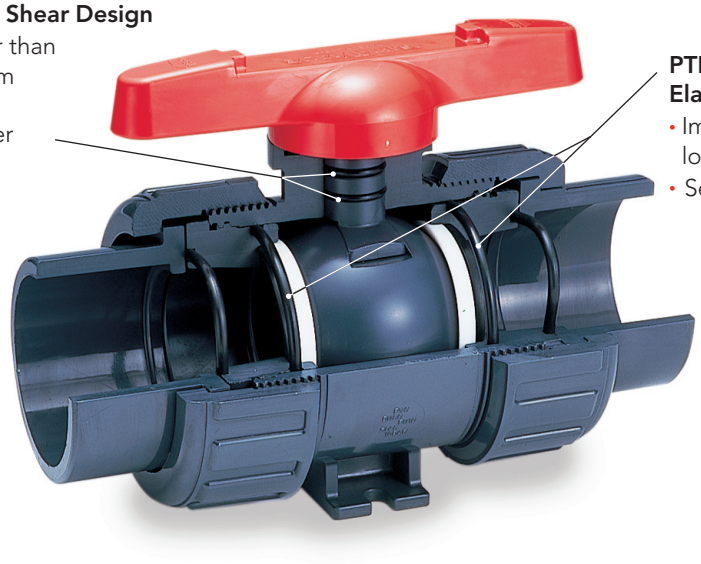
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 Ball Valves

features

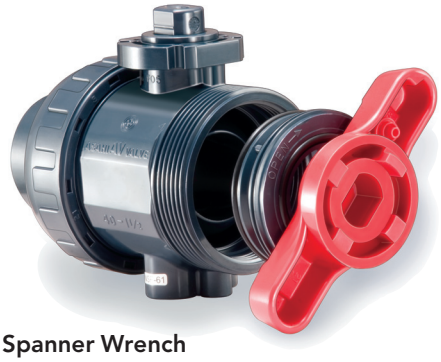
Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.



PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear



Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

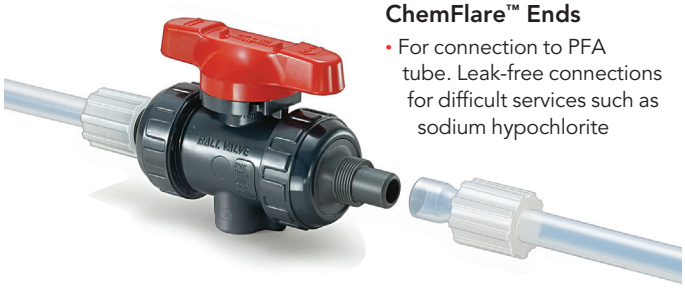
- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

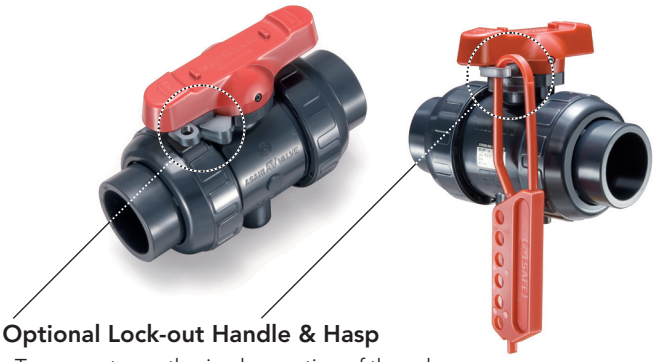
Type 21 Ball Valves

options + accessories



ChemFlare™ Ends

- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite



Optional Lock-out Handle & Hasp

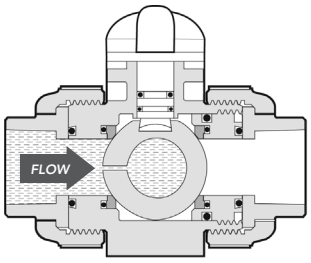
- To prevent unauthorized operation of the valve
- Used during maintenance shut-downs

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, not fabricated with couplings and reducers cemented together
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services



Vented Ball

- For sodium hypochlorite services at any concentration
- Valve shown in closed position

electric + pneumatic actuation

Pneumatic and Electric Actuators

- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM, FKM (Viton®) or CPE seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

Example: Chemline Type 21 True Union Ball Valve, PVC, 2", with EPDM seals, socket ends.

[1] 1/4" is normally the 3/8" valve reduced. 6" is 4" valve with 6" end connections.

[2] PP, PVDF and ECTFE (Halar®) metric butt fusion ends (1/2" to 4") connect to Chemline PP, PVDF and ECTFE (Halar®) piping systems.

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – For open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – Factory clean room assembled
- **Vented Ball** – For sodium hypochlorite applications

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends

- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life

- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems

- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province

- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical

Set Pressure Ranges

- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 4 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity

- 120cP is maximum recommended service viscosity

[1] For ChemFlare™ end connectors, consult Chemline.
[2] PP and PVDF spigot ends have DIN dimensions and will butt fuse directly to Chemline PP and PVDF piping systems.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

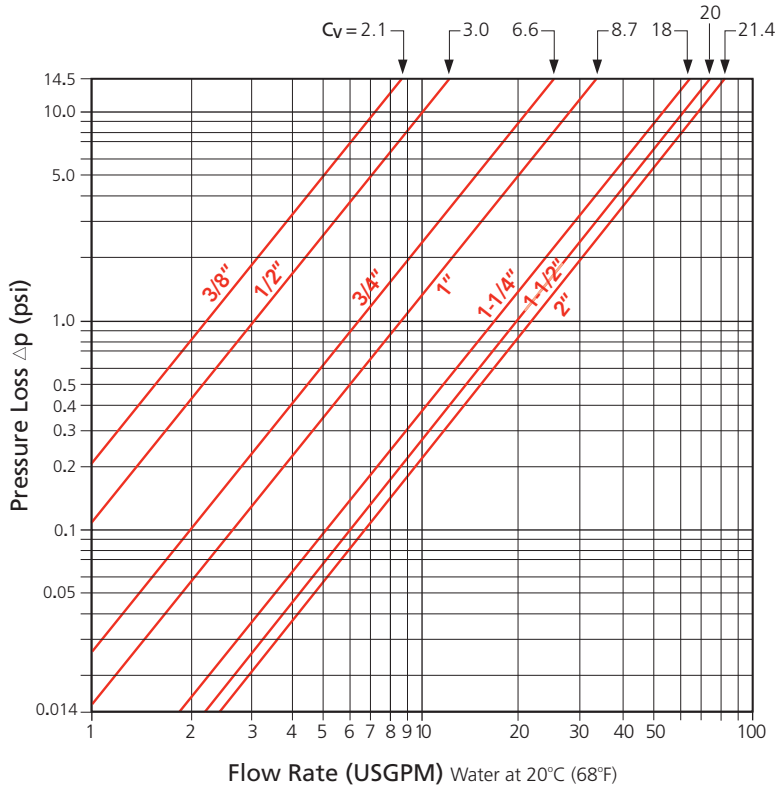
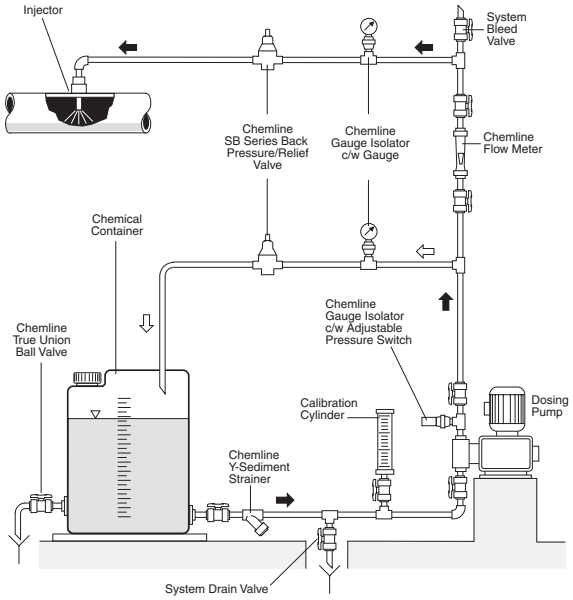
SB12 Series Back Pressure/Relief Valves 1/2” to 2”

pressure loss nomogram for SB12 valves 3/8” to 2”

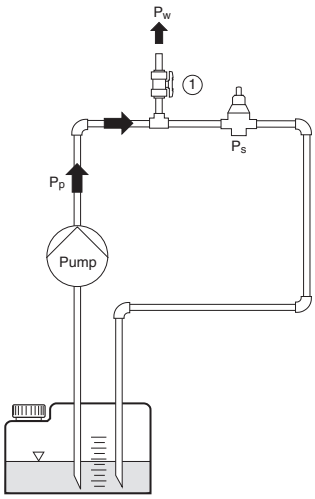


typical dosing system schematic



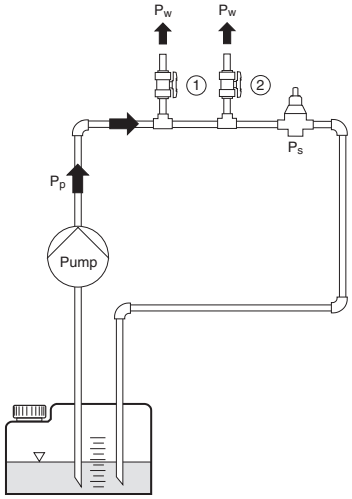
application of pressure relief valves

Constant System Pressure



$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

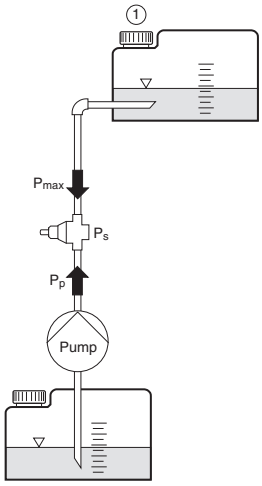
Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve

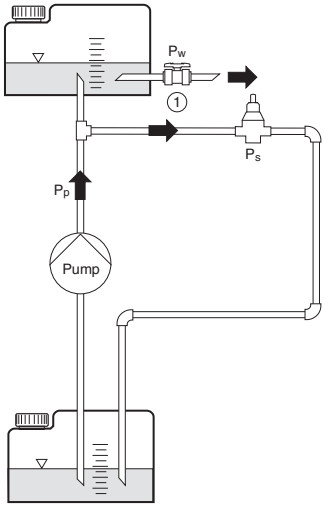
Container 1 is located above the pump



$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

SERIES: SG

INLET CONNECTION: 1/4" or 1/2" Threaded[1]

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

DIAPHRAGM: PTFE

Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine[2]. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

features

Easy to Mount Gauges

- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port

- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance

- Choice of body materials for a wide range of applications
- PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety

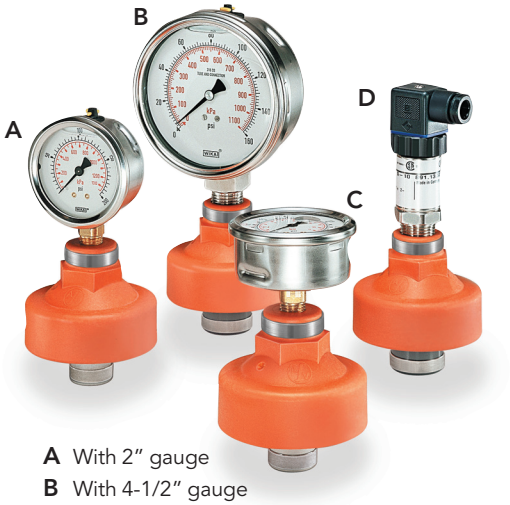
- PPG[3] top chamber
- Heavy wall connection ports

CRN Registration number by province

- Ontario: OH16085.5

Optional Gauges

- Isolators are available alone or with gauge mounted and prefilled with glycol[2]

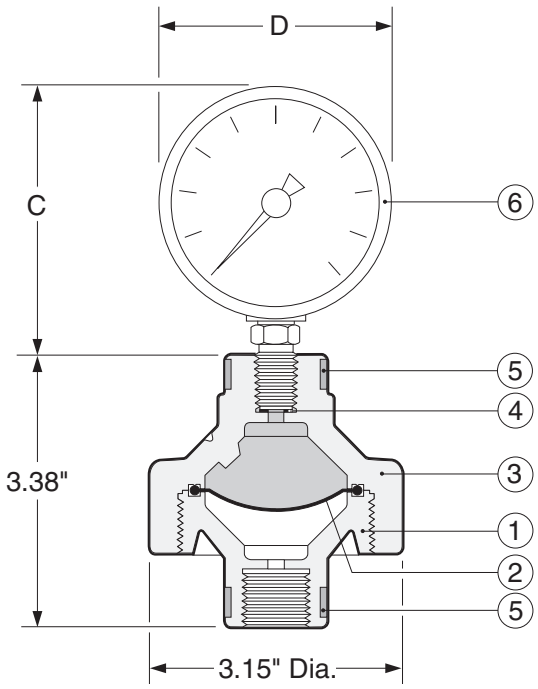


A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

[1] Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
[2] Other fluids are available for special applications such as chlorine service.
[3] Glass reinforced polypropylene.
[4] PVC isolators are certified under NSF/ANSI Standard 61 for contact with drinking water.

06/14 ©Chemline Plastics Limited 2014
Chemline is a registered trade mark of Chemline Plastics Limited

Gauge Isolators



PARTS

No.	Part	Pcs.	Materials
1	Body	1	PVC, PP, PVDF
2	Diaphragm	1	PTFE
3	Bonnet	1	PPG[1]
4	Gasket	1	EPDM
5	Stainless Steel Bands	2	304 SS
6	Optional Gauge	1	See below

[1]PPG = Glass reinforced polypropylene

OPTIONAL GAUGES

- Chemline offers the gauges listed below mounted to isolator and prefilled with glycol, glycerine or special fluid for chlorine applications. These gauges have dials and cases filled with either glycol (standard), glycerine or silicon for corrosion resistance and dampening.
- Chemline SG gauge isolators are not recommended for vacuum applications. They will not affect the gauge accuracy as low as approximately 3 psi. The accuracy depends on the process conditions and the gauge installed on it.

OTHER OPTIONS

- **Flanged** inlet connections
- **Threaded Fill Port** – drilled, tapped and plugged
- Chemline will mount any pressure instrument supplied free issue by customer

DIMENSIONS (Gauge Isolator with optional gauge installed) INCHES

Optional Gauge Ordering No.	Gauge Diameter	Gauge Connection	Housing	Bourdon Tube	Window	Accuracy	Dimensions C	Dimensions D(max.)
P025-xx	2-1/2"	1/4"	316 SS	Brass	Polycarbonate	±1.5% of span	3.1	2.5
P025-xx-SS	2-1/2"	1/4"	316 SS	316 SS	Polycarbonate	±1.5% of span	3.1	2.5
P025-xx-SS/BM	2-1/2" Back Mount	1/4"	316 SS	316 SS	Polycarbonate	±1.5% of span	1.6	2.5
P025-xx-BM	2-1/2" Back Mount	1/4"	316 SS	Brass	Polycarbonate	±1.5% of span	1.6	2.5
P040-xx-SS	4"	1/2"	316 SS	316 SS	Safety Glass	±1% of span	4.5	4.0
P045-xx-SS	4-1/2"	1/2"	PBTP Plastic[2]	316 SS	Acrylic	±0.5% of span	6.3	5.8

xx denotes the maximum gauge pressure i.e., 30, 60, 100, 160 or 200 psi. See data page for recommended working pressures.
[2] PBTP = glass filled polyester.

WORKING PRESSURES PSI

WEIGHTS

Material	10 – 20°C 50 – 68°F	30°C 86°F	40°C 104°F	50°C 122°F	60°C 140°F	70°C 158°F	80°C 176°F	90°C 194°F	100°C 212°F	120°C 248°F	Net Weights Pounds[3]
PVC	150	100	80	45	15	–	–	–	–	–	1.0
PP	150	125	100	80	65	45	–	–	–	–	0.7
PVDF	150	150	150	125	105	85	70	60	45	30	1.3

Temperature Ranges: PVC 0 to 60°C (32 to 140°F), **PP** 10 to 80°C (50 to 176°F), **PVDF** –30 to 120°C (–22 to 248°F).
NR = Not Recommended. [3] Weights are for unfilled 1/2" x 1/2" isolators without gauges. 1/2" x 1/4" isolators are 20% lighter.

ORDERING EXAMPLE

Chemline Gauge Isolators SG		A	005-	002	P	G
Body Material	**A** – PVC	**B** – PP	**K** – PVDF			
Inlet Size	**002** – 1/4"	**005** – 1/2"(Standard)				
Instrument Connection	**002** – 1/4"	**005** – 1/2"				
Diaphragm	**P** – PTFE bonded EPDM					
Filling & Mounting	**G** –Add only if isolator is supplied filled with glycol and gauge or pressure instrument is mounted by Chemline. Separate gauge item numbers are listed above.					

Example: Chemline SG Series Gauge Isolator, PVC, 1/2" x 1/4" FNPT inlet x instrument connections, PTFE diaphragm.

ACCUDRAW® Calibration Cylinders

Polypropylene

PVC

Glass

- PVC with removable "O" ring sealed top for easy cleaning

- yellow polypropylene level indicator float for high visibility

ACCUDRAW® ***has been developed for the accurate calibration of metering pumps. Standard features include:***

- translucent
- chemical resistant
- break resistant
- threaded, socket or flanged
- colored graduations and lettering
- PVC has dual scale USGPH & ml
- PVC sizes 100 - 20000 ml
- POLY sizes 100 - 4000 ml
- POLY meets ISO standards
- Glass sizes 100 - 20000 ml
- custom designs available

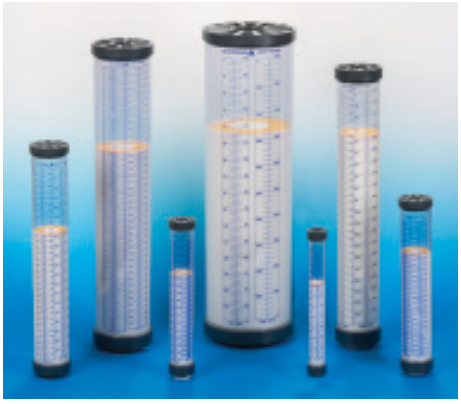
ACCUDRAW® Calibration Cylinders

"For Accuracy That Counts"

For complete product information visit our website: primaryfluid.com

Flanged: Glass, PVC

Flanged: PVC



PV#4

Sizing and Ordering Information:

ACCUDRAW Standard Materials of Construction

AC = All polypropylene construction (see below for options)
PV = All polyvinylchloride construction (see below for options)
ACS = Glass*

Note: Cylinders are NOT pressure vessels

Example: AC#1-1000B
AC = PP (polypropylene)
#1 = Bottom threaded connection only
1000 = 1000 ml
B = BSP Thread

e.g. Part # AC #1 - 1000 B

Type:
AC = Polypropylene
PV = PVC
ACS = Glass

Style:
1 = Bottom threaded conn. only
2 = Top and Bottom threaded conn.
3 = Bottom threaded conn. c/w removable vented dust cap
4 = Top/Bottom threaded conn. c/w removable "O" ring sealed top and float ring level indicator
** **Glass calibration cylinders available in Style 2 only***

Graduation Scale:
PP - ml only
PVC - ml and GPH
Glass - ml only

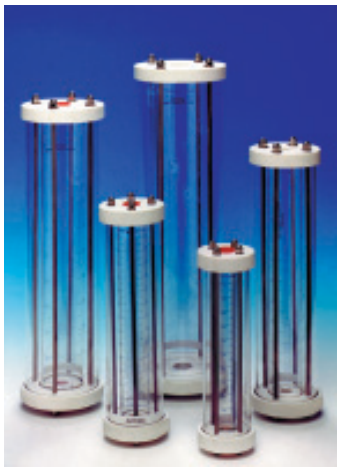
Std. connection is NPT thread
Optional: add suffix as follows
S = Socket weld connection (PVC only)
GTV = Glass/TFE construction
GKV = Glass/PVDF construction
GCV = Glass/CPVC construction
GSV = Glass/SS construction
B = BSP Thread
F = Flanged

Substitute **E** for **V** for **EPDM** wetted "O" ring seal

Sizes:		**Material**
100 =	100 ml (1.6 GPH)	PP, PVC, Glass
250 =	250 ml (4 GPH)	PP, PVC, Glass
500 =	500 ml (8 GPH)	PP, PVC, Glass
1000 =	1000 ml (16 GPH)	PP, PVC, Glass
2000 =	2000 ml (32 GPH)	PP, PVC, Glass
4000 =	4000 ml (64 GPH)	PP, PVC, Glass
6000 =	6000 ml	Glass only
8000 =	8000 ml	Glass only
10000 =	10000 ml (160 GPH)	PVC, Glass
20000 =	20000 ml (320 GPH)	PVC, Glass

Custom sizes and materials available.

ACCUDRAW® Calibration Cylinders



ACCUDRAW® Glass Calibration Cylinders ***are ideal for the calibration of metering pumps, batch systems and for handling hazardous chemicals.***

- volumes calibrated in ml
- construction materials available include TFE, PVDF, CPVC and 316 stainless steel
- sealing "O" rings are Viton and Buna N
- outer shield of acrylic construction
- port connections in NPT, metric or flanged
- standard sizes 100 - 20,000 ml
- custom designs available to your specifications

Sizing and Ordering Information: Glass Construction

Size	Conn.	Model # For TFE End Flgs	Model # For 316 S/S End Flgs	Model # For PVDF End Flgs	Model # For CPVC End Flgs
100 ml	1/2" NPT	ACS#2-100-GTV	ACS#2-100-GSV	ACS#2-100-GKV	ACS#2-100-GCV
250 ml	1/2" NPT	ACS#2-250-GTV	ACS#2-250-GSV	ACS#2-250-GKV	ACS#2-250-GCV
500 ml	1/2" NPT	ACS#2-500-GTV	ACS#2-500-GSV	ACS#2-500-GKV	ACS#2-500-GCV
1000 ml	1/2" NPT	ACS#2-1000-GTV	ACS#2-1000-GSV	ACS#2-1000-GKV	ACS#2-1000-GCV
2000 ml	1 " NPT	ACS#2-2000-GTV	ACS#2-2000-GSV	ACS#2-2000-GKV	ACS#2-2000-GCV
4000 ml	1" NPT	ACS#2-4000-GTV	ACS#2-4000-GSV	ACS#2-4000-GKV	ACS#2-4000-GCV
6000 ml	1" NPT	ACS#2-6000-GTV	ACS#2-6000-GSV	ACS#2-6000-GKV	ACS#2-6000-GCV
8000 ml	2" NPT	ACS#2-8000-GTV	ACS#2-8000-GSV	ACS#2-8000-GKV	ACS#2-8000-GCV
10000 ml	2" NPT	ACS#2-10000-GTV	ACS#2-10000-GSV	ACS#2-10000-GKV	ACS#2-10000-GCV
20000 ml	2" NPT	ACS#2-20000-GTV	ACS#2-20000-GSV	ACS#2-20000-GKV	ACS#2-20000-GCV

Cylinders are bolted together using stainless steel rods with Viton "O" rings for the glass seal and Buna N "O" rings for the acrylic seal. For EPDM "O" rings, subsititute "E" for "V".

Options available: (may affect price and delivery)

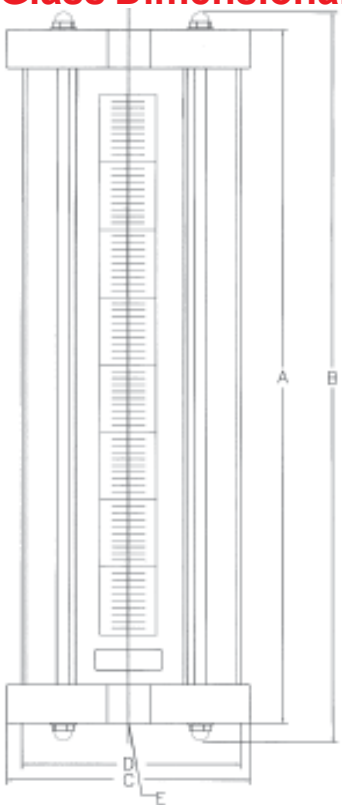
- **different type or size of thread connection, different "O" ring material, different flange material**

Descriptions:

TFE, PVDF and CPVC End Flanges:
Glass cylinder with acrylic outer shield and 3/4" thick (TFE, PVDF or CPVC) end flanges

316 S/S End Flanges:
Glass cylinder with acrylic outer shield and 1/2" thick 316 Stainless Steel end flanges

Glass Dimensional Information



Note: Cylinders are <u>not</u> pressure vessels.

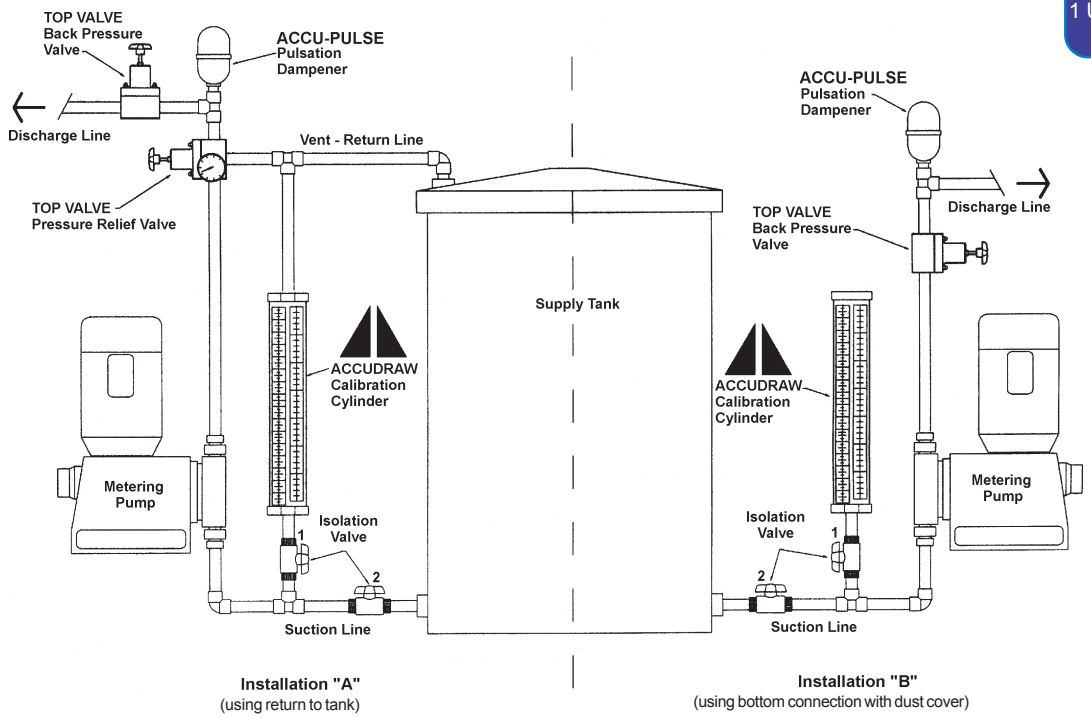
Installations

Conversion Factors
1 ml = 1 cc
1000 ml = 1 liter
ml/sec X 60 = ml/min
1 US gal/min X 0.063 = liters/sec
1 US gal = 3.786 liters



Other available products at www.primaryfluid.com

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 15 - 350 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, Teflon, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes 1/4" - 2" NPT*
- *color coded handles indicate size*
- *higher pressure & temperature available*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

ACCUPULSE Pulsation Dampeners

Designed to remove pulsatingflows from positive displacement pumps.

- *increase system efficiency and pump life; decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes with lightweight, compact design*

ALL THINGS FLOW

4/23/2018	**Item 10 (cationic Polymer)**
qty.: 3	**Progressive cavity pump**
	BN 05-12

Application data

Conveyed product	Polymer
Flowability	flowable
Viscosity	low viscosity (<500 cP/mPas)
Solids content	not specified
Size of solids	not specified
Specific gravity	unknown, 1 kg/dm³ assumed
Product temperature	32°F - 113°F
pH value	5-9
Kind of operation	continuous
Operating hours	8h/day
Location	indoor, dry atmosphere
Altitude of installation	up to 1000 m assumed
Surrounding temperature	normal (32-113°F)

Performance data

	Capacity	**Pressure**	**Speed**	
	0.26 USGPM	80 psi	41 rpm	min
	3 USGPM	80 psi	390 rpm	max
Starting torque	30 lb.ft			
Req. power at pump shaft	0.75 HP			
Inlet pressure	flooded suction (up to 0,5bar)			
NPSHr	7 ft			

Tolerances according to SEEPEX standards.

Materials and executions

Installation	vertical, drive on top
Direction of rotation	counter clockwise (left)
Lantern - Design	with cover plates
Lantern - Material	EN-JL 1040 (gci-25)
Suction casing - Design	standard
Suction casing - Material	1.4408 / ASTM A351 grade CF8M
Pressure branch - Design	standard
Pressure branch - Material	1.4408 / ASTM A351 grade CF8M
Position of branch	position 1
Suction connection	1 1/2" NPT
Pressure connection	1 1/4" NPT
Joint - Design	pin joint with joint sleeve, grease filled
Joint - Material	standard
Joint - Universal joint sleeve: material	NBR - Perbunan
Coupling rod - Design	standard
Coupling rod - Material	1.6582 encapsulated
Rotor - Design	standard
Rotor - Material	1.4404 / AISI 316L
Rotor - Coating	ductile chromium coating
Stator - Design	standard with TSE, sensor sleeve 1.4404
Stator - Material	NBR - Perbunan
Shaft sealing	mechanical seal
Code	back-to-back GLRD - LA
Shaft diameter	30 mm
Make	Burgmann
Rotating/stationary seal face	SiC SiC
Elastomers	FPM - Viton

Spring	1.4571 / AISI 316Ti
Metal parts	1.4571 / AISI 316Ti
Type	MG1-G60 Q1Q1 VGG
Casing - material	1.4404 / AISI 316L
Casing - connection standard	NPT
Plug-in Shaft - Design	standard
Plug-in Shaft - Material	1.4404 / AISI 316L
Bolting - Design	completely stainless steel
Painting - Number of colors	single-colored standard
Painting - Painted components	1 complete combination
Painting - Color	Standard Enamel (SEEPEX Blue)

Drive

Type	Gear & Motor at freq. inv.
Make	Nord
Model	SK12VLF/140TC
Mounting position	V1
Ratio (i)	4.49

	Norm	**Min**	**Max**
Speed	401 rpm	41 rpm	390 rpm
Motor speed	1800 rpm	182 rpm	1751 rpm
Frequency	60 Hz	6 Hz	58 Hz

Make	Marathon Motors
Model	145THTN6060
Rated output	2 HP
Rated speed	1800 rpm
Starting	direct on frequency inverter
Explosion proof	Weatherproof
Efficiency class	IE1
Terminal box position acc. to supplier	not specified
Cable entry position acc. to supplier	not specified

Voltage	rated voltage 575V
Frequency	60Hz
Enclosure	TENV
Thermal class	F
Winding protection	Thermostats

The frequency inverter has to follow a linear U/f characteristic curve (constant torque).
It's essential to have a minimum overload capability of 150% for at least 3 seconds. (see technical data sheet)

Baseplate

Design	baseplate for block pump, design with side feet
Material	steel, painted
GPU Type Code	B-ST-LS

Dry running protection device (TSE)

Design	standard design, complete - sensor sleeve fitted to the stator of the pump with integrated temperature sensor - connection head (IP55) - separate TSE control device suitable for mounting inside a control panel
Voltage	110-115V/50-60Hz
Temperature coefficient	NTC

Material sensor sleeve	1.4404
Material connection head	aluminium

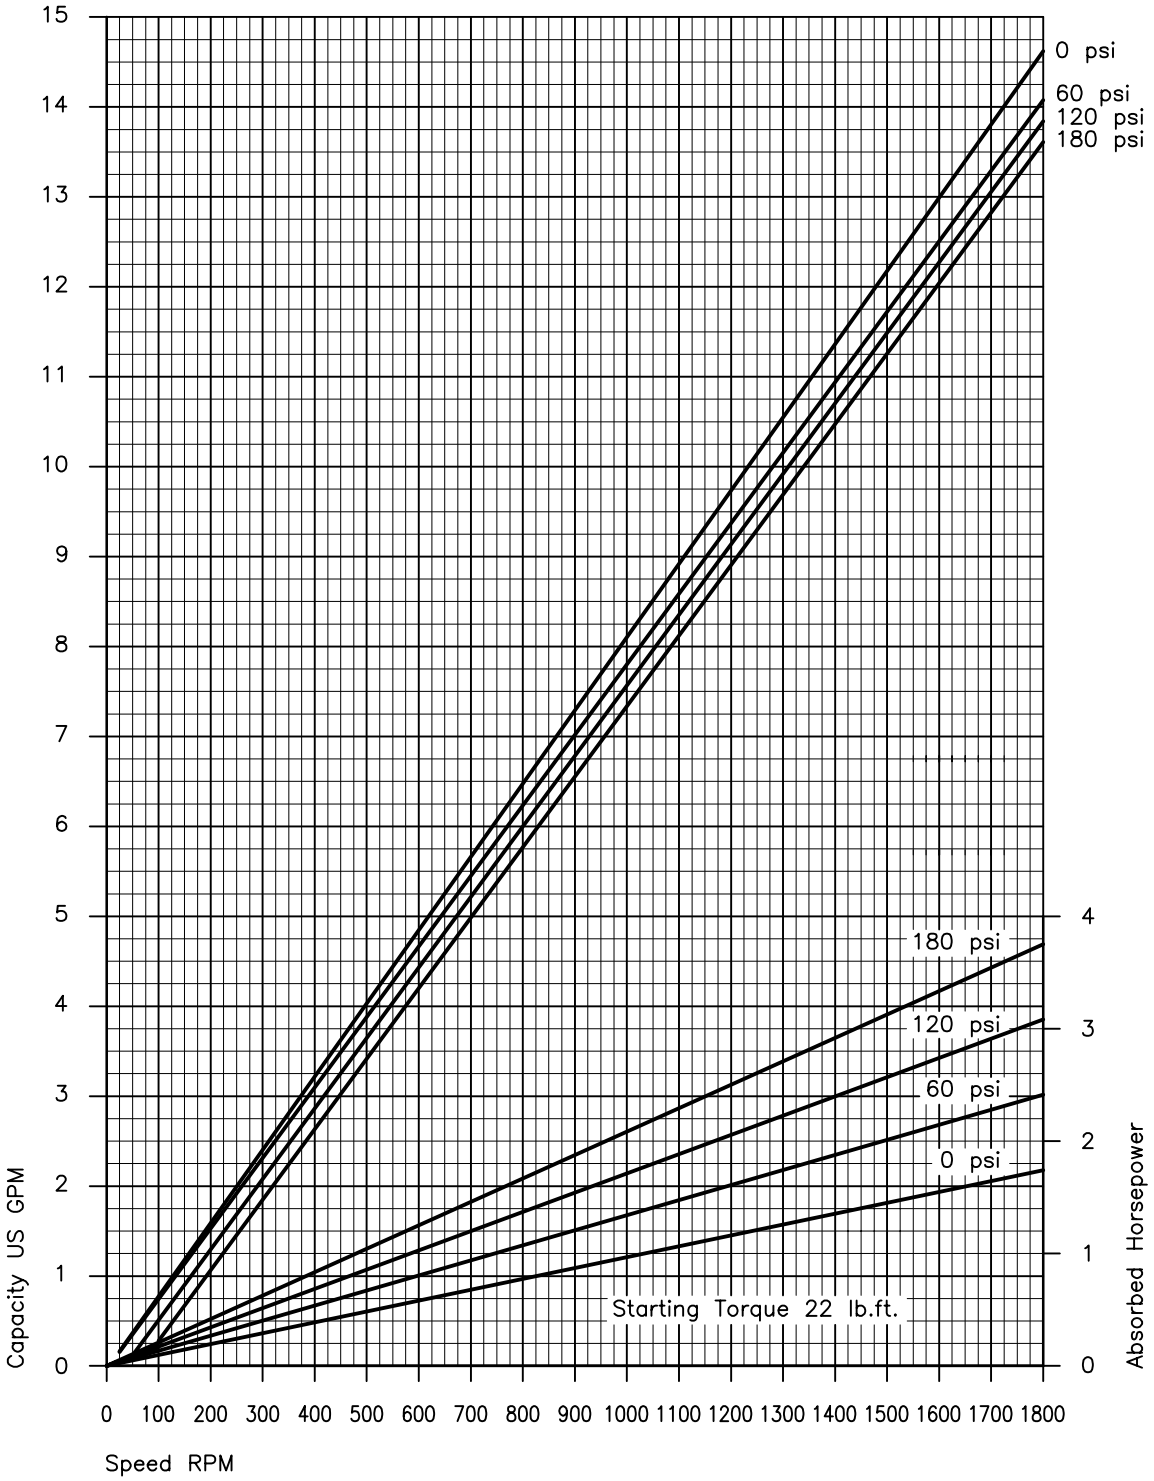
Packing

Type of packing	cardboard box (US)
Type of transport	truck / railway
Quantity of pumps per package	1 pump per package

Optional: Seal flush system

Design	SEEPEX standard double mechanical seal flush system: - Isolation valve - Strainer, 20 mesh - Needle valve - Pressure regulator, 10-125psi adjust - Solenoid valve, 120VAC, NC - ¼" NPT seal water connection plumbed to inlet of gland housing. - ¼" NPT drain connection plumbed to outlet of gland housing. Solenoid and needle valve located on the discharge.
Type	SEEPEX standard double acting mechanical seal flush system
Connection	1/8" NPT connection
Pressure Range	10 - 125 psi
Solenoid valve voltage	120V AC

Characteristic Curves
Size
05–12



Values based upon water 68°F ; For notes on drive selection refer to PER

Type 21 Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline Type 21 True Union Ball valve incorporates state of the art features for long term performance. This is a full port, full blocking True Union valve pressure rated at 16 bar (230 psi)[4]. Double stem o-rings and Safety Shear stem design provide for a high degree of safety on hazardous fluid applications. All sizes have an ISO standard actuator mounting platform integral to the valve body. This provides for sturdy and secure mounting of pneumatic or electric actuators.

PVC | CPVC | PP | PVDF

CRN Registered Consult Chemline

NSF[5] Certified to NSF/ANSI 61

SERIES: Type 21

SIZES: 3/8" – 4"

ENDS: Socket, Threaded, Flanged, Butt[1] or ChemFlare™

SEATS: PTFE

SEALS[2]: EPDM, FKM (Viton®), CPE[3]

features

Pressure rated to 230 psi[4]
- Provides a high factor of safety

Integral Actuator Mounting Platform
- Actuation is easy. Electric or pneumatic actuators may be mounted in the field.

Full Port
- High capacity and low pressure drops

Fully Blocking
- Downstream union nut may be safely disassembled for piping maintenance while valve is closed off under full system pressure

Built-In Spanner Wrench
- Top of the handle is designed to be used as a tool for accessing internal parts

Safety Shear Stem Design
- Stem has double o-rings
- Designed to hold full pressure even if stem breaks due to excessive torque

High Chemical Resistant Material
- PVC and CPVC compounds have an "A" chemical resistance rating as per ASTM D-1784. They have outperformed other PVC and CPVC compounds on aggressive chemicals.

[1] Butt ends for fusion to Chemline metric PP, PVDF or ECTFE (Halar®) piping.
[2] Other materials are available.
[3] CPE=Chlorinated Polyethylene.
[4] PVC, CPVC and PVDF 1/2" to 2" are rated at 230 psi; 2-1/2" to 4" and all size PP valves are rated at 150 psi at 20°C.
[5] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

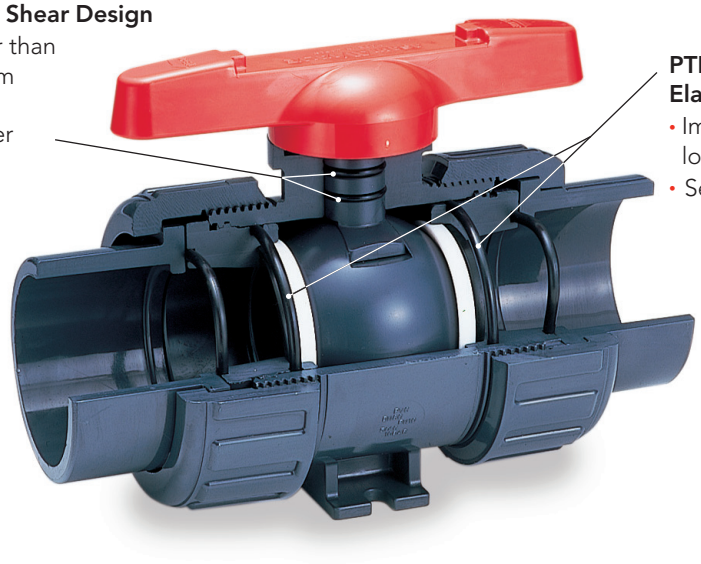
Chemline is a registered trade mark of Chemline Plastics Limited

Type 21 Ball Valves

features

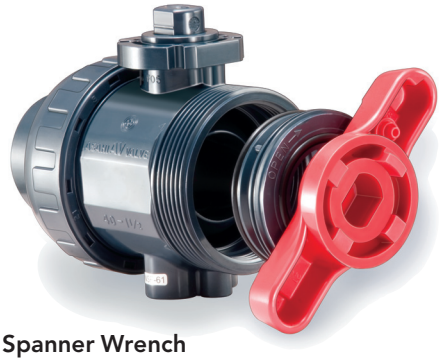
Double Stem O-Rings – Safety Shear Design

- Upper o-ring groove is deeper than lower. In case of excessive stem torque, stem will shear at the upper groove, leaving the inner o-ring intact to seal against full line pressure.



PTFE Seats have Elastomer Cushions

- Improved sealing while lowering stem torques
- Self adjusts for seat wear



Built in Spanner Wrench

- For removing or tightening the seat carrier
- All parts are replaceable

Integral Actuator Mounting Platform

- Actuation is easy. Electric or pneumatic actuators may be mounted in the field. Simply pull off the handle to reveal a standard ISO 5211 mounting platform which accepts bolt-on hardware.

Fully Blocking

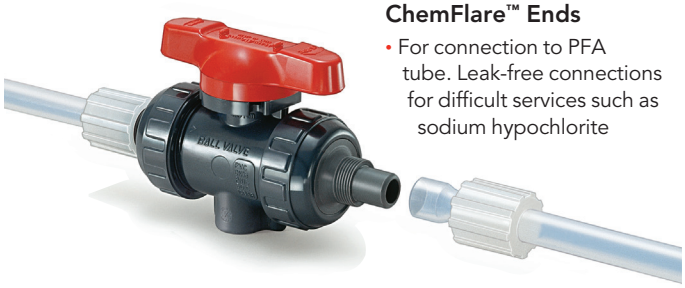
- Downstream pipe may be removed while upstream side is still pressurized. This may be done with valve installed in either direction.

Base Mounting Pad

- Optional threaded inserts allow valves to be securely anchored
- Supplied standard with actuated valves

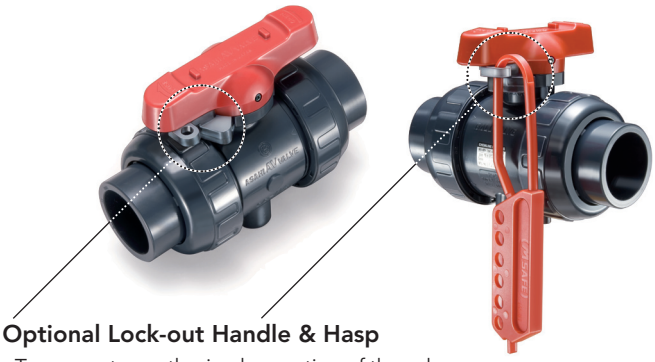
Type 21 Ball Valves

options + accessories



ChemFlare™ Ends

- For connection to PFA tube. Leak-free connections for difficult services such as sodium hypochlorite



Optional Lock-out Handle & Hasp

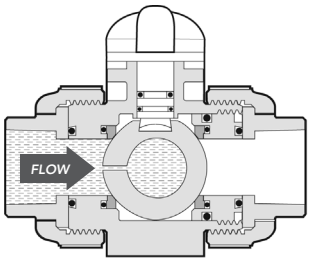
- To prevent unauthorized operation of the valve
- Used during maintenance shut-downs

One-piece moulded PVC and CPVC 6" socket ends

- Allows installation of 4" valve in 6" line
- Factory moulded, not fabricated with couplings and reducers cemented together
- Fixed to valve mechanically just like the one-piece moulded factory flanges

Different Colour Handles

- Choose a handle colour other than standard red for colour coding different services



Vented Ball

- For sodium hypochlorite services at any concentration
- Valve shown in closed position

electric + pneumatic actuation

Pneumatic and Electric Actuators

- A complete range of actuators and control accessories are available, mounted to valves using PPG plastic brackets and stainless steel couplings. Refer to separate data sheets.

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2" to 2" in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2", 3" and 4" rated at 150 psi maximum working pressure with EPDM, FKM (Viton®) or CPE seals. Ball seats shall be PTFE with elastomer cushions for closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks off under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking design.
4. All valves will be CRN (Canadian Registration Number) registered with TSSA.
5. PVC valves with EPDM or FKM (Viton®) seals shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
6. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
7. PVC compound shall have an ASTM cell classification 12454-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784 (CSA report LO 4000-172).
8. CPVC compound shall have an ASTM cell classification 23567-A with a minimum suffix "A" designation for chemical resistance as per ASTM D-1784.
9. PP material will conform to ASTM D-4101 PP 021 B 67272 material requirements.
10. PVDF material shall be unpigmented conforming to ASTM D-3222 material requirements and to be USDA Title 21 Chapter 1 Part 177. 2510 requirements for contact with food.
11. Socket ends in PVC and CPVC shall be Schedule 80 and conform to ASTM D-2467.
12. Threaded ends shall be Schedule 80 and conform to ASTM D-2464.
13. Butt fusion ends in PP or PVDF will be compatible with Chemline PP or PVDF metric piping systems.
14. Flanged ends shall be ANSI Class 150 one-piece factory moulded (not fabricated) to ensure maximum strength and close tolerance end to end dimensions.

Example: Chemline Type 21 True Union Ball Valve, PVC, 2", with EPDM seals, socket ends.

[1] 1/4" is normally the 3/8" valve reduced. 6" is 4" valve with 6" end connections.

[2] PP, PVDF and ECTFE (Halar®) metric butt fusion ends (1/2" to 4") connect to Chemline PP, PVDF and ECTFE (Halar®) piping systems.

OTHER OPTIONS & ACCESSORIES

- **Alternate O-Ring Seals**
- **Stem Extensions** made to any length
- **Limit Switches** – For open and/or closed position indication
- **Municipal Operating Nut**
- **Lubrication-free Valves** – Factory clean room assembled
- **Vented Ball** – For sodium hypochlorite applications

Ball Check & Foot Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The economical and versatile Chemline Ball Check Valve is the most popular type of non-return valves for pipe sizes under 6". A wide selection of body and seat materials, and end connections are available for many different applications. It has good flow capacity and will handle many slurry and suspended solid services. This valve works in both horizontal and vertical lines. The Foot Valve is for end of line services such as sumps.

FV: Single Union Check

SIZES: 1/2" – 4"

ENDS: Threaded, Socket, Flanged, Butt[1] or ChemFlare™[2]

SEAT/SEALS: EPDM, FKM (Viton®), PTFE coated FKM (Viton®)

features

- **True Union to 2"**
- **Full Port to 4"**
- **NSF Certified[3]**
- **Built-in Union Design** – For easy installation and maintenance
- **Free Floating Ball** – The only moving part
- **Uniseat/Seal** – Easily removable
- **May be used either horizontally or vertically**
- **Excellent flow characteristics**
- **Low seating and opening pressures**

True Union Check
1/2" to 2" in all materials

Single Union Check
1/2" to 4" in PVC
2-1/2" to 4" in CPVC, PP and PVDF

Foot Valve is light weight and has a low profile basket

[1] PP and PVDF Butt fusion ends (available 1/2" to 2") connect to Chemline PP and PVDF piping systems.
[2] For ChemFlare™ end connectors, consult Chemline.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

SAMPLE SPECIFICATION

All Ball Check valves in PVC, CPVC, PP or PVDF shall be Chemline BT or BC Series or equal with EPDM [FKM (Viton®) or PTFE coated FKM (Viton®)] seats and union ends. Sizes 1/2″ to 2″ shall be slip-out True Union style, sizes 2-1/2″ to 4″ shall be single union. The elastomer uniseat/seal shall function as both the ball seat and the union seal. Ball Check valves shall be rated 150 psi up to 2″ and 100 psi for sizes 2-1/2″ to 4″.

ORDERING EXAMPLE

Chemline Ball Check/Foot Valves	BT	A	020	E	S
Valve Type	**BT** – True Union Ball Check **BC** – Single Union Ball Check **FV** – Single Union Foot Valve **FT** – True Union Foot Valve				
Body Material	**A** – PVC **C** – CPVC **B** – PP **K** – PVDF				
Size	**005** – 1/2″ **007** – 3/4″ **010** – 1″ **012** – 1-1/4″ **015** – 1-1/2″ **020** – 2″ **025** – 2-1/2″ **030** – 3″ **040** – 4″				
Seals	**E** – EPDM **V** – FKM (Viton®) **T** – PTFE coated FKM (Viton®)				
Ends	**S** – Socket **T** – Threaded **F** – Flanged **B** – Butt[1] **CF** – ChemFlare™				

Example: Ball Check Valve, PVC, 2″, with EPDM seat, socket ends.

[1] PP and PVDF metric butt fusion ends (1/2″ to 2″) connect to Chemline PP and PVDF piping systems.

OPTIONS & ACCESSORIES

- **PTFE coated Uniseat/Seal**
- **Spring Loaded Ball** – Assists ball to seat faster

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends

- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life

- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems

- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province

- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical

Set Pressure Ranges

- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 4 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity

- 120cP is maximum recommended service viscosity

[1] For ChemFlare™ end connectors, consult Chemline.
[2] PP and PVDF spigot ends have DIN dimensions and will butt fuse directly to Chemline PP and PVDF piping systems.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

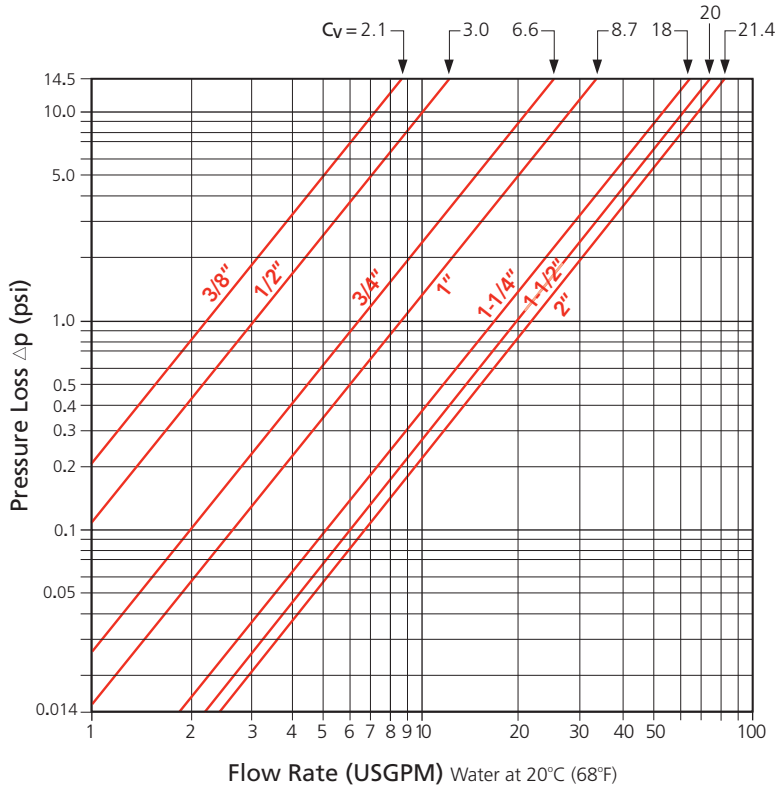
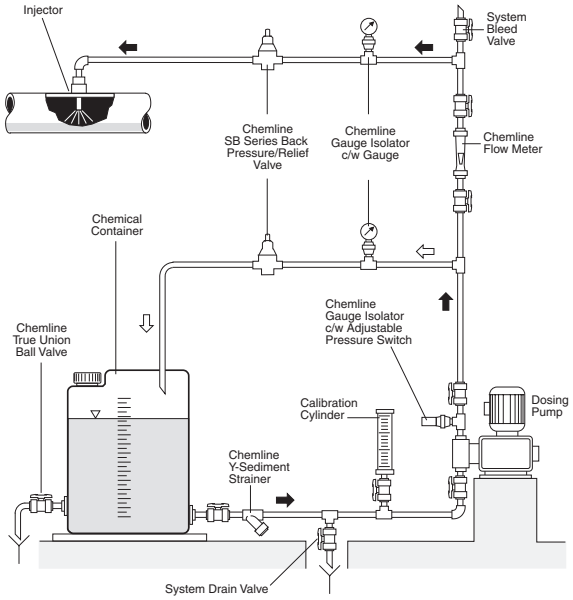
SB12 Series Back Pressure/Relief Valves 1/2” to 2”

pressure loss nomogram for SB12 valves 3/8” to 2”

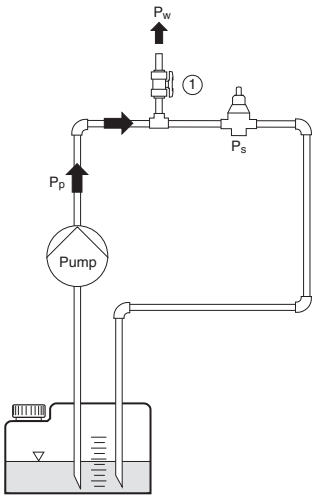


typical dosing system schematic



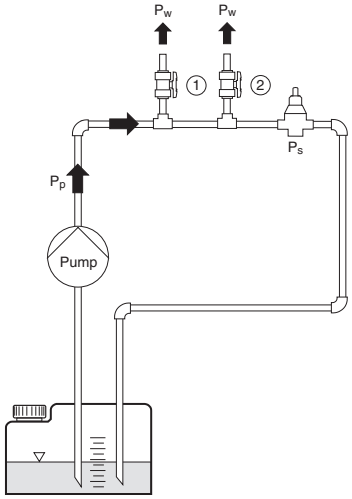
application of pressure relief valves

Constant System Pressure



$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

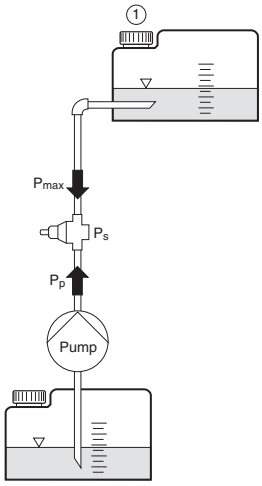
Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve

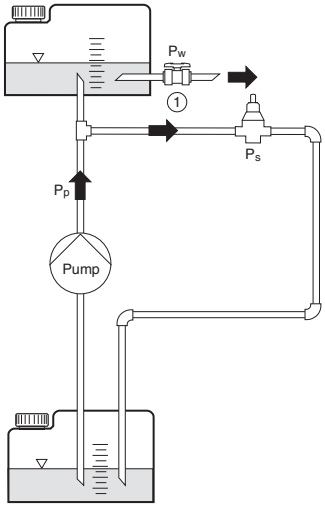
Container 1 is located above the pump



$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

Elastomers	**E** – EPDM	**V** – FPM (Viton®)				
Ends	**S** – Socket **CFx** – ChemFlare™	**T** – Threaded	**F** – Flanged **Blank** – Spigot (Butt)	**U** – Union Socket		

Example: Chemline SB 12 Series, PVC, 1/2" diameter, FPM (Viton®) seals, Union socket ends.
x = 4 for 1/4", **6** for 3/8", **8** for 1/2", **12** for 1" ID tube connections.

OPTIONS

- 4 to 60 psi Pressure Range springs for 2-1/2" to 4" valves
- **Integral Pressure Gauge** – for inlet and/or outlet
- Bodies in 316 Stainless Steel and PTFE

Optional Pressure Gauge

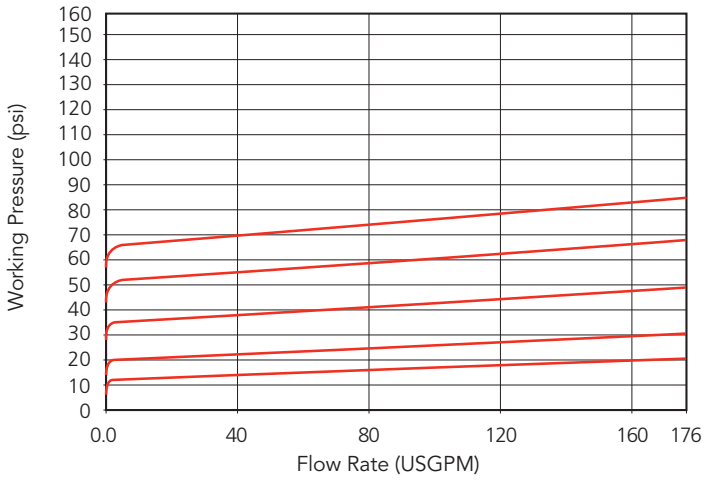
- For inlet and/or outlet

SB12 Series Back Pressure/Relief Valves 2-1/2" to 4"

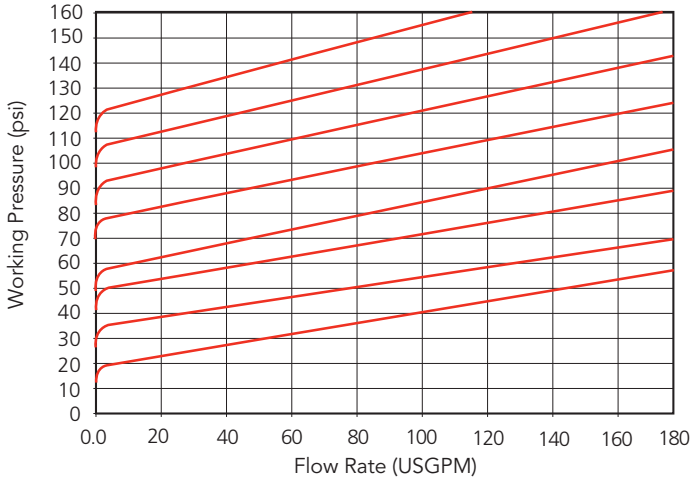
working pressure vs. flow rate

• Whether the pressure is rising or falling, hysteresis is approximately 14.5 psi for 2-1/2" to 4" valves

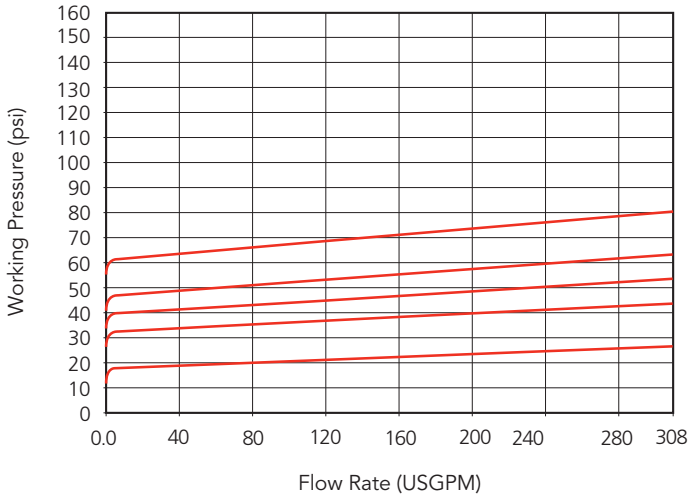
2-1/2" Valves / 4 to 60 psi set pressure range



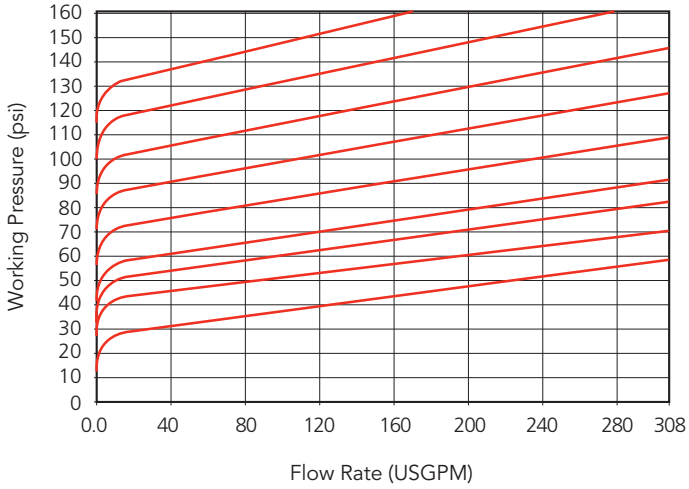
2-1/2" Valves / 7.5 to 150 psi set pressure range



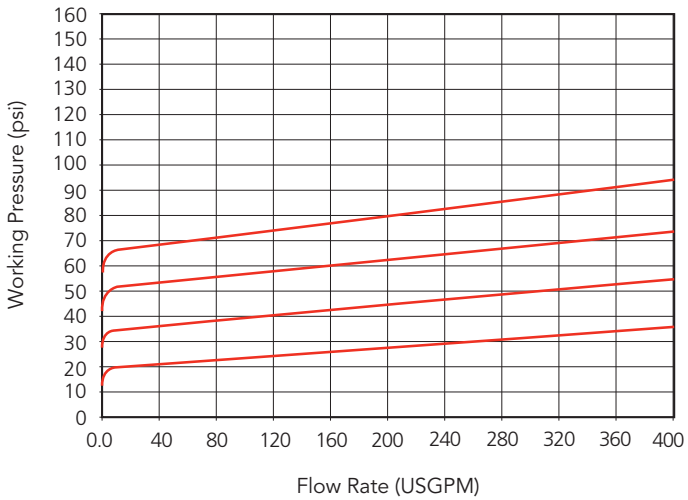
3" Valves / 4 to 60 psi set pressure range



3" Valves / 7.5 to 150 psi set pressure range



4" Valves / 4 to 60 psi set pressure range



4" Valves / 7.5 to 90 psi set pressure range

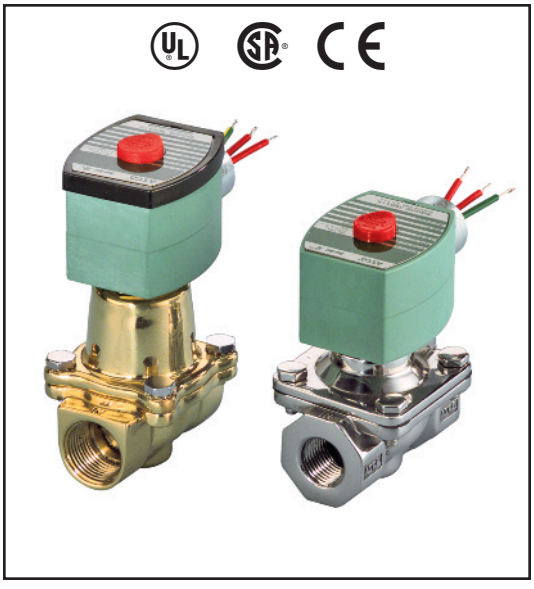
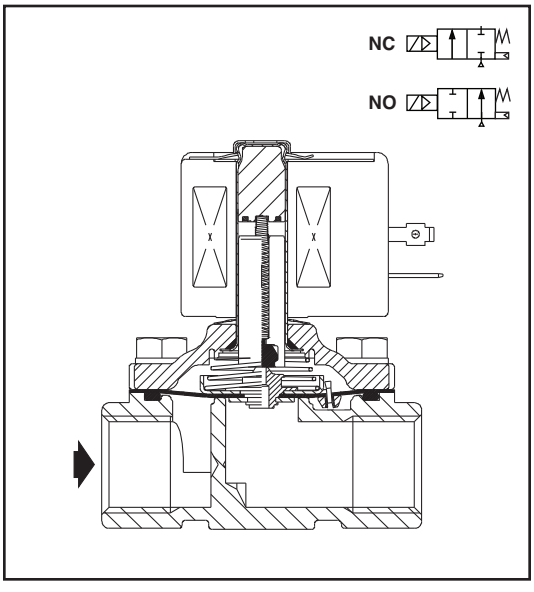
This page is intentionally left blank

Features

- Wide range of pressure ratings, sizes, and resilient materials provide long service life and low internal leakage
- High flow valves for liquid, corrosive, and air/inert gas service
- Industrial applications include:
  - Car wash
  - Laundry equipment
  - Air compressors
  - Industrial water control
  - Pumps





Construction

Valve Parts in Contact with Fluids		
Body	Brass	304 Stainless Steel*
Seals and Discs	NBR or PTFE	
Disc-Holder	PA	
Core Tube	305 Stainless Steel	
Core and Plugnut	430F Stainless Steel	
Springs	302 Stainless Steel	
Shading Coil	Copper	Silver

*Catalog Numbers 8210G127, 8210G129, 8210G132, 8210G133 have 316L Stainless Steel bodies.

Standard Voltages: 24, 120, 240, 480 volts AC, 60 Hz (or 110, 220 volts AC, 50 Hz). 6, 12, 24, 120, 240 volts DC. Must be specified when ordering.
Other voltages available when required.

Solenoid Enclosures

Standard: RedHat II - Watertight, Types 1, 2, 3, 3S, 4, and 4X; RedHat - Type I.

Optional: RedHat II - Explosionproof and Watertight, Types 3, 3S, 4, 4X, 6, 6P, 7, and 9; Red-Hat - Explosionproof and Watertight, Types 3, 4, 4X, 7, and 9.

(To order, add prefix "EF" to catalog number, except Catalog Numbers 8210B057, 8210B058, and 8210B059, which are not available with Explosionproof enclosures.)
See Optional Features Section for other available options.

Nominal Ambient Temp. Ranges

RedHat II/RedHat AC: 32°F to 125°F (0°C to 52°C)
RedHat II DC: 32°F to 104°F (0°C to 40°C)
RedHat DC: 32°F to 77°F (0°C to 25°C)
(104°F/40°C occasionally)
8210G227 AC: 32°F to 130°F (0°C to 54°C)
DC: 32°F to 90°F (0°C to 32°C)
Refer to Engineering Section for details.

Approvals

UL listed as indicated. CSA certified.
RedHat II meets applicable CE directives.
Refer to Engineering Section for details.

ATEX/IECEx certified with prefix "EV" as listed. *Refer to Optional Features Electrical Section for details.*

① 5 psi on Air; 1 psi on Water.
② Valve provided with PTFE main disc.
③ Valve includes Ultem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve.
Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless steel disc-holder.
† UL listed for fire protection systems per UL429A.
‡ DC constructions must have solenoid mounted vertical and upright.
✓ ATEX/IECEx certified with prefix "EV".
▼ ATEX/IECEx certified for DC only with prefix "EV".
◆ Not available in 6 Volt DC. EF and HB prefix only.

① 0.3 bar on Air; 0.0 bar on Water.
② Valve provided with PTFE main disc.
③ Valve includes ULtem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve.
Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless steel disc-holder.
† UL listed for fire protection systems per UL429A.
‡ DC constructions must have solenoid mounted vertical and upright.
✓ ATEX/IECEx certified with prefix "EV".
▼ ATEX/IECEx certified for DC only with prefix "EV".
◆ Not available in 6 Volt DC. EF and HB prefix only.

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF[3] Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4"

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends

- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life

- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems

- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province

- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical

Set Pressure Ranges

- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 4 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity

- 120cP is maximum recommended service viscosity

[1] For ChemFlare™ end connectors, consult Chemline.
[2] PP and PVDF spigot ends have DIN dimensions and will butt fuse directly to Chemline PP and PVDF piping systems.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

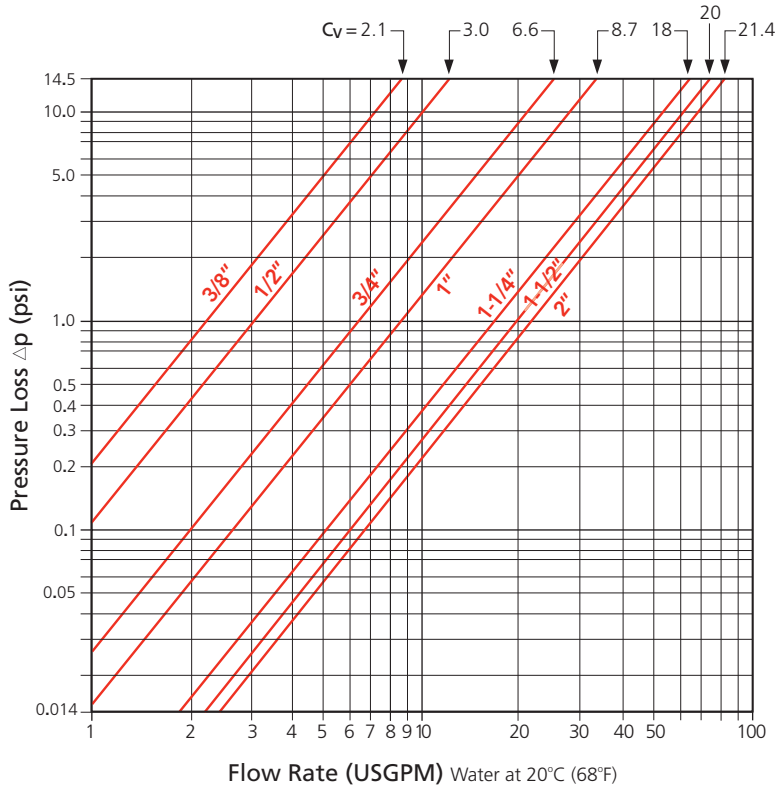
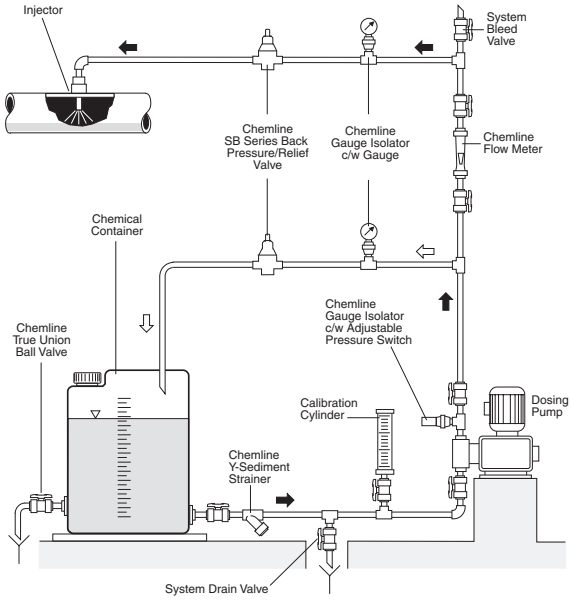
Temperature Ranges: PVC 0 to 50°C (32 to 122°F), **PP** 10 to 70°C (50 to 158°F), **PVDF** –30 to 100°C (–22 to 212°F).

SB12 Series Back Pressure/Relief Valves 1/2” to 2”

pressure loss nomogram for SB12 valves 3/8” to 2”

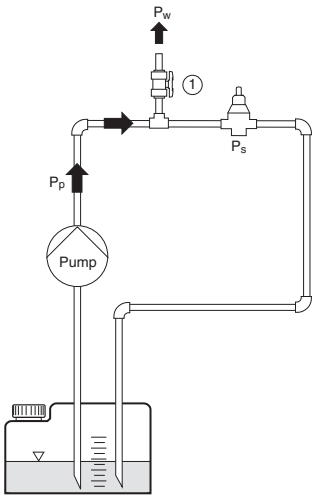


typical dosing system schematic



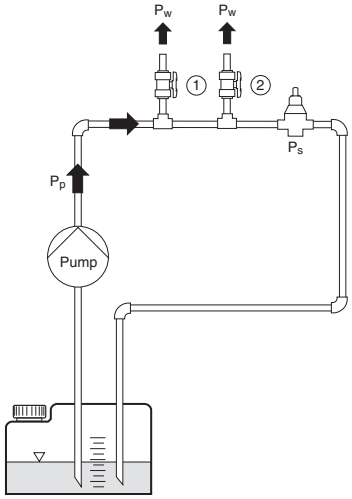
application of pressure relief valves

Constant System Pressure



$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

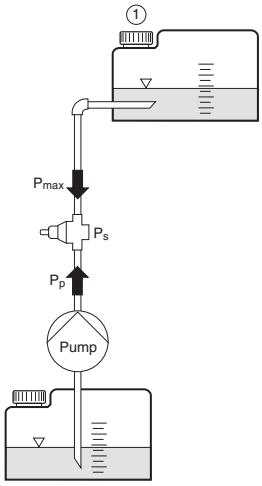
Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve

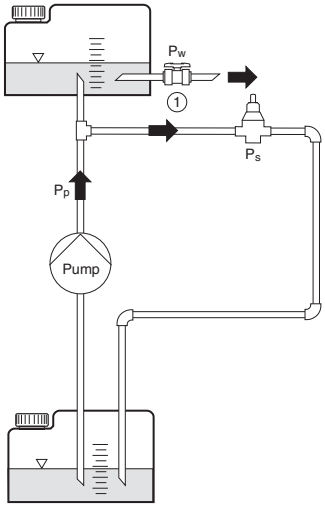
Container 1 is located above the pump



$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

Gauge Isolators

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: SG

INLET CONNECTION: 1/4" or 1/2" Threaded[1]

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

DIAPHRAGM: PTFE

Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine[2]. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

features

Easy to Mount Gauges

- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port

- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance

- Choice of body materials for a wide range of applications
- PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety

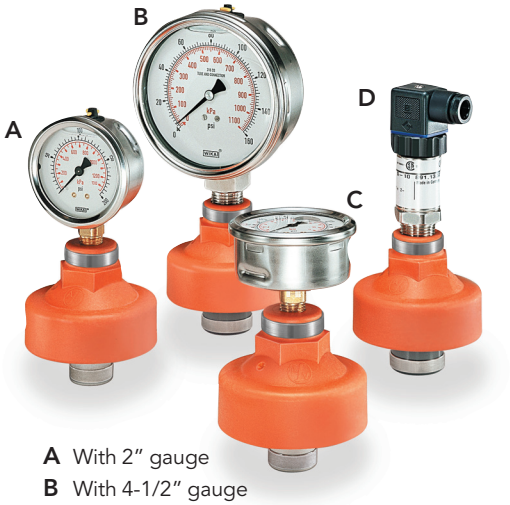
- PPG[3] top chamber
- Heavy wall connection ports

CRN Registration number by province

- Ontario: OH16085.5

Optional Gauges

- Isolators are available alone or with gauge mounted and prefilled with glycol[2]



A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

[1] Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
[2] Other fluids are available for special applications such as chlorine service.
[3] Glass reinforced polypropylene.
[4] PVC isolators are certified under NSF/ANSI Standard 61 for contact with drinking water.

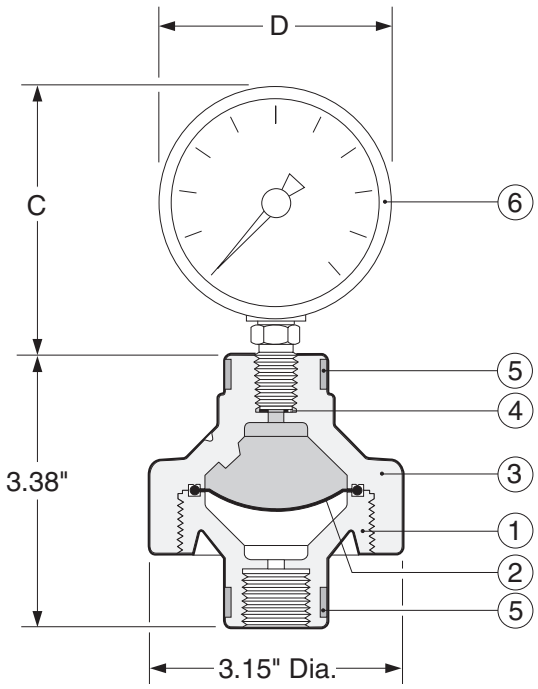
Gauge Isolators



PARTS

No.	Part	Pcs.	Materials
1	Body	1	PVC, PP, PVDF
2	Diaphragm	1	PTFE
3	Bonnet	1	PPG[1]
4	Gasket	1	EPDM
5	Stainless Steel Bands	2	304 SS
6	Optional Gauge	1	See below

[1]PPG = Glass reinforced polypropylene

OPTIONAL GAUGES

- Chemline offers the gauges listed below mounted to isolator and prefilled with glycol, glycerine or special fluid for chlorine applications. These gauges have dials and cases filled with either glycol (standard), glycerine or silicon for corrosion resistance and dampening.
- Chemline SG gauge isolators are not recommended for vacuum applications. They will not affect the gauge accuracy as low as approximately 3 psi. The accuracy depends on the process conditions and the gauge installed on it.

OTHER OPTIONS

- **Flanged** inlet connections
- **Threaded Fill Port** – drilled, tapped and plugged
- Chemline will mount any pressure instrument supplied free issue by customer

DIMENSIONS (Gauge Isolator with optional gauge installed) INCHES

Optional Gauge Ordering No.	Gauge Diameter	Gauge Connection	Housing	Bourdon Tube	Window	Accuracy	Dimensions C	Dimensions D(max.)

Globe Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

The Chemline Globe Valve is an economical throttling valve. Its heavy duty design provides for long service life. The in-line globe design causes relatively high pressure drops, however this is a desirable valve due to its economy and reliability.

PVC PP

CRN Registered Consult Chemline

SERIES: GV

SIZES: 1/2" – 4"

ENDS: Socket, Threaded[1], Flanged

SEALS: EPDM[2]

features

- **Slow Closing**
  – Prevents water hammer in PVC piping
- **Heavy Duty Construction**
  – Long service life
- **An economical throttling valve**

ACCUDRAW® Calibration Cylinders

Polypropylene

PVC

Glass

- PVC with removable "O" ring sealed top for easy cleaning

- yellow polypropylene level indicator float for high visibility

ACCUDRAW® ***has been developed for the accurate calibration of metering pumps. Standard features include:***

- translucent
- chemical resistant
- break resistant
- threaded, socket or flanged
- colored graduations and lettering
- PVC has dual scale USGPH & ml
- PVC sizes 100 - 20000 ml
- POLY sizes 100 - 4000 ml
- POLY meets ISO standards
- Glass sizes 100 - 20000 ml
- custom designs available

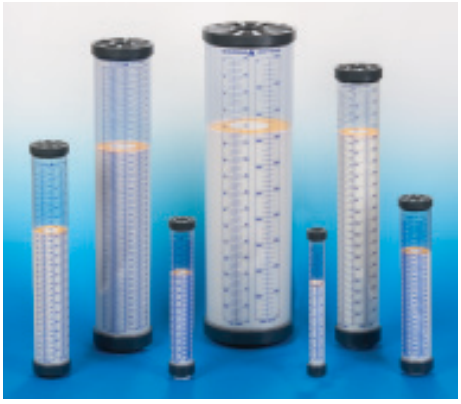
"For Accuracy That Counts"

For complete product information visit our website: primaryfluid.com

Flanged: Glass, PVC

Flanged: PVC



PV#4

Sizing and Ordering Information:

ACCUDRAW Standard Materials of Construction

AC = All polypropylene construction (see below for options)
PV = All polyvinylchloride construction (see below for options)
ACS = Glass*

Note: Cylinders are NOT pressure vessels

Example: AC#1-1000B
AC = PP (polypropylene)
#1 = Bottom threaded connection only
1000 = 1000 ml
B = BSP Thread

e.g. Part # AC #1 - 1000 B

Type:
AC = Polypropylene
PV = PVC
ACS = Glass

Style:
1 = Bottom threaded conn. only
2 = Top and Bottom threaded conn.
3 = Bottom threaded conn. c/w removable vented dust cap
4 = Top/Bottom threaded conn. c/w removable "O" ring sealed top and float ring level indicator
** **Glass calibration cylinders available in Style 2 only***

Graduation Scale:
PP - ml only
PVC - ml and GPH
Glass - ml only

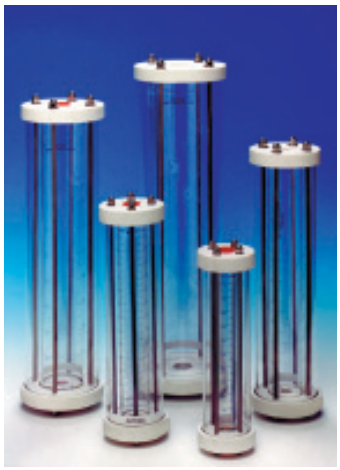
Std. connection is NPT thread
Optional: add suffix as follows
S = Socket weld connection (PVC only)
GTV = Glass/TFE construction
GKV = Glass/PVDF construction
GCV = Glass/CPVC construction
GSV = Glass/SS construction
B = BSP Thread
F = Flanged

Substitute **E** for **V** for **EPDM** wetted "O" ring seal

Sizes:		**Material**
100 =	100 ml (1.6 GPH)	PP, PVC, Glass
250 =	250 ml (4 GPH)	PP, PVC, Glass
500 =	500 ml (8 GPH)	PP, PVC, Glass
1000 =	1000 ml (16 GPH)	PP, PVC, Glass
2000 =	2000 ml (32 GPH)	PP, PVC, Glass
4000 =	4000 ml (64 GPH)	PP, PVC, Glass
6000 =	6000 ml	Glass only
8000 =	8000 ml	Glass only
10000 =	10000 ml (160 GPH)	PVC, Glass
20000 =	20000 ml (320 GPH)	PVC, Glass

Custom sizes and materials available.

ACCUDRAW® Calibration Cylinders



ACCUDRAW® Glass Calibration Cylinders ***are ideal for the calibration of metering pumps, batch systems and for handling hazardous chemicals.***

- volumes calibrated in ml
- construction materials available include TFE, PVDF, CPVC and 316 stainless steel
- sealing "O" rings are Viton and Buna N
- outer shield of acrylic construction
- port connections in NPT, metric or flanged
- standard sizes 100 - 20,000 ml
- custom designs available to your specifications

Sizing and Ordering Information: Glass Construction

Size	Conn.	Model # For TFE End Flgs	Model # For 316 S/S End Flgs	Model # For PVDF End Flgs	Model # For CPVC End Flgs
100 ml	1/2" NPT	ACS#2-100-GTV	ACS#2-100-GSV	ACS#2-100-GKV	ACS#2-100-GCV
250 ml	1/2" NPT	ACS#2-250-GTV	ACS#2-250-GSV	ACS#2-250-GKV	ACS#2-250-GCV
500 ml	1/2" NPT	ACS#2-500-GTV	ACS#2-500-GSV	ACS#2-500-GKV	ACS#2-500-GCV
1000 ml	1/2" NPT	ACS#2-1000-GTV	ACS#2-1000-GSV	ACS#2-1000-GKV	ACS#2-1000-GCV
2000 ml	1 " NPT	ACS#2-2000-GTV	ACS#2-2000-GSV	ACS#2-2000-GKV	ACS#2-2000-GCV
4000 ml	1" NPT	ACS#2-4000-GTV	ACS#2-4000-GSV	ACS#2-4000-GKV	ACS#2-4000-GCV

8000 ml	2" NPT	ACS#2-8000-GTV	ACS#2-8000-GSV	ACS#2-8000-GKV	ACS#2-8000-GCV
10000 ml	2" NPT	ACS#2-10000-GTV	ACS#2-10000-GSV	ACS#2-10000-GKV	ACS#2-10000-GCV
20000 ml	2" NPT	ACS#2-20000-GTV	ACS#2-20000-GSV	ACS#2-20000-GKV	ACS#2-20000-GCV

Cylinders are bolted together using stainless steel rods with Viton "O" rings for the glass seal and Buna N "O" rings for the acrylic seal. For EPDM "O" rings, subsititute "E" for "V".

Options available: (may affect price and delivery)

- **different type or size of thread connection, different "O" ring material, different flange material**

Descriptions:

TFE, PVDF and CPVC End Flanges:
Glass cylinder with acrylic outer shield and 3/4" thick (TFE, PVDF or CPVC) end flanges

316 S/S End Flanges:
Glass cylinder with acrylic outer shield and 1/2" thick 316 Stainless Steel end flanges

Glass Dimensional Information

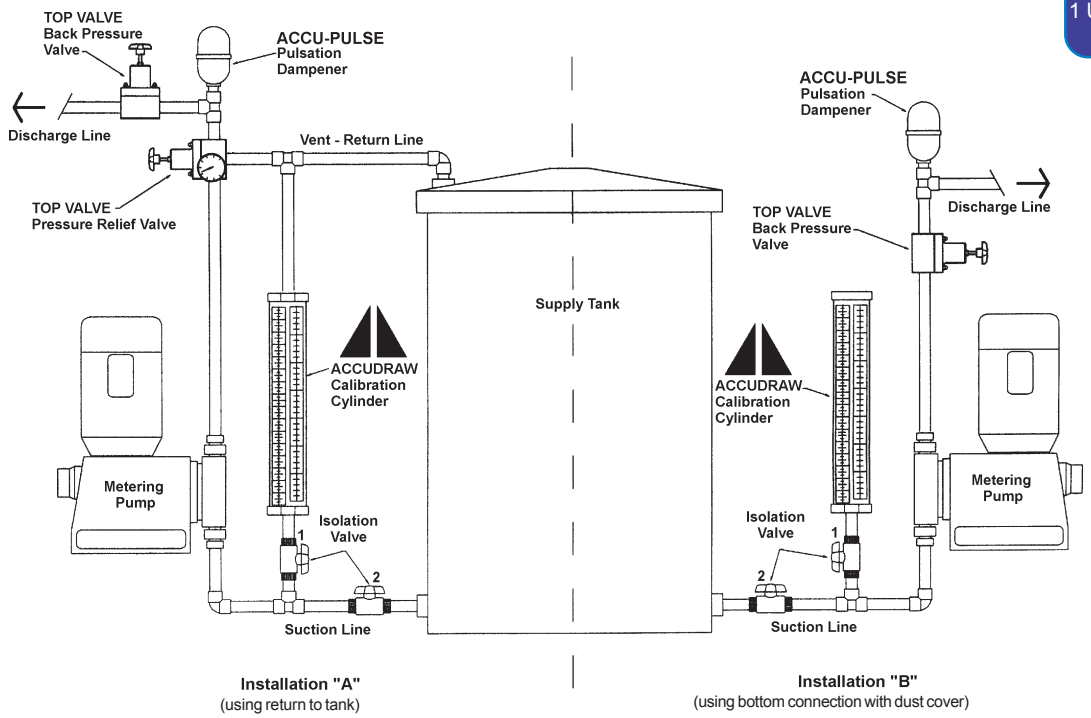
Conversion Factors
1 ml = 1 cc
1000 ml = 1 liter
ml/sec X 60 = ml/min
1 US gal/min X 0.063 = liters/sec
1 US gal = 3.786 liters



Other available products at www.primaryfluid.com

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 15 - 350 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, Teflon, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes 1/4" - 2" NPT*
- *color coded handles indicate size*
- *higher pressure & temperature available*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

ACCUPULSE Pulsation Dampeners

Designed to remove pulsatingflows from positive displacement pumps.

- *increase system efficiency and pump life; decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes with lightweight, compact design*

Variable Area Flow Meters

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline F Series Variable Area Flow Meters are ideal for plastic piping. They provide a combination of accurate visual flow rate measurement and clear flow indication from a distance. Optional limit switches allow the units to signal a low or high flow alarm. An optional flow transmitter provides a 4 to 20 mA signal output. These flow meters must be installed vertically with flow upward.

PVC | PA | PSU | PVDF — Tube

PVC | CPVC | PP | PVDF — Ends

CRN Registered Consult Chemline

SERIES: FC – Compact – 5" Single Scale
FS – Full Size – 7" Dual Scale[1]

MATERIALS: Tube: Clear PVC, Polyamide (PA), Polysulfone (PSU) or PVDF[2]
Float: PVDF
Ends: PVC, CPVC, PP, PVDF, Socket, Threaded, Flanged, Butt or ChemFlare™[3]

O-RINGS: EPDM, FPM (Viton®)

CAPACITIES: Up to 220 USGPM (50,000 litres per hour)

features

Clear Visual Indication

- Large orange float is visible from a distance
- Range indicators slide along dovetail track

Easy Installation and Maintenance

- Just unscrew union nuts and tube slides out of line

Choice of Four Tube Materials for Many Applications:

- ***Clear PVC*** – For Water or Chemicals up to 60°C (140°F) – High Chemical resistance at low cost
- ***Polyamide (PA)*** – For Water or Air up to 75°C (167°F) – High impact strength and optical clarity
- ***Polysulfone (PSU)*** – For Chemicals and Gases up to 100°C (212°F) – High impact strength and good chemical resistance
- ***PVDF[2]*** – For Chemicals and Ultrapure fluids up to 110°C (230°F) – High impact strength and excellent chemical resistance.

Ideal for All Types of Plastic Piping

- All types of end connections in PVC, CPVC, PP & PVDF

Low Pressure Drop

Good Measuring Accuracy – Class IV

- ± 3% of indicated value, plus ± 1% of full scale. – Read scale at top (largest diameter) of float

Non Fouling

- Float is self supporting in the flow. No guide rod (which can cause the float to jam) is necessary.

[1] USGPM and litres per hour (water) scale is supplied as standard on full size meters.
[2] Because PVDF is translucent, a magnetic float and limit switches are usually used.
[3] For ChemFlare™ end connectors, consult Chemline.

Variable Area Flow Meters

PARTS

▲ Recommended Spare Parts

No.	Part	Pcs.	Materials
1	Tube	1	Polyamide (PA), Polysulfone (PSU), Clear PVC, PVDF
2	Float	1	PVDF (standard or magnetic)
3	Lower Float Stop	1	PVDF
4	Upper Float Stop	1	PVDF
5	Union Nut	2	PVC, PPG, PVDF
6	End Connector	2	PVC, CPVC, PP or PVDF
7▲	O-Rings	2	EPDM, FPM(Viton®)
8▲	Range Indicator	2	ABS

ACCESSORIES

- **Limit Switches** – One switch for both maximum or minimum. A magnetic float is required.
- **Switch Ratings** – P (max) = 10 VA, E (max) = 470VAC, I (max) = 0.5A
- **Throttling Valve** for flow control
- **4–20 mA Output Signal Unit** must be factory calibrated for specific service

OPTIONS

- **Custom Direct Reading Scale** for services other than water
- **Alternate O-Rings** – ie. FPM (Viton®)
- **End Size Reduction** – Accuracy is not significantly affected by end reduction
- **Other Ends** – Threaded, socket or flanged end connections in PVC, CPVC, PP or PVDF. Butt ends in PP or PVDF.

MAXIMUM WORKING PRESSURES AND TEMPERATURE RANGES

Construction (‡ = Optional Materials)				Maximum	
Tube	O-Rings	Union Nuts	Ends	Pressure[2]	Temperature Range
PVC	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polyamide (PA)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 75°C (32 to 167°F)
Polysulfone (PSU)	EPDM	PVC	PVC	150 psi	0 to 60°C (32 to 140°F)
Polysulfone (PSU)	EPDM	PPG‡	PP or CPVC‡	150 psi	0 to 90°C (32 to 194°F)
PVDF	FPM(Viton®)	PVDF	PVDF	150 psi	–40 to 110°C (–40 to 230°F)

[2] 150 psi is not recommended at maximum temperatures. Consult Chemline.

flow meter sizing – liquid flow

Standard Scale values are for clean water flow at 20°C (68°F). For liquids with densities and viscosities similar to water (ie. specific gravity of 1.0 and viscosities between 0.5 cP and 1.3 cP) the standard water scale will be accurate enough.

The table below shows correction factors to be applied for liquids with specific gravities other then 1.0. Multiply the correction factor by the water scale value to obtain actual flow rate. Example: For a liquid of specific gravity of 1.66, the correction factor is 0.740. For water flow range of 100 to 1000 litres/hr, corrected range becomes 74 to 740 litres/hr. Viscosity should be between 0.5 cP and 1.3 cP for standard scales to be accurate.

For "sizing" liquid flows ie. determining actual flow range of a tube, please advise the **chemical name, concentration, temperature, specific gravity** and **viscosity.** Custom direct reading scales in any units are available special order.

SCALE CORRECTION FACTORS – FOR LIQUIDS WITH SPECIFIC GRAVITIES OTHER THAN 1.00

Specific Gravity	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09

SCALE CORRECTION FACTORS – FOR AIR AT NON-STANDARD TEMPERATURES AND PRESSURES

Air density is dependent on the actual pressure and temperature.
Calculate the Scale Correction Factor using either Method 1 or 2. Multiply the standard air flow ranges above by the Factor to obtain actual flow rates.

Method 1

Calculate the Factor with the following formula.

$$\text{Factor} = \frac{1}{3.7005}\sqrt{\frac{\text{psia}}{(1+0.00367t)}}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Method 2

Calculate the density of the air at conditions and find factor from the chart below.

$$\text{Air Density (g/ml)} = \frac{\text{psia}}{11{,}360\,(1+0.00367t)}$$

psia = pressure of the air absolute
= psig + 14.7 (atmospheric pressure = 14.7 psia)
t = temperature of the air °C

Air Density vs. Flow Factor

Temperature vs. Pressure

LSFLO Reed Limit Switch

for FC & FS flow meters

The **LSFLO** limit switches serve as switches for minimum or maximum flow values. The normally open latching reed switch closes when the float in the measuring tube reaches and exceedes the switching position. The switch condition is maintained as long as the float is above the limit switch and will open when the float in the tube drops below the switch.

Normally closed switches are available on request.

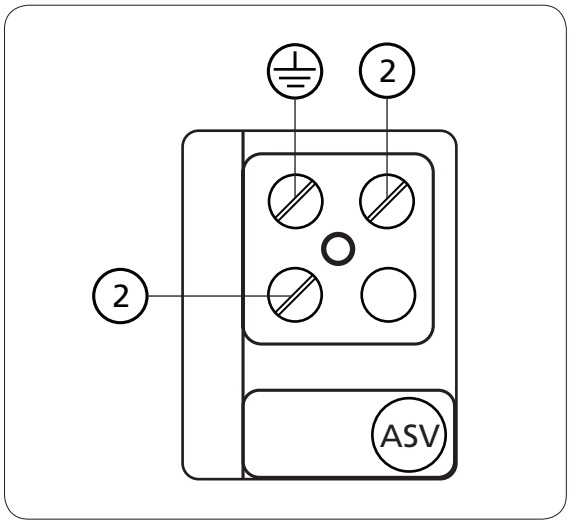
technical

- **Operating voltage:** maximum 230 VAC
- **Operating current:** maximum 0.5 A
- **Constant current when switched:** maximum 1 A
- **Rupturing capacity:** maximum 10 W/10 VA
- **Closed resistance:** < 150 mΩ
- **Open resistance:** > 10^{10} Ω
- **Operating temperature:** 0°C(32°F) to 55°C(131°F)
- **Protection:** IP 65 (DIN EN 60528)
- **Hysteresis (switch on and off point):** 3 mm
- **Protection:** IP 65 (DIN EN 60528)
- **Dimensions:** 34 x 17 x 41 mm
- **Weight (with plug):** 40 g
- **Connections:** the polarity of the connections has no influence on the function

INSTALLATION

Screw clamps are used to fit the LSFLO on the dovetail guide of the flow meter.

CONNECTIONS



START-UP

Prior to the first start up it is important that the float passes the LSFLO switch three times to ensure the electronics inside recognize the magnetic field from the floats properly.

ZE3000 Flow Transmitters

for FS flow meters

The **ZE300**0 flow transmitter provides a 4–20 mA output signal, generated by detection of the position of the magnetic float.

IMPORTANT: This micro-processor controlled unit is factory calibrated and unique to each flowmeter model. Flowmeter model must be advised when ordering.

technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **8–28 VDC input**
- **Factory calibrated (flow meter to be specified when ordering)**
- **11 point calibration**
- **Non-volatile value storage**
- **0 Button to compensate for the surrounding magnetic influences**
- **Factory setting of the lower limit value (low-cut-off) 0-99% according to customer's specificaitons**
- **Factory time lag (low-pass filter) 0.1-2.5 sec. according to customer's specifications**
- **Measuring accuracy:** < 0.5%
- **Temperature range:** –30°C(–20°F) to 65°C(150°F)

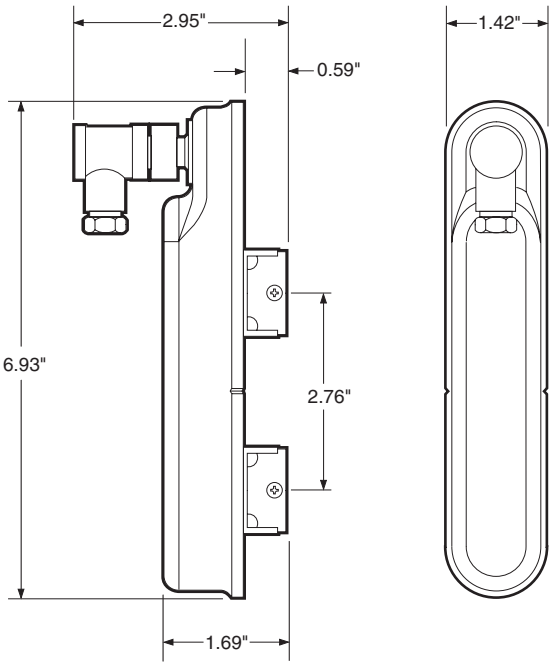
INSTALLATION

Screw clamps are used to fit the ZE3000 on the dovetail guide of the flow meter.

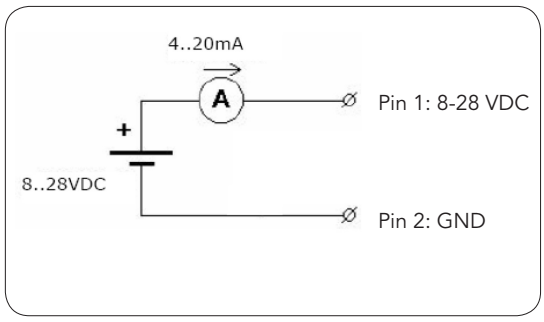
During installation, ensure that the notch of the ZE3000 coincides with the 50% mark on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

DIMENSIONS

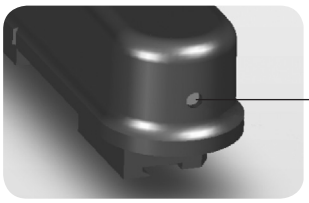


WIRING



START-UP

After installation and wiring, press the 0 button for at least 2 sec. to compensate for possible electro-magnetic interference. During this time make sure the float is at the bottom of the flowmeter (ie. no flow condition).



Note:
Do not press button during normal operation.

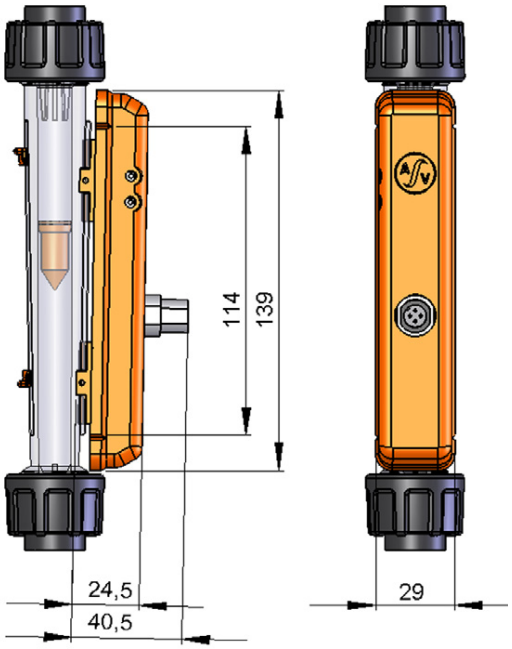
ZE3075 Flow Transmitters

for FC flow meters

The **ZE3075** flow transmitter provides a 2- wire 4–20 mA output signal omit generated by precise detection of the position of the magnetic float.

The magnetic float travels along the reed chain of switches activating them.

This micro-processor controlled unit is field calibrated.



technical

- **2-Wire technology**
- **4–20 mA analog output** (4-20.1 for 8 VDC supply; 4-22.0 for 28 VDC supply
- **18–30 VDC input**
- **Field calibration**
- **Non-volatile value storage**
- **Measuring length:** 114 mm (4.5")
- **Measuring resolution:** 3.5 mm (0.138")
- **Measuring accuracy:** 3%
- **Temperature range:** –20°C(–4°F) to 70°C(158°F)

INSTALLATION

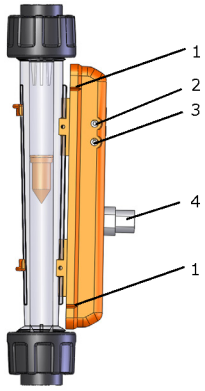
Screw clamps are used to fit the ZE3075 on the dovetail guide of the flow meter.

During installation, ensure that the top and bottom notches of the ZE3075 coincide with the 10% and 100% marks on the flow meter scale.

Following this, proceed with the wiring according to the diagram.

COMPONENTS

1. Alignment notches for the proper location of the transmitter
2. Potentiometer for the upper limit value of the output signal
3. Potentiometer for the lower limit value of the output signal
4. Plug connector



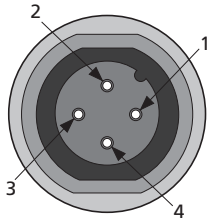
WIRING

The unit is connected with a commercially available unshielded cable.

Where electro-magnetic interference is to be expected, we recommend the use of a shielded cable.

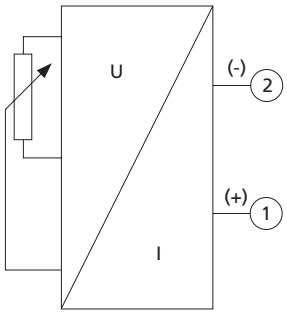
Cable cross section: max. 0.75 mm² cable outer diameter: 6 to 8 mm.

Flange Connector



1. Signal (+)
2. Signal (+)
3. n.c.
4. n.c.

Circuit Diagram



CALIBRATION

Compensation between the non-linear scaling of the flowmeter and the linear output signal of the flow data sensor must be performed by adjusting, preferably between 20% and 80% of the flow rate.

20% corresponds to 7.2mA and 80% to 16.8mA.

- Connect the ampermeter and the respective voltage supply to the flow data sensor
- Allow 20% of the flow to pass through the FC flow meter
- Set the min. trimmer potentiometer (3) such that the corresponding current (7.2mA) is shown in the ampermeter
- Allow 80% of the flow to pass through the FC flow meter
- Set the max. trimmer potentiometer (3) such that the corresponding current (16.8mA) is shown in the ampermeter
- Check the values at 20% and 80% several times and repeat the adjustment, if required

MILLIKEN
VALVE COMPANY

MILLCENTRIC®
ECCENTRIC PLUG VALVE

MILLIKEN
VALVE COMPANY

Milliken Valve offers the following for your water and wastewater needs:

- Eccentric Plug Valves
  - Series 601/600 Flanged & MJ
  - Series 601S Stainless Steel
  - Series 601RL Rubber Lined
  - Series 602 High Pressure
  - Series 603 Threaded End
  - Series 604E Three Way
  - Series 606 Grooved End
  - Series 611/610 Flanged & MJ
  - Model 625 UL /CGA Listed
- AWWA Swing Check Valves
- Wafer Check Valves
- Flex Check
- Spring Loaded Check Valves
- AWWA Butterfly Valves
- General Service Butterfly Valves

The Milliken Valve Company designs, develops, manufactures and markets plug, butterfly, and check valves and their respective controls and actuators. These valves are used primarily in the water, wastewater, and industrial markets.

Milliken Valve was started over two decades ago manufacturing the eccentric plug valve for the waste water and HVAC marketplace. Growth has been constant with the addition of a AWWA butterfly valve, general service butterfly valve, swing check valve, rubber flapper check valve, double disc check valve, wafer (outside spring) check valve, globe style check valve and compact wafer check valve.

Milliken believes that in order to satisfy customers, our products need to be considered the best design and the highest quality within the industry. All of our valves have had extensive testing before they are marketed or sold. Milliken's quality standards are a step above the industry norm, and Milliken is committed to standing behind its products in the field. All valves are tested in complete conformance to applicable standards before shipment. In addition, valve designs are routinely sent to independent testing facilities to ensure they meet or exceed expectations.

Technical Specification Series 601GL Glass Lined Valves 19

Suggested Specifications

The Milliken criteria of quality, reliability, safety and value are embodied in the Millcentric® Eccentric valve, setting higher standards for dependable performance with excellent features achieved by the utilization of the very latest design and manufacturing techniques.

- Computer Aided Design
- High Integrity Casting
- CNC manufacturing delivers consistent sizes on all components

All complemented by rigorous Quality Control System

Body

Conforming to AWWA C504 wall thickness, the MILLCENTRIC valve body casting is in ASTM A126 CL B cast iron using high pressure molding techniques. Alternative flanged, grooved or mechanical joint ends are available.

Flange diameter, thickness and drilling conform to ANSI B16.1 Class 125 or 250.

Grooved ends meet AWWA C-606 for ductile or steel pipe. Mechanical joints to AWWA C111 (ANSI A21.11).

Seat

The MILLCENTRIC valve incorporates as standard, on 3" and larger, a ⅛" thick welded 99% nickel seat for corrosion and erosion resistance specifically profiled for low torque and extended seat life.

Stem Seal

High integrity sealing by combining the advantages of a resilient and abrasion resistant U-Cup seal. From vacuum to high pressure, the self-adjusting sealing system (per AWWA C504) gives positive, trouble-free service and is retained independently of the plug stem or external torque device, therely eliminating periodic maintenance.

Bearings

The plug rotates in permanently lubricated 316 grade stainless steel bearings, located in the body and bonnet, along with upper and lower PTFE thrust washers, which ensure consistently low operating torque.

Plug

Supported on integral trunnions, the plug is totally encapsulated with an elastomer that is molded on 2½" – 48" and vulcanized on 54" and larger to the casting providing tight shut off even under vacuum conditions. High integrity corrosion-free sealing is achieved by a variety of abrasion resistant elastomers which protect the plug right up to the trunnions. When assembled, the light compression of the elastomers onto PTFE thrust washers, prevents entry of abrasive materials into the bearings.

Bonnet Seal

Superior "O" ring sealing with metal/metal contact means lower bolting stresses compared with compression gaskets.

Flow

The port design (round on 2½" – 12" and rectangular on 14" and larger) with streamlined internal contours gives the highest industry capacity straight through flow in the full open position, reducing turbulence and pressure drop and the effect of erosive media. Handling of sludges and slurries is therefore enhanced.

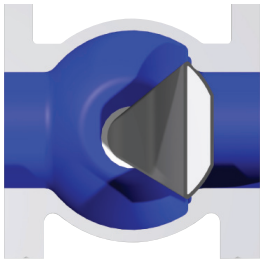
Interchangeable

Because of the common face to face dimension with wedge gate valves (3" – 12"), fitting the tight shut-off rotary MILLCENTRIC valve into existing systems is accomplished without pipeline modifications.

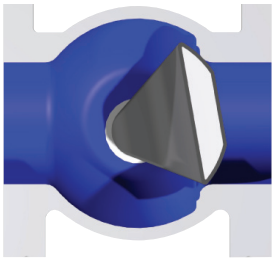
Travel Stops

Adjustable open and closed travel stops are fitted as standard on both wrench and gear operated MILLCENTRIC valves.

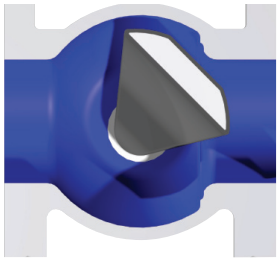
Suggested Specifications



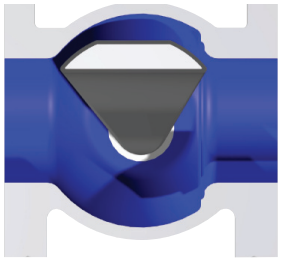
- Valve in closed position for bubble tight shut-off
- Normal flow direction gives pressure assisted sealing
- Torques are low even in reverse flow



- Plug rotates away from the seat for instant opening
- Seat wear and operating torque reduced
- No further seat contact until valve is closed again



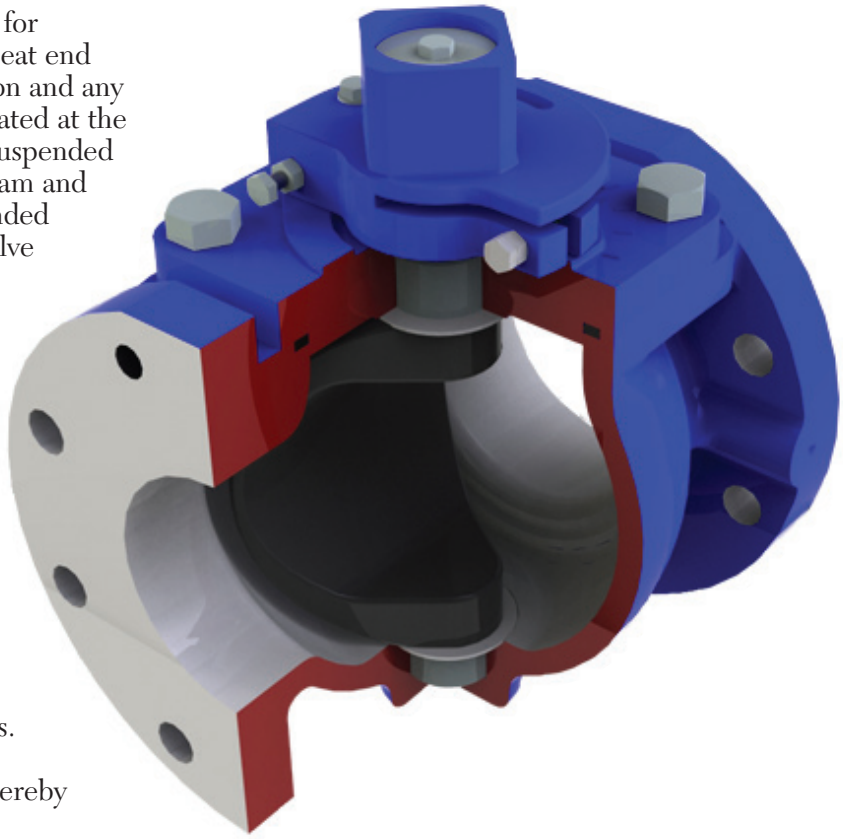
- Design of Millcentric plug valve allows modulating control over the full 90˚ travel
- Ideally suited for balancing service
- Standard rotary valve provides control and tight shut off in one valve



- Plug is out of flow path when fully open
- Straight through, uninterrupted smooth flow
- Round port reduces turbulence and erosion, lowers pumping costs and can be “pigged” to clean the pipeline

Installation

The Millcentric® plug valve is suitable for flow and shut-off in either direction. Seat end downstream is the preferred orientation and any reverse flow requirement should be stated at the time of order. For use on fluids with suspended solids, installation with the seat upstream and the valve stem horizontal is recommended with, plug rotation to the top of the valve will ensure smooth operation.



In-Line Maintenance

In the unlikely event of stem leakage, the stem seals can be easily replaced without removing the bonnet. Access to the body for cleaning or inspection does not require removal from the line.

Modular Construction

Design of the bonnet and stem allows for on-site adaption of gear operators, power actuators, or extension devices on to standard valves. Conversion can be easily undertaken without removing the valve bonnet, thereby minimizing downtime.

Power Operation

Pneumatic, electric or hydraulic operation is available, complete with accessories such as limit switches, solenoid valves and positioners when required.

Testing per AWWA C517

ELASTOMERS AVAILABLE FOR MILLCENTRIC VALVE

Natural rubber is also available.

Nitrile

A general purpose material sometimes referred to as BUNA-N or HYCAR with a –20°F to 212°F temperature range. Used on sewage, water, hydrocarbon and mineral oils.

EPDM

An excellent polymer for use on chilled water through to LP steam applications having a temperature range of –35°F to 250°F. Resistance to many acids, alkalies, detergents, phosphate esters, alcohols and glycols is an added benefit.

Neoprene

This versatile material shows outstanding resistance to abrasion and ozone. Chemical resistance to a wide range of petroleum base products and dilute acids and alkalies. Temperature range –20°F to 225°F.

Viton

Retention of mechanical properties at high temperature is an important feature of this elastomer: temperature range is –10°F to 300°F. It also has excellent resistance to oils, fuels, lubricants and most mineral acids and aromatic hydrocarbons.
Note: Not for water or steam applications.

Elastomer Selection Chart

Service	Elastomer	Average Useful Temp. Range	Service	Elastomer	Average Useful Temp. Range	Service	Elastomer	Average Useful Temp. Range
Acetone	EPDM	–35°F to 250°F	Caustic Soda	EPDM	–35°F to 250°F	Oil, Animal	Nitrile	–20°F to 212°F

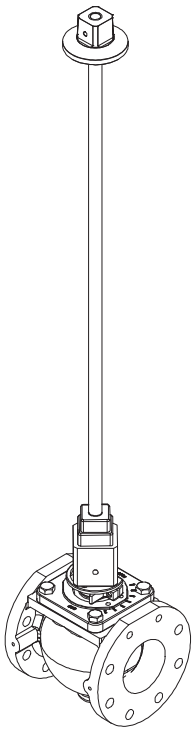
NOTE: Larger sizes are available. Contact Milliken Valve for data.

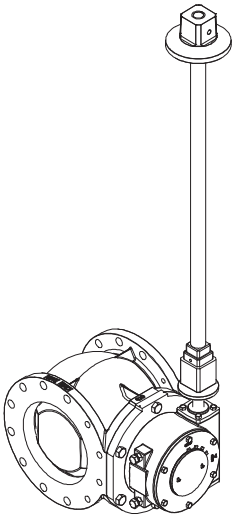
Adaption

A range of extended stems & floor mounted stands for remote operation, particularly in buried service, are available.
Chainwheels & locking devices are readily incorporated onto the Millcentric Valve.

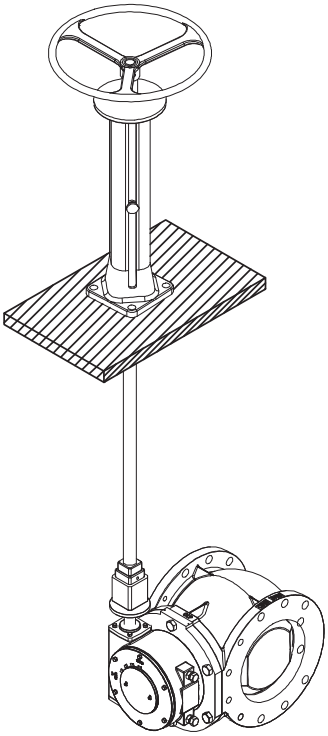
Valve with extended stem & 2" nut (Only for 8" and smaller valves)



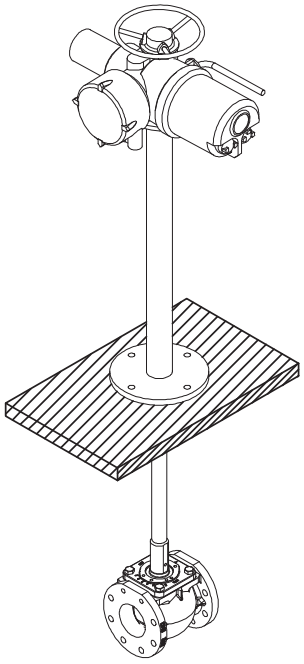
Valve with extended stem, buried gear and 2" nut



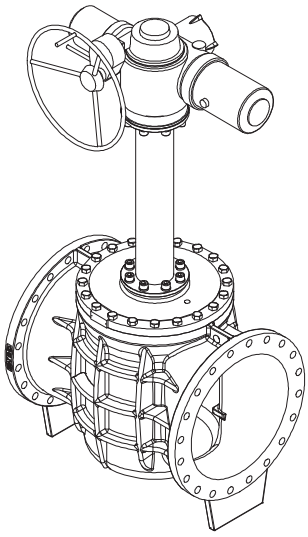
Valve with indicating floorstand



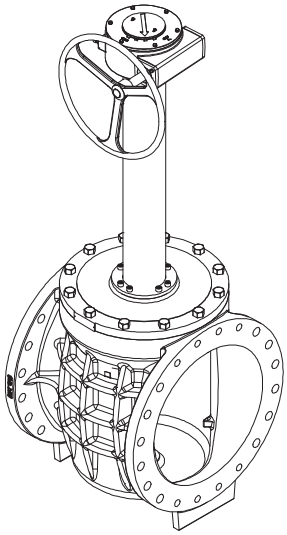
Valve with non-indicating floorstand & motor operator



Valve with extended bonnet & motor operator



Valve with extended bonnet with gear



Technical Specification Series 601/600 Valves

TECHNICAL SPECIFICATION
ECCENTRIC PLUG VALVES
AWWA C517-09 Standards
Series 601/600 Valves

Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ANSI C-111-92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.

Valve bodies shall be of **ASTM A-126 Class B** cast iron in accordance with **AWWA C-517-09 Section 4.3.3.1**. Valves 3" and larger shall be furnished with a welded-in overlay seat of ⅛" thick of not less than 99% nickel in accordance with **AWWA C-517-09, Section 4.3.3.4**. Sprayed, plated or screwed-in seats are not acceptable.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for sizes 20" and smaller, and **ASTM A126 Class B Cast Iron** for sizes 24" and larger in compliance with **AWWA C-517-09 Sections 4.3.3.1 and 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Wrench operated valves 2½"-8" shall be capable of being converted to worm gear or automated operation without removing the bonnet or plug from the valve. All wrench operated valves shall be equipped with a 2" square nut for use with removeable levers or extended "T" handles.

Worm gear operators, where required, shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Millcentric **Series 601/600** as manufactured by **Milliken Valve Company of Bethlehem, Pennsylvania**.

Technical Specification Series 602 Class 250 Valves

TECHNICAL SPECIFICATION
ANSI CLASS 250 ECCENTRIC PLUG VALVES
AWWA C517-09 Standards
Series 602 Valves

Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 250** including facing, drilling and flange thickness. Ports shall be round on sizes 2½" through 12" to facilitate "pigging" when required. Valves 14" and larger shall be of a rectangular port design.

Valve bodies shall be of **ASTM A-536 Grade 65-45-12** ductile iron in accordance with **AWWA C-517-09 Section 4.3.3.2**. Valves 3" and larger shall be furnished with a welded-in overlay seat of ⅛" thick of not less than 99% nickel in accordance with **AWWA C-517-09 Section 4.3.3.4**. Sprayed, plated or screwed-in seats are not acceptable.

Plugs shall be of **ASTM A-536-Grade 65-45-12** in compliance with **AWWA C-517-09 Section 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit form entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517- 09 Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Worm gear operators shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 400 psi for valves 2½"-12" and 300 psi for valves 14"-48" with pressure behind the plug.

Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be **Series 602** as manufactured by **Milliken Valve Company of Bethlehem, Pennsylvania**.

Technical Specification Series 601RL Rubberlined Valves

TECHNICAL SPECIFICATION
RUBBERLINED ECCENTRIC PLUG VALVES
AWWA C517-09 Standards
Series 601RL Valves

Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ANSI C-111- 92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.

Valve bodies shall be of **ASTM A-126 Class B** cast iron in accordance with **AWWA C- 517-09 Section 4.3.3.1**. The interior of the valve bodies shall be covered with a suitable elastomer with a minimum thickness of ⅛". The elastomer shall extend through the valve flow way and onto the flanges to ensure a positive seal.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for sizes 20" and smaller, and **ASTM A126 Class B Cast Iron** for sizes 24" and larger in compliance with **AWWA C-517-09 Sections 4.3.3.1 and 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Worm gear operators shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Millcentric® **Series 601RL** as manufactured by **Milliken Valve Company of Bethlehem, Pennsylvania**.

Technical Specification Series 601S – Stainless Steel Valves

TECHNICAL SPECIFICATION
STAINLESS STEEL ECCENTRIC PLUG VALVES
AWWA C517-09 Standards
Series 601S Valves

Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125** including facing, drilling and flange thickness. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.

Valve bodies shall be of **CF8M (316 stainless steel)**. Valves shall be furnished with 316 stainless steel seat in accordance with **AWWA C-517-09 Section 4.3.3.4**.

Plugs shall be of **CF8M (316 stainless steel)**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09 Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Wrench operated valves 2½"-8" shall be capable of being converted to worm gear or automated operation without removing the bonnet or plug from the valve. All wrench operated valves shall be equipped with a 2" square nut for use with removable levers or extended "T" handles.

Worm gear operators, where required, shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. Milliken Valve designs, develops, manufactures and markets plug valves and check valves which are available with various accessories, controls and actuators. These valves are used primarily in the water, wastewater and industrial markets.

Milliken Valve was founded over 25 years ago and manufactures the eccentric plug valve for water, wastewater and industrial applications. Milliken has grown consistently until it is now a leading manufacturer of high quality plug valves.

Milliken has a quality management system independently certified to ISO 9001.

A market leading, wide selection of plug valves are available for most water, wastewater and industrial applications:

Multiport 100% Port 3-Way Plug Valve

- 3-Way Valve 3" – 16", suitable for flow diversion and isolation.

Eccentric Plug Valve

- Size range ½" - 72"
- Pressure rating up to Class 250
- Rubber lined 3" and larger
- Glass lined 3" and larger
- Stainless steel ½" - 48"

Flex Check Valve

The eccentric plug valve is perfectly complemented by a soft-seated flexible-disc check valve in sizes 2" to 24" and is available with manual back-flushing device, position indicator and limit switch.

Swing Check Valve

Milliken Valve also has a wide selection of high quality metal or soft seated swing check valves in sizes 2" to 72" with accessories available for spring or weight assisted closing and air cushion or oil decelerator anti-slam devices under the respected CCNE brand.

Overview of Valve Details - 1/2" - 2"

The Milliken criteria of quality, reliability, safety and value are embodied in the MILLCENTRIC® Eccentric valve, setting higher standards for dependable performance with excellent features achieved by the utilization of the very latest design and manufacturing techniques.

- Computer Aided Design
- High Integrity Casting
- CNC manufacturing delivers consistent sizes on all components

All complemented by a rigorous Quality Control System

Body

The MILLCENTRIC valve body casting is ASTM A536 65-45-12 ductile iron using high pressure molding techniques. Threaded connection available on 1/2"-2" sizes. Flanged connection available on 2" size.

Flange diameter, thickness and drilling conform to ANSI B16.1 Class 125.

Seat

The valve seat shall be furnished with an overlay of corrosion and abrasion resistant epoxy.

Stem Seal

High integrity sealing by combining the advantages of a resilient and abrasion resistant U-Cup seal. From vacuum to high pressure, the self-adjusting sealing system (per AWWA C504) gives positive, trouble-free service and is retained independently of the plug stem or external torque device, thereby eliminating periodic maintenance.

Bearings

The plug rotates in permanently lubricated stainless steel bearings, located in the body and bonnet, along with upper and lower PTFE thrust washers which ensure consistently low operating torque.

Plug

Supported on integral trunnions, the plug is totally encapsulated with an elastomer that is molded to the casting providing tight shut off even under vacuum conditions. High integrity corrosion-free sealing is achieved by a variety of abrasion resistant elastomers which protect the plug right up to the trunnions. When assembled, the light compression of the elastomers onto PTFE thrust washers prevents entry of abrasive materials into the bearings.

Bonnet Seal

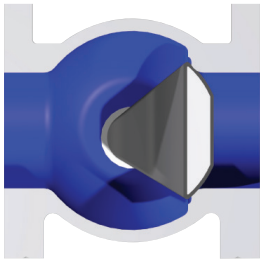
Superior “O” ring sealing with metal/metal contact means lower bolting stresses compared with compression gaskets.

Flow

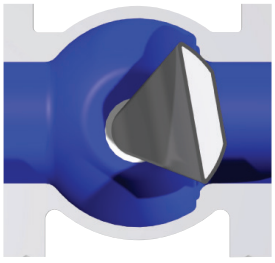
The full round port design with streamlined internal contours gives the highest industry capacity straight through flow in the full open position, reducing turbulence and pressure drop and the effect of erosive media. Handling of sludges and slurries is therefore enhanced.

Travel Stops

Adjustable open and closed travel stops are fitted as standard on both wrench and gear operated MILLCENTRIC valves.

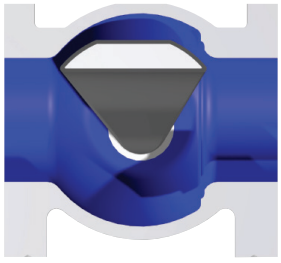


- Valve in closed position for bubble tight shut-off
- Normal flow direction gives pressure assisted sealing
- Torques are low even in reverse flow



- Plug rotates away from the seat for instant opening
- Seat wear and operating torque reduced
- No further seat contact until valve is closed again

- Design of MILLCENTRIC® plug valve allows modulating control over the full 90˚ travel
- Ideally suited for balancing service
- Standard rotary valve provides control and tight shut off in one valve



- Plug is out of flow path when fully open
- Straight through, uninterrupted smooth flow
- Round port reduces turbulence and erosion, lowers pumping costs and can be “pigged” to clean the pipeline

Installation

The MILLCENTRIC® plug valve is suitable for flow and shut-off in either direction. Seat end downstream is the preferred orientation and any reverse flow requirement should be stated at the time of order. For use on fluids with suspended solids, installation with the seat upstream and the valve stem horizontal is recommended with plug rotation to the top of the valve.

In-Line Maintenance

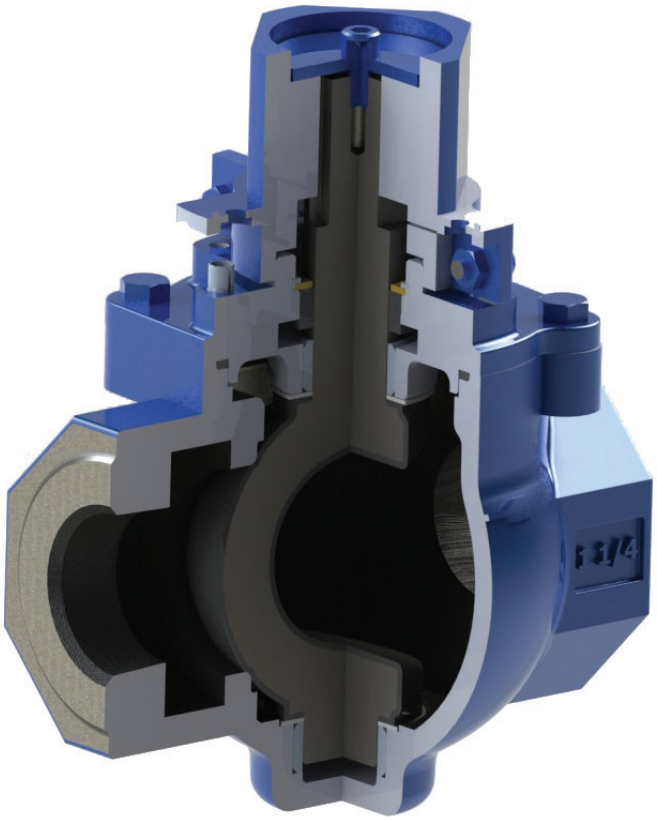
In the unlikely event of stem leakage, the stem seals can be easily replaced without removing the bonnet. Access to the body for cleaning or inspection does not require removal from the line.

Modular Construction

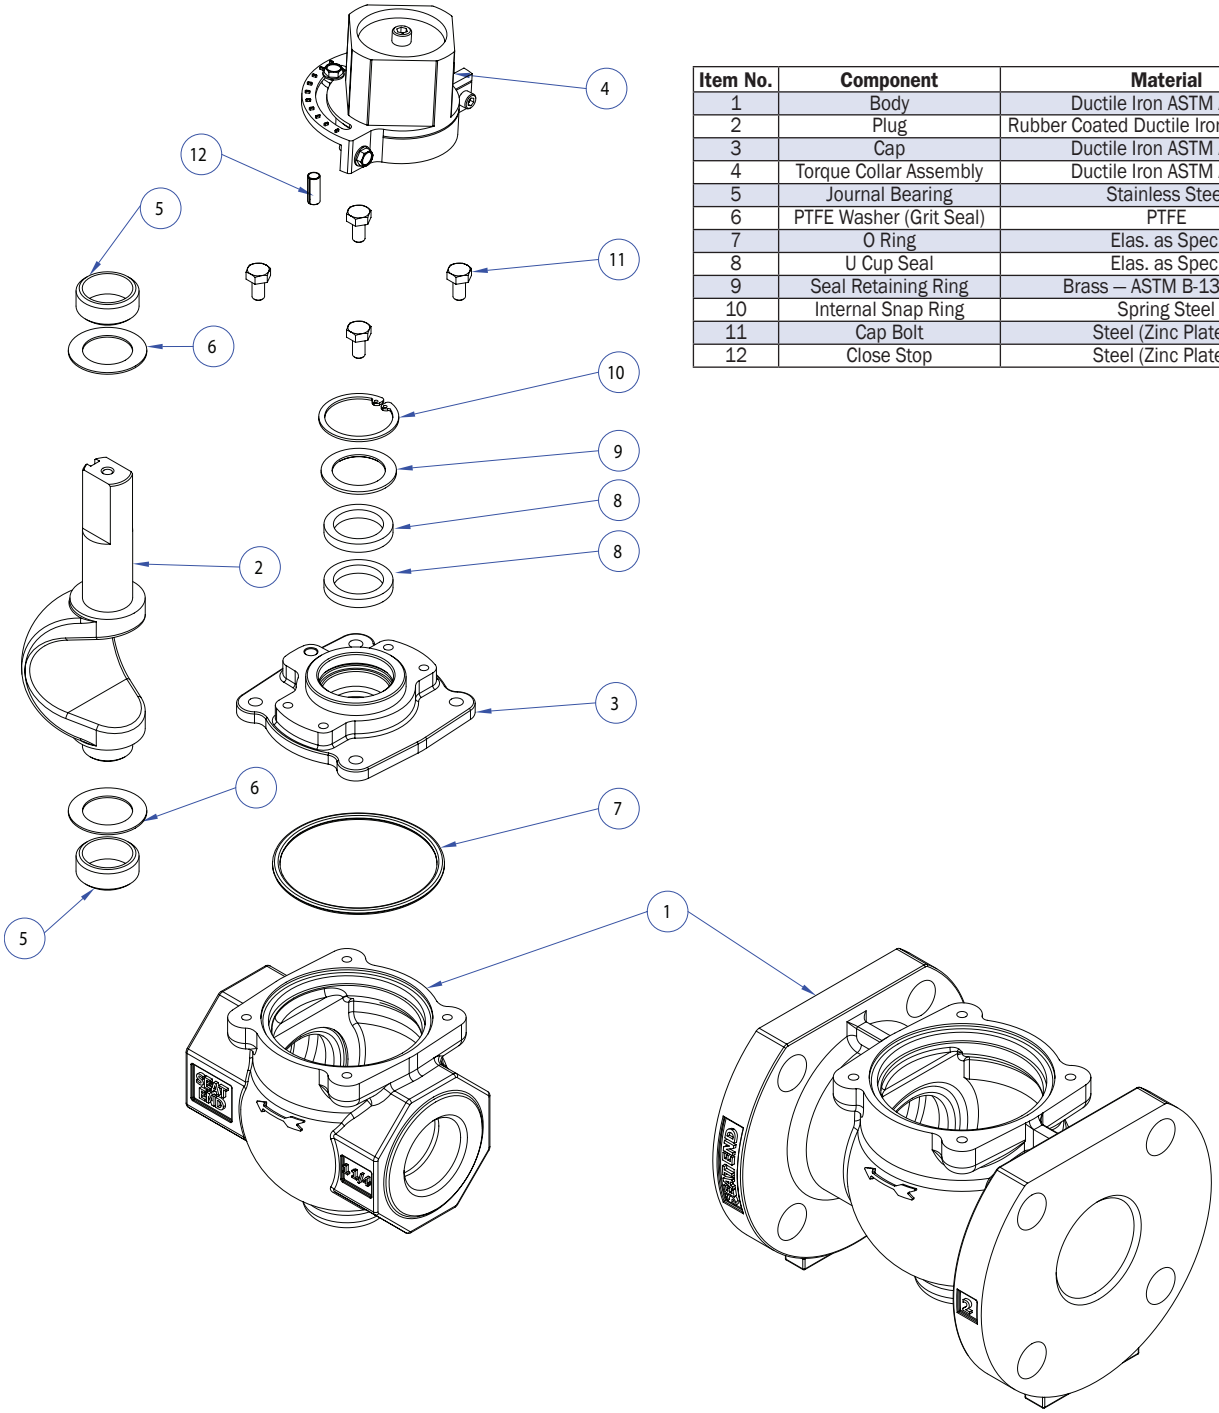
Design of the bonnet and stem allows for on-site adaption of gear operators, power actuators, or extension devices on to standard valves. Conversion can be easily undertaken without removing the valve bonnet, thereby minimizing downtime.

Power Operation

Pneumatic, electric or hydraulic operation is available, complete with accessories such as limit switches, solenoid valves and positioners when required.



Standard Materials of Construction, Fig. 613A/611A, 1/2" - 2"



Item No.	Component	Material	Qty.
1	Body	Ductile Iron ASTM A536	1

ELASTOMERS AVAILABLE FOR MILLCENTRIC VALVE

Nitrile

A general purpose material sometimes referred to as BUNA-N or HYCAR with a -20°F to 212°F temperature range. Used on sewage, water, hydrocarbon and mineral oils.

EPDM

An excellent polymer for use on chilled water through to LP steam applications having a temperature range of -35°F to 250F. Resistance to many acids, alkalies, detergents, phosphate esters, alcohols and glycols is an added benefit.

Neoprene

This versatile material shows outstanding resistance to abrasion and ozone. Chemical resistance to a wide range of petroleum base products and dilute acids and alkalies. Temperature range -20°F to 225°F.

Viton

Retention of mechanical properties at high temperature is an important feature of this elastomer: temperature range is -10°F to 300°F. It also has excellent resistance to oils, fuels, lubricants and most mineral acids and aromatic hydrocarbons. Note: Viton not for water or steam applications.

Elastomer Selection Chart

Service	Elastomer	Average Useful Temperature Range	Service	Elastomer	Average Useful Temperature Range	Service	Elastomer	Average Useful Temperature Range

Henry Pratt Company

Ballcentric® Plug Valve

Engineering Creative Solutions
for Fluid Systems Since 1901

A Tradition of Excellence

With the development of the first rubber seated butterfly valve more than 70 years ago, the Henry Pratt Company became a trusted name in the flow control industry, setting the standard for product quality and customer service. Today Pratt provides the following range of superior products to the water, wastewater and power generation industries.

Butterfly Valves: from 3" to 162"

Rectangular Valves: 1' x 1' to 14' x 16'

Ball Valves –
Rubber Seated: from 4" to 60"
Metal Seated: from 6" to 48"

Plug Valves: from 1/2" to 72", 100% port available up to 48", 3 ways

Air Valves for Water and Wastewater: from 1/2" to 20"

Hydraulic Control Systems

Valve Controls

Energy Dissipating Valves and Fixed Energy Dissipaters

Cone Valves

Check Valves

Plunger Valves

A Commitment to Meeting The Customers' Needs

Henry Pratt valves represent a long-term commitment to both the customer and to a tradition of product excellence. This commitment is evident in the number of innovations we have brought to the industries we serve. In fact, the Henry Pratt Company was the first to introduce many of the flow control products in use today, including the first rubber seated butterfly valve, one of the first nuclear N-Stamp valves, and the bonded seat butterfly valve.

Innovative Products For Unique Applications

Though many of the standard valves we produce are used in water filtration and distribution applications, Pratt has built a reputation on the ability to develop specialized products that help customers to meet their individual operational challenges.

Creative Engineering for Fluid Systems

Pratt's ability to provide practical solutions to complex issues is demonstrated by the following case histories.

Earthquake Proof Valves

Pratt designed and manufactured hydraulically actuated valves for a water storage application so that the valves would automatically operate in the event of earthquakes. This led to the development of a valve that will withstand acceleration forces of up to 6gs.

Custom Actuation/Isolation Valves

Pratt has designed and manufactured nuclear quality quarter-turn valves and parts since the first nuclear-powered generating plants were built. Our custom valves are able to close in a millisecond, using specially designed Pratt electro-pneumatic actuators.

Valves Designed for Harsh Environments

Pratt designed and manufactured a 144" diameter butterfly valve for the emergency cooling system at a jet engine test facility. The valve was designed to supply water to help dissipate the tremendous heat generated by the engines during testing.

PRATT
Henry Pratt Company

Through experience, commitment and creative engineering, Pratt is uniquely suited to provide superior products for our customers' special needs.

Scope of Line

The Henry Pratt criteria of quality, reliability, safety and value are embodied in the Ballcentric® plug valve, setting higher standards for dependable performance with excellent features achieved by the utilization of the very latest design and manufacturing techniques.

- Computer Aided Design
- High Integrity Casting
- CNC manufacturing delivers consistent sizes on all components

All complemented by rigorous Quality Control System

Body

Conforming to AWWA C504 wall thickness, the Ballcentric® plug valve body casting is in ASTM A126 CL B cast iron using high pressure molding techniques. Alternative flanged, grooved or mechanical joint ends are available.

Flange diameter, thickness and drilling conform to ANSI B16.1 Class 125 or 250.

Grooved ends meet AWWA C-606 for ductile or steel pipe. Mechanical joints to AWWA C111 (ANSI A21.11).

Seat

The Ballcentric® plug valve incorporates as standard, on 3" and larger, a 1/8" thick welded 99% nickel seat for corrosion and erosion resistance specifically profiled for low torque and extended seat life.

Stem Seal

High integrity sealing by combining the advantages of a resilient and abrasion resistant U-Cup seal. From vacuum to high pressure, the self-adjusting sealing system (per AWWA C504) gives positive, trouble-free service and is retained independently of the plug stem or external torque device, thereby eliminating periodic maintenance.

Bearings

The plug rotates in permanently lubricated 316 grade stainless steel bearings, located in the body and bonnet, along with upper and lower PTFE thrust washers, which ensure consistently low operating torque.

Plug

Supported on integral trunnions, the plug is totally encapsulated with an elastomer that is molded on 2 1/2" – 48" and vulcanized on 54" and larger to the casting providing tight shut off even under vacuum conditions. High integrity corrosion-free sealing is achieved by a variety of abrasion resistant elastomers which protect the plug right up to the trunnions. When assembled, the light compression of the elastomers onto PTFE thrust washers, prevents entry of abrasive materials into the bearings.

Bonnet Seal

Superior "O" ring sealing with metal/metal contact means lower bolting stresses compared with compression gaskets.

Flow

The port design (round on 2 1/2" – 12" and rectangular on 14" and larger) with streamlined internal contours gives the highest industry capacity straight through flow in the full open position, reducing turbulence and pressure drop and the effect of erosive media. Handling of sludges and slurries is therefore enhanced.

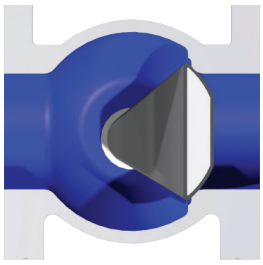
Interchangeable

Because of the common face to face dimension with wedge gate valves (3" – 12"), fitting the tight shut-off rotary Ballcentric® plug valve into existing systems is accomplished without pipeline modifications.

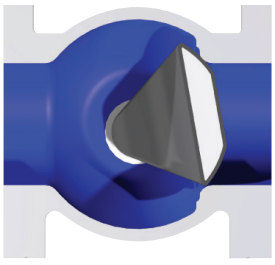
Travel Stops

Adjustable open and closed travel stops are fitted as standard on both wrench and gear operated Ballcentric® plug valves.

Features and Benefits

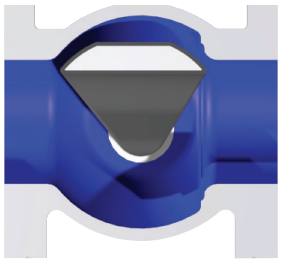


- Valve in closed position for bubble tight shut-off
- Normal flow direction gives pressure assisted sealing
- Torques are low even in reverse flow



- Plug rotates away from the seat for instant opening
- Seat wear and operating torque reduced
- No further seat contact until valve is closed again

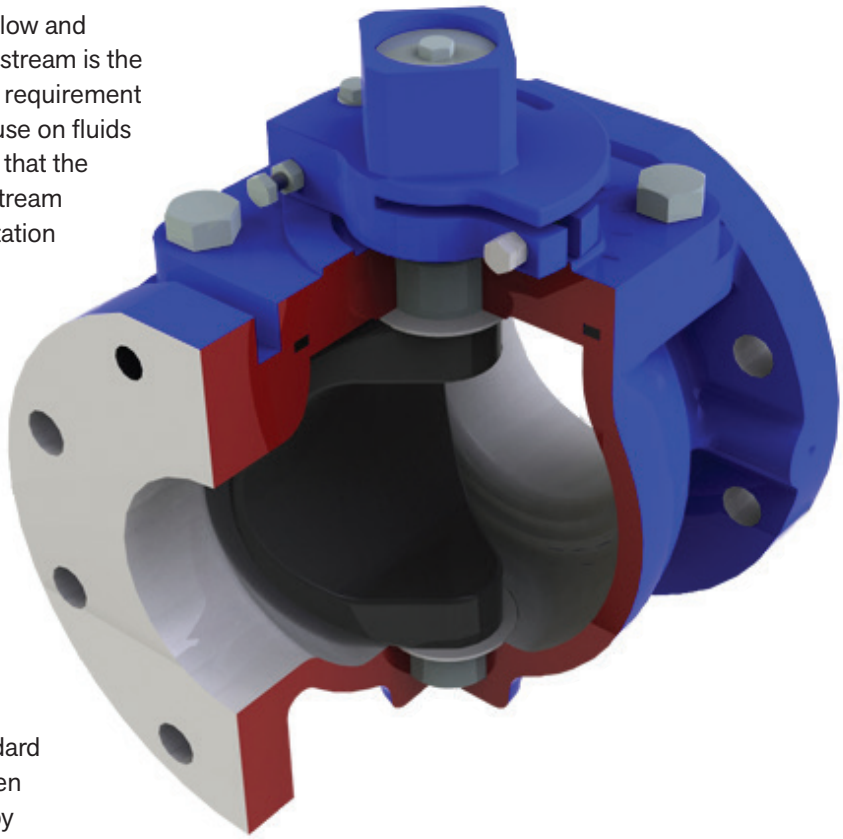
- Design of Ballcentric® plug valve allows modulating control over the full 90˚ travel
- Ideally suited for balancing service
- Standard rotary valve provides control and tight shut off in one valve



- Plug is out of flow path when fully open
- Straight through, uninterrupted smooth flow
- Round port reduces turbulence and erosion, lowers pumping costs and can be "pigged" to clean the pipeline

Installation

The Ballcentric® plug valve is suitable for flow and shut-off in either direction. Seat end downstream is the preferred orientation and any reverse flow requirement should be stated at the time of order. For use on fluids with suspended solids, it is recommended that the valve should be installed with the seat upstream and the valve stem horizontal with plug rotation to the top of the valve ensuring smooth operation.



In-Line Maintenance

In the unlikely event of stem leakage, the stem seals can be easily replaced without removing the bonnet. Access to the body for cleaning or inspection does not require removal from the line.

Modular Construction

Design of the bonnet and stem allows for on-site adaption of gear operators, power actuators, or extension devices on to standard valves. Conversion can be easily undertaken without removing the valve bonnet, thereby minimizing downtime.

Power Operation

Pneumatic, electric or hydraulic operation is available, complete with accessories such as limit switches, solenoid valves and positioners when required.

Dimensional Data

ORDERING INFORMATION

Valve Types	Designation
Mechanical Joint Cast Iron	600
Mechanical Joint Ductile Iron	610
ANSI 125 Flanged Cast Iron	601
ANSI 125 Flanged Ductile Iron	611
ANSI 150 Flanged Ductile Iron	621
ANSI 250 Flanged Ductile Iron	602
ANSI 125 Grooved for Steel Pipe	606S
ANSI 125 Grooved for Ductile Pipe	606D
ANSI 150 Flanged 316SS	601S
SEAT	
Nickel (3" & Larger)	N
Epoxy (2½" ONLY)	E
316SS (on stainless steel valve only)	S
Rubberlined	RL
Glasslined	GL
ELASTOMER TRIM	
EPDM	0
Buna-Nitrile	1
Viton	2
Neoprene	3
Natural	4
MANUAL OPERATORS	
Above Ground Gear and Handwheel	AGHW
Above Ground Gear with 2" Nut	AGNUT
Buried Gear with 2" Nut	BG
Memory Stop Gear with Handwheel	MGHW
Lever / Wrench (8" & smaller)	L
Direct Nut (8" & smaller)	TC

Example: 4" 601N3AGHW = 4" ANSI 125 Flanged, Nickel Seat, Neoprene plug with Above Ground Gear and Handwheel

Valves are only tested for bi-directional shut-off if specified at time of order. Contact Henry Pratt for bi-directional ratings.

NOTE: We recommend mechanical joint or buried flanged valves to have gear operators

NOTE: We recommend valves for bi-directional service to have gear operators

PRESSURE RATING

12" and smaller	ANSI 125	175 psi
14" and larger	ANSI 125	150 psi
20" and smaller	ANSI 150	285 psi
12" and smaller	ANSI 250	400 psi
14" and larger	ANSI 250	300 psi

Body Hydrotest = 150% of rated pressure / Seat Test = 100% of rated pressure Testing per AWWA C517

ELASTOMERS AVAILABLE FOR BALLCENTRIC® PLUG VALVE

Natural rubber is also available.

Nitrile

A general purpose material sometimes referred to as BUNA-N or HYCAR with a –20°F to 212°F temperature range. Used on sewage, water, hydrocarbon and mineral oils.

EPDM

An excellent polymer for use on chilled water through to LP steam applications having a temperature range of –35°F to 250°F. Resistance to many acids, alkalies, detergents, phosphate esters, alcohols and glycols is an added benefit.

Neoprene

This versatile material shows outstanding resistance to abrasion and ozone. Chemical resistance to a wide range of petroleum base products and dilute acids and alkalies. Temperature range –20°F to 225°F.

Viton

Retention of mechanical properties at high temperature is an important feature of this elastomer: temperature range is –10°F to 300°F. It also has excellent resistance to oils, fuels, lubricants and most mineral acids and aromatic hydrocarbons.
Note: Not for water or steam applications.

Elastomer Selection Chart

Service	Elastomer	Average Useful Temp. Range	Service	Elastomer	Average Useful Temp. Range	Service	Elastomer	Average Useful Temp. Range
Acetone	EPDM	–35°F to 250°F	Caustic Soda	EPDM	–35°F to 250°F	Oil, Animal	Nitrile	–20°F to 212°F
Air	EPDM	–35°F to 250°F	Cement Slurry	EPDM	–35°F to 250°F	Oil, Mobil Therm Light	Viton	10°F to 250°F
Air w/Oil	Nitrile	0°F to 212°F	Copper Sulphate	EPDM	–35°F to 250°F	Oil, Mobil Therm 600	Viton	10°F to 250°F
Alcohol AMYL	EPDM	0°F to 212°F	Creosote (Coal)	Nitrile	–20°F to 212°F	Oil, Mobil Therm 603	Nitrile	–20°F to 212°F

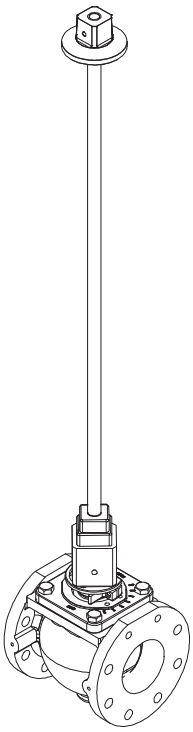
NOTE: Larger sizes are available. Contact Henry Pratt Valve for data.

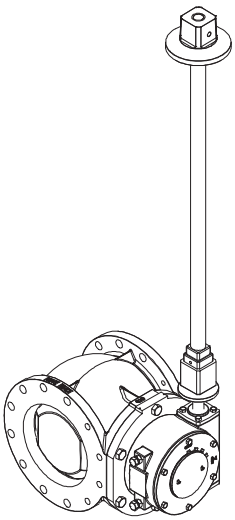
Adaption

**A range of extended stems & floor mounted stands for remote operation, particularly in buried service, are available.
Chainwheels & locking devices are readily incorporated onto the Ballcentric® Plug Valve.**

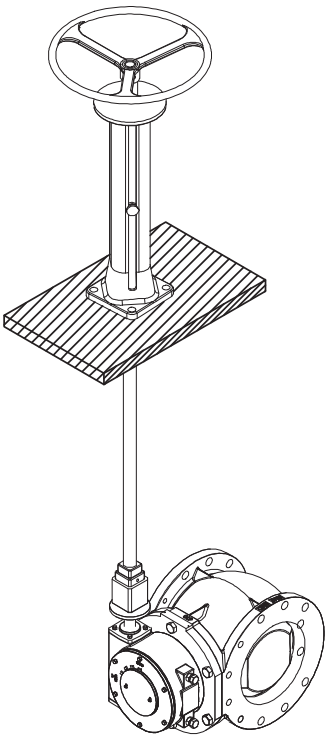
Valve with extended stem & 2" nut (Only for 8" and smaller valves)



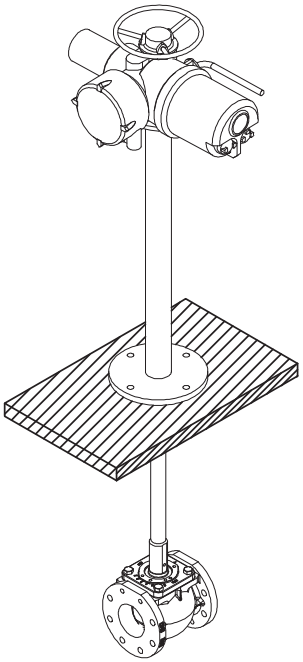
Valve with extended stem, buried gear and 2" nut



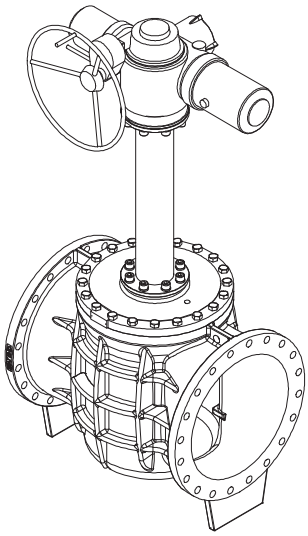
Valve with indicating floorstand



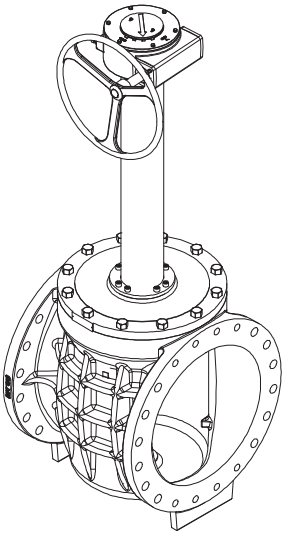
Valve with non-indicating floorstand & motor operator



Valve with extended bonnet & motor operator



Valve with extended bonnet with gear



Technical Specification Ballcentric® Series 601/600 Plug Valves

AWWA C517-09 Standards

Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ANSI C-111-92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.

Valve bodies shall be of **ASTM A-126 Class B** cast iron in accordance with **AWWA C-517-09 Section 4.3.3.1**. Valves 3" and larger shall be furnished with a welded-in overlay seat of 1/8" thick of not less than 99% nickel in accordance with **AWWA C-517-09, Section 4.3.3.4**. Sprayed, plated or screwed-in seats are not acceptable.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for sizes 20" and smaller, and **ASTM A126 Class B Cast Iron** for sizes 24" and larger in compliance with **AWWA C-517-09 Sections 4.3.3.1 and 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Wrench operated valves 2½"-8" shall be capable of being converted to worm gear or automated operation without removing the bonnet or plug from the valve. All wrench operated valves shall be equipped with a 2" square nut for use with removeable levers or extended "T" handles.

Worm gear operators, where required, shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Ballcentric® Plug Valve Series 601/600 as manufactured by Henry Pratt Company of Aurora, Illinois.

Technical Specification Ballcentric® Series 602 ANSI Class 250 Plug Valves

AWWA C517-09 Standards
Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 250** including facing, drilling and flange thickness. Ports shall be round on sizes 2½" through 12" to facilitate "pigging" when required. Valves 14" and larger shall be of a rectangular port design.
Valve bodies shall be of **ASTM A-536 Grade 65-45-12** ductile iron in accordance with **AWWA C-517-09 Section 4.3.3.2**. Valves 3" and larger shall be furnished with a welded-in overlay seat of 1/8" thick of not less than 99% nickel in accordance with **AWWA C-517-09 Section 4.3.3.4**. Sprayed, plated or screwed-in seats are not acceptable.

Plugs shall be of **ASTM A-536-Grade 65-45-12** in compliance with **AWWA C-517-09 Section 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit form entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517- 09 Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Worm gear operators shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 400 psi for valves 2½"-12" and 300 psi for valves 14"-48" with pressure behind the plug.

Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Ballcentric® Plug Valve **Series 602** as manufactured by Henry Pratt Company of Aurora, Illinois.

Technical Specification Ballcentric® Series 601RL Rubberlined Plug Valves

AWWA C517-09 Standards
Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ ANSI C-111- 92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.
Valve bodies shall be of **ASTM A-126 Class B** cast iron in accordance with **AWWA C- 517-09 Section 4.3.3.1**. The interior of the valve bodies shall be covered with a suitable elastomer with a minimum thickness of 1/8". The elastomer shall extend through the valve flow way and onto the flanges to ensure a positive seal.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for sizes 20" and smaller, and **ASTM A126 Class B Cast Iron** for sizes 24" and larger in compliance with **AWWA C-517-09 Sections 4.3.3.1 and 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6.** Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Worm gear operators shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Ballcentric® Plug Valve **Series 601RL** as manufactured by **Henry Pratt Company of Aurora, Illinois.**

Technical Specification Ballcentric® Series 601S – Stainless Steel Plug Valves

AWWA C517-09 Standards
Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125** including facing, drilling and flange thickness. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.
Valve bodies shall be of **CF8M (316 stainless steel)**. Valves shall be furnished with 316 stainless steel seat in accordance with **AWWA C-517-09 Section 4.3.3.4**.

Plugs shall be of **CF8M (316 stainless steel)**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09 Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Wrench operated valves 2½"-8" shall be capable of being converted to worm gear or automated operation without removing the bonnet or plug from the valve. All wrench operated valves shall be equipped with a 2" square nut for use with removable levers or extended "T" handles.

Worm gear operators, where required, shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Ballcentric® Plug Valve **Series 601S** as manufactured by Henry Pratt Company of Aurora, Illinois.

Technical Specification Ballcentric® Series 611/610 Ductile Iron Plug Valves

AWWA C517-09 Standards
Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ ANSI C-111-92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 2½"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.
Valve bodies shall be of **ASTM A-536 Grade 65-45-12** in accordance with **AWWA C-517-09 Section 4.3.3.2.** Valves 3" and larger shall be furnished with a welded-in overlay seat of 1/8" thick of not less than 99% nickel in accordance with **AWWA C-517-09, Section 4.3.3.4**. Sprayed, plated or screwed-in seats are not acceptable.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for all sizes in accordance with **AWWA C-517-09 Section 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6**. Bearings shall be of sintered, oil impregnated type 316 stainless steel **ASTM A-743 Grade CF-8M**. Valve shaft seals shall be of the "U" cup type in accordance with **AWWA C-517-09 Section 4.4.7**. Seals shall be self adjusting and repackable without removing the bonnet from the valve.

Wrench operated valves 2½"-8" shall be capable of being converted to worm gear or automated operation without removing the bonnet or plug from the valve. All wrench operated valves shall be equipped with a 2" square nut for use with removeable levers or extended "T" handles.

Worm gear operators, where required, shall be of the heavy duty construction with the ductile iron quadrant supported on the top and bottom by oil impregnated bronze bearings. The worm gear and shaft shall be manufactured of hardened steel and run on high efficiency roller bearings. All worm gear operators shall be sized for bi-directional shutoff at the valves design pressure rating.

Valves shall be designed and manufactured to shut off bubble tight at 175 psi for valves 2½"-12" and 150 psi for valves 14" and larger. Each valve shall be given a hydrostatic and seat test with the test results being certified when required by the customer. Certified copies of Proof-of-Design test reports shall be furnished as outlined in **AWWA C-517-09 Section 5.2.2** when requested.

Plug valves shall be Ballcentric® Plug Valve **Series 611/610** as manufactured by Henry Pratt Company of Aurora, Illinois.

Technical Specification Ballcentric® Series 601GL Glass Lined Plug Valves

AWWA C517-09 Standards
Valves shall be of the non-lubricated eccentric type with an elastomer covering all seating surfaces. The elastomer shall be suitable for the service intended. Flanged valves shall be manufactured in accordance with **ANSI B16.1 Class 125/150** including facing, drilling and flange thickness. Mechanical joint ends shall be in compliance with **AWWA/ ANSI C-111-92**. Grooved ends shall be manufactured to the dimensions of **ANSI/AWWA C606** for ductile or steel pipe as required. Ports shall be round on sizes 3"-12" and rectangular port design on valves 14" and larger. All valves shall be capable of being "pigged" with a soft pig when required.
Valve bodies shall be of **ASTM A-126 Class B** cast iron in accordance with A**WWA C-517-09 Section 4.3.3.1**. Interior of valves shall be glass lined at .008-.012 mils thickness, covering the entire interior of valve bodies and stopping at the flange faces.

Plugs shall be of **ASTM A-536-Grade 65-45-12** for sizes 20" and smaller, and **ASTM A126 Class B Cast Iron** for sizes 24" and larger in compliance with **AWWA C-517-09 Sections 4.3.3.1 and 4.3.3.2**. The plugs shall be of one piece solid construction with PTFE thrust bearings on the upper and lower bearing journals to reduce torque and prevent dirt and grit from entering the bearing and seal area.

Valves shall be furnished with replaceable sleeve type bearings conforming to **AWWA C-517-09, Section 4.3.3.6**. SOLITAX®sc TURBIDITY & SUSPENDED SOLIDS SENSORS

Applications

- Drinking Water
- Wastewater
- Beverage
- Industrial Water
- Power

PROGNOSYS™ READY

Accurate, color-independent suspended solids and turbidity measurements.

Greater Accuracy, Less Maintenance

Hach SOLITAX sc sensors provide accurate, color-independent measurement of turbidity and suspended solids in drinking water, wastewater and industrial process applications. A self-cleaning device prevents biological growth and interference of gas bubbles. This system's reliable performance and full data communication capability help improve process control and reduce treatment costs associated with polymer use, digester volume, and sludge handling.

Excellent Correlation to Laboratory Analysis

SOLITAX sc sensors show an exceptional correlation to laboratory analysis. On-line measurement not only saves time on manual analysis, but also provides critical real-time measurements that can be used to operate the plant more efficiently.

Fully Serviceable Sensors

Conventional turbidity and suspended solids sensors are potted and are discarded when they no longer function. SOLITAX sc sensors are fully serviceable, which often doubles the useful life of the sensor.

Easy One-point Calibration

Factory calibrated in conformity with DIN EN ISO 7027 for long-term calibration stability. Calibration is easy with a simple correction factor procedure.

Multi-channel, Multi-parameter System

Any two SOLITAX sc sensors can be installed on one Hach sc200 Controller. The same controller can also accommodate any combination of parameters. All of Hach's model sc sensors are "plug and play" with no complicated wiring or set-up procedure necessary.

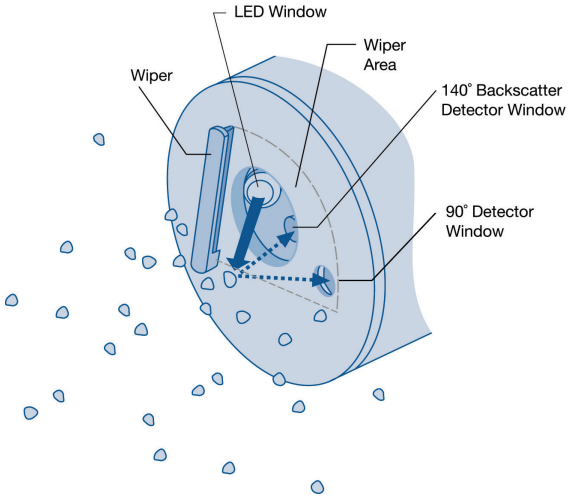
Cable Length	10 m (optional extension cables available)				
					Subject to change without notice

Principle of Operation

SOLITAX sc ts-line sensor with dual-beam optics and added backscatter detector

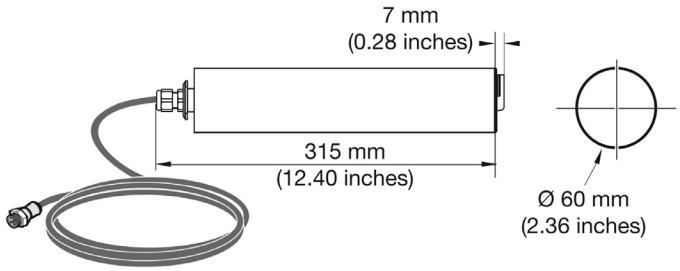
- Dual infrared light beams. LED light source transmits light at 45° to sensor face.
- Nephelometric photoreceptors detect light at 90° to the transmitted light beam.
- Backscatter photoreceptor (included on all models except the SOLITAX sc t-line) detects light at 140° to the transmitted light beam to measure suspended solids in heavily loaded sample streams.
- Self-cleaning wiper, optional.
- T-line probes measure turbidity only. TS, HS, inline, and highline sensors measure either turbidity or suspended solids.



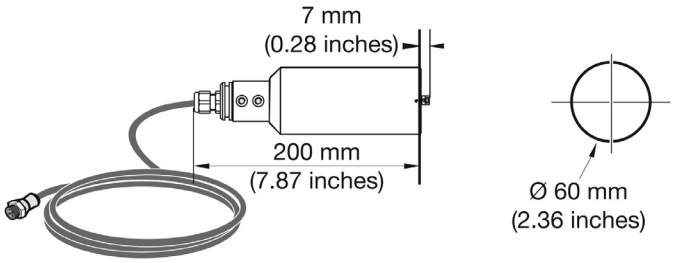
Dimensions

Hach SOLITAX sc sensors can be fixed to the rim of the tank for immersion applications or inserted directly through the sidewall of a pipeline for insertion applications. A variety of installation kits are available.

SOLITAX sc Insertion Probe

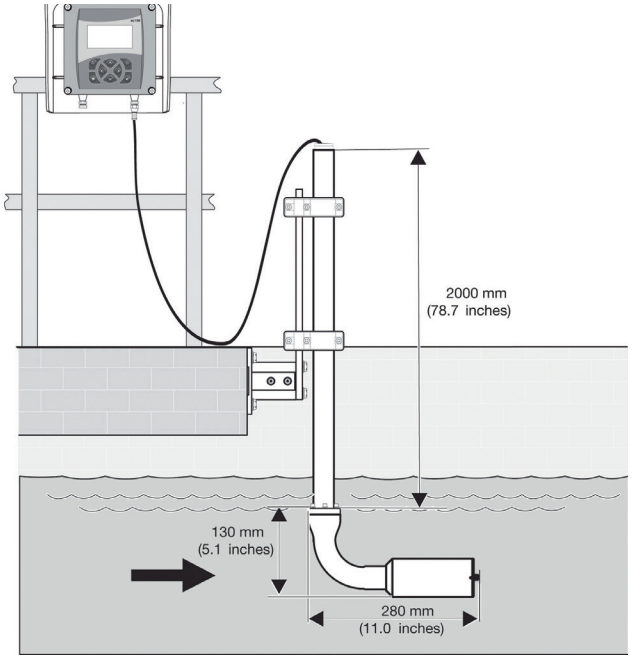


SOLITAX sc Immersion Probe



Installation / Mounting

Installation for mounting SOLITAX sc for immersion in open tanks. (Stainless steel pole mount kit, Prod. No. LZY714.99.53120)



Fixture with ball valve for mounting SOLITAX sc models inline and highline sensors in pipes., minimum pipe size 100 mm (4-in.) (Prod. No. LZX337, max pressure 6 bar; Prod. No. 936, max. pressure 1 bar.

Common Configurations: SOLITAX sc Turbidity and Suspended Solids Analyzers with sc200 controller and sensors shown

Immersion in Open Tanks Applications

2983400 Turbidity Analyzer, t-line sc, stainless steel with wiper (0.001 to 4000 NTU)

2983500 Turbidity and Suspended Solids Analyzer, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

2983600 Turbidity and High Range Suspended Solids Analyzer, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Insertion in Pipes Applications (includes insertion mounting kit)

2983700 Turbidity and Suspended Solids Analyzer, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

2983900 Turbidity and High Range Suspended Solids Analyzer, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

NOTE:
1. Power Cords must be ordered separately.
2. Fixed point installation kit or handrail mount kit must be ordered separately for all immersion analyzers.

Individual SOLITAX sc Sensors

Immersion Sensors

LXV423.99.10000 Turbidity, t-line sc, PVC with wiper (0.001 to 4000 NTU)

LXV423.99.12000 Turbidity, t-line sc, PVC without wiper (0.001 to 4000 NTU)

LXV423.99.10100 Turbidity and Suspended Solids, ts-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.12100 Turbidity and Suspended Solids, ts-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.00100 Turbidity and Suspended Solids, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.02100 Turbidity and Suspended Solids, ts-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.10200 Turbidity and Suspended Solids, hs-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.12200 Turbidity and Suspended Solids, hs-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.00200 Turbidity and Suspended Solids, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.02200 Turbidity and Suspended Solids, hs-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Insertion Sensors

LXV424.99.00100 Turbidity and Suspended Solids, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV424.99.02100 Turbidity and Suspended Solids, inline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV424.99.00200 Turbidity and Suspended Solids, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV424.99.02200 Turbidity and Suspended Solids, highline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Installation Accessories

LZY714.99.53120 Stainless Steel pole mount kit for SOLITAX t-line, ts-line, and hs-line immersion sensors, including 10 cm base and 2 m pole with sensor adapter

5738400 Insertion Mounting Kit for inline and highline insertion sensors (ball valve safety armature and extraction system). Kit includes a 4 inch pre-coped Carbon Steel Flange. Non-coped flanges are available

AHA033NPT Sensor Adapter, straight 1-1/2 FNPT

AHA034NPT Sensor Adapter, elbow 1-1/2 FNPT 90°

MH236B00Z Handrail Mounting Kit (for sensor to be used with either adapter above) includes 1.5-inch diameter by 7.5-ft long CPVC pipe and swivel/pivot/ pipe clamp assembly

LZX337 Stainless steel ball valve safety armature/ extraction fitting for in-line and hi-line probes w/o welding flange, maximum operating pressure 6 bar/87 psi

LZX936 Stainless steel ball valve armature, maximum operation pressure 1 bar/14.5 psi

LZX660 Non-coped stainless steel welding flange for insertion kit

LZX661 Non-coped carbon steel welding flange for insertion kit

sc200™ UNIVERSAL CONTROLLER

Applications
- Drinking Water
- Wastewater
- Industrial Water
- Power

One Controller for the Broadest Range of Sensors.

Choose from 30 digital and analog sensor families for up to 17 different parameters.

Maximum Versatility

The sc200 controller allows the use of digital and analog sensors, either alone or in combination, to provide compatibility with Hach's broad range of sensors, eliminating the need for dedicated, parameter-specific controllers.

Ease of Use and Confidence in Results

Large, high-resolution, transreflective display provides optimal viewing resolution in any lighting condition. Guided calibration procedures in 19 languages minimize complexity and reduce operator error. Password-protected SD card reader offers a simple solution for data download and transfer. Visual warning system provides critical alerts.

Wide Variety of Communication Options

Utilize two to five analog outputs to transmit primary and secondary values for each sensor, or integrate Hach sensors and analyzers into MODBUS RS232/RS485, Profibus® DP, and HART networks.

Password protected SD card reader offers a simple solution for data download and transfer, and sc200 and digital sensor configuration file duplication and backup.

Specifications*

Dimensions (H x W x D)	5.7 in x 5.7 in x 7.1 in (144 mm x 144 mm x 181 mm)
Display	Graphic dot matrix LCD with LED backlighting, transreflective
Display Size	1.9 x 2.7 in. (48 mm x 68 mm)
Display Resolution	240 x 160 pixels
Weight	3.75 lbs. (1.70 kg)
Power Requirements (Voltage)	100 - 240 V AC, 24 V DC
Power Requirements (Hz)	50/60 Hz
Operating Temperature Range	-20 to 60 °C , 0 to 95% RH non-condensing
Analog Outputs	Two (Five with optional expansion module) to isolated current outputs, max 550 Ω , Accuracy: ± 0.1% of FS (20mA) at 25 °C, ± 0.5% of FS over -20 °C to 60 °C range Operational Mode: measurement or calculated value
Analog Output Functional Mode	Linear, Logarithmic, Bi-linear, PID
Security Levels	2 password-protected levels
Mounting Configurations	Wall, pole, and panel mounting
Enclosure Rating	NEMA 4X/IP66
Conduit Openings	1/2 in NPT Conduit
Relay: Operational Mode	Primary or secondary measurement, calculated value (dual channel only) or timer
Relay Functions	Scheduler (Timer), Alarm, Feeder Control, Event Control, Pulse Width Modulation, Frequency Control, and Warning
Relays	Four electromechanical SPDT (Form C) contacts, 1200 W, 5 A
Communication	MODBUS RS232/RS485, PROFIBUS DPV1, or HART 7.2 optional
Memory Backup	Flash memory
Electrical Certifications	EMC CE compliant for conducted and radiated emissions: - CISPR 11 (Class A limits) - EMC Immunity EN 61326-1 (Industrial limits) Safety cETLus safety mark for: - General Locations per ANSI/UL 61010-1 & CAN/CSA C22.2. No. 61010-1 - Hazardous Location Class I, Division 2, Groups A,B,C & D (Zone 2, Group IIC) per FM 3600 / FM 3611 & CSA C22.2 No. 213 M1987 with approved options and appropriately rated Class I, Division 2 or Zone 2 sensors cULus safety mark - General Locations per UL 61010-1 & CAN/CSA C22.2. DIFFERENTIAL pH AND ORP SENSORS

Applications

- Drinking Water
- Wastewater
- Industrial Water
- Power

Wide range pH glass
(HF resistant glass also available)

The smart choice for accurate, reliable, and dependable pH/ORP measurement.

Hach Digital pHD sc sensors are available in convertible (PEEK® or Ryton®), insertion, and sanitary body styles. Three electrodes are used in these sensors to increase measurement accuracy and eliminate sensor ground loops.

Differential Electrode Measurement Technique

This field-proven technique uses three electrodes instead of the two normally used in conventional pH sensors. Process and reference electrodes measure the pH differentially with respect to a third ground electrode. The end result is unsurpassed measurement accuracy, reduced reference junction potential, and elimination of sensor ground loops. These sensors provide greater reliability, resulting in less downtime and maintenance.

Patented Technology

The former GLI, now a Hach Company brand, invented the Differential Electrode Technique for pH measurement in 1970. The pHD™ sensor series (U.S. Patent Number 6395158B1, May 28, 2002) takes this field-proven technology to a new level.

Replaceable Salt Bridge/Protector

The unique, replaceable salt bridge holds an extraordinary volume of buffer to extend the working life of the sensor by protecting the reference electrode from harsh process conditions.

Built-in Encapsulated Preamp

Encapsulated construction protects the sensor's built-in preamp from moisture and humidity, ensuring reliable sensor operation. The preamp in the pHD analog sensor produces a strong signal, enabling the sensor to be located up to 1000 m (3280 ft.) from the analyzer.

Durable Body Materials

Both the digital and analog pH and ORP differential sensors feature a durable PEEK® body for chemical compatibility with most process solutions. For less aggressive solutions, Hach offers a Ryton® sensor in a convertible style for pH and ORP measurement. A sensor with a stainless steel body is available for immersion applications.

Versatile Mounting Styles

Sensors are available in four mounting styles—convertible, insertion, immersion, and sanitary.

Differential Sensor Warranty

Hach Company offers an outstanding warranty on its differential sensors. We will replace any differential sensor that fails due to defects in materials or workmanship within one year from the date of shipment, and up to 30 months on a prorated basis for any failure.

HACH®
Be Right™

Specifications*

pH Sensors

Some industrial applications require accurate measurement and control below 2 or above 12 pH. In these special cases, please contact Hach Technical Support for further details.

Measuring Range	-2 to 14 pH
Sensitivity	±0.01 pH
Stability	0.03 pH per 24 hours, non-cumulative
Operating Temperature	Digital Sensor: -5 to 70ºC (23 to 158ºF) Analog Sensor with Digital Gateway: 5 to 105ºC (23 to 221ºF) Immersion Sensor: 0 to 50ºC (32 to 122ºF)
Flow Rate	3 m (10 ft.) per second, maximum
Sensor Pressure/ Temperature Limits	Digital: 6.9 bar at 70ºC (100 psi at 158ºF) Analog: 6.9 bar at 105ºC (100 psi at 221ºF)
Built-in Temperature Element	NTC 300 ohm thermistor for automatic temperature compensation and analyzer temperature readout
Transmission Distance	100 m (328 ft.), maximum 1000 m (3280 ft.), maximum when used with a termination box
Sensor Cable (integral)	4 conductor cable with one shield and polyurethane jacket; rated to 105ºC (221ºF); 10 m (33 ft.) standard length
Wetted Materials	PEEK® or Ryton® (PVDF), salt bridge of matching material with Kynar® junction, glass process electrode, titanium ground electrode, and Viton® O-ring seals (Please contact Hach Technical Support for available wetted O-ring materials.)

ORP (Redox) Sensors

For best ORP measuring results in solutions containing zinc, cyanide, cadmium or nickel, Hach recommends using the pHD sc ORP sensor equipped with an optional gold electrode.

Measuring Range	-1500 to +1500 mV
Sensitivity	±0.5 mV
Stability	2 mV per 24 hours, non-cumulative
Operating Temperature	Digital Sensor: -5 to 70ºC (23 to 158ºF) Analog Sensor with Digital Gateway: -5 to 105ºC (23 to 221ºF) Immersion Sensor: 0 to 50ºC (32 to 122ºF)
Flow Rate	3 m (10 ft.) per second, maximum
Sensor Pressure/ Temperature Limits	Digital: 6.9 bar at 70ºC (100 psi at 158ºF) Analog: 6.9 bar at 105ºC (100 psi at 221ºF)
Built-in Temperature Element	NTC 300 ohm thermistor for analyzer temperature readout only—no automatic temperature compensation necessary for ORP measurement
Transmission Distance	100 m (328 ft.), maximum 1000 m (3280 ft.), maximum when used with a termination box
Sensor Cable (integral)	4 conductor cable with one shield and polyurethane jacket; rated to 105ºC (221ºF); 10 m (33 ft.) standard length
Wetted Materials	PEEK® or Ryton® (PVDF), salt bridge of matching material with Kynar® junction, glass and platinum (or plastic and gold) process electrode, titanium ground electrode, and Viton® O-ring seals

pHD sc Digital and pHD Analog Sensor Accessories

Cables

Extension cables are used only with digital sensors or digital gateways when connecting to an sc Digital Controller.

6122400	Digital Extension Cable, 1 m (3.2 ft.)
5796000	Digital Extension Cable, 7.7 m (25 ft.)
5796100	Digital Extension Cable, 15 m (50 ft.)
5796200	Digital Extension Cable, 31 m (100 ft.)

Interconnect cables are used only with analog sensors, junction box, and controller.

1W1100	Analog Interconnect Cable, order per foot

Digital Termination Box

Required when the cable between the sensor/gateway and sc Digital Controller is 100 m (328 ft.) to 1000 m (3280 ft.)

5867000	Digital Termination Box

Analog Junction Box

Required when the cable between the analog sensor and controller is greater than standard sensor cable. Includes terminal strip and gasket.

60A2053	Junction Box, Surface-mount, aluminum (includes mounting hardware)
60A9944	Junction Box, Pipe-mount, PVC (for 1/2-inch diameter pipe, includes mounting hardware)
60G2052	Junction Box, Pipe-mount, PVC (for 1-inch diameter pipe, includes mounting hardware)
76A4010-001	Junction Box, NEMA 4X (no mounting hardware included)

Salt Bridges

The double junction salt bridge on the standard cell of all Hach pHD sensors is field-replaceable.

SB-P1SV	PEEK Sensor and Salt Bridge Body, Kynar (PVDF) Outer Junction
SB-P2SV	PEEK Sensor and Salt Bridge Body, Ceramic Outer Junction
SB-P1SP[1]	PEEK Sensor and Salt Bridge Body, Kynar (PVDF) Outer Junction
SB-R1SV	RytonSensor and Salt Bridge Body Kynar (PVDF) Outer Junction

[1]*Special perfluoroelastomer O-ring in place of the Viton® O-ring*

pHD Sensor Reagents and Standards

25M1A1025-115	Standard Cell Solution, 500 mL
25M8A1002-101	Gel Powder, for high temperature applications, 2 g

pH Buffers

2283549	pH 7, 500 mL (1 pint)
2283449	pH 4, 500 mL (1 pint)
2283649	pH 10, 500 mL (1 pint)

ORP Reference Solutions (in resealable plastic bottles)

25M2A1001-115	200 mV	500 mL (1 pint)
25M2A1002-115	600 mV	500 mL (1 pint)

Mounting Hardware for pHD sc Differential Sensors

Sanitary Mount

MH018S8SZ 316 SS

Includes 2-inch sanitary tee and heavy-duty clamp. Cap and EPDM compound gasket supplied with sensor; can be ordered separately.

Union Mount

6131300	CPVC
6131400	316 SS

Includes standard 1-1/2 inch tee, union pipe with adapter, sealing hub, and lock ring and Viton® O-ring.

Flow-through Mount

MH334N4NZ	CPVC
MH314N4MZ	316 SS

Includes a standard 1-inch tee in respective material.

Insertion Mount

Digital		*Analog*	
5646300	CPVC	**5646400**	CPVC
5646350	316 SS	**5646450**	316 SS

Includes a 1-1/2 inch ball valve, 1-1/2 inch NPT close nipple, sensor adapter with two Viton® O-rings and wiper, extension pipe, pipe adapter, back tube, and lock ring.

Immersion Mount

Standard Hardware

Digital		*Analog*	
6136400	CPVC	**MH434A00B**	CPVC
6136500	316 SS	**MH414A00B**	316 SS

Includes 1-inch by 4 ft. pipe and 1-inch x 1-inch NPT coupling. (Pipe-mount junction box with terminal strip included in analog hardware.)

Handrail Hardware

MH236B00Z CPVC

Includes 1-1/2 inch by 7.5 ft. CPVC pipe, and swivel/pivot/ pipe clamp assembly.

Chain Mount Hardware

2881900 316 ss

Includes stainless steel bail, nuts, and washers. Does not include chain. To be used with stainless steel immersion sensor only.

Ball Float Hardware

6131000 CPVC

Includes 1-1/2 inch by 7.5 ft. CPVC pipe, ball float assembly, and swivel/pivot/ pipe clamp assembly.

Type 1009 4½″ & 6″ Stainless Steel Gauge

PLUS! Performance

- *4½″ and 6″ SS gauges*
- *Dry and liquid-filled versions*
- *Micrometer adjustable pointer*
- *Variety of Bourdon tube materials*
- *ASME Grade 1A, ±1% of span accuracy*
- *New PLUS!™ Performance Option:*
  - *Liquid-filled performance in a dry gauge*
  - *Fights vibration and pulsations with out liquid-fill headaches*
  - *Order as option XLL*

The 4½″ and 6″ Ashcroft® Type 1009 gauges are suitable where ambient corrosion is a major concern. Its attractive stainless steel case and ring provides excellent resistance to chemical, weather and corrosion attack. This 1009 has many optional features that allow a user to develop a basic or special product specification. The 1009 is part of the extensive line of Ashcroft stainless steel pressure gauges.

The gauge is available dry, liquid-filled weatherproof or hermetically sealed and now with ***PLUS!***™ Performance option.

TEMPERATURE LIMITS

	Ambient	Process	Storage
Dry	–20°F/200°F[1] (–29°C/93°C)	–20°F/250°F[1] (–29°C/121°C)	–40°F/250°F (–40°C/121°C)
PLUS!™	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)
LF (glycerin)	20°F/150°F (7°C/66°C)	20°F/150°F (7°C/93°C)	0°F/150°F (–18°C/66°C)
(silicone)	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)
(Halocarbon®)	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)

Note: Other than discoloration of the dial and hardening of the gasketing that may occur as ambient or process temperatures exceeds 150°F, non-liquid-filled gauges with standard glass windows, can withstand continuous operating temperatures up to 250°F (121°C). Liquid-filled gauges can withstand 200°F (93°C) but glycerin fill and acrylic window will tend to yellow. Accuracy at temperatures above or below the reference ambient temperature of 68°F will be affected by approximately .4% per 25°F. Gauges with welded joints will withstand 750°F (450°F (232°C) with silver brazed joints) for short times without rupture, although other parts of the gauge will be destroyed and calibration will be lost. For continuous use and for process or ambient temperatures above 250°F (121°C), a diaphragm seal or capillary or siphon is recommended.

PRODUCT SPECIFICATIONS

Model Number:	1009
Accuracy:	1% full scale (Grade A, ASME B40.100)
Ranges:	Vacuum – 30,000 psi
Dial Size:	4½″ and 6″ diameter
Case:	Open front
Case Material:	304 SS
Weather Protection:	Dry Case: IP54 Liquid filled or hermetically sealed case: IP 65
Ring Type:	304 SS, bayonet
Window:	Glass
Dial:	Aluminum, white background, black figures and graduations.
Pointer:	Micrometer adjustable
Movement:	400 SS (conventional)
Bourdon Tube and Socket:	Bronze/Brass (A)[1] 316L SS/316L SS (S)[2] Monel®/Monel® (P)[2]
Connection Size:	¼, ½ NPT
Connection Location:	Lower and back

Type 100 Series Threaded Capsule Diaphragm Seal

TYPE 100 SHOWN

When isolation of the process from an instrument is required, Ashcroft® offers a comprehensive line of diaphragm seals. Seal types include threaded, flanged, in-line threaded, in-line flanged, in-line socket weld, in-line butt weld, saddle and sanitary seals. Also available is a complete offering of isolation or iso-rings and isolation or iso-spools.

APPLICATIONS

- Elevated process temperatures
- Corrosive service
- Isolation of the process for safety
- Suspended solids in the process
- Sanitary connections
- Minimize process dead leg
- Ease of cleaning between batches

FEATURES

- The top housing and diaphragm capsule are interchangeable with all Ashcroft bottom housings.
- A fill/bleed connection is standard, which permits filling the seal and instrument simultaneously after evacuation and allows the fill to flow into the completed unit.
- A Viton O-ring, compatible with all standard fill fluids, and a Teflon back-up ring provide a seal between the diaphragm capsule and the top housing.
- A thin Teflon PTFE gasket between the diaphragm and bottom housing ensures a leak-tight corrosion resistant seal even at high pressure.
- Top housing and pressure instrument are removable.
- Continuous-duty design will prevent loss of process fluid if pressure instrument is removed or fails.

SPECIFICATIONS

Model Number:	Type 100, 101, 102, 103, 104, 105, 106, 107, 108
Process Connection Size:	See Table A (Pg. 2)
Instrument Connection Size:	¼, ½ NPT
Diaphragm Material:	See Table B (Pg. 2)
Bottom Housing Materials:	See Table C (Pg. 2)
Filling Fluid:	Glycerin, Halocarbon, Silicone, Stylthern

OPTIONS	**Code**
316 stainless steel top housing	**YT**
Stainless steel clamp rings and flanged ring – includes 300 stainless steel clamping bolts (1500 psi max)	**SE**
300 series stainless steel clamping bolts (max pres is 1500 psi)	**SB**
Pipe plugs for flushing connections – pipe plugs are available in the same materials as bottom housings per Table C (Pg. 2)	**PU**
5000 psi pressure rating Threaded inlet and metal diaphragm only	**HP**
Welded instrument to diaphragm seal	**DU**
Dual flushing connections (½ NPT) (Limited to 2″ thru 3″ flanged seals	**DB**
Ring joint (Flanged seal only)	**RJ**
Flat face (Flanged seal only)	**FF**
Clean for gaseous oxygen or strong oxidizing agent applications	**6B**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Halocarbon is a registered trademark of Halocarbon Products
GYLON 3510 is a registered trademark of Garlock Inc.

HOW TO ORDER:

1. **From Table A**...select TYPE NUMBER based on process connection, process connection size and diaphragm type/construction. (e.g., Threaded/1˝/capsule–code-10-100)
2. **From Table B**...select DIAPHRAGM MATERIAL. (e.g., 316L stainless steel–code S)
3. **From Table C**...select BOTTOM HOUSING MATERIAL. (e.g., 316 stainless steel–code S)
4. **From Table D**...select INSTRUMENT CONNECTION size. (e.g., 1/4 NPT–code 02T)
5. **From Table E**...select FILLING FLUID, if diaphragm seal will be attached to instrument. (e.g., Glycerin–code CG)

Typical code: 10–100SS–02T–CG

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Technical Information

Proline Promag 50W, 53W

Electromagnetic Flow Measuring System
Flow measurement of liquids in water or wastewater applications

Application

Electromagnetic flowmeter for bidirectional measurement of liquids with a minimum conductivity of ≥ 5 µS/cm:
- Drinking water
- Wastewater
- Sewage sludge

- Flow measurement up to 110000 m³/h (484315 gal/min)
- Fluid temperature up to +80 °C (+176 °F)
- Process pressures up to 40 bar (580 psi)
- Lengths in accordance with DVGW/ISO

Application-specific lining of the measuring pipe from polyurethane or hard rubber with the following drinking water permissions:
- KTW
- WRAS
- NSF
- ACS

Approvals for hazardous area:
- ATEX
- IECEx
- FM
- CSA
- NEPSI

Connection to process control system:
- HART
- PROFIBUS DP/PA
- FOUNDATION Fieldbus
- MODBUS RS485

Your benefits

Promag measuring devices offer you cost-effective flow measurement with a high degree of accuracy for a wide range of process conditions.

The uniform Proline transmitter concept comprises:
- Modular device and operating concept resulting in a higher degree of efficiency
- Software options for batching, electrode cleaning and for measuring pulsating flow
- High degree of reliability and measuring stability
- Uniform operating concept

The tried-and-tested Promag sensors offer:
- No pressure loss
- Not sensitive to vibrations
- Simple installation and commissioning

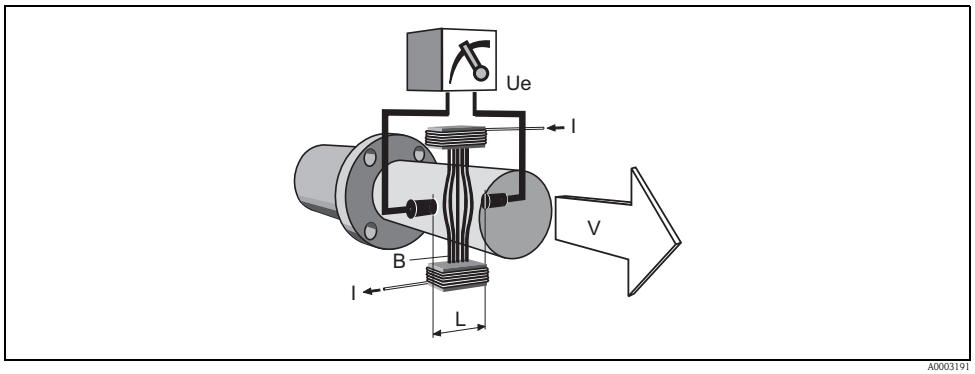
Function and system design

Measuring principle

Following Faraday's law of magnetic induction, a voltage is induced in a conductor moving through a magnetic field.
In the electromagnetic measuring principle, the flowing medium is the moving conductor.
The voltage induced is proportional to the flow velocity and is supplied to the amplifier by means of two measuring electrodes. The flow volume is calculated by means of the pipe cross-sectional area.
The DC magnetic field is created through a switched direct current of alternating polarity.



A0003191

$Ue = B \cdot L \cdot v$
$Q = A \cdot v$

Ue	Induced voltage
B	Magnetic induction (magnetic field)
L	Electrode spacing
v	Flow velocity
Q	Volume flow
A	Pipe cross-section
I	Current strength

Measuring system

The measuring system consists of a transmitter and a sensor.
Two versions are available:
- Compact version: Transmitter and sensor form a mechanical unit.
- Remote version: Sensor is mounted separate from the transmitter.

Transmitter:
- Promag 50 (user interface with push buttons for operation, two-line display, illuminated)
- Promag 53 ("Touch Control" without opening the housing, four-line display, unilluminated)

Sensor:
- Promag W (DN 25 to 2000 / 1 to 78")

Input

Measured variable

Flow velocity (proportional to induced voltage)

Measuring ranges

Measuring ranges for liquids
Typically v = 0.01 to 10 m/s (0.03 to 33 ft/s) with the specified accuracy

Operable flow range

Over 1000 : 1

Input signal

Status input (auxiliary input)
- U = 3 to 30 V DC, R_i = 5 kΩ, galvanically isolated
- Configurable for: totalizer(s) reset, measured value suppression, error-message reset

Status input (auxiliary input) with PROFIBUS DP and MODBUS RS485
- U = 3 to 30 V DC, R_i = 3 kΩ, galvanically isolated
- Switching level: 3 to 30 V DC, independent of polarity
- Configurable for: totalizer(s) reset, measured value suppression, error-message reset, batching start/stop (optional), batch totalizer reset (optional)

Current input (only Promag 53)
- active/passive selectable, galvanically isolated, full scale value selectable, resolution: 3 µA, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading)
- active: 4 to 20 mA, $R_i \leq 150$ Ω, max. 24 V DC, short-circuit-proof
- passive: 0/4 to 20 mA, $R_i < 150$ Ω, max. 30 V DC

Output

Output signal

Promag 50

Current output
active/passive selectable, galvanically isolated, time constant selectable (0.01 to 100 s), full scale value selectable, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading), resolution: 0.5 µA
- active: 0/4 to 20 mA, $R_L < 700$ Ω (HART: $R_L \geq 250$ Ω)
- passive: 4 to 20 mA, operating voltage V_S: 18 to 30 V DC, $R_i \geq 150$ Ω

Pulse/frequency output
passive, open collector, 30 V DC, 250 mA, galvanically isolated
- Frequency output: full scale frequency 2 to 1000 Hz (f_{max} = 1250 Hz), on/off ratio 1:1, pulse width max. 10s
- Pulse output: pulse value and pulse polarity selectable, max. pulse width configurable (0.5 to 2000 ms)

PROFIBUS DP interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- Profil version 3.0
- Data transmission rate: 9,6 kBaud to 12 MBaud
- Automatic data transmission rate recognition
- Function blocks: 1 × analog Input, 1 × totalizer
- Output data: volume flow, totalizer
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

PROFIBUS PA interface
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- Profil version 3.0
- Current consumption: 11 mA
- Permissible supply voltage: 9 to 32 V
- Bus connection with integrated reverse polarity protection
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Function blocks: 1 × analog input, 2 × totalizer
- Output data: volume flow, totalizer
- Input data: positive zero return (ON/OFF), control totalizer, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

Promag 53

Current output
active/passive selectable, galvanically isolated, time constant selectable (0.01 to 100 s),
full scale value selectable, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading), resolution: 0.5 µA
- active: 0/4 to 20 mA, $R_L < 700\ \Omega$ (HART: $R_L \geq 250\ \Omega$)
- passive: 4 to 20 mA, operating voltage V_S: 18 to 30 V DC, $R_i \geq 150\ \Omega$

Pulse/frequency output
active/passive selectable, galvanically isolated (Ex i version: only passive)
- active: 24 V DC, 25 mA (max. 250 mA during 20 ms), $R_L > 100\ \Omega$
- passive: open collector, 30 V DC, 250 mA
- Frequency output: full scale frequency 2 to 10000 Hz (f_{max} = 12500 Hz), EEx-ia: 2 to 5000 Hz; on/off ratio 1:1, pulse width max. 10 s
- Pulse output: pulse value and pulse polarity selectable, max. pulse width configurable (0.05 to 2000 ms)

PROFIBUS DP interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- Profil version 3.0
- Data transmission rate: 9,6 kBaud to 12 MBaud
- Automatic data transmission rate recognition
- Function blocks: 2 × analog Input, 3 × totalizer
- Output data: volume flow, calculated mass flow, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device
- Available output combination → 8

PROFIBUS PA interface
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- Profil version 3.0
- Current consumption: 11 mA
- Permissible supply voltage: 9 to 32 V
- Bus connection with integrated reverse polarity protection
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Function blocks: 2 × analog input, 3 × totalizer
- Output data: volume flow, calculated mass flow, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

MODBUS RS485 interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- MODBUS device type: Slave
- Adress range: 1 to 247
- Bus address adjustable via miniature switches or local display (optional) at the measuring device
- Supported MODBUS function codes: 03, 04, 06, 08, 16, 23
- Broadcast: supported with the function codes 06, 16, 23
- Übertragungsmodus: RTU oder ASCII
- Supported baudrate: 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200 Baud
- Response time:
  - Direct data access = typically 25 to 50 ms
  - Auto-scan buffer (data range) = typically 3 to 5 ms
- Available output combination → 8

FOUNDATION Fieldbus interface
- FOUNDATION Fieldbus H1
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- ITK version 5.01
- Current consumption: 12 mA
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Bus connection with integrated reverse polarity protection
- Function blocks:
  - 5 × Analog Input (execution time: 18 ms each)
  - 1 × PID (25 ms)
  - 1 × Digital Output (18 ms)
  - 1 × Signal Characterizer (20 ms)
  - 1 × Input Selector (20 ms)
  - 1 × Arithmetic (20 ms)
  - 1 × Integrator (18 ms)
- Output data: volume flow, calculated mass flow, temperature, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), reset totalizer
- Link Master (LM) functionality is supported

Signal on alarm
- Current output → failure response selectable (e.g. in accordance with NAMUR recommendation NE 43)
- Pulse/frequency output → failure response selectable
- Status output (Promag 50) → non-conductive by fault or power supply failure
- Relay output (Promag 53) → de-energized by fault or power supply failure

Load

see "Output signal"

Low flow cutoff

Switch points for low flow cutoff are selectable.

Galvanic isolation

All circuits for inputs, outputs and power supply are galvanically isolated from each other.

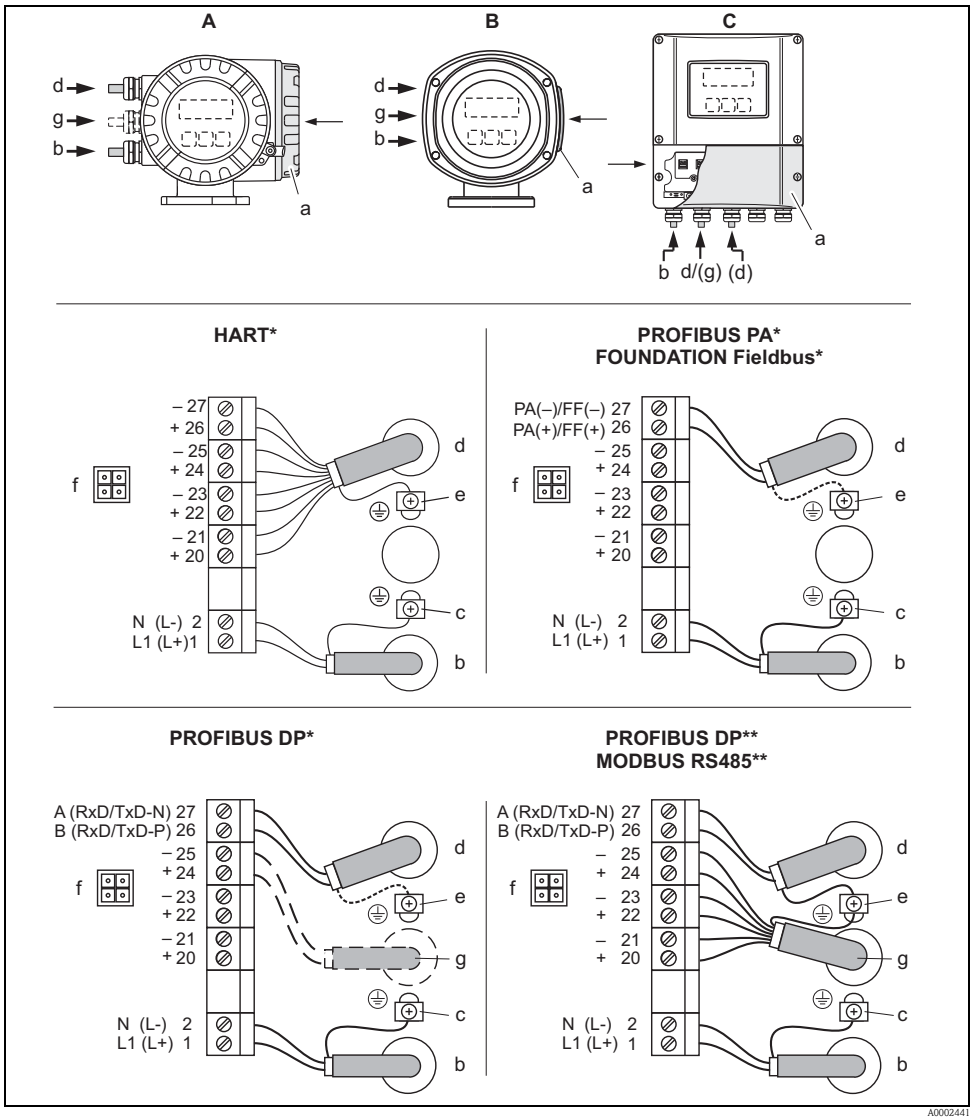
Switching output

Status output (Promag 50, Promag 53)
Open collector, max. 30 V DC / 250 mA, galvanically isolated.
Configurable for: error messages, Empty Pipe Detection (EPD), flow direction, limit values.

Relay outputs (Promag 53)
Normally closed (NC or break) or normally open (NO or make) contacts available
(default: relay 1 = NO, relay 2 = NC), max. 30 V / 0,5 A AC ; 60 V / 0,1 A DC, galvanically isolated.
Configurable for: error messages, Empty Pipe Detection (EPD), flow direction, limit values, batching contacts.

Power supply

Electrical connection, measuring unit



Connecting the transmitter, cable cross-section max. 2.5 mm² (14 AWG)

d Coil current cable
n.c. Not connected, insulated cable shields
Terminal no. and cable colors: 6/5 = brown; 7/8 = white; 4 = green; 36/37 = yellow

Supply voltage (power supply)

- 85 to 260 V AC, 45 to 65 Hz
- 20 to 55 V AC, 45 to 65 Hz
- 16 to 62 V DC

PROFIBUS PA and FOUNDATION Fieldbus
- Non-Ex: 9 to 32 V DC
- Ex i: 9 to 24 V DC
- Ex d: 9 to 32 V DC

Cable entry

Power supply and signal cables (inputs/ outputs):
- Cable entry M20 × 1.5 (8 to 12 mm / 0.31 to 0.47")
- Sensor cable entry for armoured cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63")
- Thread for cable entries, ½" NPT, G ½"

Connecting cable for remote version:
- Cable entry M20 × 1.5 (8 to 12 mm / 0.31 to 0.47")
- Sensor cable entry for armoured cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63")
- Thread for cable entries, ½" NPT, G ½"

Remote version cable specifications

Coil cable
- 2 × 0.75 mm^2 (18 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28")
- Conductor resistance: ≤ 37 Ω/km (≤ 0.011 Ω/ft)
- Capacitance core/core, shield grounded: ≤ 120 pF/m (≤ 37 pF/ft)
- Operating temperature: –20 to +80 °C (–68 to +176 °F)
- Cable cross-section: max. 2.5 mm^2 (14 AWG)
- Test voltage for cable insulation: ≤ 1433 AC r.m.s. 50/60 Hz or ≥ 2026 V DC

Signal cable
- 3 × 0.38 mm^2 (20 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28") and individual shielded cores
- With empty pipe detection (EPD): 4 × 0.38 mm^2 (20 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28") and individual shielded cores
- Conductor resistance: ≤ 50 Ω/km (≤ 0.015 Ω/ft)
- Capacitance core/shield: ≤ 420 pF/m (≤ 128 pF/ft)
- Operating temperature: –20 to +80 °C (–68 to +176 °F)
- Cable cross-section: max. 2.5 mm^2 (14 AWG)

6 Cable shield
7 Outer jacket

Operation in zones of severe electrical interference
The measuring device complies with the general safety requirements in accordance with EN 61010 and the EMC requirements of IEC/EN 61326 and NAMUR recommendation NE 21.

Caution!
Grounding is by means of the ground terminals provided for the purpose inside the connection housing. Ensure that the stripped and twisted lengths of cable shield to the ground terminal are as short as possible.

Power consumption

- AC: < 15 VA (incl. sensor)
- DC: < 15 W (incl. sensor)

Switch-on current:
- Max. 3 A (< 5 ms) for 260 V AC
- Max. 13.5 A (< 50 ms) for 24 V DC

Power supply failure

Lasting min. ½ cycle frequency: EEPROM saves measuring system data
- EEPROM or T-DAT (Promag 53 only) retain the measuring system data in the event of a power supply failure
- S-DAT: exchangeable data storage chip which stores the data of the sensor (nominal diameter, serial number, calibration factor, zero point etc.)

Potential equalization

Warning!
The measuring system must be included in the potential equalization.

Perfect measurement is only ensured when the fluid and the sensor have the same electrical potential. This is ensured by the reference electrode integrated in the sensor as standard.

The following should also be taken into consideration for potential equalization:
- Internal grounding concepts in the company
- Operating conditions, such as the material/ grounding of the pipes (see table)

Standard situation

Operating conditions	Potential equalization
When using the measuring device in a: ■ Metal, grounded pipe Potential equalization takes place via the ground terminal of the transmitter. Note! When installing in metal pipes, we recommend you connect the ground terminal of the transmitter housing with the piping.	 A0011892 Via the ground terminal of the transmitter

Special situations

Operating conditions	Potential equalization
When using the measuring device in a: ■ Metal pipe that is not grounded This connection method also applies in situations where: ■ Customary potential equalization cannot be ensured. ■ Excessively high equalizing currents can be expected. Both sensor flanges are connected to the pipe flange by means of a ground cable (copper wire, at least 6 mm² / 0.0093 in²) and grounded. Connect the transmitter or sensor connection housing, as applicable, to ground potential by means of the ground terminal provided for the purpose. ■ DN ≤ 300 (12"): the ground cable is mounted directly on the conductive flange coating with the flange screws. ■ DN ≥ 350 (14"): the ground cable is mounted directly on the transportation metal support. Note! The ground cable for flange-to-flange connections can be ordered separately as an accessory from Endress+Hauser.	 A0011893 Via the ground terminal of the transmitter and the flanges of the pipe
When using the measuring device in a: ■ Plastic pipe ■ Pipe with insulating lining This connection method also applies in situations where: ■ Customary potential equalization cannot be ensured. ■ Excessively high equalizing currents can be expected. Potential equalization takes place using additional ground disks, which are connected to the ground terminal via a ground cable (copper wire, at least 6 mm² / 0.0093 in²). When installing the ground disks, please comply with the enclosed Installation Instructions.	 A0011895 Via the ground terminal of the transmitter and the optionally available ground disks

Operating conditions	Potential equalization
When using the measuring device in a: ■ Pipe with a cathodic protection unit The device is installed potential-free in the pipe. Only the two flanges of the pipe are connected with a ground cable (copper wire, at least 6 mm² / 0.0093 in²). Here, the ground cable is mounted directly on the conductive flange coating with flange screws. Note the following when installing: ■ The applicable regulations regarding potential-free installation must be observed. ■ There should be **no** electrically conductive connection between the pipe and the device. ■ The mounting material must withstand the applicable torques.	 A0011896 Potential equalization and cathodic protection 1 Power supply isolation transformer 2 Electrically isolated

Performance characteristics

Reference operating conditions

As per DIN EN 29104 and VDI/VDE 2641:
- Fluid temperature: +28 °C ± 2 K (+82 °F ± 2 K)
- Ambient temperature: +22 °C ±2 K (+72 °F ± 2 K)
- Warm-up period: 30 minutes

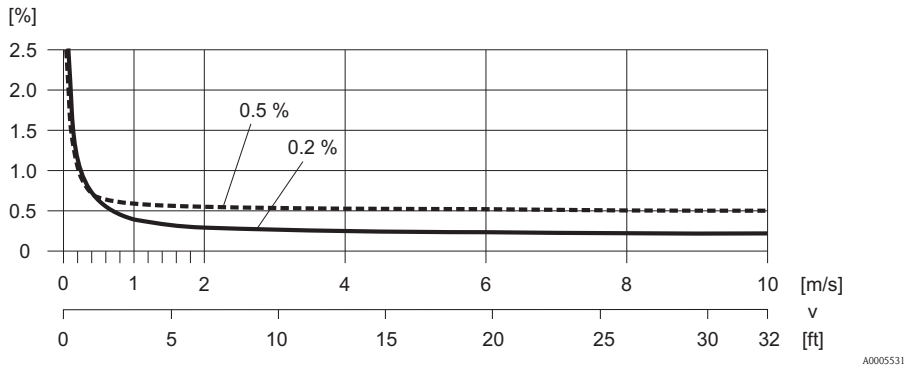
Installation conditions:
- Inlet run > 10 × DN
- Outlet run > 5 × DN
- Sensor and transmitter grounded.
- The sensor is centered in the pipe.

Maximum measured error

Promag 50:
- Current output: also typically ± 5 µA
- Pulse output: ±0.5% o.r. ± 1 mm/s (±0.5% o.r. ± 0.04 in/s)
  optional: ±0.2% o.r. ± 2 mm/s (±0.2% o.r. ± 0.08 in/s) (o.r. = of reading)

Promag 53:
- Current output: also typically ± 5 µA
- Pulse output: ±0.2% o.r. ± 2 mm/s (±0.2% o.r. ± 0.08 in/s) (o.r. = of reading)

Fluctuations in the supply voltage do not have any effect within the specified range.



Max. measured error in % of reading

Repeatability

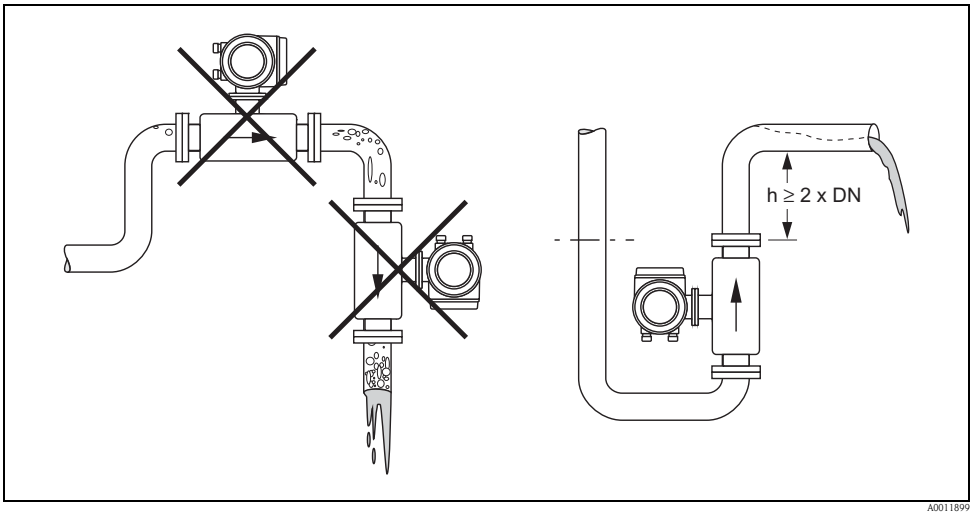
Max. ±0.1% o.r. ± 0.5 mm/s (±0.1% o.r. ± 0.02 in/s) (o.r. = of reading)

Operating conditions: Installations

Installation instructions

Mounting location

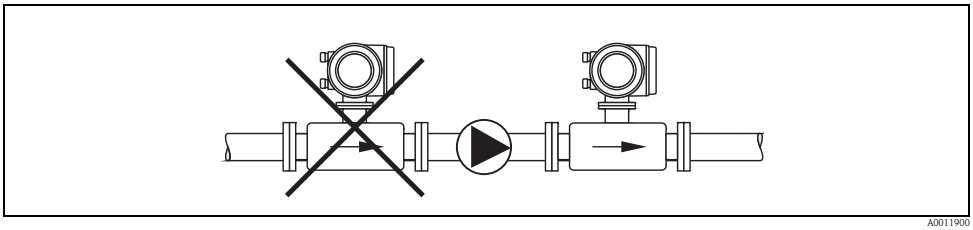
Entrained air or gas bubble formation in the measuring tube can result in an increase in measuring errors.
Avoid the following installation locations in the pipe:
- Highest point of a pipeline. Risk of air accumulating!
- Directly upstream from a free pipe outlet in a vertical pipeline.



Mounting location

Installation of pumps

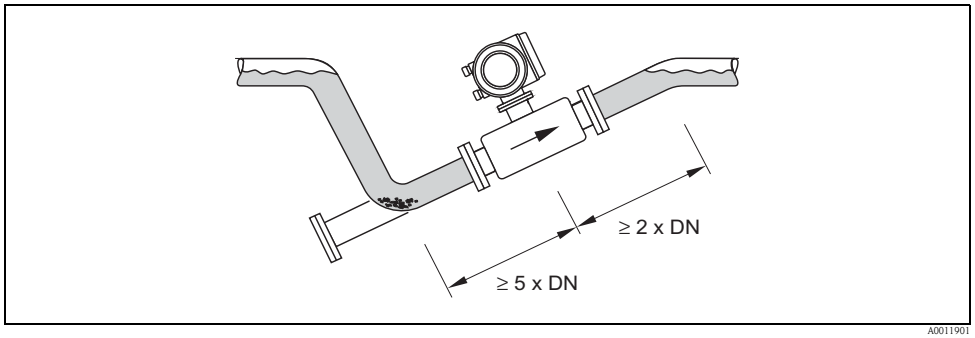
Sensors may not be installed on the pump suction side. This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. Information on the pressure tightness of the measuring tube lining → 21, Section "Pressure tightness".
Pulsation dampers may be needed when using piston pumps, piston diaphragm pumps or hose pumps. Information on the shock and vibration resistance of the measuring system → 20, Section "Shock and vibration resistance".



Installation of pumps

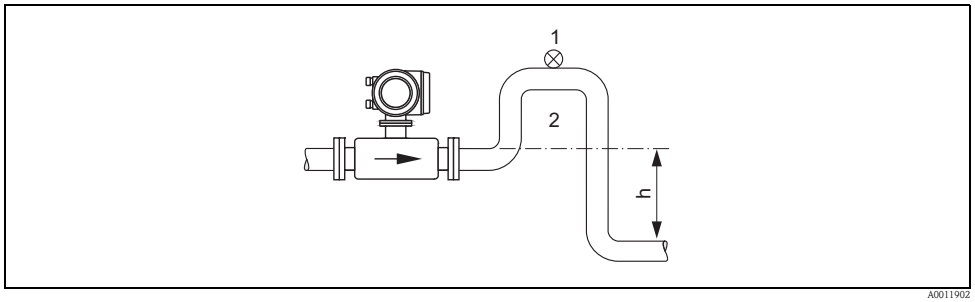
Partially filled pipes
Partially filled pipes with gradients necessitate a drain-type configuration.
The empty pipe detection function (EPD) provides additional security in detecting empty or partially filled pipes.

Caution!
Risk of solids accumulating. Do not install the sensor at the lowest point in the drain. It is advisable to install a cleaning valve.



Installation with partially filled pipes

Down pipes
Install a siphon or a vent valve downstream of the sensor in down pipes h ≥ 5 m (16.4 ft). This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. This measure also prevents the liquid current stopping in the pipe which could cause air locks. Information on the pressure tightness of the measuring tube lining → 21, Section "Pressure tightness".



Installation measures for vertical pipes

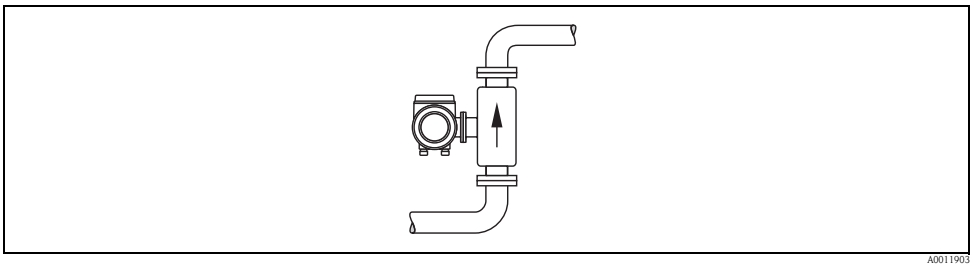
1 Vent valve
2 Pipe siphon
h Length of the down pipe

Orientation

An optimum orientation helps avoid gas and air accumulations and deposits in the measuring tube. However, the measuring device also offers the additional function of empty pipe detection (EPD) for detecting partially filled measuring tubes or if outgassing fluids or fluctuating operating pressures are present.

Vertical orientation

This is the ideal orientation for self-emptying piping systems and for use in conjunction with empty pipe detection.



A0011903

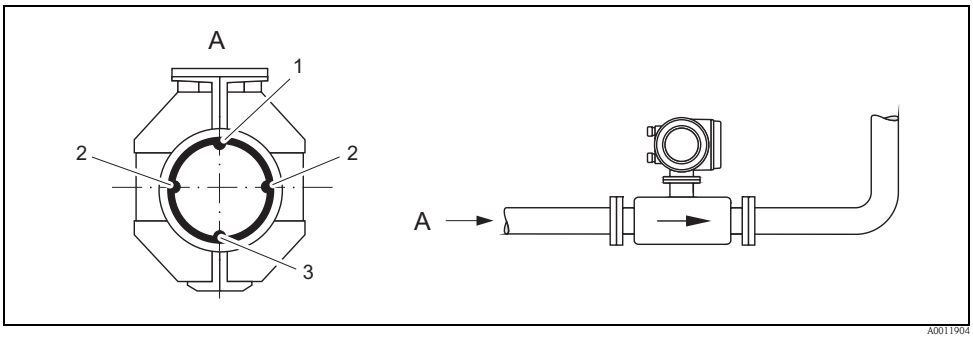
Vertical orientation

Horizontal orientation

The measuring electrode axis should be horizontal. This prevents brief insulation of the two measuring electrodes by entrained air bubbles.

Caution!

Empty pipe detection only works correctly with horizontal orientation if the transmitter housing is facing upwards. Otherwise there is no guarantee that empty pipe detection will respond if the measuring tube is only partially filled or empty.



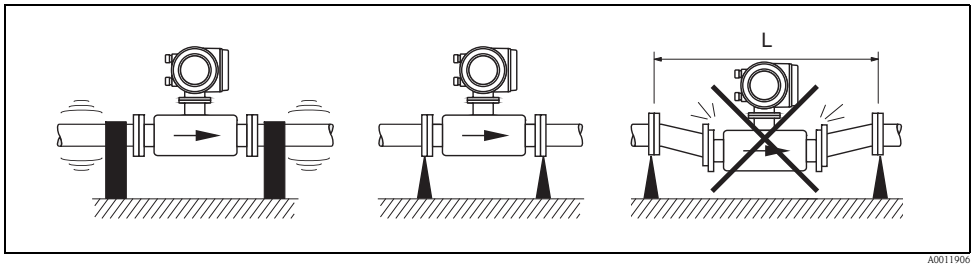
A0011904

Horizontal orientation

1 EPD electrode for empty pipe detection
2 Measuring electrodes for signal detection
3 Reference electrode for potential equalization

Vibrations
Secure the piping and the sensor if vibration is severe.

Caution!
If vibrations are too severe, we recommend the sensor and transmitter be mounted separately. Information on the permitted shock and vibration resistance → 20, Section "Shock and vibration resistance".

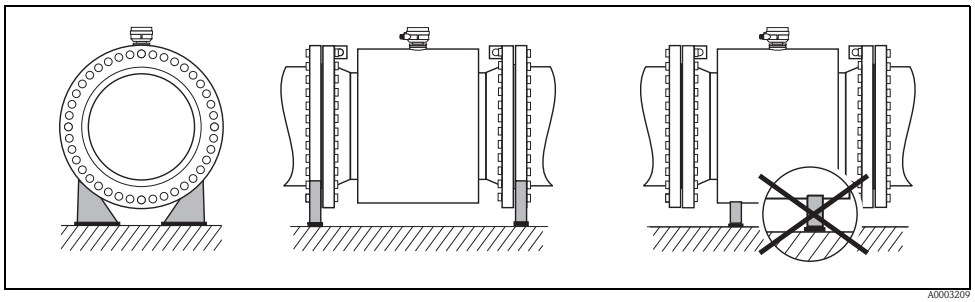


Measures to prevent vibration of the measuring device

L > 10 m (33 ft)

Foundations, supports
If the nominal diameter is DN ≥ 350, mount the transmitter on a foundation of adequate load-bearing strength.

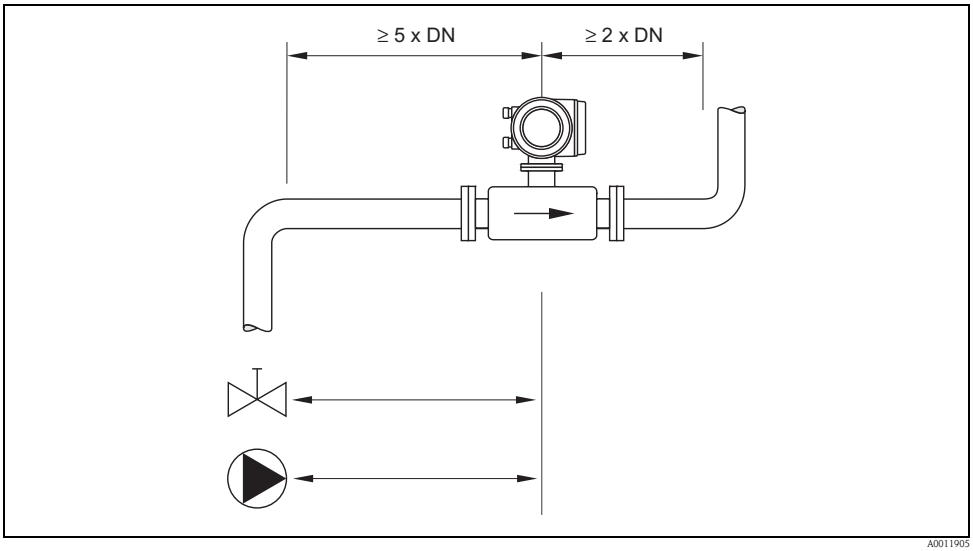
Caution!
Do not allow the casing to take the weight of the sensor. This would buckle the casing and damage the internal magnetic coils.



Inlet and outlet run

If possible, install the sensor well clear of assemblies such as valves, T-pieces, elbows etc.

Note the following inlet and outlet runs to comply with measuring accuracy specifications:
- Inlet run: ≥ 5 × DN
- Outlet run: ≥ 2 × DN



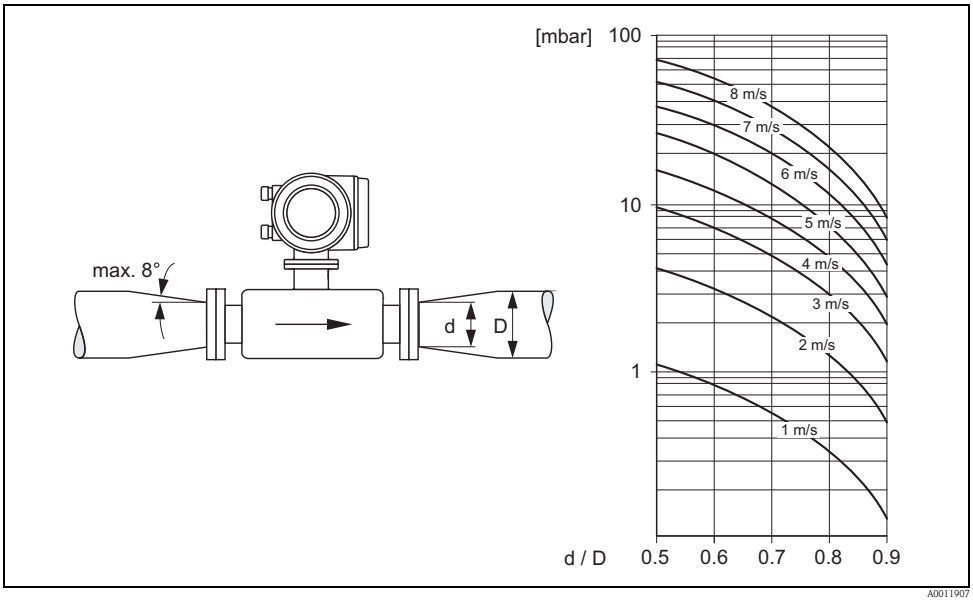
Inlet and outlet run

Adapters

Suitable adapters to DIN EN 545 (double-flange reducers) can be used to install the sensor in larger-diameter pipes. The resultant increase in the rate of flow improves measuring accuracy with very slow-moving fluids. The nomogram shown here can be used to calculate the pressure loss caused by reducers and expanders.

Note!
The nomogram only applies to liquids of viscosity similar to water.

1. Calculate the ratio of the diameters d/D.
2. From the nomogram read off the pressure loss as a function of flow velocity (downstream from the reduction) and the d/D ratio.

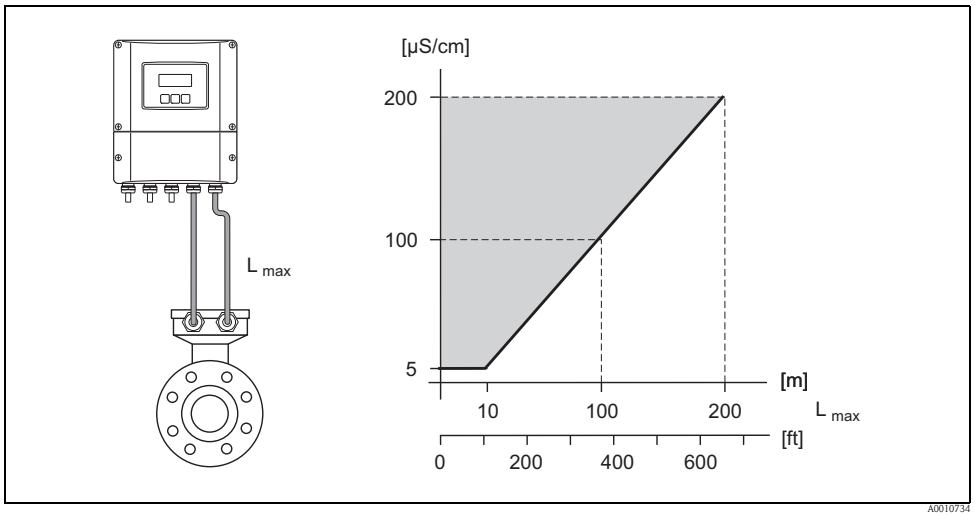


Pressure loss due to adapters

Length of connecting cable

When mounting the remote version, please note the following to achieve correct measuring results:

- Fix cable run or lay in armored conduit. Cable movements can falsify the measuring signal especially in the case of low fluid conductivities.
- Route the cable well clear of electrical machines and switching elements.
- If necessary, ensure potential equalization between sensor and transmitter.
- The permitted cable length L_{max} is determined by the fluid conductivity. A minimum conductivity of 20 µS/cm is required for measuring demineralized water.
- When the empty pipe detection function is switched on (EPD), the maximum connecting cable length is 10 m (33 ft).



Permitted length of connecting cable for remote version
Area marked in gray = permitted range; L_{max} = length of connecting cable in [m] ([ft]); fluid conductivity in [µS/cm]

Operating conditions: Environment

Ambient temperature range

Transmitter
- Standard: –20 to +60 °C (–4 to +140 °F)
- Optional: –40 to +60 °C (–40 to +140 °F)

Note!
At ambient temperatures below –20 °C (–4 °F)the readability of the display may be impaired.

Sensor
- Flange material carbon steel: –10 to +60 °C (14 to +140 °F)
- Flange material stainless steel: –40 to +60 °C (–40 to +140 °F)

Caution!
The permitted temperature range of the measuring tube lining may not be undershot or overshot
→ 21, Section "Medium temperature range".

Please note the following points:
- Install the device in a shady location. Avoid direct sunlight, particularly in warm climatic regions.
- The transmitter must be mounted separate from the sensor if both the ambient and fluid temperatures are high.

Storage temperature

The storage temperature corresponds to the operating temperature range of the measuring transmitter and the appropriate measuring sensors.

Caution!
- The measuring device must be protected against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- A storage location must be selected where moisture does not collect in the measuring device. This will help prevent fungus and bacteria infestation which can damage the liner.
- Do not remove the protective plates or caps on the process connections until the device is ready to install.

Degree of protection
- Standard: IP 67 (NEMA 4X) for transmitter and sensor.
- Optional: IP 68 (NEMA 6P) for sensor for remote version.
- For information regarding applications where the device is buried directly in the soil or is installed in a flooded wastewater basin please contact your local Endress+Hauser Sales Center.

Shock and vibration resistance

Acceleration up to 2 g following IEC 600 68-2-6

Electromagnetic compatibility (EMC)
- As per IEC/EN 61326 and NAMUR recommendation NE 21.

Operating conditions: Process

Medium temperature range

The permitted temperature depends on the lining of the measuring tube:
- Polyurethane: –20 to +50 °C (–4 to +122 °F) (DN 25 to 1200 / 1 to 48")
- Hard rubber: ±0 to +80 °C (+32 to +176 °F) (DN 50 to 2000 / 2 to 78")

Conductivity

The minimum conductivity is:
- ≥ 5 µS/cm for fluids generally
- ≥ 20 µS/cm for demineralized water

Note!
In the remote version, the necessary minimum conductivity also depends on the cable length (→ 19, Section "Length of connecting cable").

Medium pressure range (nominal pressure)

- EN 1092-1 (DIN 2501)
  - PN 6 (DN 350 to 2000 / 14 to 78")
  - PN 10 (DN 200 to 2000 / 8 to 78")
  - PN 16 (DN 65 to 2000 / 3 to 78")
  - PN 25 (DN 200 to 1000 / 8 to 40")
  - PN 40 (DN 25 to 150 / 1 to 6")
- ANSI B 16.5
  - Class 150 (DN 1 to 24")
  - Class 300 (DN 1 to 6")
- AWWA
  - Class D (DN 28 to 78")
- JIS B2220
  - 10 K (DN 50 to 300 / 2 to 12")
  - 20 K (DN 25 to 300 / 1 to 12")
- AS 2129
  - Table E (DN 80, 100, 150 to 400, 500, 600 / 3", 4", 6 to 16", 20", 24")
- AS 4087
  - PN 16 (DN 80, 100, 150 to 400, 500, 600 / 3", 4", 6 to 16", 20", 24")

Pressure tightness

Measuring tube lining: Polyurethane

Nominal diameter		Limit values for abs. pressure [mbar] ([psi]) at fluid temperatures:			
		25 °C (77 °F)		50 °C (122 °F)	
[mm]	[inch]	[mbar]	[psi]	[mbar]	[psi]
25 to 1200	1 to 48"	0	0	0	0

Measuring tube lining: Hard rubber

Nominal diameter		Limit values for abs. pressure [mbar] ([psi]) at fluid temperatures:					
		25 °C (77 °F)		50 °C (122 °F)		80 °C (176 °F)	
[mm]	[inch]	[mbar]	[psi]	[mbar]	[psi]	[mbar]	[psi]
50 to 2000	2 to 78"	0	0	0	0	0	0

Limiting flow

The diameter of the pipe and the flow rate determine the nominal diameter of the sensor.
The optimum flow velocity is between 2 to 3 m/s (6.5 to 9.8 ft/s). The velocity of flow (v), moreover, has to be matched to the physical properties of the fluid:

- v < 2 m/s (6.5 ft/s): for abrasive fluids such as potter's clay, lime milk, ore slurry etc.
- v > 2 m/s (6.5 ft/s): for fluids causing build-up such as wastewater sludges etc.

Flow characteristic values (SI units)

Diameter		Recommended flow	Factory settings

Pressure loss

- No pressure loss if the sensor is installed in a pipe with the same nominal diameter.
- Pressure losses for configurations incorporating adapters according to DIN EN 545 (→ 18, Section "Adapters").

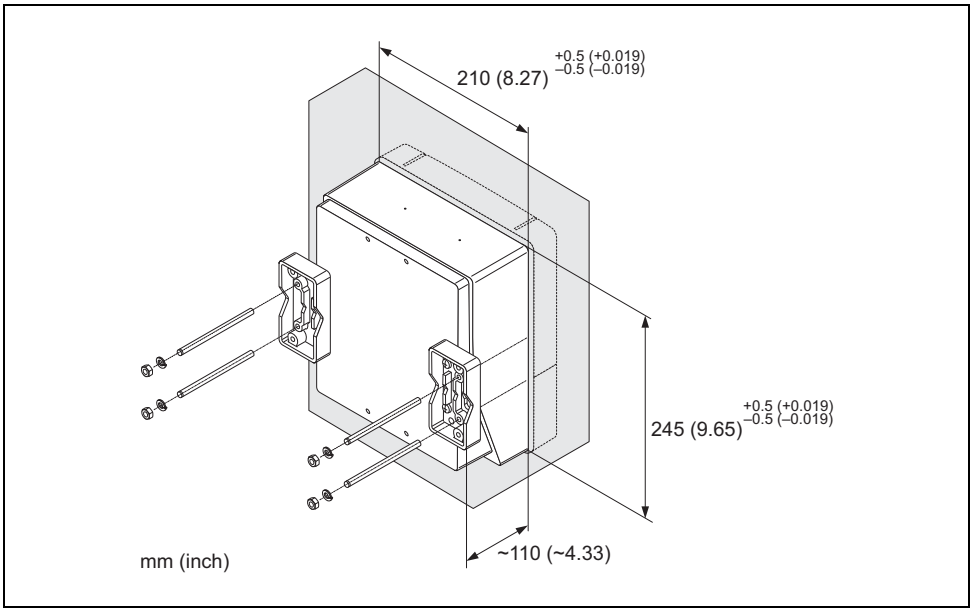
There is a separate mounting kit for the wall-mounted housing. It can be ordered from Endress+Hauser as an accessory. The following installation variants are possible:
- Panel-mounted installation
- Pipe mounting

Installation in control panel



A0001131

Pipe mounting

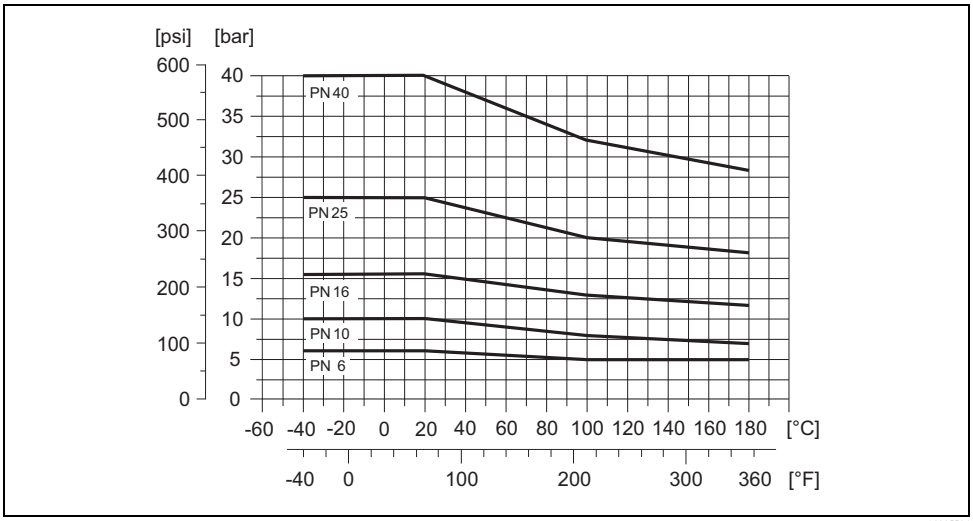
Material

- Transmitter housing
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mount housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 25 to 300 (1 to 12"): powder-coated die-cast aluminum
  - DN 350 to 2000 (14 to 78"): with protective lacquering
- Measuring tube
  - DN ≤ 300 (12"): stainless steel 1.4301 or 1.4306/304L; (for flanges made of carbon steel with Al/Zn protective coating)
  - DN ≥ 350 (14"): stainless steel 1.4301 or 1.4306/304L; (for flanges made of carbon steel with Al/Zn protective coating)
- Electrodes: 1.4435, Alloy C-22, Tantalum
- Flanges
  - EN 1092-1 (DIN 2501): 1.4571/316L; RSt37-2 (S235JRG2); C22; FE 410W B (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - ANSI: A105; F316L (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AWWA: 1.0425
  - JIS: RSt37-2 (S235JRG2); HII; 1.0425/316L (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AS 2129
    - DN 150 to 300, 600 (6 to 12", 24"): A105 or RSt37-2 (S235JRG2)
    - DN 50, 80, 100, 350, 400, 500 (2", 3", 4", 14", 16", 20"): A105 or St44-2 (S275JR)
  - AS 4087: A105 or St44-2 (S275JR)
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435/316L, Alloy C-22, Tantalum

Material load diagram

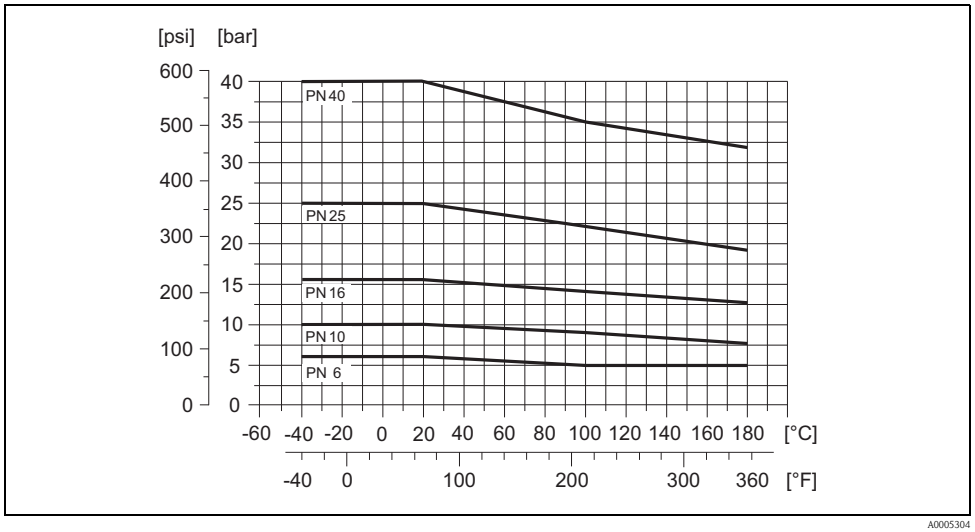
Caution!
The following diagrams contain material load diagrams (reference curves) for flange materials with regard to the medium temperature. However, the maximum medium temperatures permitted always depend on the lining material of the sensor and/or the sealing material (→ 21).

Flange connection to EN 1092-1 (DIN 2501)
Material: RSt37-2 (S235JRG2) / C22 / Fe 410W B

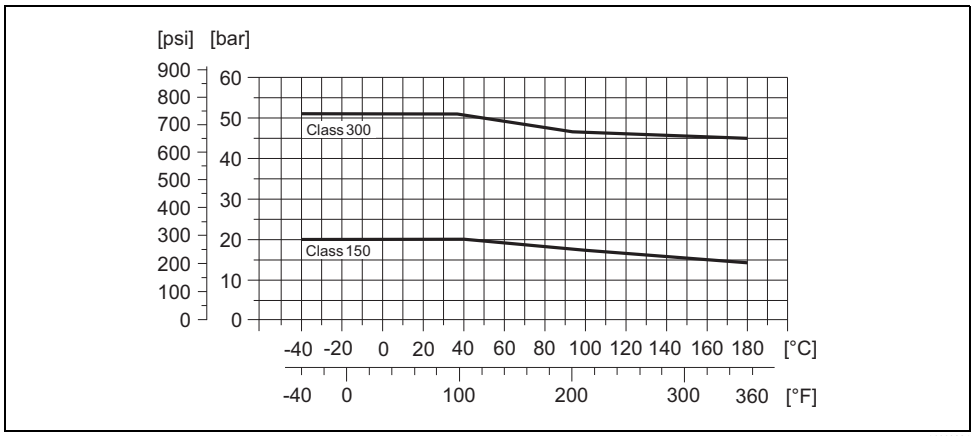


A0005594

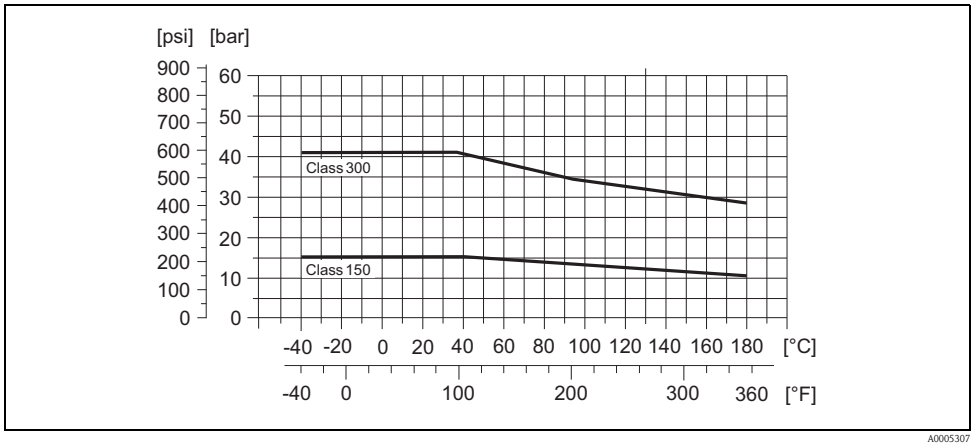
Flange connection to EN 1092-1 (DIN 2501)
Material: 316L / 1.4571



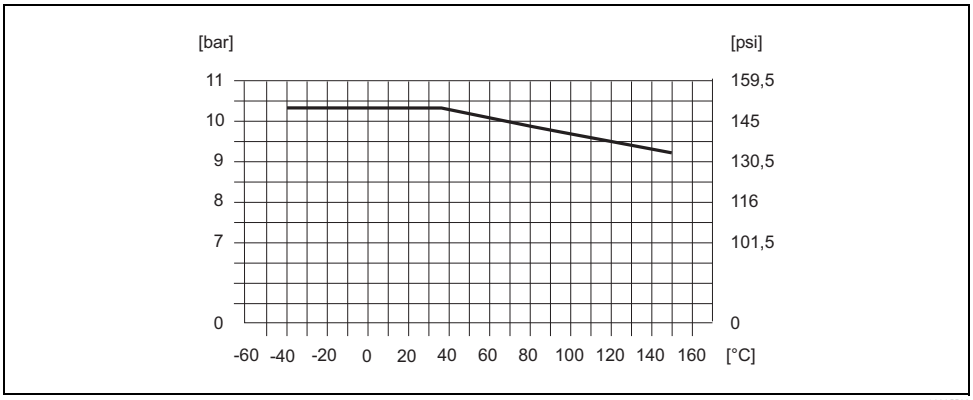
Flange connection to ANSI B16.5
Material: A 105



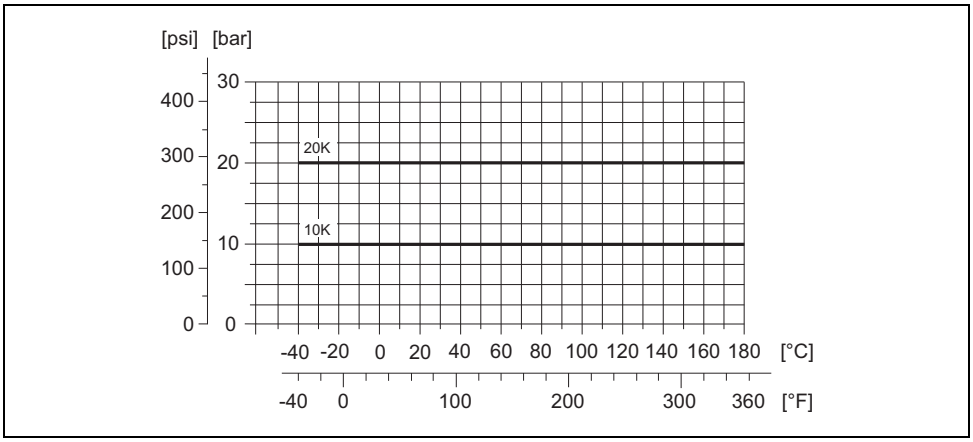
Flange connection to ANSI B16.5
Material: F316L



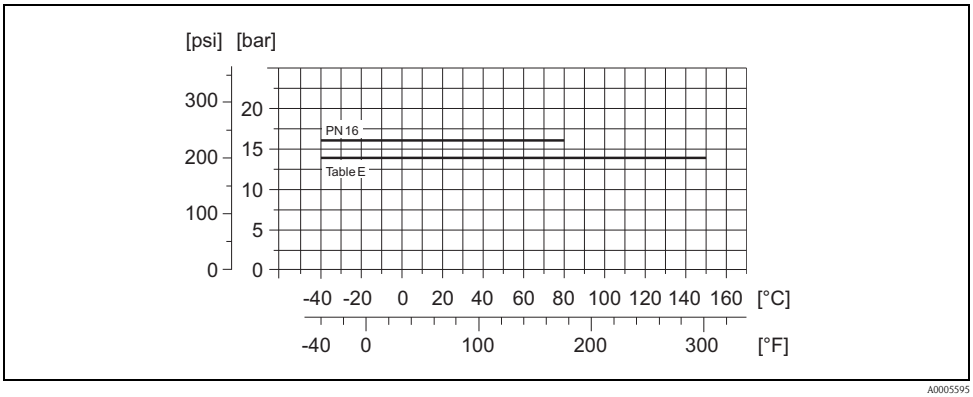
Flange connection to AWWA C 207, Class D
Material: 1.0425



Flange connection to JIS B2220
Material: RSt37-2 (S235JRG2) / HII / 1.0425 / 316L



Flange connection to AS 2129 Table E or AS 4087 PN 16
Material: A105 / RSt37-2 (S235JRG2) / St44-2 (S275JR)



Fitted electrodes

Measuring electrodes, reference electrodes and empty pipe detection electrodes:
- Standard available with 1.4435, Alloy C-22, tantalum
- Optional: exchangeable measuring electrodes made of 1.4435 (DN 350 to 2000 / 14 to 78")

Process connections

Flange connection:
- EN 1092-1 (DIN 2501), DN ≤ 300 (12") form A, DN ≥ 350 (14") form B
  (Dimensions to DIN 2501, DN 65 PN 16 and DN 600 (24") PN 16 exclusively to EN 1092-1)
- ANSI B16.5
- AWWA C 207, Class D
- JIS B2220
- AS 2129 Table E
- AS 4087 PN 16

Surface roughness

- Electrodes
  – 1.4435, Alloy C-22, tantal: ≤ 0.3 to 0.5 µm (≤ 11.8 to 19.7 µin)

(all data refer to parts in contact with medium)

Human interface

Display elements

- Liquid crystal display: backlit, two lines (Promag 50) or four lines (Promag 53) with 16 characters per line
- Custom configurations for presenting different measured-value and status variables
- Totalizer
  – Promag 50: 2 totalizers
  – Promag 53: 3 totalizers

Operating elements

Unified operation concept for both types of transmitter:

Promag 50:
- Local operation via three keys (−, +, E)
- Quick Setup menus for straightforward commissioning

Promag 53:
- Local operation via three keys (−, +, E)
- Application-specific Quick Setup menus for straightforward commissioning

Language groups

Language groups available for operation in different countries:

Promag 50, Promag 53:
- Western Europe and America (WEA):
  English, German, Spanish, Italian, French, Dutch, Portuguese
- Eastern Europe and Scandinavia (EES):
  English, Russian, Polish, Norwegian, Finnish, Swedish, Czech
- South and east Asia (SEA):
  English, Japanese, Indonesian

Promag 53:
- China (CN):
  English, Chinese

You can change the language group via the operating program "FieldCare".

Remote operation

- Promag 50: Remote control via HART, PROFIBUS DP/PA
- Promag 53: Remote control via HART, PROFIBUS DP/PA, MODBUS RS485, FOUNDATION Fieldbus

Certificates and approvals

CE mark

The measuring system is in conformity with the statutory requirements of the EC Directives. Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

C-tick mark

The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

Pressure measuring device approval

Measuring devices with a nominal diameter smaller than or equal to DN 25 correspond to Article 3(3) of the EC Directive 97/23/EC (Pressure Equipment Directive) and have been designed and manufactured according to good engineering practice. Where necessary (depending on the medium and process pressure), there are additional optional approvals to Category II/III for larger nominal diameters.

Ex approval

Information about currently available Ex versions (ATEX, IECEx, FM, CSA, NEPSI) can be supplied by your Endress+Hauser Sales Center on request. All explosion protection data are given in a separate documentation which is available upon request.

Other standards and guidelines

- EN 60529
  Degrees of protection by housing (IP code)
- EN 61010
  Protection Measures for Electrical Equipment for Measurement, Control, Regulation and Laboratory Procedures.
- IEC/EN 61326
  “Emission in accordance with requirements for Class A”.
  Electromagnetic compatibility (EMC requirements)
- NAMUR NE 21:
  Electromagnetic compatibility (EMC) of industrial process and laboratory control equipment.
- NAMUR NE 43:
  Standardization of the signal level for the breakdown information of digital transmitters with analog output signal.
- NAMUR NE 53:
  Software of field devices and signal-processing devices with digital electronics.
- ANSI/ISA-S82.01
  Safety Standard for Electrical and Electronic Test, Measuring, Controlling and related Equipment - General Requirements Pollution degree 2, Installation Category II.
- CAN/CSA-C22.2 No. 1010.1-92
  Safety requirements for Electrical Equipment for Measurement and Control and Laboratory Use. Pollution degree 2, Installation Category II

FOUNDATION Fieldbus certification

The flow device has successfully passed all the test procedures carried out and is certified and registered by the Fieldbus Foundation. The device thus meets all the requirements of the following specifications:

- Certified to FOUNDATION Fieldbus Specification
- The device meets all the specifications of the FOUNDATION Fieldbus H1.
- Interoperability Test Kit (ITK), revision status 5.01 (device certification number: on request)
- The device can also be operated with certified devices of other manufacturers
- Physical Layer Conformance Test of the Fieldbus Foundation

MODBUS RS485 certification

The measuring device meets all the requirements of the MODBUS/TCP conformity test and has the “MODBUS/TCP Conformance Test Policy, Version 2.0”. The measuring device has successfully passed all the test procedures carried out and is certified by the “MODBUS/TCP Conformance Test Laboratory” of the University of Michigan.

PROFIBUS DP/PA certification

The flow device has successfully passed all the test procedures carried out and is certified and registered by the PNO (PROFIBUS User Organisation). The device thus meets all the requirements of the following specifications:

- Certified to PROFIBUS PA, profile version 3.0 (device certification number: on request)
- The device can also be operated with certified devices of other manufacturers (interoperability)

Accessories

Various accessories, which can be ordered separately from Endress+Hauser, are available for the transmitter and the sensor. Your Endress+Hauser service organization can provide detailed information on the order codes in question.

Order Codes

NOTE: Endress+Hauser reserves the right to change or modify product, specifications, and ordering information at any time without notice.
Please consult Endress+Hauser or your local representative for the most recent information.

Please note that the Promag 50W/53W is also available with:
- Hard rubber and Polyurethane liners; ACS, KTW/W270 and WRAS B59620 approvals
- PED Cat. II / III material certificates
- ATEX and NEPSI hazardous area approvals
- DIN2501 and JIS B2220 process connections

Consult factory for information.

- E SCS/A2LA 3-point 0.2% calibration (ISO/IEC 17025) with certificate traceable according to ISO 9000 (specify range)
- 9 Special version, to be specified

050 Certificates
- 1 Standard, no certificate
- 2 3.1B material certificate for pipe and flanges
- 3 2.3 pressure test certificate (1.5 x PN, 3 minutes) for sensors up to 12" only
- 4 3.1B material and 2.3 pressure test certificate for sensors up to 12" only
- 5 CRN approval
- 8 CRN approval + material certificate + pressure test
- 9 Special version, to be specified

060 Approvals
- A For use in non-hazardous areas
- N FM explosion proof Class I, Div. 1 / CSA Class I, Div. 1 (only for aluminum field housing, compact version, not for 14" and larger sensors)
- R FM non-incendive Class I, Div. 2 / CSA Class I, Div. 2

070 Housing
- A NEMA 4X (IP 67) compact aluminum housing
- C NEMA 4X (IP 67) remote wall-mounted (only for approvals A or R)
- G NEMA 4X (IP 67) remote aluminum field housing for non-hazardous areas
- K NEMA 6P sensor, wall-mounted housing (only for approvals A or R)
- N NEMA 6P sensor, aluminum field housing, non-hazardous
- P NEMA 4X (IP 67) compact aluminum housing, HE (harsh environment), compact and remote sensor sizes up to 12" only *
- S NEMA 4X (IP 67) remote wall-mounted housing, HE (harsh environment), remote sensor sizes 14" to 78" (only for approvals A and R) *
- 1 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67), compact, aluminum field housing (only for approvals A and R)
- 3 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67), compact (only for approvals A and R)
- 5 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67) wall mount housing, for NEMA 6P sensor (only for approvals A and R)
- 9 Special version, to be specified

080 Cable for remote
- 0 Without cable
- 1 15 foot coil and signal cable
- 2 30 foot coil and signal cable
- 5 Coil and signal cable, specify length (maximum 650 ft depending on conductivity of process material)
- 7 Coil and signal cable, flexible conduit, specify length (maximum 650 ft depending on conductivity of process material)
- 9 Special version, to be specified

090 Cable entries
- B 1/2" NPT
- L 1/2" NPT fieldbus connector (only for approval A and R)
- 9 Special version, to be specified

100 Power supply / display
- 7 85 to 260 VAC, without display, remote configuration only (not for wall mount or SS housing)
- 8 20 to 55 VAC / 16 to 62 VDC, without display, remote configuration only (not for wall mount or SS housing)
- A 85 to 260 VAC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- B 20 to 55 VAC / 16 to 62 VDC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- X Sensor only (without transmitter, only available up to 8")
- 9 Special version, to be specified

110 Software
- A Standard software
- X Sensor only (up to 8" only)
- 9 Special version, to be specified

120 Outputs / Inputs
- A Current HART, SIL, frequency
- D Current HART, SIL, frequency, status output, status input
- H PROFIBUS-PA (approvals A and R only)
- J PROFIBUS-DP (approvals A and R only)
- S Current HART, SIL, frequency; active I.S. (not for approvals A and R)
- T Current HART, SIL, frequency; passive I.S. (not for approvals A and R)
- W Current HART, SIL
- X Sensor only
- 9 Special version, to be specified

* Harsh environment (HE) option is available for process conditions where cool process temperatures in tropical (high humidity) environments or process fluids which undergo large cyclical temperature variations which can cause high amounts of moisture that could condense onto the measurement tube.

- B 3-point calibration, 0.2%
- D SCS/A2LA 3-point 0.5% calibration (ISO/IEC 17025) with certificate traceable according to ISO 9000 (specify range)
- E SCS/A2LA 3-point 0.2% calibration (ISO/IEC 17025) with certificate traceable according to ISO 9000 (specify range)
- 9 Special version, to be specified

050 Certificates
- 1 Standard, no certificate
- 2 3.1B material certificate for pipe and flanges
- 9 Special version, to be specified

060 Approvals
- A For use in non-hazardous areas
- R FM non-incendive Class I, Div. 2 / CSA Class I, Div. 2

070 Housing
- A NEMA 4X (IP 67) compact aluminum housing
- C NEMA 4X (IP 67) remote wall-mounted (only for approvals A or R)
- G NEMA 4X (IP 67) remote aluminum field housing for non-hazardous areas
- K NEMA 6P sensor, wall-mounted housing (only for approvals A or R)
- S NEMA 4X (IP 67) remote wall-mounted housing, HE (harsh environment), remote sensor sizes 14” to 78” (only for approvals A and R) *
- 1 –40°F (–40°C) ambient temperature, NEMA 4X (IP 67), compact, aluminum field housing (only for approvals A and R)
- 3 –40°F (–40°C) ambient temperature, NEMA 4X (IP 67), compact (only for approvals A and R)
- 5 –40°F (–40°C) ambient temperature, NEMA 4X (IP 67) wall mount housing, for NEMA 6P sensor (only for approvals A and R)
- 9 Special version, to be specified

080 Cable for remote
- 0 Without cable
- 1 15 foot coil and signal cable
- 2 30 foot coil and signal cable
- 5 Coil and signal cable, specify length (maximum 650 ft depending on conductivity of process material)
- 7 Coil and signal cable, flexible conduit, specify length (maximum 650 ft depending on conductivity of process material)
- 9 Special version, to be specified

090 Cable entries
- B 1/2” NPT
- L 1/2” NPT fieldbus connector (only for approval A and R)
- 9 Special version, to be specified

100 Power supply / display
- 7 85 to 260 VAC, without display, remote configuration only (not for wall mount or SS housing)
- 8 20 to 55 VAC / 16 to 62 VDC, without display, remote configuration only (not for wall mount or SS housing)
- A 85 to 260 VAC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- B 20 to 55 VAC / 16 to 62 VDC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- X Sensor only (without transmitter, only available up to 8”)
- 9 Special version, to be specified

110 Software
- A Standard software
- 9 Special version, to be specified

120 Outputs / Inputs
- A Current HART, SIL, frequency
- D Current HART, SIL, frequency, status output, status input
- H PROFIBUS-PA (approvals A and R only)
- J PROFIBUS-DP (approvals A and R only)
- S Current HART, SIL, frequency; active I.S. (not for approvals A and R)
- T Current HART, SIL, frequency; passive I.S. (not for approvals A and R)
- W Current HART, SIL
- X Sensor only
- 9 Special version, to be specified

* Harsh environment (HE) option is available for process conditions where cool process temperatures in tropical (high humidity) environments or process fluids which undergo large cyclical temperature variations which can cause high amounts of moisture that could condense onto the measurement tube.

- Spares & Services

Valve solutions

For demanding shut-off and control applications

We deliver flow control solutions for the most demanding process conditions. Our story has started over 40 years ago making us the industry benchmark and experts on valve technology. Our robust full bore design enables effortless process flow. We provide services ranging from sizing, materials selection, installation, spare parts and maintenance to optimize the up- and downstreams flow.

1977:
Company Larox is established

1993:
Company Larox Flowsys Oy is established

2000:
Product portfolio expanded to plastic body PVEG valves

2009:
Product portfolio expanded to Slurry Knife Gate Valves

2011 -
Name changed

4 DECADES: KNOW-HOW & INDUSTRY EXPERTISE

- Mining, metallurgy & minerals
- Construction
- Energy
- Environment
- Water & wastewater
- Chemical process industry
- Oil & offshore
- Pulp & paper
- Food & pharma

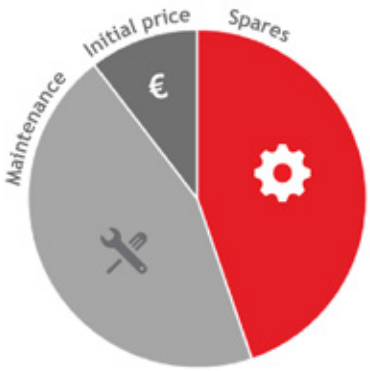
2014:
Flowrox biggest DN1200 knife gate valves delivered for mining application

2016:
Launch of Smart Solutions™

OVER 100 000 products delivered Globally

WE PROVIDE THE OPTIMAL SOLUTION:

Ball valve



Flowrox valve solution

The shown comparison of cost over a period of 5 years on a DN100 pinch valve feeding abrasive slurry. The valve operates 4-6 times/hour. The conventional valve is a stainless ball valve with PTFE seats.

YOUR BENEFITS

- Low Total Cost of Ownership
- Low operating costs
- Improved process performance
- Long service intervals
- Minimized downtime
- Heavy duty design

Flowrox Valve Product Portfolio

Pinch Valves

Heavy duty pinch valves

- Pressure rating up to 100 bar
- Size DN25 - 800
- High cycling applications
- For isolation & control purposes

General line pinch valves

- Pressure rating 10 bar
- Size DN50 - 250
- Low cycling applications
- For isolation duty

Slurry Knife Gate Valves

SKW

- Without flange
- Pressure rating 10 bar
- Size DN50 - 600
- Isolation duties only

SKF

- With flange
- Pressure rating 10 bar
- Size DN80 - 1200
- Isolation duties only

SKH

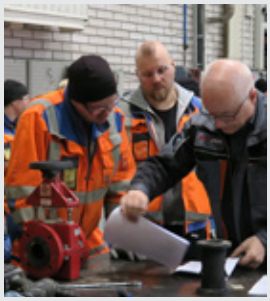
- Without flange
- Pressure rating 20 bar
- Size DN80 - 600
- Isolation duties only

Smart Solutions™

Enhance your performance with Smart Solutions™

- Smart valve series provide online information about the process, valve operations and condition of the valve.
- Enables advanced reporting and data analytics, making your process more reliable and transparent
- Fast analysis of faults and planning of maintenance

Services



Comprehensive Valve Installation, Maintenance and Spare Services

- Site survey services
- Spare parts and component services
- Installation and maintenance services, repairing services
- Analysis services / commissioning / training

Expansion project: Saving time during start-up with 330 Flowrox valves

Customer:
Trafigura Mining Group, MATSA mine, Spain
Products:
330 PVE enclosed body & PVG shut-off valves
Application: Ore & water treatment & process water supply in copper, zinc and lead mining
Benefits: Increased safety, easy installation & maintenance, process reliability, light-weight products.

Long-term benefits in ownership

The Tranfigura Mining Group ordered 330 Flowrox PVE enclosed body pinch valves and PVG shut-off pinch valves for various demanding flow control and shut-off duties, from ore treatment to water treatment plant and process water supply.

“When the project was engineered, we constantly had in mind that the choice of appropriate instrumentation for each application is fundamental to the process performance. We decided that all control valves and also some of the shut-off valves would be pinch valves, which finally ended up saving us a lot of time in the start-up of the plant,” says Ms. **Luisa Montes**, a Project Team Member from MATSA mine.

All installed Flowrox Pinch Valves delivered were an enclosed body type and include an SBRT valve sleeve to meet the requirements of various mediums in different process areas and to achieve the longest sleeve life time.

As the valves are self-cleaning, even if any solids are accumulated in the sleeve wall, it breaks away when the valve is operated. This is due to the flexibility of the sleeve, making the valve lifetime longer than many other competing products on the market.

The Flowrox Pinch Valves were chosen to gain long-term benefits based on low total cost of ownership. The PVE control valves at the plant are actuated by pneumatic double acting actuators with positioners. Also, all of the on/off PVG valves include limit switches for position indication.

“In the future, we are definitely expecting cost savings,” Ms. Montes states.

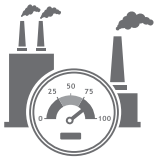
OUR CUSTOMER: TRAFIGURA MINING GROUP

Trafigura Mining is a market leader in copper, lead and zinc concentrates trading. The flagship mine, Aguas Teñidas (MATSA),is located in Andalucia, Spain. In the year 2015 the production of concentrates nearly doubled to 4.4 Mt per year.

Flowrox Valve References

Customer: HUSAB Uranium Mine, Namibia
Products: Pinch valves
Application: Tailings Transfer
Benefits:
- Increased process reliability
- Cost efficiency with remote valve control
- Low total cost of ownership

Customer: Wastewater treatment plant, Warsaw, Poland
Products: DN500 control pinch valves
Application: Flow control of biological sludge
Benefits:
- Gentle handling due to living bacteria in sludge
- Wide and accurate flow control range
- Extended maintenance interval



Customer: LKAB, Sweden
Products: PV and PVE pinch valves
Application: Thickener underflow
Benefits:
- Reliability with abrasive slurry
- Wide and accurate flow control range
- Extended maintenance interval

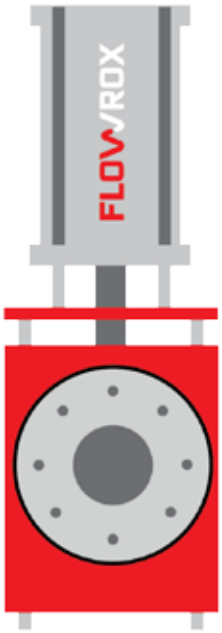
Heavy Duty Pinch Valves

Flowrox heavy duty pinch valves are “The pinch valves”. They are made to last and are ideal where shut-off and control applications involve abrasive or corrosive slurries, powders or coarse substances.

Made to Last

The operating principle of Flowrox pinch valves is simple. In the open position, the valve is at full bore with no flow restrictions. During closing, two pinch bars squeeze the valve sleeve shut on the centerline. The sleeve is naturally wear resistant and when particles hit the sleeve´s rubber surface, the collision energy is absorbed and released when the rubber bounces back.

Heavy duty pinch valves provide bubble tight shut-off even if solids have built up on the sleeve wall. When compressed, any crystallized particles flake off the sleeve surface. The full bore structure ensures free flow of the medium. The construction and materials of the three main components (sleeve, body and actuator) can be tailored to suit your process conditions.



Benefits: This Is How We Flow!

- Long service intervals
- Only one wearing part
- Excellent also for dry powders
- Low maintenance cost

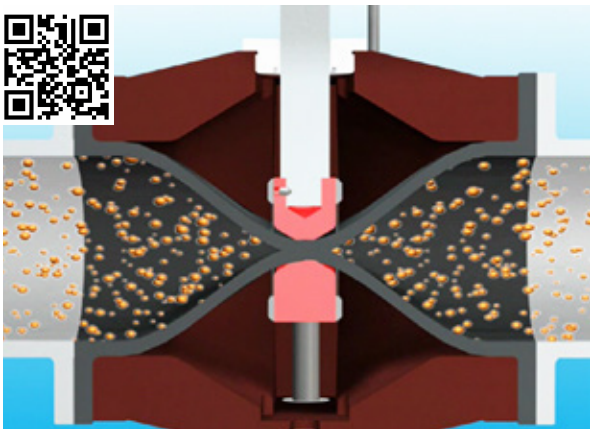


Image: *During closing, two pinch bars squeeze the valve sleeve shut on the centerline. See the Pinch Valve in action by scanning the QR code.*

Example: PVE 150A10-203LR1Z2, SBRT

Control Valves

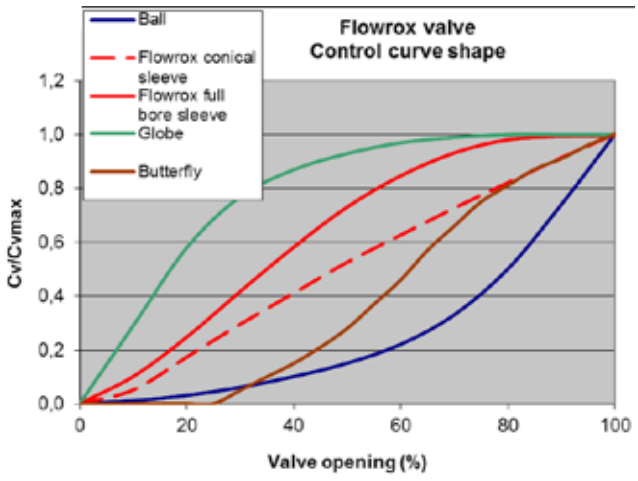
The Flowrox control valves are designed for demanding control applications in which conventional valves encounter problems with wear due to increased turbulence.

When the controlled flow is abrasive, it is a big advantage to have only one, wear resistant, valve part in contact with the medium. The need for maintenance and spare parts is reduced.

Controllability can be further improved with conical sleeves or smart positioners.

Flowrox control valve sizing is based on international IEC60534 standard (harmonized with ANSI/ISA S75).

Flowrox Control Valve Sizing Program is available to ease your work.

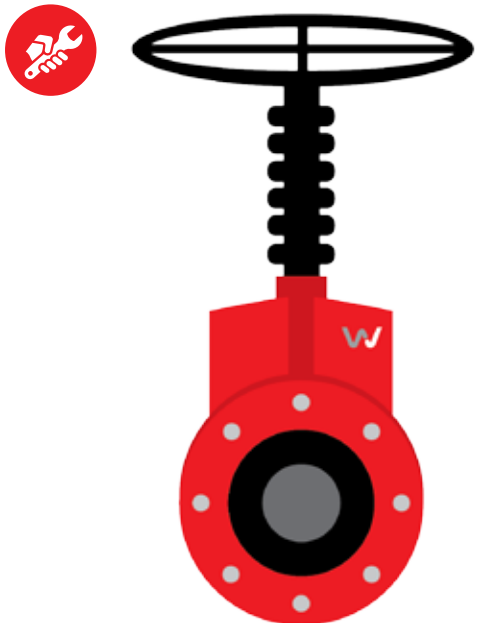


General Line Pinch Valves

PVG and PVEG valves

Flowrox general line pinch valves are robust and cost-effective valves with simple, single-sided closing mechanism. PVG valves have a strong valve body and opening tags in the sleeve as standard. PVEG valves have a corrosion resistant and light-weight plastic body.

They both are ideal for low cycle applications involving abrasion, corrosion and aggressive slurries. Through the reliability and structure, they offer substantial savings based on improved performance, long service lifetime and low total cost of ownership.



Benefits: This Is How We Flow!

- Long service intervals
- Only one wearing part
- Excellent also for dry powders
- Simple sleeve replacement

Image: *The closing element squeezes the sleeve shut against the lower body half, providing a 100 % tight shut-off. See the PVG in action by scanning the QR code.*

Image: *PVEG50M manual polyamide body pinch valves in a hydrocyclone at Kara Mine, TMM, Tasmania, Australia.*

Knife Gate Valves

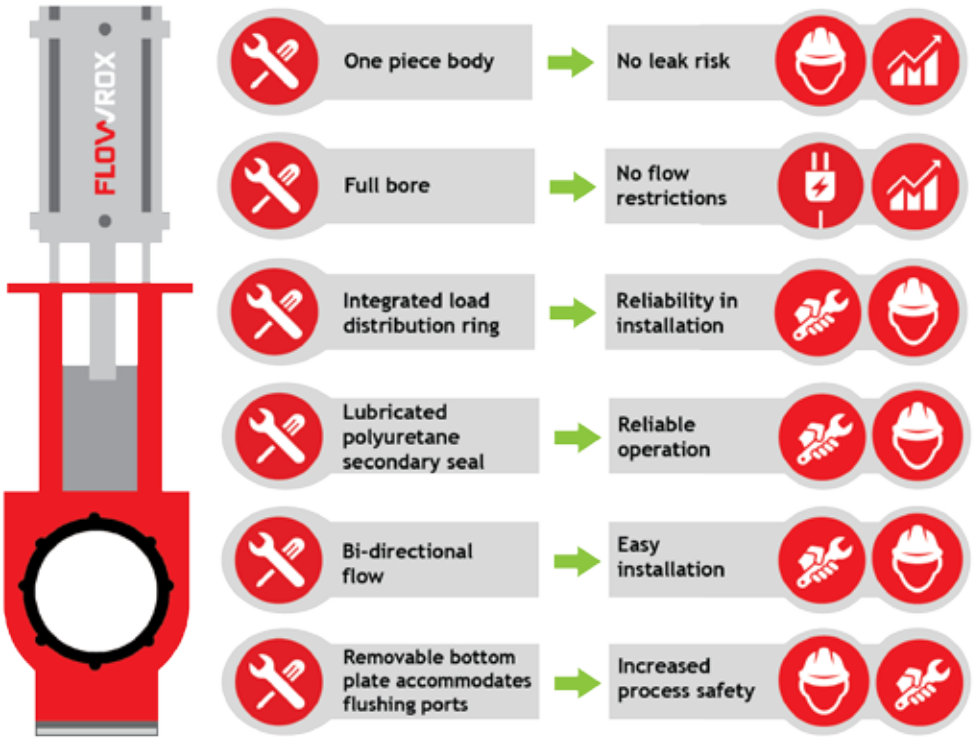
Heavy Duty Slurry Knife Gate Valves isolate flow, even in the most demanding process conditions. The complete valve is built around an ease-of-maintenance concept.

Slurry Knife Gate Valves

The designs of Flowrox Slurry Knife Gate Valves are based on the years of experience Flowrox has gained, providing reliable solutions for abrasive and corrosive process applications.
They feature a load distribution ring that prevents over compression and ensures tight sealing between the ring sleeve and the valve gate. To add to the ease of maintenance, the load distribution ring has been integrated into the ring sleeves of the valve.

The universal tower design of the valve accommodates most actuator types, allowing for actuator interchangeability. The tower also ensures that the top plate, body and actuator are always aligned and that the gate is in the right position.

The valve body itself is a one-piece casting, eliminating the need for sealing between the body halves.



Benefits: This Is How We Flow!

- Small face-to-face dimension
- Easy installation
- Available in large size scale
- Low maintenance cost

Image: *Elastomer ring sleeves on both sides of the gate provide a tight shut off. See the Flowrox knife gate valve in action by scanning the QR code.*

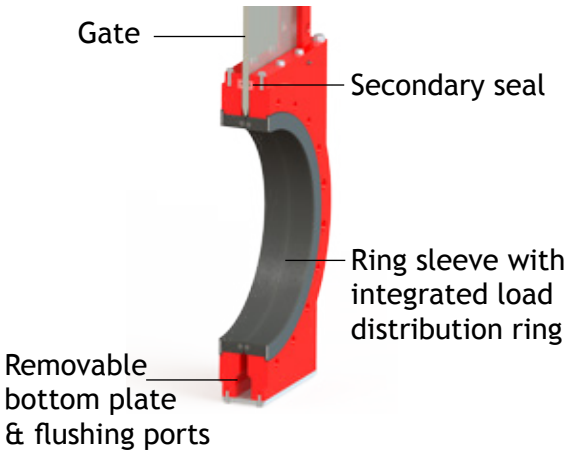
Slurry Knife Gate Design



Flowrox Knife Gate Valves are suitable for large-scale project deliveries with a selection of Flowrox pumps and valves.

Smart Features

Enhance your performance with Smart Solutions™. Flowrox Smart features can be included into any old or new delivery. The Smart valves are next generation solutions delivering data and information in order to provide reliable and cost-efficient production. Real time information from site results in optimised production with maximised output and minimised unplanned shutdowns.

Smart Solutions™

Flowrox Smart valves provide you with online information about their condition, process and operations.

Flowrox Smart PVE is based on the reliable PVE valve and is equipped with a new smart positioner for detailed information about valve operations. The SPVE includes a leak sensor and various embedded instruments for additional information.

Optional SensoMate Smart sleeve detects the wearing before actual sleeve failure.

The Flowrox Smart Valve combined with the Malibu™ IIoT user interface enables advanced reporting and data analytics, making your process more reliable and transparent. Malibu™ is accessible on any device with an Internet browser.

Technical Features

- Pre-fail indications
- Real time data in Malibu™
- Pressure measurement at the valve inlet/outlet
- Medium temperature measurement
- Leak sensor
- Connectivity with 3G/4G, WIFI or LAN

From Features to Benefits

- **Online valve performance monitoring**
  - → Detect issues before they become a problem
- **Automatic pre-fail indications**
  - → Savings in maintenance & unexpected shutdown costs
- **Analytics tools**
  - → Help you make the correct decisions fast
- **Advanced reporting tools**
  - → Access to detailed asset performance information
- **Easy accessibility via Internet**
  - → Access where ever you are

The Flowrox smart instrumentation can be retrofitted to automatic pinch valves.

Flowrox Smart Valves:

The SPVE series provides online information about the process performance and condition of the valve.

The Flowrox Smart Valve combined with Malibu™ enables advanced reporting and data analytics, making your process more reliable and transparent.

Spares & Services

Sleeves: The core of our valves

Our technologically advanced Flowrox sleeves guarantee high resistance to wear and corrosion, trouble-free operation and extended lifetime.

Robust Heart of the Pinch Valve

The handmade sleeve has a reinforced construction, making it the pressure-containing part of the valve.

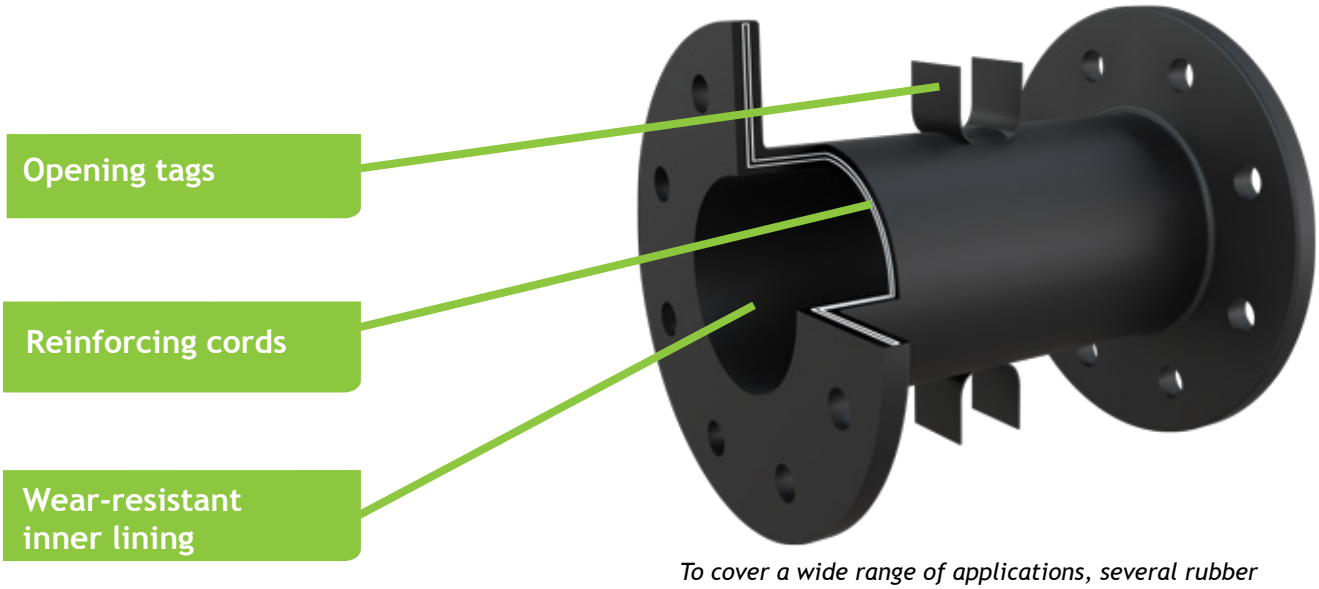
Standard Flowrox PV, PVE and PVG sleeves are equipped with opening tags to ensure full valve opening in all process conditions.

Ring Sleeves for Knife Gate Valves

The ring sleeve is a moulded part with a reinforcement steel ring integrated near the sealing area. The flange of the ring sleeve is reinforced with a load distribution ring to ensure even compression.

Special Sleeve Features

- **Conical sleeve for control valves**
- **Suction sleeve for negative pressure applications**
- **SensoMate sleeve detecting and signalling critical wear**
- **Polyurethane lined sleeve with improved protection against wear in abrasive control applications**
- **Foodgrade rubber for FDA requirements**



To cover a wide range of applications, several rubber compounds are available.

Flowrox valves are available in various sizes and models for various applications.
Flowrox Services supports you throughout the entire life cycle.

Services

We offer prompt support, spare parts and services in order to maximise your performance.

We manufacture and deliver original spare parts and components for all Flowrox products (valves, hose pumps, PC pumps).

- On-time trouble-free delivery of spares and services
- Cost savings through optimised service cycles and reduced downtime of equipment
- Longer life cycles for equipment

We are recognised as a reliable industrial solutions provider for demanding process conditions. Our 40 years of experience in flow control and elastomer technology are obvious benefits we can offer. Formerly known as Larox Flowsys, our heritage forms the foundation of what we are today; the benchmark for heavy duty valves, pumps and systems. We know that all processes are different, all customers unique and process conditions vary, but we are happy to adapt.

We operate on 6 continents and support our customers through a network of over 200 representatives.

SOLITAX® sc Turbidity and Suspended Solids Sensors

Hach SOLITAX sc sensors provide accurate, color-independent measurement of turbidity and suspended solids in drinking water, wastewater, and industrial process applications. A self-cleaning wiper prevents measurement error due to fouling. These sensors demonstrate excellent correlation with laboratory analysis so it's an exceptional tool for process control.

Features and Benefits

Accurate, Color-independent Measurement

Hach's SOLITAX sc Turbidity and Suspended Solids Sensors are immune to shifts in color of activated sludge caused by variations in through-flow volume, climatic fluctuations, or other unexpected events. Unlike conventional systems, that need to be continually calibrated to compensate for color variation, the proven measurement technique used in the SOLITAX sc sensor is the only technology that provides measurement completely independent of color.

Self-cleaning Wiper Prevents Erroneous Values

The SOLITAX sc sensor's self-cleaning wiper prevents erroneous values and maintenance problems by preventing biological growth. Gas bubbles in the sample do not interfere with the measurement.

Excellent Correlation to Laboratory Analysis

Comparisons between laboratory analysis and continuous suspended solids measurement using SOLITAX sc sensors show an exceptional correlation to mixed liquor, settled and thickened sludge. Online measurement not only saves time on manual analysis but also provides critical real time TSS measurements that can be used to operate the plant more efficiently. *(See Correlation Chart on page 2.)*

Fully Serviceable Sensors

Conventional Turbidity and Suspended Solids sensors are potted and are discarded when they no longer function. SOLITAX sc sensors are serviceable so that the useful life of the sensor, in many cases, is doubled.

Easy One-point Calibration

Calibration of SOLITAX sc sensors is easy with a simple correction factor procedure to measure turbidity or suspended solids. Multipoint calibration is available for nonlinear samples.

Versatile Mounting Styles

SOLITAX sc sensors can easily be configured for many applications. Models designed for immersion into a tank are available in PVC plastic or stainless steel. An insertion style sensor for pipes is available in stainless steel. Installation kits for either style sensor are also available.

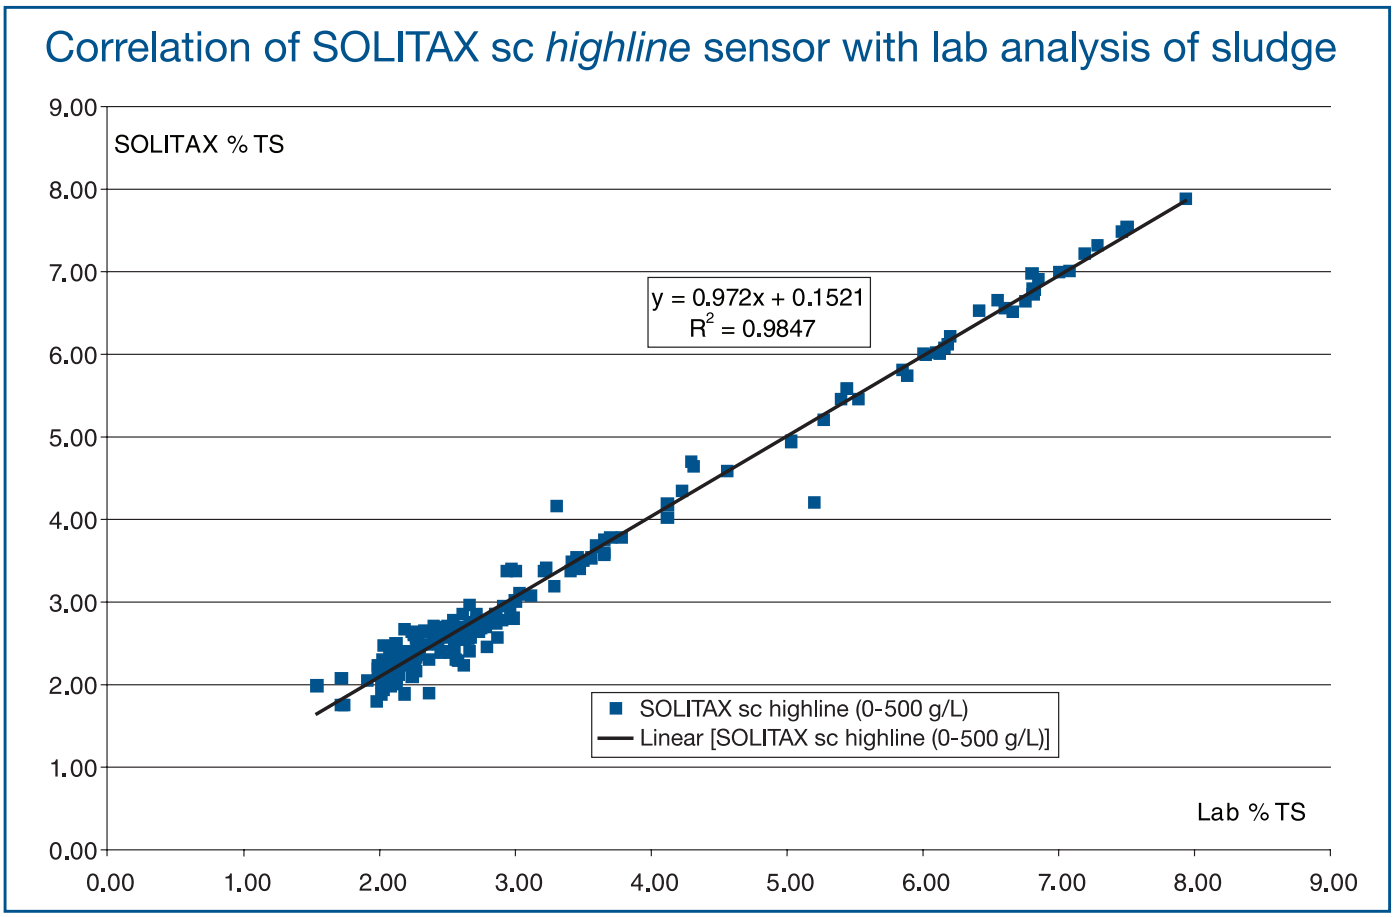
Multi-channel, Multi-parameter System

Any combination of two SOLITAX sc sensors can be installed using one Hach sc200 Controller. The same controller can also accommodate any combination of parameters, including suspended solids, turbidity, pH/ORP, dissolved oxygen, conductivity, and nitrate. All of Hach's model sc sensors are "plug and play" with no complicated wiring or set-up procedure necessary.

Communications—Multiple alarm/control schemes are available using four relays and two PID control outputs. Communications use analog 4-20 mA and digital MODBUS®/RS485, MODBUS®/RS232 protocols. (Other digital protocols are available. Contact your Hach representative for details.)

Data logger—A built-in data logger collects measurement data, calibration, verification points, and alarm history for up to 6 months. The embedded SD card reader ensures simple download of the logged data.

Correlation of SOLITAX sc *highline* sensor with lab analysis of sludge



Principal of Operation:
SOLITAX sc ts-line sensor with dual-beam optics and added back-scatter detector

- *Dual infrared light beams. LED light source transmits light at 45° to sensor face.*
- *Nephelometric photoreceptors detect light at 90° to the transmitted light beam.*
- *Backscatter photoreceptor (included on all models except the SOLITAX sc t-line) detects light at 140° to the transmitted light beam to measure suspended solids in heavily loaded sample streams.*
- *Self-cleaning wiper, optional.*
- *T-line probes measure turbidity only.*
- *TS, HS, inline, and highline sensors measure either turbidity or suspended solids. The parameter to be measured is user selectable and can be changed at any time.*

Engineering Specifications

1. The suspended solids and/or turbidity sensor shall consist of a digital sensor designed to connect to a universal controller.
2. The suspended solids and/or turbidity sensor shall use dual infrared light beam technique design utilizing an LED light source in the sensor to transmit an infrared/scattered dual beam into the sample stream at an angle of 45 degrees to the sensor face.
3. A photoreceptor located in the sensor face shall detect scattered light (turbidity) at 90 degrees to the transmitted beam.
4. A backscatter photoreceptor (included on all models except the SOLITAX sc t-line), positioned at 140 degrees to the transmitted beam, shall detect light scattered for suspended solids readings.
5. The sensor shall analyze the dual-beam data and provides a color independent measurement.
6. The sensor shall have a self-cleaning wiper to prevent erroneous values and maintenance problems caused by biological activity, scum build-up, and gas bubbles.
7. The self-cleaning wiper shall ensure that measurements are accurate, continuous, and completely color independent.
8. The sensor shall have an operating range of 0.001 mg/L to 50 g/L or 0.001 mg/L to 500 g/L and/or 0.001 to 4000 NTU suspended solids and turbidity depending on the model.
9. The sensor shall be capable of immersion in a tank or insertion into a pipe.
10. The materials of construction shall be PVC or polished stainless steel, depending on the sensor selection.
11. The sensor shall have an operating temperature of >0 to 40°C (32 to 104°F).
12. The initial response time shall be 1 second and user-adjustable up to 300 seconds.
13. The accuracy shall be less than 1% of reading or 0.01 NTU, whichever is greater for turbidity and less than 5% of reading for suspended solids.
14. The suspended solids and turbidity sensor shall be Hach Company Model t-line sc for turbidity measurement or ts-line sc, hs-line sc, inline sc, or highline sc for suspended solids and turbidity measurement.

Dimensions

Hach SOLITAX sc sensors can be fixed to the rim of the tank for immersion applications or inserted directly through the sidewall of a pipeline for insertion applications. The optical unit of the sensor should be installed facing downstream in the direction of the flow to minimize the impact of debris against the measurement system. A variety of installation kits are available.

2983600 Turbidity and High Range Suspended Solids Analyzer includes sc200 controller and stainless steel hs-line sc sensor (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L) with wiper

Insertion in Pipes Applications

2983700 Turbidity and Suspended Solids Analyzer includes sc200 controller, stainless steel inline sc sensor (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L) with wiper, and insertion mounting kit

2983900 Turbidity and High Range Suspended Solids Analyzer includes sc200 controller, stainless steel highline sc sensor (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L) with wiper, and insertion mounting kit

Both 2983700 and 2983900 include the insertion mounting kit which includes a 4 inch pre-coped Carbon Steel Flange. Non-coped flanges are available. See below.

NOTE

1. Power cords must be ordered separately.
2. Fixed point installation kit or handrail mount kit must be ordered separately for all immersion analyzers.

Individual SOLITAX sc Sensors

Immersion Sensors

LXV423.99.10000 Turbidity, t-line sc, PVC with wiper (0.001 to 4000 NTU)

LXV423.99.12000 Turbidity, t-line sc, PVC without wiper (0.001 to 4000 NTU)

LXV423.99.10100 Turbidity and Suspended Solids, ts-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.12100 Turbidity and Suspended Solids, ts-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.00100 Turbidity and Suspended Solids, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.02100 Turbidity and Suspended Solids, ts-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV423.99.10200 Turbidity and Suspended Solids, hs-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.12200 Turbidity and Suspended Solids, hs-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.00200 Turbidity and Suspended Solids, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV423.99.02200 Turbidity and Suspended Solids, hs-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Insertion Sensors

LXV424.99.00100 Turbidity and Suspended Solids, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV424.99.02100 Turbidity and Suspended Solids, inline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)

LXV424.99.00200 Turbidity and Suspended Solids, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

LXV424.99.02200 Turbidity and Suspended Solids, highline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)

Accessories

5733000 Calibration Kit, includes calibration cylinder, two 500-mL 800 NTU StablCal®, and a sensor bracket

2660549 800 NTU StablCal®, 500-mL (two required per calibration)

LZX050 Wiper Blades, replacement only, pkg. of 5

9220600 Sun Shield for sc200 controller

Cable Accessories

5796000 7.6 m (25 ft.) Extension Cable

5796100 15.2 m (50 ft.) Extension Cable

5796200 30.5 m (100 ft.) Extension Cable

Maximum total length 100 m (328 ft.)

Installation Accessories

5734400 Fixed Point Installation Kit for t-line, ts-line, and hs-line immersion sensors, includes stand and sun shield for controller and pipe for sensor cable

5738400 Insertion Mounting Kit for inline and highline insertion sensors (ball valve and extraction system). Kit includes a 4 inch pre-coped Carbon Steel Flange. Non-coped flanges are available. See below.

AHA033NPT Sensor Adapter, straight 1-1/2 FNPT

AHA034NPT Sensor Adapter, elbow 1-1/2 FNPT, 90°

MH236B00Z Handrail Mounting Kit (for sensor to be used with either adapter above) includes 1.5-inch diameter by 7.5-ft long CPVC pipe and swivel/pivot/ pipe clamp assembly

LZX337 Stainless steel ball valve/extraction fitting for in-line and hi-line probes w/o welding flange

LZX660 Non-coped stainless steel welding flange for insertion kit

LZX661 Non-coped carbon steel welding flange for insertion kit

To complete your turbidity and suspended solids measurement system, choose from these Hach controllers...

Model sc200 Controller

(see Lit. #2665)

The sc200 Universal Controller is the most versatile controller on the market. The new sc200 controller is the only controller that allows the use of digital and analog sensors, either alone or in combination, to provide compatibility with the broadest range of sensors. It replaces the Hach sc100 digital and GLI53 analog controllers with advanced features for easier operator use.

Model sc1000 Controller

(see Lit. #2403)

Get the same great features as the sc200 Controller above—"plug and play", all digital operation and communication—but with the Hach sc1000 Controller, up to eight Hach sensors can be used with one controller in any combination. The sc1000 Controller is also expandable and upgradeable to easily adapt to your needs.

At Hach, it's about learning from our customers and providing the right answers. It's more than ensuring the quality of water—it's about ensuring the quality of life. When it comes to the things that touch our lives...

Keep it pure.

Make it simple.

Be right.

HACH®
Be Right™

sc200™ UNIVERSAL CONTROLLER

Applications
- Drinking Water
- Wastewater
- Industrial Water
- Power

One Controller for the Broadest Range of Sensors.

Choose from 30 digital and analog sensor families for up to 17 different parameters.

Maximum Versatility

The sc200 controller allows the use of digital and analog sensors, either alone or in combination, to provide compatibility with Hach's broad range of sensors, eliminating the need for dedicated, parameter-specific controllers.

Ease of Use and Confidence in Results

Large, high-resolution, transreflective display provides optimal viewing resolution in any lighting condition. Guided calibration procedures in 19 languages minimize complexity and reduce operator error. Password-protected SD card reader offers a simple solution for data download and transfer. Visual warning system provides critical alerts.

Wide Variety of Communication Options

Utilize two to five analog outputs to transmit primary and secondary values for each sensor, or integrate Hach sensors and analyzers into MODBUS RS232/RS485, Profibus® DP, and HART networks.

Password protected SD card reader offers a simple solution for data download and transfer, and sc200 and digital sensor configuration file duplication and backup.

Specifications*

Dimensions (H x W x D)	5.7 in x 5.7 in x 7.1 in (144 mm x 144 mm x 181 mm)
Display	Graphic dot matrix LCD with LED backlighting, transreflective
Display Size	1.9 x 2.7 in. (48 mm x 68 mm)
Display Resolution	240 x 160 pixels
Weight	3.75 lbs. (1.70 kg)
Power Requirements (Voltage)	100 - 240 V AC, 24 V DC
Power Requirements (Hz)	50/60 Hz
Operating Temperature Range	-20 to 60 °C , 0 to 95% RH non-condensing
Analog Outputs	Two (Five with optional expansion module) to isolated current outputs, max 550 Ω , Accuracy: ± 0.1% of FS (20mA) at 25 °C, ± 0.5% of FS over -20 °C to 60 °C range Operational Mode: measurement or calculated value
Analog Output Functional Mode	Linear, Logarithmic, Bi-linear, PID
Security Levels	2 password-protected levels
Mounting Configurations	Wall, pole, and panel mounting
Enclosure Rating	NEMA 4X/IP66
Conduit Openings	1/2 in NPT Conduit
Relay: Operational Mode	Primary or secondary measurement, calculated value (dual channel only) or timer
Relay Functions	Scheduler (Timer), Alarm, Feeder Control, Event Control, Pulse Width Modulation, Frequency Control, and Warning
Relays	Four electromechanical SPDT (Form C) contacts, 1200 W, 5 A
Communication	MODBUS RS232/RS485, PROFIBUS DPV1, or HART 7.2 optional
Memory Backup	Flash memory
Electrical Certifications	EMC CE compliant for conducted and radiated emissions: - CISPR 11 (Class A limits) - EMC Immunity EN 61326-1 (Industrial limits) Safety cETLus safety mark for: - General Locations per ANSI/UL 61010-1 & CAN/CSA C22.2. No. 61010-1 - Hazardous Location Class I, Division 2, Groups A,B,C & D (Zone 2, Group IIC) per FM 3600 / FM 3611 & CSA C22.2 No. 213 M1987 with approved options and appropriately rated Class I, Division 2 or Zone 2 sensors cULus safety mark - General Locations per UL 61010-1 & CAN/CSA C22.2. BG Преди инсталацията/монтажа на продукта, прочетете внимателно всички инструкции за инсталация и ги спазвайте по време на инсталирането. Инсталацията трябва да се извършва от квалифициран специалист в съответствие с местните разпоредби за безопасност. Погрижете се избраното място на инсталацията да гарантира безопасна инсталация и експлоатация. Продуктът е предназначен единствено за придържане/прикрепване на измервателните сензори/продукти на HACH/HACH LANGE. Всяко друго приложение може да носи риск за потребителя. Работите по поддръжката и ремонта трябва да се извършват изключително от оторизирания отдел за обслужване на клиенти. Могат да се използват само оригинални резервни части и препоръчани от производителя принадлежности. Всякакви изменения по продукта водят до анулиране на всички отговорности от страна на производителя. Неспазването на инструкциите за употреба или използването на продукта за цели, различни от тези, за които е предназначен, може да доведе до сериозно нараняване на потребителя и/или повреда на оборудването. Работата по заваряване, трябва да бъде извършвана само от квалифицирани заварчици съгласно DIN/EN 287 или от сертифицирани фирми по EN 3834-2.

CS Při instalaci/montáži produktu si pečlivě přečtěte všechny pokyny k instalaci a v průběhu instalace tyto pokyny dodržujte. Instalaci musí provádět kvalifikovaný odborník v souladu s místními bezpečnostními předpisy. Pečlivě vyberte umístění pro instalaci, které zajistí bezpečnou instalaci a provoz. Produkt je určen pouze k upevnění/přichycení měřicích snímačů/produktů HACH/HACH LANGE. Jakékoli jiné použití může znamenat riziko pro uživatele. Údržbu a opravy smí provádět výhradně autorizované oddělení zákaznických služeb. Je dovoleno používat pouze originální náhradní díly a příslušenství doporučené výrobcem. Jakékoli změny provedené na produktu způsobí neplatnost veškerých záruk. Nedodržení těchto pokynů nebo používání produktu pro jiný účel než pro který je určen může způsobit uživateli vážné zranění anebo poškodit zařízení. Potřebné svářečské práce musí být provedeny kvalifikovaným svářečem výhradně podle DIN/EN 287 nebo dodavatelem v souladu s EN 3834-2.

DA Før du installerer/monterer produktet, skal du læse alle installationsinstruktionerne grundigt og følge dem under installeringen. Installationen skal udføres af en kvalificeret ekspert i overensstemmelse med alle lokale sikkerhedsbestemmelser. Vælg sikker og betjeningsvenligt placering til installationen. Produktet er kun beregnet til at holde/fastgøre HACH/HACH LANGE-målesensorer/-produkter. Enhver anden form for brug kan medføre skadesrisiko for brugeren. Vedligeholdelse og reparation bør kun udføres af en autoriseret kundeserviceafdeling. Der må kun anvendes originale reservedele og tilbehør, der er anbefalet af producenten. Alle ændringer af produktet ophæver garantien. Hvis du ikke følger disse instruktioner eller bruger produktet til et andet formål, end det er beregnet til, kan der forekomme alvorlige personskader og/eller skader på udstyret. Svejsearbejde må kun udføres af DIN/EN 287 kvalificerede svejsere, eller EN 3834-2 certificerede firmaer.

DE Die Montageanleitung ist vor der Installation/Montage des Produktes sorgfältig und vollständig zu lesen und zu befolgen. Die Installation muss von einer Fachkraft (qualifiziertes Personal) unter Einhaltung aller lokal gültigen Sicherheitsvorschriften erfolgen. Der Montageort ist so zu wählen, dass eine sichere Installation und der sichere Betrieb gewährleistet ist. Die Verwendung des Produktes ist ausschließlich zum Halten/Befestigen von HACH/HACH LANGE Messsonden/Produkten vorgesehen. Jede andere Benutzung ist mit Risiken für den Benutzer verbunden. Wartungs- und Reparaturarbeiten sollten nur vom autorisierten Kundendienst durchgeführt werden. Es dürfen nur vom Hersteller empfohlene Originalersatz- und Zubehörteile verwendet werden. Änderungen am Produkt haben den Verlust jeglicher Haftungsansprüche zur Folge. Nichtbeachtung dieser Anweisungen oder eine andere Verwendung des Produktes kann schwerwiegende Verletzungen der Anwender oder Beschädigung am Gerät zur Folge haben. Die notwendigen Schweißarbeiten dürfen ausschließlich von entsprechend DIN/EN 287 qualifizierten Schweißern durchgeführt werden, oder von Fachfirmen entsprechend EN 3834-2.

EL Πριν από την εγκατάσταση/τοποθέτηση του προϊόντος, διαβάστε προσεκτικά και ακολουθήστε όλες τις οδηγίες εγκατάστασης κατά την εγκατάσταση. Η εγκατάσταση πρέπει να πραγματοποιηθεί από κατάλληλα εκπαιδευμένο τεχνικό και σύμφωνα με όλους τους τοπικούς κανονισμούς ασφάλειας. Επιλέξτε μια θέση τοποθέτησης που θα διασφαλίσει την ασφαλή εγκατάσταση και λειτουργία. Το προϊόν προορίζεται αποκλειστικά για τη στήριξη/σύνδεση των αισθητήρων μέτρησης/προϊόντων HACH/HACH LANGE. Οποιαδήποτε άλλη χρήση ενδέχεται να ενέχει κινδύνους για τον χρήστη. Οι εργασίες συντήρησης και επισκευής θα πρέπει να εκτελούνται αποκλειστικά από το εξουσιοδοτημένο τμήμα εξυπηρέτησης πελατών. Επιτρέπεται η χρήση μόνον των γνήσιων ανταλλακτικών και των αξεσουάρ που συνιστά ο κατασκευαστής. Οποιεσδήποτε αλλαγές στο προϊόν ακυρώνουν την ευθύνη της εταιρείας. Σε περίπτωση που δεν τηρηθούν αυτές τις οδηγίες ή χρησιμοποιηθεί το προϊόν για διαφορετικό σκοπό από αυτόν που προορίζεται, ενδέχεται να προκληθεί σοβαρός τραυματισμός στον χειριστή και/ή βλάβη στον εξοπλισμό. Οι απαιτούμενες εργασίες συγκόλλησης θα πρέπει να διεξαχθούν από εξειδικευμένο προσωπικό σύμφωνα με DIN / EN287 ή από κατασκευαστικές εταιρείες σύμφωνα με DIN 3834-2.

EN Before installing/mounting the product, read all the installation instructions carefully and follow the instructions during installation. Installation must be carried out by a qualified expert in accordance with all local safety regulations. Take care to choose an installation location that will ensure safe installation and operation. The product is intended solely for holding/attaching HACH/HACH LANGE measuring sensors/products. Any other use may involve risks for the user. Maintenance and repair work should be carried out exclusively by the authorized customer service department. Only original replacement and accessory parts recommended by the manufacturer may be used. Any changes made to the product will nullify all liability. Failure to follow these instructions or use of the product for a purpose other than that for which it was intended may result in serious injury to the user and/or damage to the equipment. The required welding work must be performed exclusively in accordance with DIN / EN 287 qualified welders, or from contractors in accordance with EN 3834-2.

ES Antes de instalar o fijar el producto, lea con atención todas las instrucciones de instalación y sígalas durante el montaje. La instalación debe llevarla a cabo un experto cualificado, de acuerdo con las normas de seguridad locales. Elija una ubicación para la instalación que garantice que ésta y el funcionamiento del producto sean seguros. El producto sólo está diseñado para sujetar o fijar sensores o productos de medición de HACH/HACH LANGE. Cualquier otro uso puede conllevar riesgos para el usuario. El trabajo de mantenimiento y reparación sólo debe llevarse a cabo por el departamento de atención al cliente autorizado. Sólo deben utilizarse las piezas de repuesto recomendadas por el fabricante. Cualquier cambio que se realice en el producto anulará toda responsabilidad. Si no se siguen estas instrucciones o si se utiliza el producto para un uso distinto del uso para el que fue diseñado, el usuario puede sufrir heridas graves y/o se puede dañar el equipo. Los trabajos de soldadura requeridos deben ser realizados exclusivamente por soldadores cualificados según DIN / EN 287, o por contratistas de acuerdo a EN 3834-2.

FI Ennen kuin asennat/kiinnität tuotteen, lue kaikki asennusohjeet huolellisesti ja noudata niitä. Tuotteen saa asentaa vain valtuutettu henkilö, ja asennuksessa on noudatettava kaikkia paikallisia turvallisuusmääräyksiä. Asenna tuote sellaiseen paikkaan, johon asentaminen on turvallista ja jossa tuote toimii oikein. Tuote on tarkoitettu ainoastaan HACH/HACH LANGE -mittausanturien/-tuotteiden ripustamiseen/kiinnittämiseen. Muunlainen käyttö voi aiheuttaa vaaratilanteita käyttäjälle. Huolto- ja korjaustyöt saa tehdä vain valtuutettu asiakaspalveluosasto. Tuotteessa saa käyttää vain valmistajan suosittelemia alkuperäisiä varaja lisäosia. Tuotteeseen tehdyt muutokset mitätöivät kaikki vastuut. Jos näitä ohjeita ei noudateta tai jos tuotetta käytetään johonkin muuhun kuin sen varsinaiseen käyttötarkoitukseen, käyttäjälle voi aiheutua vakavia vammoja ja/tai laite voi vaurioitua. Vain DIN / EN 287 mukaan hyväksytyt hitsaajat tai EN 3834-2 mukaiset urakoitsijat saavat tehdä vaaditut hitsaustyöt.

FR Avant l'installation/le montage du produit, lisez attentivement toutes les instructions d'installation et suivez-les au cours de l'installation. L'installation doit être réalisée par un expert qualifié conformément à toutes les réglementations de sécurité locales. Veillez à choisir un emplacement permettant d'assurer une installation et un fonctionnement en toute sécurité. Ce produit est uniquement destiné à maintenir/fixer des capteurs/équipements de mesure HACH LANGE. Toute autre utilisation entraînerait un risque pour l'utilisateur. Seul le service clientèle agréé est autorisé à effectuer les travaux de maintenance et de réparation. Seuls les pièces de rechange et les accessoires d'origine recommandés par le fabricant doivent être utilisés. La modification du produit annule toute responsabilité. Le non-respect de ces instructions ou l'utilisation de ce produit à des fins autres que celles auxquelles il est destiné risqueraient de gravement blesser l'utilisateur et/ou d'endommager le matériel. Le travail de soudure requis doit être réalisé exclusivement par des soudeurs qualifiés en conformité avec DIN / EN 287, ou par prestataires conformément à EN 3834-2.

HR Prije instalacije/postavljanja uređaja, pažljivo pročitajte sve upute za montažu i pratite ih tijekom postupka instalacije. Instalaciju mora provesti kvalificirani stručnjak u skladu s lokalnim sigurnosnim propisima. Brižljivo odaberite mjesto instalacije na kojem će se postavljanje uređaja i njegovo korištenje odvijati u sigurnim uvjetima. Uređaj je namijenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mjernih senzora/uređaja. Upotreba uređaja u druge svrhe može predstavljati rizik za korisnika. Održavanje i popravke smije provoditi isključivo ovlašteni servisni odjel. Mogu se upotrebljavati samo originalni rezervni i dodatni dijelovi koje je preporučio proizvođač. Bilo kakve izmjene izvršene na uređaju poništit će njegovu pouzdanost. Nepoštivanje ovih uputa ili upotreba uređaja za svrhe za koje nije namijenjen mogu dovesti do ozbiljnih ozljeda osoba koje se njime koriste i/ili štete na opremi. Potreban posao za zavarivanje mora biti izveden prema DIN / EN 287 od strane kvalificiranih varioca ili izvođača radova prema EN 3834-2.

HU A termék üzembe helyezése/rögzítése előtt tekintse át a vonatkozó utasításokat, és tartsa is be azokat. Az üzembe helyezést kizárólag szakember végezheti, a hatályos biztonsági előírásoknak megfelelően. A telepítéshez biztonságos üzemet szavatoló helyet válasszon. A termék kizárólag HACH/HACH LANGE mérőberendezések és készülékek rögzítésére szolgál. Az ettől eltérő bármilyen használat kockázattal jár. A karbantartást és egyéb javításokat kizárólag az arra feljogosított ügyfélszolgálati részleg végezheti el. Csak a gyártó által ajánlott cserealkatrészek használhatóak. A terméken végzett bármilyen módosítás a felelősség kizárását vonja maga után. Az utasítások be nem tartása, a termék megadott felhasználási területtől eltérő célra való alkalmazása a kezelő súlyos sérülését és/vagy a berendezés károsodását okozhatja. A szükséges hegesztési munkákat csak DIN/EN 287 bizonyítvánnyal rendelkező hegesztő szakember, vagy EN 3834-2 minősítéssel rendelkező szakcég végezheti.

IT Prima di installare/montare il prodotto, leggere le istruzioni sull'installazione e attenersi scrupolosamente ad esse durante l'installazione. L'installazione deve essere eseguita da personale qualificato in base alle norme di sicurezza locali. Scegliere con cura il punto di installazione per un'installazione corretta e un funzionamento sicuro. Il prodotto è adatto esclusivamente per il sostegno/collegamento di prodotti/sensori di misura HACH/HACH LANGE. Qualsiasi altro utilizzo può provocare lesioni all'utente. La manutenzione e gli interventi di riparazione devono essere eseguiti esclusivamente dal reparto assistenza clienti. Il produttore consiglia di sostituire gli accessori solo con ricambi originali. Qualsiasi modifica apportata al prodotto prevede l'esclusione da qualsiasi responsabilità. La mancata osservanza della procedura di installazione o l'utilizzo inappropriato del prodotto possono provocare serie lesioni all'utente e/o danni all'apparecchiatura. Il lavoro di saldatura richiesto deve essere effettuato esclusivamente in accordo alla direttiva DIN / EN 287 da saldatori qualificati o da costruttori in accordo a EN 3834-2.

JA 製品を取り付ける前にすべての設置手順をよく読み、手順に従って設置してください。 設置は地域の安全基準に従い、資格のある担当者が行ってください。 設置場所は、安全に取り付けて操作できる場所を選んでください。 本製品は、HACH/HACH LANGE 測定センサー/製品の保持および接続専用です。 その他の用途には、ユーザーの責任において使用してください。 メンテナンスおよび修理は、認定されたカスタマー・サービス部門のみが実施できます。 交換部品および付属品には、メーカー推奨の純正品のみを使用してください。 製品を改変した場合、保証は無効になります。 手順に従わなかった場合、または製品を用途外に使用した場合は、重傷を負ったり、装置が破損することがあります。 ウェルディングはDIN/EN287に基づいて認定された作業者あるいはEN3834-2に基づく受託業者が実施する。

KO 본 제품을 설치하거나 장착하기 전에 모든 설치 지침을 충분히 검토하고 설치 시 반드시 해당 지침을 따르십시오. 설치는 숙련된 기술자가 지역의 모든 관련 안전 규정을 준수하여 수행해야 합니다. 설치 및 작동 시 안전한 장소를 신중하게 고르십시오. 본 제품은 HACH/HACH LANGE 측정 센서 또는 측정 제품을 지지하거나 연결하는 용도로만 사용됩니다. 그 외 다른 용도로 사용 시 작업자가 위험할 수 있습니다. 유지 관리 및 보수 작업은 공인된 고객 서비스 부서에서 전적으로 담당해야 합니다. 제조사가 승인한 교체용 부품 및 주변 장치만 사용 가능합니다. 제품 변경으로 인한 책임은 지지 않습니다. 이러한 지침에 어긋나거나 원래 제품의 용도와 다른 목적으로 사용할 경우 작업자에게 심각한 부상이 일어나거나 장비가 손상될 수 있습니다. 용접 작업이 필요한 경우에는 반드시 DIN/EN 287 자격을 가진 용접공이나 EN3834-2에 상응한 사람에 의해서 반드시 수행되어져야 합니다.

NL Lees vóór montage van het product alle montage-instructies grondig door en volg de instructies tijdens de montage op. Montage dient te worden uitgevoerd door een gekwalificeerde persoon en in overeenstemming met alle plaatselijke veiligheidsvoorschriften. Kies een montagelocatie die een veilige montage en werking garandeert. Het product is uitsluitend bedoeld voor opname/bevestiging van meetsensoren/-producten van HACH/HACH LANGE. Elk ander gebruik kan gevaren voor de gebruiker met zich meebrengen. Onderhoud en reparatie mogen uitsluitend worden uitgevoerd door de geautoriseerde afdeling klantenservice. Er mogen alleen originele, door de fabrikant aanbevolen reservedelen en accessoires worden gebruikt. Bij elke aanpassing van het product vervalt de aansprakelijkheid. Als u deze instructies niet opvolgt of als u het product voor een ander doel gebruikt dan waarvoor het is bedoeld, kan dit leiden tot ernstig letsel van de gebruiker en/of beschadiging van de apparatuur. Het benodigde laswerk mag uitsluitend uitgevoerd worden door DIN/EN287 gekwalificeerde lassers, of door EN3834-2 gecertificeerde installateurs.

PL Przed zainstalowaniem/zamontowaniem produktu, uważnie przeczytać wszystkie instrukcje i postępować zgodnie z ich zaleceniami podczas instalacji. Instalacja powinna zostać wykonana przez specjalistę o odpowiednich kwalifikacjach, zgodnie ze wszystkimi obowiązującymi lokalnie przepisami bezpieczeństwa. Wybrać takie miejsce instalacji, które zapewni bezpieczeństwo podczas instalacji i użytkowania. Produkt jest przeznaczony wyłącznie do zamocowania/zawieszenia czujników/mierników firmy HACH/HACH LANGE. Jakiekolwiek inne zastosowanie niesie ze sobą ryzyko dla użytkownika. Konserwacje i naprawy powinny być przeprowadzane wyłącznie przez upoważniony personel działu serwisowego klienta. Wolno używać tylko oryginalnych części zamiennych i części wyposażenia zalecanych przez producenta. Jakiekolwiek modyfikacje w budowie i działaniu produktu oznaczają wygaśnięcie

gwarancji i wykluczają wszelką odpowiedzialność producenta. Nieprzestrzeganie tych instrukcji lub używanie produktu do celów innych niż wynika z opisu jego przeznaczenia, może być przyczyną poważnych wypadków z udziałem użytkownika i/lub uszkodzenia sprzętu. Wymagane prace spawalnicze muszą być wykonane zgodnie z normą DIN / EN 287 przez wykfalifikowany personel lub przez firmy pośredniczące zgodnie z EN3834-2.

PT Antes de instalar/montar o produto, leia atentamente as instruções de instalação e siga-as durante a instalação. A instalação deve ser efectuada por um profissional qualificado em conformidade com todas as regulamentações locais de segurança. Escolha cuidadosamente o local de instalação de modo a assegurar uma operação e instalação com segurança. Este produto foi concebido apenas para segurar/fixar sensores/produtos para medições da HACH/HACH LANGE. Qualquer outro tipo de utilização pode implicar riscos para o utilizador. O trabalho de manutenção e reparação deve ser efectuado única e exclusivamente pelo departamento de assistência ao cliente devidamente autorizado. Apenas podem ser utilizados acessórios e peças de substituição originais recomendados pelo fabricante. Qualquer alteração feita ao produto anula qualquer responsabilidade da nossa parte. O não cumprimento das instruções ou a utilização do produto para outros fins que não aqueles para que o produto foi concebido pode resultar em ferimentos graves e/ou danos no equipamento. O trabalho de soldadura exigido deverá ser executado exclusivamente por soldadores qualificados de acordo com a norma DIN /EN 287, ou por empreiteiros em conformidade com a norma EN 3834-2.

RO Înainte de instalarea/montarea produsului, citiți cu atenție toate instrucțiunile de instalare și urmați instrucțiunile în timpul instalării. Instalarea trebuie realizată de un expert calificat în conformitate cu toate reglementările locale pentru siguranță. Aveți grijă să alegeți o locație de instalare care să asigure instalarea și funcționarea în siguranță. Produsul este destinat exclusiv pentru menținerea/atașarea senzorilor/produselor de măsurare HACH/HACH LANGE. Utilizarea în alte scopuri poate implica riscuri pentru utilizator. Întreținerea și lucrările de reparație trebuie realizate exclusiv de departamentul de service autorizat pentru clienți. Pot fi utilizate numai piesele de schimb și accesoriile originale recomandate de producător. Orice modificare adusă produsului va duce la anularea oricărei răspunderi. Nerespectarea acestor instrucțiuni sau utilizarea produsului în alte scopuri decât în cele destinate pot duce la accidente grave pentru utilizator și/sau defectarea echipamentului. Lucrările de sudură necesare trebuie să fie efectuate exclusiv de sudori calificați în conformitate cu DIN / EN 287 , sau de contractori în conformitate cu EN 3834-2.

RU Перед установкой/монтажом изделия необходимо внимательно прочитать инструкции по установке и строго следовать им во время выполнения работ. Установка должна быть выполнена квалифицированным специалистом с соблюдением действующих правил по технике безопасности. Выбирая место для установки, необходимо учитывать требования по безопасности при монтаже и эксплуатации изделий. Данное изделие предназначено только для крепления измерительных датчиков/приборов компании HACH/HACH LANGE. Любое другое применение может представлять опасность для пользователя. Работы по ремонту и техобслуживанию должны выполняться исключительно специалистами уполномоченной сервисной организации. С изделием могут использоваться только запчасти и принадлежности, рекомендуемые изготовителем. Любые изменения, внесенные в конструкцию изделия, приведут к отмене гарантии поставщика. Несоблюдение требований инструкций или использование изделия не по назначению могут стать причиной серьезных травм для людей и/или повреждения оборудования. Необходимые сварочные работы должны проводиться только сварщиками, квалифицированными в соответствии с DIN / EN 287, или подрядчиками в соотвествии с DIN 3834-2.

SK Pred inštaláciou/upevnením produktu si pozorne prečítajte všetky pokyny k inštalácii a počas inštalácie ich dodržujte. Inštaláciu musí vykonať kvalifikovaný expert v súlade so všetkými miestnymi bezpečnostnými nariadeniami. Uistite sa, že si vyberiete miesto inštalácie, ktoré zaručí bezpečnú inštaláciu a prevádzku. Produkt je určený výlučne pre uchytenie/upevnenie meracích snímačov/produktov HACH/HACH LANGE. Akékoľvek iné použitie môže zahŕňať riziká pre používateľa. Údržbu a opravy by malo vykonávať výlučne autorizované oddelenie služieb pre zákazníkov. Môžu sa použiť len originálne náhradné diely a príslušenstvo, ktoré odporúča výrobca. Akékoľvek zmeny vykonané na produkte spôsobia neplatnosť všetkej zodpovednosti. Nedodržanie týchto pokynov alebo používanie produktu na iný než určený účel môže spôsobiť vážne zranenie používateľa alebo poškodenie zariadenia. Požadované zváračské práce musia byť vykonané výhradene v súlade s DIN/EN 287 kvalifikovanými zváračmi, alebo dodávateľmi v súlade s EN 3834-2.

SL Pred namestitvijo/postavitvijo izdelka natančno preberite vsa navodila za namestitev in jih med nameščanjem upoštevajte. Namestitev mora izvesti usposobljen strokovnjak v skladu z vsemi lokalnimi varnostnimi predpisi. Za namestitev izberite mesto, ki zagotavlja varno namestitev in uporabo. Izdelek je namenjen izključno za namestitev/pritrditev merilnih senzorjev/izdelkov HACH/HACH LANGE. Vsakršna drugačna uporaba lahko predstavlja nevarnost za uporabnika. Vzdrževanje in popravilo lahko izvaja izključno osebje pooblaščenega servisnega oddelka. Uporabljate lahko samo originalne nadomestne dele in dodatno opremo, ki jih priporoča proizvajalec. Spremembe izdelka razveljavijo vsakršno odgovornost. Če teh navodil ne upoštevate ali izdelek uporabljate v neprimeren namen, lahko pride do hudih poškodb uporabnika in/ali poškodovanja opreme. Zahtevana dela varenja lahko izvajajo izključno usposobljeni varilci v skladu z DIN/EN 287 ali izvajalci v skladu z EN 3834-2.

SR Pre instalacije/montaže uređaja pažljivo pročitajte sva uputstva za montažu i pratite ih tokom postupka montaže. Instalaciju mora provesti kvalifikovani stručnjak u skladu sa lokalnim propisima o bezbednosti. Brižljivo odaberite mesto instalacije na kom će se montaža uređaja i korišćenje odvijati u bezbednim uslovima. Uređaj je namenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mernih senzora/uređaja. Upotreba uređaja u druge svrhe može da predstavlja rizik po korisnika. Održavanje i opravke sme da provodi isključivo ovlašćeni serviser. Kod zamene i opravaka smeju da se koriste samo originalni rezervni i dodatni delovi koje je preporučio proizvođač. Bilo kakve izmene izvršene na uređaju poništiće njegovu pouzdanost. Nepridržavanje uputstava ili upotreba uređaja u svrhe za koje nije namenjen mogu dovesti do ozbiljnih povreda ljudi koji ga koriste i/ili štete na opremi. Neophodni radovi zavarivanja treba da budu izvršeni od strane zavarivača u skladu sa DIN / EN 287 ili od ugovorenog izvođača radova u skladu sa EN 3834-2.

SV Läs alla installationsanvisningar noggrant innan du installerar/monterar produkten och följ anvisningarna under installationen. Installationen måste utföras av en kvalificerad expert i enlighet med alla lokala säkerhetsföreskrifter. Se till att välja en installationsplats som garanterar säker installation och drift. Produkten är endast ämnad för att hålla/fästa mätsensorer/-produkter från HACH/HACH LANGE. Annan användning kan medföra risker för användaren. Underhålls- och reparationsarbeten ska uteslutande utföras av den auktoriserade kundserviceavdelningen. Endast originalreservdelar och -tillbehör som rekommenderas av tillverkaren ska användas. Om någon ändring görs på produkten upphävs tillverkarens ansvar. Det kan det medföra allvarliga skador för användaren eller skador på utrustningen om du inte följer anvisningarna eller om du använder produkten i installationer den inte är avsedd för. Svetsarbeten skall uteslutande utföras av svetsare kvalificerade enligt DIN/EN 287, eller av entreprenör enligt EN3834-2.

TR Ürünün montajını yapmadan önce, tüm montaj talimatlarını dikkatlice okuyun ve kurulum sırasında talimatları mutlaka takip edin. Montaj, kalifiye bir uzman tarafından tüm yerel güvenlik düzenlemelerine uygun şekilde yapılmalıdır. Ürünü, montaj ve kullanımın güvenli olacağı bir yere monte edin. Ürün sadece HACH/HACH LANGE ölçüm sensörlerini/ ürünlerini, tutmak/takmak için tasarlanmıştır. Başka amaçlarla kullanılması, kullanıcı için tehlikeler doğurabilir. Bakım ve onarım sadece yetkili müşteri hizmetleridepartmanı tarafından gerçekleştirilmelidir. Sadece üretici tarafından önerilen orijinal yedek parça ve aksesuarlar kullanılmalıdır. Ürüne yapılan her türlü değişiklik, tüm sorumluluğu ortadan kaldırır. Bu talimatlara uyulmaması veya ürünün üretim amacından başka bir amaçla kullanılması sonucunda kullanıcı ciddi şekilde yaralanabilir ve/veya ürün zarar görebilir. Gerekli kaynak işi yalnızca kalifiye kaynakçılar tarafından DIN / EN 287'ye göre yapılmalıdır, veya müteahhitler tarafından EN 3834-2'ye göre yapılmalıdır.

ZH 在安装/固定产品之前，请仔细阅读所有安装说明，并在安装过程中遵守这些说明。 必须由合格的专家完成安装，并遵守当地的所有安全法规。仔细选择安装地点，确保安全地安装和操作。 本产品只能用于固定/连接 HACH/HACH LANGE 测量传感器/产品。 用于其他用途可能会给用户带来危险。 维护和修理工作应由经授权的客户服务部门完成。 只能使用正宗替换件和制造商推荐的附件。 对本产品进行任何更改均可能导致所有担保失效。不遵守这些说明，或者将本产品用于其它用途，可能会对用户造成严重伤害和/或设备损坏。所需的焊接工作必须要根据DIN/EN 287，由合格的焊接工人单独执行，或者根据EN 3834-2由承包人执行。

BG Преди инсталацията/монтажа на продукта, прочетете внимателно всички инструкции за инсталация и ги спазвайте по време на инсталирането. Инсталацията трябва да се извършва от квалифициран специалист в съответствие с местните разпоредби за безопасност. Погрижете се избраното място на инсталацията да гарантира безопасна инсталация и експлоатация. Продуктът е предназначен единствено за придържане/прикрепване на измервателните сензори/продукти на HACH/HACH LANGE. Всяко друго приложение може да носи риск за потребителя. Работите по поддръжката и ремонта трябва да се извършват изключително от оторизирания отдел за обслужване на клиенти. Могат да се използват само оригинални резервни части и препоръчани от производителя принадлежности. Всякакви изменения по продукта водят до анулиране на всички отговорности от страна на производителя. Неспазването на инструкциите за употреба или използването на продукта за цели, различни от тези, за които е предназначен, може да доведе до сериозно нараняване на потребителя и/или повреда на оборудването. Работата по заваряване, трябва да бъде извършвана само от квалифицирани заварчици съгласно DIN/EN 287 или от сертифицирани фирми по EN 3834-2.

CS Při instalaci/montáži produktu si pečlivě přečtěte všechny pokyny k instalaci a v průběhu instalace tyto pokyny dodržujte. Instalaci musí provádět kvalifikovaný odborník v souladu s místními bezpečnostními předpisy. Pečlivě vyberte umístění pro instalaci, které zajistí bezpečnou instalaci a provoz. Produkt je určen pouze k upevnění/přichycení měřicích snímačů/produktů HACH/HACH LANGE. Jakékoli jiné použití může znamenat riziko pro uživatele. Údržbu a opravy smí provádět výhradně autorizované oddělení zákaznických služeb. Je dovoleno používat pouze originální náhradní díly a příslušenství doporučené výrobcem. Jakékoli změny provedené na produktu způsobí neplatnost veškerých záruk. Nedodržení těchto pokynů nebo používání produktu pro jiný účel než pro který je určen může způsobit uživateli vážné zranění anebo poškodit zařízení. Potřebné svářečské práce musí být provedeny kvalifikovaným svářečem výhradně podle DIN/EN 287 nebo dodavatelem v souladu s EN 3834-2.

DA Før du installerer/monterer produktet, skal du læse alle installationsinstruktionerne grundigt og følge dem under installeringen. Installationen skal udføres af en kvalificeret ekspert i overensstemmelse med alle lokale sikkerhedsbestemmelser. Vælg sikker og betjeningsvenligt placering til installationen. Produktet er kun beregnet til at holde/fastgøre HACH/HACH LANGE-målesensorer/-produkter. Enhver anden form for brug kan medføre skadesrisiko for brugeren. Vedligeholdelse og reparation bør kun udføres af en autoriseret kundeserviceafdeling. Der må kun anvendes originale reservedele og tilbehør, der er anbefalet af producenten. Alle ændringer af produktet ophæver garantien. Hvis du ikke følger disse instruktioner eller bruger produktet til et andet formål, end det er beregnet til, kan der forekomme alvorlige personskader og/eller skader på udstyret. Svejsearbejde må kun udføres af DIN/EN 287 kvalificerede svejsere, eller EN 3834-2 certificerede firmaer.

DE Die Montageanleitung ist vor der Installation/Montage des Produktes sorgfältig und vollständig zu lesen und zu befolgen. Die Installation muss von einer Fachkraft (qualifiziertes Personal) unter Einhaltung aller lokal gültigen Sicherheitsvorschriften erfolgen. Der Montageort ist so zu wählen, dass eine sichere Installation und der sichere Betrieb gewährleistet ist. Die Verwendung des Produktes ist ausschließlich zum Halten/Befestigen von HACH/HACH LANGE Messsonden/Produkten vorgesehen. Jede andere Benutzung ist mit Risiken für den Benutzer verbunden. Wartungs- und Reparaturarbeiten sollten nur vom autorisierten Kundendienst durchgeführt werden. Es dürfen nur vom Hersteller empfohlene Originalersatz- und Zubehörteile verwendet werden. Änderungen am Produkt haben den Verlust jeglicher Haftungsansprüche zur Folge. Nichtbeachtung dieser Anweisungen oder eine andere Verwendung des Produktes kann schwerwiegende Verletzungen der Anwender oder Beschädigung am Gerät zur Folge haben. Die notwendigen Schweißarbeiten dürfen ausschließlich von entsprechend DIN/EN 287 qualifizierten Schweißern durchgeführt werden, oder von Fachfirmen entsprechend EN 3834-2.

EL Πριν από την εγκατάσταση/τοποθέτηση του προϊόντος, διαβάστε προσεκτικά και ακολουθήστε όλες τις οδηγίες εγκατάστασης κατά την εγκατάσταση. Η εγκατάσταση πρέπει να πραγματοποιηθεί από κατάλληλα εκπαιδευμένο τεχνικό και σύμφωνα με όλους τους τοπικούς κανονισμούς ασφάλειας. Επιλέξτε μια θέση τοποθέτησης που θα διασφαλίσει την ασφαλή εγκατάσταση και λειτουργία. Το προϊόν προορίζεται αποκλειστικά για τη στήριξη/σύνδεση των αισθητήρων μέτρησης/προϊόντων HACH/HACH LANGE. Οποιαδήποτε άλλη χρήση ενδέχεται να ενέχει κινδύνους για τον χρήστη. Οι εργασίες συντήρησης και επισκευής θα πρέπει να εκτελούνται αποκλειστικά από το εξουσιοδοτημένο τμήμα εξυπηρέτησης πελατών. Επιτρέπεται η χρήση μόνον των γνήσιων ανταλλακτικών και των αξεσουάρ που συνιστά ο κατασκευαστής. Οποιεσδήποτε αλλαγές στο προϊόν ακυρώνουν την ευθύνη της εταιρείας. Σε περίπτωση που δεν τηρηθούν αυτές τις οδηγίες ή χρησιμοποιηθεί το προϊόν για διαφορετικό σκοπό από αυτόν που προορίζεται, ενδέχεται να προκληθεί σοβαρός τραυματισμός στον χειριστή και/ή βλάβη στον εξοπλισμό. Οι απαιτούμενες εργασίες συγκόλλησης θα πρέπει να διεξαχθούν από εξειδικευμένο προσωπικό σύμφωνα με DIN / EN287 ή από κατασκευαστικές εταιρείες σύμφωνα με DIN 3834-2.

EN Before installing/mounting the product, read all the installation instructions carefully and follow the instructions during installation. Installation must be carried out by a qualified expert in accordance with all local safety regulations. Take care to choose an installation location that will ensure safe installation and operation. The product is intended solely for holding/attaching HACH/HACH LANGE measuring sensors/products. Any other use may involve risks for the user. Maintenance and repair work should be carried out exclusively by the authorized customer service department. Only original replacement and accessory parts recommended by the manufacturer may be used. Any changes made to the product will nullify all liability. Failure to follow these instructions or use of the product for a purpose other than that for which it was intended may result in serious injury to the user and/or damage to the equipment. The required welding work must be performed exclusively in accordance with DIN / EN 287 qualified welders, or from contractors in accordance with EN 3834-2.

ES Antes de instalar o fijar el producto, lea con atención todas las instrucciones de instalación y sígalas durante el montaje. La instalación debe llevarla a cabo un experto cualificado, de acuerdo con las normas de seguridad locales. Elija una ubicación para la instalación que garantice que ésta y el funcionamiento del producto sean seguros. El producto sólo está diseñado para sujetar o fijar sensores o productos de medición de HACH/HACH LANGE. Cualquier otro uso puede conllevar riesgos para el usuario. El trabajo de mantenimiento y reparación sólo debe llevarse a cabo por el departamento de atención al cliente autorizado. Sólo deben utilizarse las piezas de repuesto recomendadas por el fabricante. Cualquier cambio que se realice en el producto anulará toda responsabilidad. Si no se siguen estas instrucciones o si se utiliza el producto para un uso distinto del uso para el que fue diseñado, el usuario puede sufrir heridas graves y/o se puede dañar el equipo. Los trabajos de soldadura requeridos deben ser realizados exclusivamente por soldadores cualificados según DIN / EN 287, o por contratistas de acuerdo a EN 3834-2.

FI Ennen kuin asennat/kiinnität tuotteen, lue kaikki asennusohjeet huolellisesti ja noudata niitä. Tuotteen saa asentaa vain valtuutettu henkilö, ja asennuksessa on noudatettava kaikkia paikallisia turvallisuusmääräyksiä. Asenna tuote sellaiseen paikkaan, johon asentaminen on turvallista ja jossa tuote toimii oikein. Tuote on tarkoitettu ainoastaan HACH/HACH LANGE -mittausanturien/-tuotteiden ripustamiseen/kiinnittämiseen. Muunlainen käyttö voi aiheuttaa vaaratilanteita käyttäjälle. Huolto- ja korjaustyöt saa tehdä vain valtuutettu asiakaspalveluosasto. Tuotteessa saa käyttää vain valmistajan suosittelemia alkuperäisiä varaja lisäosia. Tuotteeseen tehdyt muutokset mitätöivät kaikki vastuut. Jos näitä ohjeita ei noudateta tai jos tuotetta käytetään johonkin muuhun kuin sen varsinaiseen käyttötarkoitukseen, käyttäjälle voi aiheutua vakavia vammoja ja/tai laite voi vaurioitua. Vain DIN / EN 287 mukaan hyväksytyt hitsaajat tai EN 3834-2 mukaiset urakoitsijat saavat tehdä vaaditut hitsaustyöt.

FR Avant l'installation/le montage du produit, lisez attentivement toutes les instructions d'installation et suivez-les au cours de l'installation. L'installation doit être réalisée par un expert qualifié conformément à toutes les réglementations de sécurité locales. Veillez à choisir un emplacement permettant d'assurer une installation et un fonctionnement en toute sécurité. Ce produit est uniquement destiné à maintenir/fixer des capteurs/équipements de mesure HACH LANGE. Toute autre utilisation entraînerait un risque pour l'utilisateur. Seul le service clientèle agréé est autorisé à effectuer les travaux de maintenance et de réparation. Seuls les pièces de rechange et les accessoires d'origine recommandés par le fabricant doivent être utilisés. La modification du produit annule toute responsabilité. Le non-respect de ces instructions ou l'utilisation de ce produit à des fins autres que celles auxquelles il est destiné risqueraient de gravement blesser l'utilisateur et/ou d'endommager le matériel. Le travail de soudure requis doit être réalisé exclusivement par des soudeurs qualifiés en conformité avec DIN / EN 287, ou par prestataires conformément à EN 3834-2.

HR Prije instalacije/postavljanja uređaja, pažljivo pročitajte sve upute za montažu i pratite ih tijekom postupka instalacije. Instalaciju mora provesti kvalificirani stručnjak u skladu s lokalnim sigurnosnim propisima. Brižljivo odaberite mjesto instalacije na kojem će se postavljanje uređaja i njegovo korištenje odvijati u sigurnim uvjetima. Uređaj je namijenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mjernih senzora/uređaja. Upotreba uređaja u druge svrhe može predstavljati rizik za korisnika. Održavanje i popravke smije provoditi isključivo ovlašteni servisni odjel. Mogu se upotrebljavati samo originalni rezervni i dodatni dijelovi koje je preporučio proizvođač. Bilo kakve izmjene izvršene na uređaju poništit će njegovu pouzdanost. Nepoštivanje ovih uputa ili upotreba uređaja za svrhe za koje nije namijenjen mogu dovesti do ozbiljnih ozljeda osoba koje se njime koriste i/ili štete na opremi. Potreban posao za zavarivanje mora biti izveden prema DIN / EN 287 od strane kvalificiranih varioca ili izvođača radova prema EN 3834-2.

HU A termék üzembe helyezése/rögzítése előtt tekintse át a vonatkozó utasításokat, és tartsa is be azokat. Az üzembe helyezést kizárólag szakember végezheti, a hatályos biztonsági előírásoknak megfelelően. A telepítéshez biztonságos üzemet szavatoló helyet válasszon. A termék kizárólag HACH/HACH LANGE mérőberendezések és készülékek rögzítésére szolgál. Az ettől eltérő bármilyen használat kockázattal jár. A karbantartást és egyéb javításokat kizárólag az arra feljogosított ügyfélszolgálati részleg végezheti el. Csak a gyártó által ajánlott cserealkatrészek használhatóak. A terméken végzett bármilyen módosítás a felelősség kizárását vonja maga után. Az utasítások be nem tartása, a termék megadott felhasználási területtől eltérő célra való alkalmazása a kezelő súlyos sérülését és/vagy a berendezés károsodását okozhatja. A szükséges hegesztési munkákat csak DIN/EN 287 bizonyítvánnyal rendelkező hegesztő szakember, vagy EN 3834-2 minősítéssel rendelkező szakcég végezheti.

IT Prima di installare/montare il prodotto, leggere le istruzioni sull'installazione e attenersi scrupolosamente ad esse durante l'installazione. L'installazione deve essere eseguita da personale qualificato in base alle norme di sicurezza locali. Scegliere con cura il punto di installazione per un'installazione corretta e un funzionamento sicuro. Il prodotto è adatto esclusivamente per il sostegno/collegamento di prodotti/sensori di misura HACH/HACH LANGE. Qualsiasi altro utilizzo può provocare lesioni all'utente. La manutenzione e gli interventi di riparazione devono essere eseguiti esclusivamente dal reparto assistenza clienti. Il produttore consiglia di sostituire gli accessori solo con ricambi originali. Qualsiasi modifica apportata al prodotto prevede l'esclusione da qualsiasi responsabilità. La mancata osservanza della procedura di installazione o l'utilizzo inappropriato del prodotto possono provocare serie lesioni all'utente e/o danni all'apparecchiatura. Il lavoro di saldatura richiesto deve essere effettuato esclusivamente in accordo alla direttiva DIN / EN 287 da saldatori qualificati o da costruttori in accordo a EN 3834-2.

JA 製品を取り付ける前にすべての設置手順をよく読み、手順に従って設置してください。 設置は地域の安全基準に従い、資格のある担当者が行ってください。 設置場所は、安全に取り付けて操作できる場所を選んでください。 本製品は、HACH/HACH LANGE 測定センサー/製品の保持および接続専用です。 その他の用途には、ユーザーの責任において使用してください。 メンテナンスおよび修理は、認定されたカスタマー・サービス部門のみが実施できます。 交換部品および付属品には、メーカー推奨の純正品のみを使用してください。 製品を改変した場合、保証は無効になります。 手順に従わなかった場合、または製品を用途外に使用した場合は、重傷を負ったり、装置が破損することがあります。 ウェルディングはDIN/EN287に基づいて認定された作業者あるいはEN3834-2に基づく受託業者が実施する。

KO 본 제품을 설치하거나 장착하기 전에 모든 설치 지침을 충분히 검토하고 설치 시 반드시 해당 지침을 따르십시오. 설치는 숙련된 기술자가 지역의 모든 관련 안전 규정을 준수하여 수행해야 합니다. 설치 및 작동 시 안전한 장소를 신중하게 고르십시오. 본 제품은 HACH/HACH LANGE 측정 센서 또는 측정 제품을 지지하거나 연결하는 용도로만 사용됩니다. 그 외 다른 용도로 사용 시 작업자가 위험할 수 있습니다. 유지 관리 및 보수 작업은 공인된 고객 서비스 부서에서 전적으로 담당해야 합니다. 제조사가 승인한 교체용 부품 및 주변 장치만 사용 가능합니다. 제품 변경으로 인한 책임은 지지 않습니다. 이러한 지침에 어긋나거나 원래 제품의 용도와 다른 목적으로 사용할 경우 작업자에게 심각한 부상이 일어나거나 장비가 손상될 수 있습니다. 용접 작업이 필요한 경우에는 반드시 DIN/EN 287 자격을 가진 용접공이나 EN3834-2에 상응한 사람에 의해서 반드시 수행되어져야 합니다.

NL Lees vóór montage van het product alle montage-instructies grondig door en volg de instructies tijdens de montage op. Montage dient te worden uitgevoerd door een gekwalificeerde persoon en in overeenstemming met alle plaatselijke veiligheidsvoorschriften. Kies een montagelocatie die een veilige montage en werking garandeert. Het product is uitsluitend bedoeld voor opname/bevestiging van meetsensoren/-producten van HACH/HACH LANGE. Elk ander gebruik kan gevaren voor de gebruiker met zich meebrengen. Onderhoud en reparatie mogen uitsluitend worden uitgevoerd door de geautoriseerde afdeling klantenservice. Er mogen alleen originele, door de fabrikant aanbevolen reservedelen en accessoires worden gebruikt. Bij elke aanpassing van het product vervalt de aansprakelijkheid. Als u deze instructies niet opvolgt of als u het product voor een ander doel gebruikt dan waarvoor het is bedoeld, kan dit leiden tot ernstig letsel van de gebruiker en/of beschadiging van de apparatuur. Het benodigde laswerk mag uitsluitend uitgevoerd worden door DIN/EN287 gekwalificeerde lassers, of door EN3834-2 gecertificeerde installateurs.

PL Przed zainstalowaniem/zamontowaniem produktu, uważnie przeczytać wszystkie instrukcje i postępować zgodnie z ich zaleceniami podczas instalacji. Instalacja powinna zostać wykonana przez specjalistę o odpowiednich kwalifikacjach, zgodnie ze wszystkimi obowiązującymi lokalnie przepisami bezpieczeństwa. Wybrać takie miejsce instalacji, które zapewni bezpieczeństwo podczas instalacji i użytkowania. Produkt jest przeznaczony wyłącznie do zamocowania/zawieszenia czujników/mierników firmy HACH/HACH LANGE. Jakiekolwiek inne zastosowanie niesie ze sobą ryzyko dla użytkownika. Konserwacje i naprawy powinny być przeprowadzane wyłącznie przez upoważniony personel działu serwisowego klienta. Wolno używać tylko oryginalnych części zamiennych i części wyposażenia zalecanych przez producenta. Jakiekolwiek modyfikacje w budowie i działaniu produktu oznaczają wygaśnięcie

gwarancji i wykluczają wszelką odpowiedzialność producenta. Nieprzestrzeganie tych instrukcji lub używanie produktu do celów innych niż wynika z opisu jego przeznaczenia, może być przyczyną poważnych wypadków z udziałem użytkownika i/lub uszkodzenia sprzętu. Wymagane prace spawalnicze muszą być wykonane zgodnie z normą DIN / EN 287 przez wykfalifikowany personel lub przez firmy pośredniczące zgodnie z EN3834-2.

PT Antes de instalar/montar o produto, leia atentamente as instruções de instalação e siga-as durante a instalação. A instalação deve ser efectuada por um profissional qualificado em conformidade com todas as regulamentações locais de segurança. Escolha cuidadosamente o local de instalação de modo a assegurar uma operação e instalação com segurança. Este produto foi concebido apenas para segurar/fixar sensores/produtos para medições da HACH/HACH LANGE. Qualquer outro tipo de utilização pode implicar riscos para o utilizador. O trabalho de manutenção e reparação deve ser efectuado única e exclusivamente pelo departamento de assistência ao cliente devidamente autorizado. Apenas podem ser utilizados acessórios e peças de substituição originais recomendados pelo fabricante. Qualquer alteração feita ao produto anula qualquer responsabilidade da nossa parte. O não cumprimento das instruções ou a utilização do produto para outros fins que não aqueles para que o produto foi concebido pode resultar em ferimentos graves e/ou danos no equipamento. O trabalho de soldadura exigido deverá ser executado exclusivamente por soldadores qualificados de acordo com a norma DIN /EN 287, ou por empreiteiros em conformidade com a norma EN 3834-2.

RO Înainte de instalarea/montarea produsului, citiţi cu atenţie toate instrucţiunile de instalare şi urmaţi instrucţiunile în timpul instalării. Instalarea trebuie realizată de un expert calificat în conformitate cu toate reglementările locale pentru siguranţă. Aveţi grijă să alegeţi o locaţie de instalare care să asigure instalarea şi funcţionarea în siguranţă. Produsul este destinat exclusiv pentru menţinerea/ataşarea senzorilor/produselor de măsurare HACH/HACH LANGE. Utilizarea în alte scopuri poate implica riscuri pentru utilizator. Întreţinerea şi lucrările de reparaţie trebuie realizate exclusiv de departamentul de service autorizat pentru clienţi. Pot fi utilizate numai piesele de schimb şi accesoriile originale recomandate de producător. Orice modificare adusă produsului va duce la anularea oricărei răspunderi. Nerespectarea acestor instrucţiuni sau utilizarea produsului în alte scopuri decât în cele destinate pot duce la accidente grave pentru utilizator şi/sau defectarea echipamentului. Lucrările de sudură necesare trebuie să fie efectuate exclusiv de sudori calificaţi în conformitate cu DIN / EN 287 , sau de contractori în conformitate cu EN 3834-2.

RU Перед установкой/монтажом изделия необходимо внимательно прочитать инструкции по установке и строго следовать им во время выполнения работ. Установка должна быть выполнена квалифицированным специалистом с соблюдением действующих правил по технике безопасности. Выбирая место для установки, необходимо учитывать требования по безопасности при монтаже и эксплуатации изделий. Данное изделие предназначено только для крепления измерительных датчиков/приборов компании HACH/HACH LANGE. Любое другое применение может представлять опасность для пользователя. Работы по ремонту и техобслуживанию должны выполняться исключительно специалистами уполномоченной сервисной организации. С изделием могут использоваться только запчасти и принадлежности, рекомендуемые изготовителем. Любые изменения, внесенные в конструкцию изделия, приведут к отмене гарантии поставщика. Несоблюдение требований инструкций или использование изделия не по назначению могут стать причиной серьезных травм для людей и/или повреждения оборудования. Необходимые сварочные работы должны проводиться только сварщиками, квалифицированными в соответствии с DIN / EN 287, или подрядчиками в соотвествии с DIN 3834-2.

SK Pred inštaláciou/upevnením produktu si pozorne prečítajte všetky pokyny k inštalácii a počas inštalácie ich dodržujte. Inštaláciu musí vykonať kvalifikovaný expert v súlade so všetkými miestnymi bezpečnostnými nariadeniami. Uistite sa, že si vyberiete miesto inštalácie, ktoré zaručí bezpečnú inštaláciu a prevádzku. Produkt je určený výlučne pre uchytenie/upevnenie meracích snímačov/produktov HACH/HACH LANGE. Akékoľvek iné použitie môže zahŕňať riziká pre používateľa. Údržbu a opravy by malo vykonávať výlučne autorizované oddelenie služieb pre zákazníkov. Môžu sa použiť len originálne náhradné diely a príslušenstvo, ktoré odporúča výrobca. Akékoľvek zmeny vykonané na produkte spôsobia neplatnosť všetkej zodpovednosti. Nedodržanie týchto pokynov alebo používanie produktu na iný než určený účel môže spôsobiť vážne zranenie používateľa alebo poškodenie zariadenia. Požadované zváračské práce musia byť vykonané výhradene v súlade s DIN/EN 287 kvalifikovanými zváračmi, alebo dodávateľmi v súlade s EN 3834-2.

SL Pred namestitvijo/postavitvijo izdelka natančno preberite vsa navodila za namestitev in jih med nameščanjem upoštevajte. Namestitev mora izvesti usposobljen strokovnjak v skladu z vsemi lokalnimi varnostnimi predpisi. Za namestitev izberite mesto, ki zagotavlja varno namestitev in uporabo. Izdelek je namenjen izključno za namestitev/pritrditev merilnih senzorjev/izdelkov HACH/HACH LANGE. Vsakršna drugačna uporaba lahko predstavlja nevarnost za uporabnika. Vzdrževanje in popravilo lahko izvaja izključno osebje pooblaščenega servisnega oddelka. Uporabljate lahko samo originalne nadomestne dele in dodatno opremo, ki jih priporoča proizvajalec. Spremembe izdelka razveljavijo vsakršno odgovornost. Če teh navodil ne upoštevate ali izdelek uporabljate v neprimeren namen, lahko pride do hudih poškodb uporabnika in/ali poškodovanja opreme. Zahtevana dela varenja lahko izvajajo izključno usposobljeni varilci v skladu z DIN/EN 287 ali izvajalci v skladu z EN 3834-2.

SR Pre instalacije/montaže uređaja pažljivo pročitajte sva uputstva za montažu i pratite ih tokom postupka montaže. Instalaciju mora provesti kvalifikovani stručnjak u skladu sa lokalnim propisima o bezbednosti. Brižljivo odaberite mesto instalacije na kom će se montaža uređaja i korišćenje odvijati u bezbednim uslovima. Uređaj je namenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mernih senzora/uređaja. Upotreba uređaja u druge svrhe može da predstavlja rizik po korisnika. Održavanje i opravke sme da provodi isključivo ovlašćeni serviser. Kod zamene i opravaka smeju da se koriste samo originalni rezervni i dodatni delovi koje je preporučio proizvođač. Bilo kakve izmene izvršene na uređaju poništiće njegovu pouzdanost. Nepridržavanje uputstava ili upotreba uređaja u svrhe za koje nije namenjen mogu dovesti do ozbiljnih povreda ljudi koji ga koriste i/ili štete na opremi. Neophodni radovi zavarivanja treba da budu izvršeni od strane zavarivača u skladu sa DIN / EN 287 ili od ugovorenog izvođača radova u skladu sa EN 3834-2.

SV Läs alla installationsanvisningar noggrant innan du installerar/monterar produkten och följ anvisningarna under installationen. Installationen måste utföras av en kvalificerad expert i enlighet med alla lokala säkerhetsföreskrifter. Se till att välja en installationsplats som garanterar säker installation och drift. Produkten är endast ämnad för att hålla/fästa mätsensorer/-produkter från HACH/HACH LANGE. Annan användning kan medföra risker för användaren. Underhålls- och reparationsarbeten ska uteslutande utföras av den auktoriserade kundserviceavdelningen. Endast originalreservdelar och -tillbehör som rekommenderas av tillverkaren ska användas. Om någon ändring görs på produkten upphävs tillverkarens ansvar. Det kan det medföra allvarliga skador för användaren eller skador på utrustningen om du inte följer anvisningarna eller om du använder produkten i installationer den inte är avsedd för. Svetsarbeten skall uteslutande utföras av svetsare kvalificerade enligt DIN/EN 287, eller av entreprenör enligt EN3834-2.

TR Ürünün montajını yapmadan önce, tüm montaj talimatlarını dikkatlice okuyun ve kurulum sırasında talimatları mutlaka takip edin. Montaj, kalifiye bir uzman tarafından tüm yerel güvenlik düzenlemelerine uygun şekilde yapılmalıdır. Ürünü, montaj ve kullanımın güvenli olacağı bir yere monte edin. Ürün sadece HACH/HACH LANGE ölçüm sensörlerini/ürünlerini, tutmak/takmak için tasarlanmıştır. Başka amaçlarla kullanılması, kullanıcı için tehlikeler doğurabilir. Bakım ve onarım sadece yetkili müşteri hizmetleridepartmanı tarafından gerçekleştirilmelidir. Sadece üretici tarafından önerilen orijinal yedek parça ve aksesuarlar kullanılmalıdır. Ürüne yapılan her türlü değişiklik, tüm sorumluluğu ortadan kaldırır. Bu talimatlara uyulmaması veya ürünün üretim amacından başka bir amaçla kullanılması sonucunda kullanıcı ciddi şekilde yaralanabilir ve/veya ürün zarar görebilir. Gerekli kaynak işi yalnızca kalifiye kaynakçılar tarafından DIN / EN 287'ye göre yapılmalıdır, veya müteahhitler tarafından EN 3834-2'ye göre yapılmalıdır.

ZH 在安装/固定产品之前，请仔细阅读所有安装说明，并在安装过程中遵守这些说明。 必须由合格的专家完成安装，并遵守当地的所有安全法规。仔细选择安装地点，确保安全地安装和操作。 本产品只能用于固定/连接 HACH/HACH LANGE 测量传感器/产品。 用于其他用途可能会给用户带来危险。 维护和修理工作应由经授权的客户服务部门完成。 只能使用正宗替换件和制造商推荐的附件。 对本产品进行任何更改均可能导致所有担保失效。不遵守这些说明，或者将本产品用于其它用途，可能会对用户造成严重伤害和/或设备损坏。所需的焊接工作必须要根据DIN/EN 287，由合格的焊接工人单独执行，或者根据EN 3834-2由承包人执行。

Technical Information

Proline Promag 50W, 53W

Electromagnetic Flow Measuring System
Flow measurement of liquids in water or wastewater applications

Application

Electromagnetic flowmeter for bidirectional measurement of liquids with a minimum conductivity of ≥ 5 µS/cm:
- Drinking water
- Wastewater
- Sewage sludge

- Flow measurement up to 110000 m³/h (484315 gal/min)
- Fluid temperature up to +80 °C (+176 °F)
- Process pressures up to 40 bar (580 psi)
- Lengths in accordance with DVGW/ISO

Application-specific lining of the measuring pipe from polyurethane or hard rubber with the following drinking water permissions:
- KTW
- WRAS
- NSF
- ACS

Approvals for hazardous area:
- ATEX
- IECEx
- FM
- CSA
- NEPSI

Connection to process control system:
- HART
- PROFIBUS DP/PA
- FOUNDATION Fieldbus
- MODBUS RS485

Your benefits

Promag measuring devices offer you cost-effective flow measurement with a high degree of accuracy for a wide range of process conditions.

The uniform Proline transmitter concept comprises:
- Modular device and operating concept resulting in a higher degree of efficiency
- Software options for batching, electrode cleaning and for measuring pulsating flow
- High degree of reliability and measuring stability
- Uniform operating concept

The tried-and-tested Promag sensors offer:
- No pressure loss
- Not sensitive to vibrations
- Simple installation and commissioning

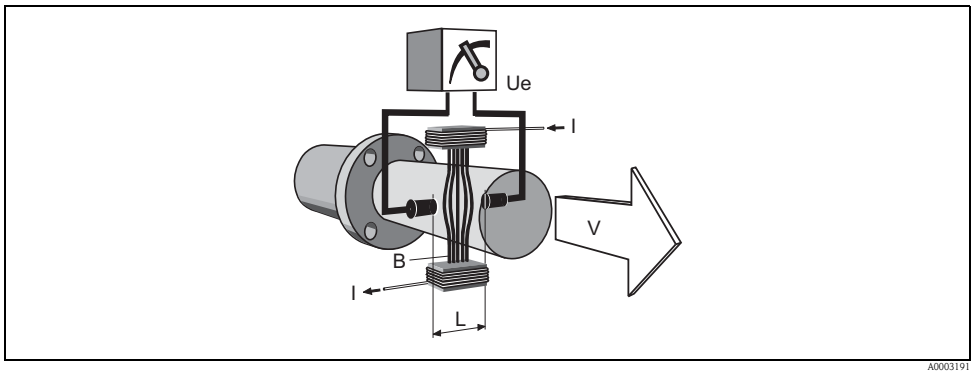
Function and system design

Measuring principle

Following Faraday's law of magnetic induction, a voltage is induced in a conductor moving through a magnetic field.
In the electromagnetic measuring principle, the flowing medium is the moving conductor.
The voltage induced is proportional to the flow velocity and is supplied to the amplifier by means of two measuring electrodes. The flow volume is calculated by means of the pipe cross-sectional area.
The DC magnetic field is created through a switched direct current of alternating polarity.



A0003191

$Ue = B \cdot L \cdot v$
$Q = A \cdot v$

Ue	Induced voltage
B	Magnetic induction (magnetic field)
L	Electrode spacing
v	Flow velocity
Q	Volume flow
A	Pipe cross-section
I	Current strength

Measuring system

The measuring system consists of a transmitter and a sensor.
Two versions are available:
- Compact version: Transmitter and sensor form a mechanical unit.
- Remote version: Sensor is mounted separate from the transmitter.

Transmitter:
- Promag 50 (user interface with push buttons for operation, two-line display, illuminated)
- Promag 53 ("Touch Control" without opening the housing, four-line display, unilluminated)

Sensor:
- Promag W (DN 25 to 2000 / 1 to 78")

Input

Measured variable

Flow velocity (proportional to induced voltage)

Measuring ranges

Measuring ranges for liquids
Typically v = 0.01 to 10 m/s (0.03 to 33 ft/s) with the specified accuracy

Operable flow range

Over 1000 : 1

Input signal

Status input (auxiliary input)
- U = 3 to 30 V DC, R_i = 5 kΩ, galvanically isolated
- Configurable for: totalizer(s) reset, measured value suppression, error-message reset

Status input (auxiliary input) with PROFIBUS DP and MODBUS RS485
- U = 3 to 30 V DC, R_i = 3 kΩ, galvanically isolated
- Switching level: 3 to 30 V DC, independent of polarity
- Configurable for: totalizer(s) reset, measured value suppression, error-message reset, batching start/stop (optional), batch totalizer reset (optional)

Current input (only Promag 53)
- active/passive selectable, galvanically isolated, full scale value selectable, resolution: 3 µA, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading)
- active: 4 to 20 mA, $R_i \leq 150$ Ω, max. 24 V DC, short-circuit-proof
- passive: 0/4 to 20 mA, $R_i < 150$ Ω, max. 30 V DC

Output

Output signal

Promag 50

Current output
active/passive selectable, galvanically isolated, time constant selectable (0.01 to 100 s), full scale value selectable, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading), resolution: 0.5 µA
- active: 0/4 to 20 mA, $R_L < 700$ Ω (HART: $R_L \geq 250$ Ω)
- passive: 4 to 20 mA, operating voltage V_S: 18 to 30 V DC, $R_i \geq 150$ Ω

Pulse/frequency output
passive, open collector, 30 V DC, 250 mA, galvanically isolated
- Frequency output: full scale frequency 2 to 1000 Hz (f_{max} = 1250 Hz), on/off ratio 1:1, pulse width max. 10s
- Pulse output: pulse value and pulse polarity selectable, max. pulse width configurable (0.5 to 2000 ms)

PROFIBUS DP interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- Profil version 3.0
- Data transmission rate: 9,6 kBaud to 12 MBaud
- Automatic data transmission rate recognition
- Function blocks: 1 × analog Input, 1 × totalizer
- Output data: volume flow, totalizer
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

PROFIBUS PA interface
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- Profil version 3.0
- Current consumption: 11 mA
- Permissible supply voltage: 9 to 32 V
- Bus connection with integrated reverse polarity protection
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Function blocks: 1 × analog input, 2 × totalizer
- Output data: volume flow, totalizer
- Input data: positive zero return (ON/OFF), control totalizer, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

Promag 53

Current output
active/passive selectable, galvanically isolated, time constant selectable (0.01 to 100 s),
full scale value selectable, temperature coefficient: typ. 0.005% o.r./°C (o.r. = of reading), resolution: 0.5 µA
- active: 0/4 to 20 mA, $R_L < 700\ \Omega$ (HART: $R_L \geq 250\ \Omega$)
- passive: 4 to 20 mA, operating voltage V_S: 18 to 30 V DC, $R_i \geq 150\ \Omega$

Pulse/frequency output
active/passive selectable, galvanically isolated (Ex i version: only passive)
- active: 24 V DC, 25 mA (max. 250 mA during 20 ms), $R_L > 100\ \Omega$
- passive: open collector, 30 V DC, 250 mA
- Frequency output: full scale frequency 2 to 10000 Hz (f_{max} = 12500 Hz), EEx-ia: 2 to 5000 Hz; on/off ratio 1:1, pulse width max. 10 s
- Pulse output: pulse value and pulse polarity selectable, max. pulse width configurable (0.05 to 2000 ms)

PROFIBUS DP interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- Profil version 3.0
- Data transmission rate: 9,6 kBaud to 12 MBaud
- Automatic data transmission rate recognition
- Function blocks: 2 × analog Input, 3 × totalizer
- Output data: volume flow, calculated mass flow, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device
- Available output combination → 8

PROFIBUS PA interface
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- Profil version 3.0
- Current consumption: 11 mA
- Permissible supply voltage: 9 to 32 V
- Bus connection with integrated reverse polarity protection
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Function blocks: 2 × analog input, 3 × totalizer
- Output data: volume flow, calculated mass flow, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), totalizer control, value for local display
- Cyclic data transmission compatible with previous model Promag 33
- Bus address adjustable via miniature switches or local display (optional) at the measuring device

MODBUS RS485 interface
- Transmission technology (Physical Layer): RS485 in accordance with ANSI/TIA/EIA-485-A: 1998, galvanically isolated
- MODBUS device type: Slave
- Adress range: 1 to 247
- Bus address adjustable via miniature switches or local display (optional) at the measuring device
- Supported MODBUS function codes: 03, 04, 06, 08, 16, 23
- Broadcast: supported with the function codes 06, 16, 23
- Übertragungsmodus: RTU oder ASCII
- Supported baudrate: 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200 Baud
- Response time:
  - Direct data access = typically 25 to 50 ms
  - Auto-scan buffer (data range) = typically 3 to 5 ms
- Available output combination → 8

FOUNDATION Fieldbus interface
- FOUNDATION Fieldbus H1
- Transmission technology (Physical Layer): IEC 61158-2 (MBP), galvanically isolated
- ITK version 5.01
- Current consumption: 12 mA
- Error current FDE (Fault Disconnection Electronic): 0 mA
- Bus connection with integrated reverse polarity protection
- Function blocks:
  - 5 × Analog Input (execution time: 18 ms each)
  - 1 × PID (25 ms)
  - 1 × Digital Output (18 ms)
  - 1 × Signal Characterizer (20 ms)
  - 1 × Input Selector (20 ms)
  - 1 × Arithmetic (20 ms)
  - 1 × Integrator (18 ms)
- Output data: volume flow, calculated mass flow, temperature, totalizer 1 to 3
- Input data: positive zero return (ON/OFF), reset totalizer
- Link Master (LM) functionality is supported

Signal on alarm
- Current output → failure response selectable (e.g. in accordance with NAMUR recommendation NE 43)
- Pulse/frequency output → failure response selectable
- Status output (Promag 50) → non-conductive by fault or power supply failure
- Relay output (Promag 53) → de-energized by fault or power supply failure

Load

see "Output signal"

Low flow cutoff

Switch points for low flow cutoff are selectable.

Galvanic isolation

All circuits for inputs, outputs and power supply are galvanically isolated from each other.

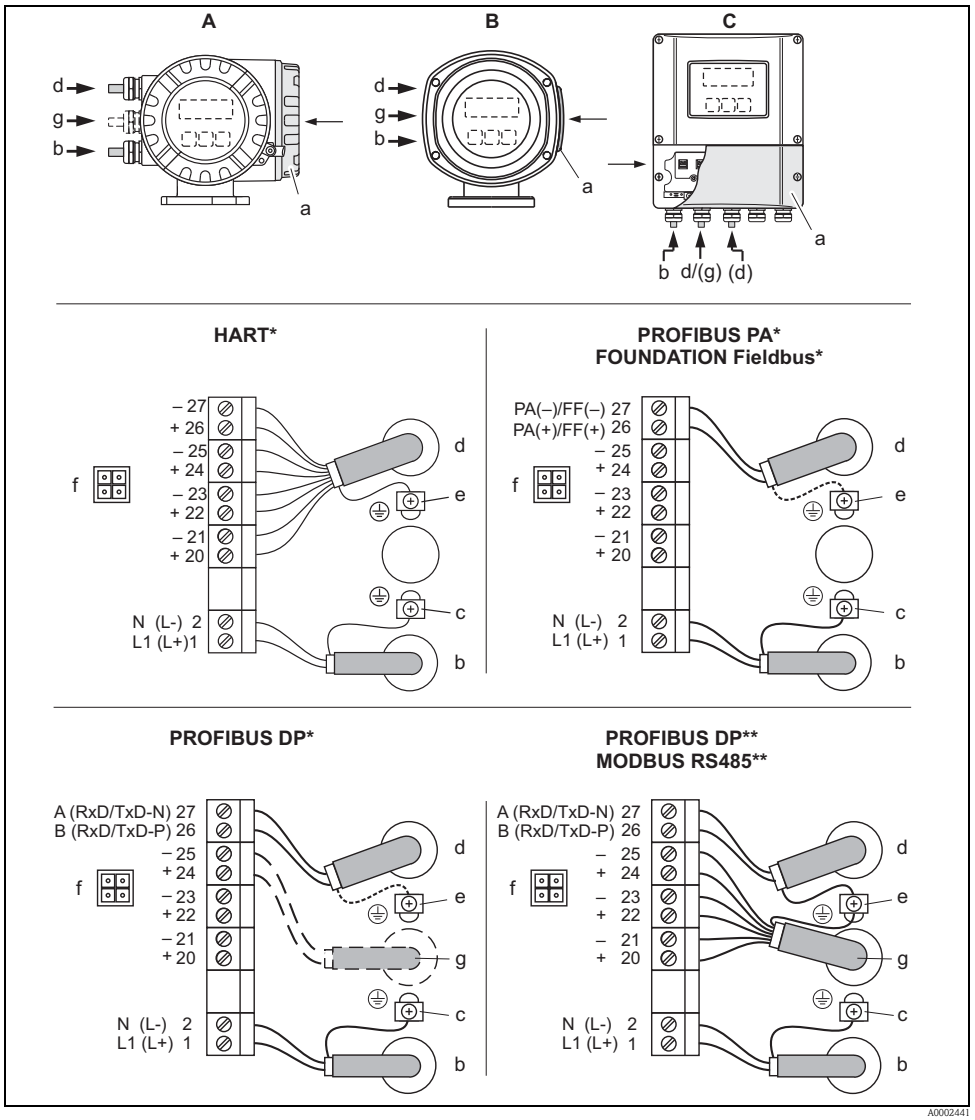
Switching output

Status output (Promag 50, Promag 53)
Open collector, max. 30 V DC / 250 mA, galvanically isolated.
Configurable for: error messages, Empty Pipe Detection (EPD), flow direction, limit values.

Relay outputs (Promag 53)
Normally closed (NC or break) or normally open (NO or make) contacts available
(default: relay 1 = NO, relay 2 = NC), max. 30 V / 0,5 A AC ; 60 V / 0,1 A DC, galvanically isolated.
Configurable for: error messages, Empty Pipe Detection (EPD), flow direction, limit values, batching contacts.

Power supply

Electrical connection, measuring unit



Connecting the transmitter, cable cross-section max. 2.5 mm² (14 AWG)

A View A (field housing)

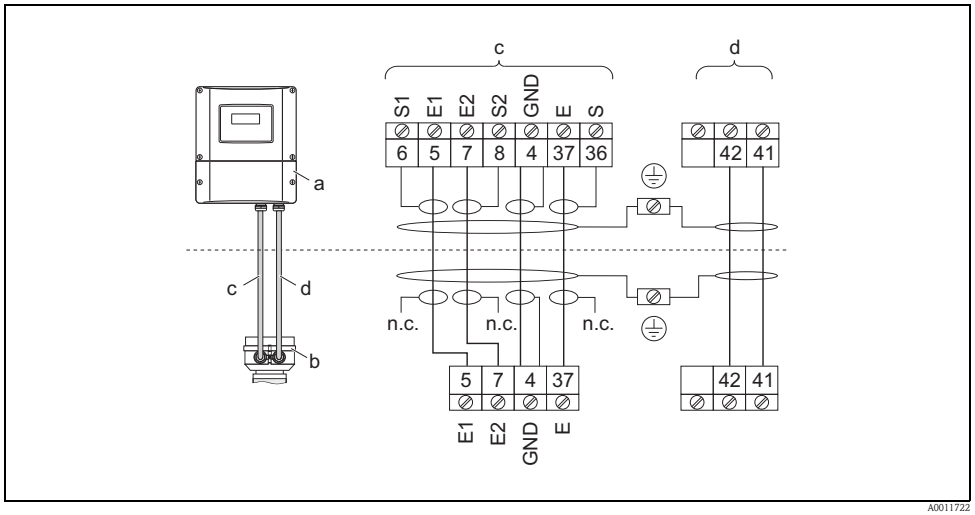
Electrical connection, remote version



Connecting the remote version

a Wall-mount housing connection compartment
b Sensor connection housing cover
c Signal cable
d Coil current cable
n.c. Not connected, insulated cable shields
Terminal no. and cable colors: 6/5 = brown; 7/8 = white; 4 = green; 36/37 = yellow

Supply voltage (power supply)

- 85 to 260 V AC, 45 to 65 Hz
- 20 to 55 V AC, 45 to 65 Hz
- 16 to 62 V DC

PROFIBUS PA and FOUNDATION Fieldbus
- Non-Ex: 9 to 32 V DC
- Ex i: 9 to 24 V DC
- Ex d: 9 to 32 V DC

Cable entry

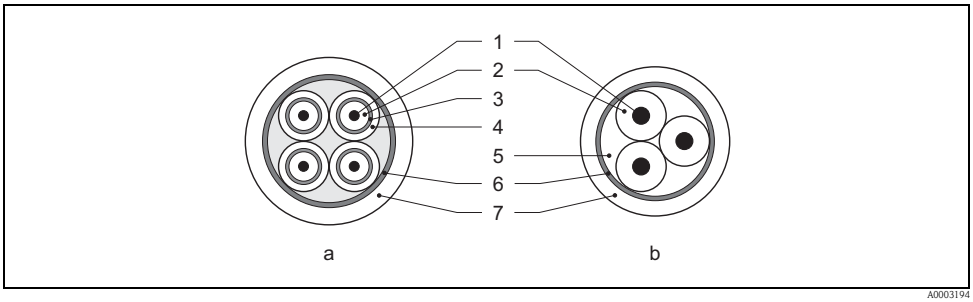
Power supply and signal cables (inputs/ outputs):
- Cable entry M20 × 1.5 (8 to 12 mm / 0.31 to 0.47")
- Sensor cable entry for armoured cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63")
- Thread for cable entries, ½" NPT, G ½"

Connecting cable for remote version:
- Cable entry M20 × 1.5 (8 to 12 mm / 0.31 to 0.47")
- Sensor cable entry for armoured cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63")
- Thread for cable entries, ½" NPT, G ½"

Remote version cable specifications

Coil cable
- 2 × 0.75 mm^2 (18 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28")
- Conductor resistance: ≤ 37 Ω/km (≤ 0.011 Ω/ft)
- Capacitance core/core, shield grounded: ≤ 120 pF/m (≤ 37 pF/ft)
- Operating temperature: –20 to +80 °C (–68 to +176 °F)
- Cable cross-section: max. 2.5 mm^2 (14 AWG)
- Test voltage for cable insulation: ≤ 1433 AC r.m.s. 50/60 Hz or ≥ 2026 V DC

Signal cable
- 3 × 0.38 mm^2 (20 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28") and individual shielded cores
- With empty pipe detection (EPD): 4 × 0.38 mm^2 (20 AWG) PVC cable with common, braided copper shield (∅ ~ 7 mm / 0.28") and individual shielded cores
- Conductor resistance: ≤ 50 Ω/km (≤ 0.015 Ω/ft)
- Capacitance core/shield: ≤ 420 pF/m (≤ 128 pF/ft)
- Operating temperature: –20 to +80 °C (–68 to +176 °F)
- Cable cross-section: max. 2.5 mm^2 (14 AWG)



a Signal cable
b Coil current cable

1 Core
2 Core insulation
3 Core shield
4 Core jacket
5 Core reinforcement
6 Cable shield
7 Outer jacket

Operation in zones of severe electrical interference
The measuring device complies with the general safety requirements in accordance with EN 61010 and the EMC requirements of IEC/EN 61326 and NAMUR recommendation NE 21.

Caution!
Grounding is by means of the ground terminals provided for the purpose inside the connection housing. Ensure that the stripped and twisted lengths of cable shield to the ground terminal are as short as possible.

Power consumption

- AC: < 15 VA (incl. sensor)
- DC: < 15 W (incl. sensor)

Switch-on current:
- Max. 3 A (< 5 ms) for 260 V AC
- Max. 13.5 A (< 50 ms) for 24 V DC

Power supply failure

Lasting min. ½ cycle frequency: EEPROM saves measuring system data
- EEPROM or T-DAT (Promag 53 only) retain the measuring system data in the event of a power supply failure
- S-DAT: exchangeable data storage chip which stores the data of the sensor (nominal diameter, serial number, calibration factor, zero point etc.)

Potential equalization

Warning!
The measuring system must be included in the potential equalization.

Perfect measurement is only ensured when the fluid and the sensor have the same electrical potential. This is ensured by the reference electrode integrated in the sensor as standard.

The following should also be taken into consideration for potential equalization:
- Internal grounding concepts in the company
- Operating conditions, such as the material/ grounding of the pipes (see table)

Standard situation

Operating conditions	Potential equalization
When using the measuring device in a: ■ Metal, grounded pipe Potential equalization takes place via the ground terminal of the transmitter. Note! When installing in metal pipes, we recommend you connect the ground terminal of the transmitter housing with the piping.	 A0011892 Via the ground terminal of the transmitter

Special situations

Operating conditions	Potential equalization
When using the measuring device in a: ■ Metal pipe that is not grounded This connection method also applies in situations where: ■ Customary potential equalization cannot be ensured. ■ Excessively high equalizing currents can be expected. Both sensor flanges are connected to the pipe flange by means of a ground cable (copper wire, at least 6 mm² / 0.0093 in²) and grounded. Connect the transmitter or sensor connection housing, as applicable, to ground potential by means of the ground terminal provided for the purpose. ■ DN ≤ 300 (12"): the ground cable is mounted directly on the conductive flange coating with the flange screws. ■ DN ≥ 350 (14"): the ground cable is mounted directly on the transportation metal support. Note! The ground cable for flange-to-flange connections can be ordered separately as an accessory from Endress+Hauser.	 A0011893 Via the ground terminal of the transmitter and the flanges of the pipe
When using the measuring device in a: ■ Plastic pipe ■ Pipe with insulating lining This connection method also applies in situations where: ■ Customary potential equalization cannot be ensured. ■ Excessively high equalizing currents can be expected. Potential equalization takes place using additional ground disks, which are connected to the ground terminal via a ground cable (copper wire, at least 6 mm² / 0.0093 in²). When installing the ground disks, please comply with the enclosed Installation Instructions.	 A0011895 Via the ground terminal of the transmitter and the optionally available ground disks

Operating conditions	Potential equalization
When using the measuring device in a: ■ Pipe with a cathodic protection unit The device is installed potential-free in the pipe. Only the two flanges of the pipe are connected with a ground cable (copper wire, at least 6 mm² / 0.0093 in²). Here, the ground cable is mounted directly on the conductive flange coating with flange screws. Note the following when installing: ■ The applicable regulations regarding potential-free installation must be observed. ■ There should be **no** electrically conductive connection between the pipe and the device. ■ The mounting material must withstand the applicable torques.	 A0011896 Potential equalization and cathodic protection 1 Power supply isolation transformer 2 Electrically isolated

Performance characteristics

Reference operating conditions

As per DIN EN 29104 and VDI/VDE 2641:
- Fluid temperature: +28 °C ± 2 K (+82 °F ± 2 K)
- Ambient temperature: +22 °C ±2 K (+72 °F ± 2 K)
- Warm-up period: 30 minutes

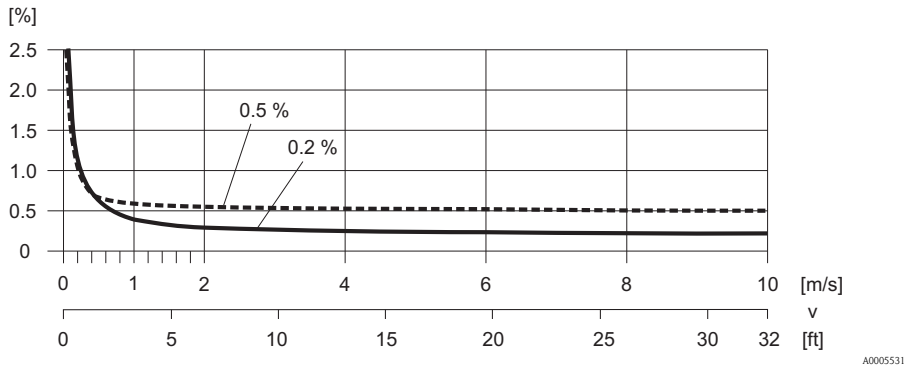
Installation conditions:
- Inlet run > 10 × DN
- Outlet run > 5 × DN
- Sensor and transmitter grounded.
- The sensor is centered in the pipe.

Maximum measured error

Promag 50:
- Current output: also typically ± 5 µA
- Pulse output: ±0.5% o.r. ± 1 mm/s (±0.5% o.r. ± 0.04 in/s)
  optional: ±0.2% o.r. ± 2 mm/s (±0.2% o.r. ± 0.08 in/s) (o.r. = of reading)

Promag 53:
- Current output: also typically ± 5 µA
- Pulse output: ±0.2% o.r. ± 2 mm/s (±0.2% o.r. ± 0.08 in/s) (o.r. = of reading)

Fluctuations in the supply voltage do not have any effect within the specified range.



Max. measured error in % of reading

Repeatability

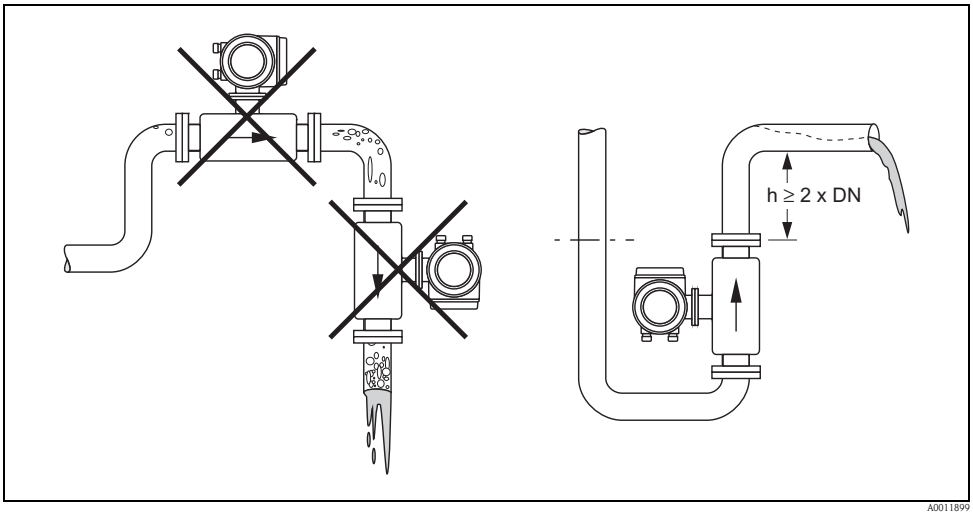
Max. ±0.1% o.r. ± 0.5 mm/s (±0.1% o.r. ± 0.02 in/s) (o.r. = of reading)

Operating conditions: Installations

Installation instructions

Mounting location

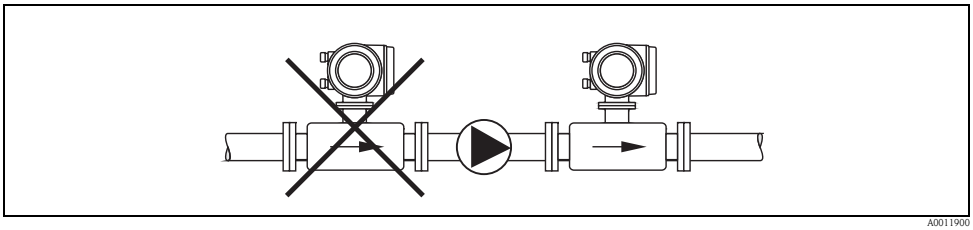
Entrained air or gas bubble formation in the measuring tube can result in an increase in measuring errors.
Avoid the following installation locations in the pipe:
- Highest point of a pipeline. Risk of air accumulating!
- Directly upstream from a free pipe outlet in a vertical pipeline.



Mounting location

Installation of pumps

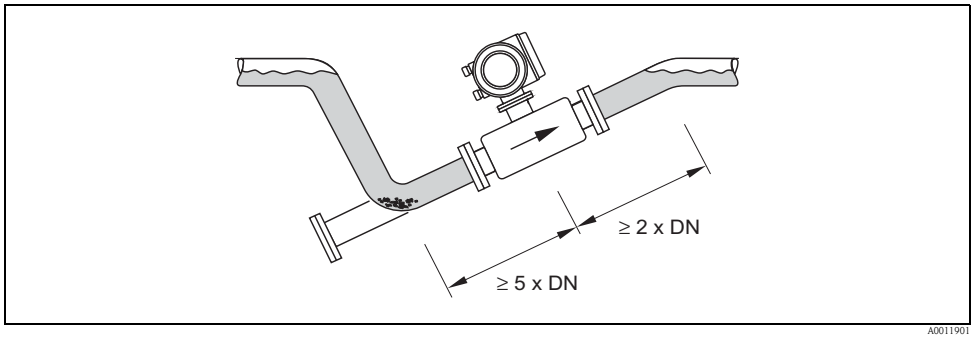
Sensors may not be installed on the pump suction side. This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. Information on the pressure tightness of the measuring tube lining → 21, Section "Pressure tightness".
Pulsation dampers may be needed when using piston pumps, piston diaphragm pumps or hose pumps. Information on the shock and vibration resistance of the measuring system → 20, Section "Shock and vibration resistance".



Installation of pumps

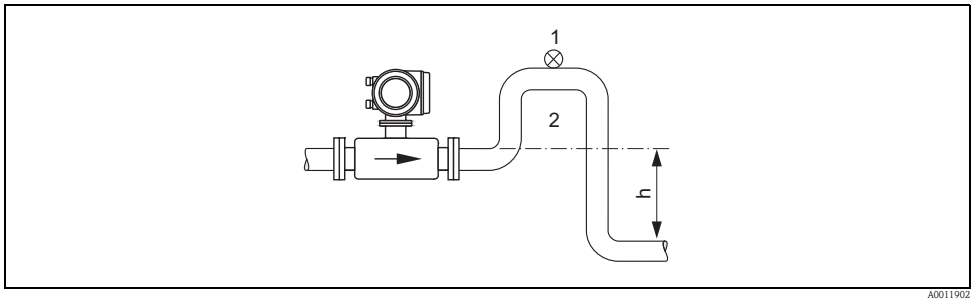
Partially filled pipes
Partially filled pipes with gradients necessitate a drain-type configuration.
The empty pipe detection function (EPD) provides additional security in detecting empty or partially filled pipes.

Caution!
Risk of solids accumulating. Do not install the sensor at the lowest point in the drain. It is advisable to install a cleaning valve.



Installation with partially filled pipes

Down pipes
Install a siphon or a vent valve downstream of the sensor in down pipes h ≥ 5 m (16.4 ft). This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. This measure also prevents the liquid current stopping in the pipe which could cause air locks. Information on the pressure tightness of the measuring tube lining → 21, Section "Pressure tightness".



Installation measures for vertical pipes

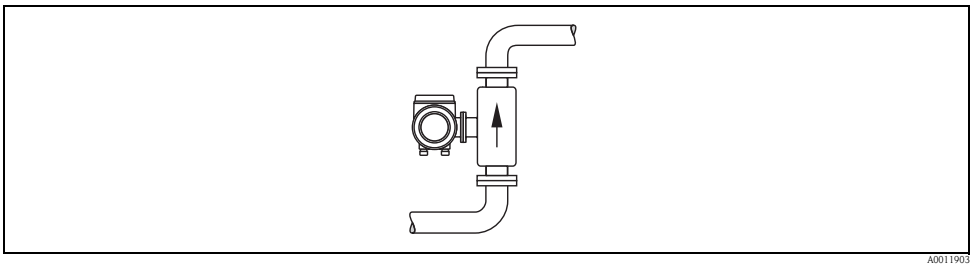
1 Vent valve
2 Pipe siphon
h Length of the down pipe

Orientation

An optimum orientation helps avoid gas and air accumulations and deposits in the measuring tube. However, the measuring device also offers the additional function of empty pipe detection (EPD) for detecting partially filled measuring tubes or if outgassing fluids or fluctuating operating pressures are present.

Vertical orientation

This is the ideal orientation for self-emptying piping systems and for use in conjunction with empty pipe detection.



A0011903

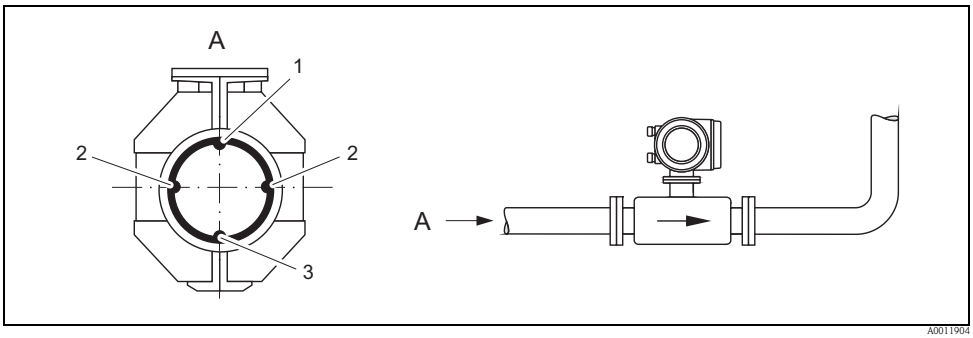
Vertical orientation

Horizontal orientation

The measuring electrode axis should be horizontal. This prevents brief insulation of the two measuring electrodes by entrained air bubbles.

Caution!

Empty pipe detection only works correctly with horizontal orientation if the transmitter housing is facing upwards. Otherwise there is no guarantee that empty pipe detection will respond if the measuring tube is only partially filled or empty.



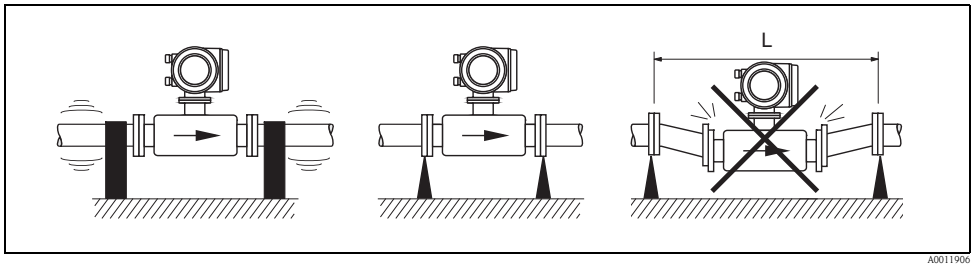
A0011904

Horizontal orientation

1 EPD electrode for empty pipe detection
2 Measuring electrodes for signal detection
3 Reference electrode for potential equalization

Vibrations
Secure the piping and the sensor if vibration is severe.

Caution!
If vibrations are too severe, we recommend the sensor and transmitter be mounted separately. Information on the permitted shock and vibration resistance → 20, Section "Shock and vibration resistance".

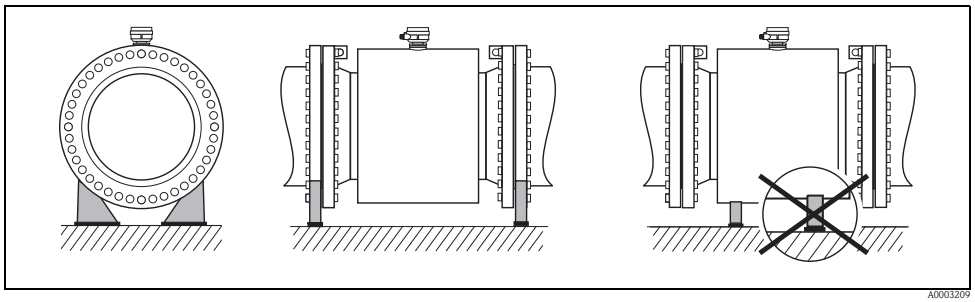


Measures to prevent vibration of the measuring device

L > 10 m (33 ft)

Foundations, supports
If the nominal diameter is DN ≥ 350, mount the transmitter on a foundation of adequate load-bearing strength.

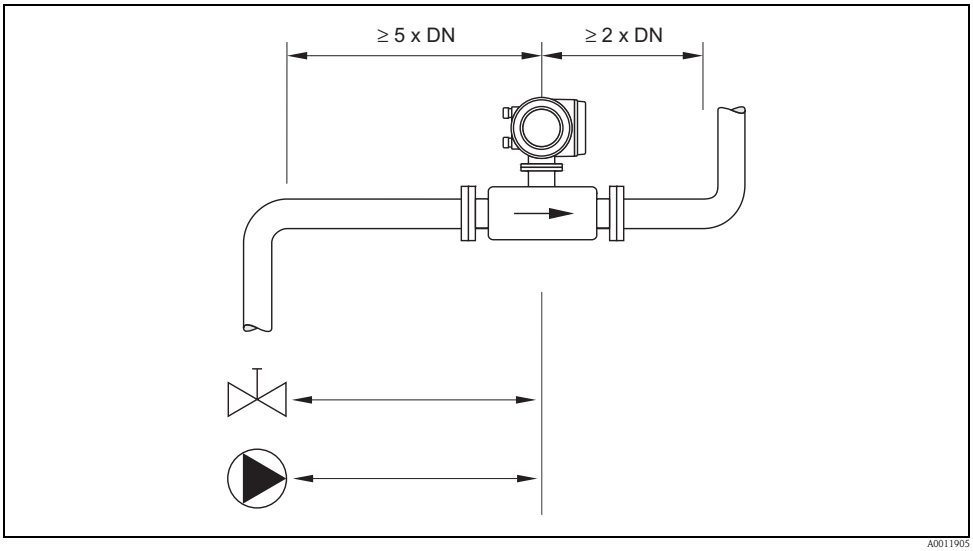
Caution!
Do not allow the casing to take the weight of the sensor. This would buckle the casing and damage the internal magnetic coils.



Inlet and outlet run

If possible, install the sensor well clear of assemblies such as valves, T-pieces, elbows etc.

Note the following inlet and outlet runs to comply with measuring accuracy specifications:
- Inlet run: ≥ 5 × DN
- Outlet run: ≥ 2 × DN



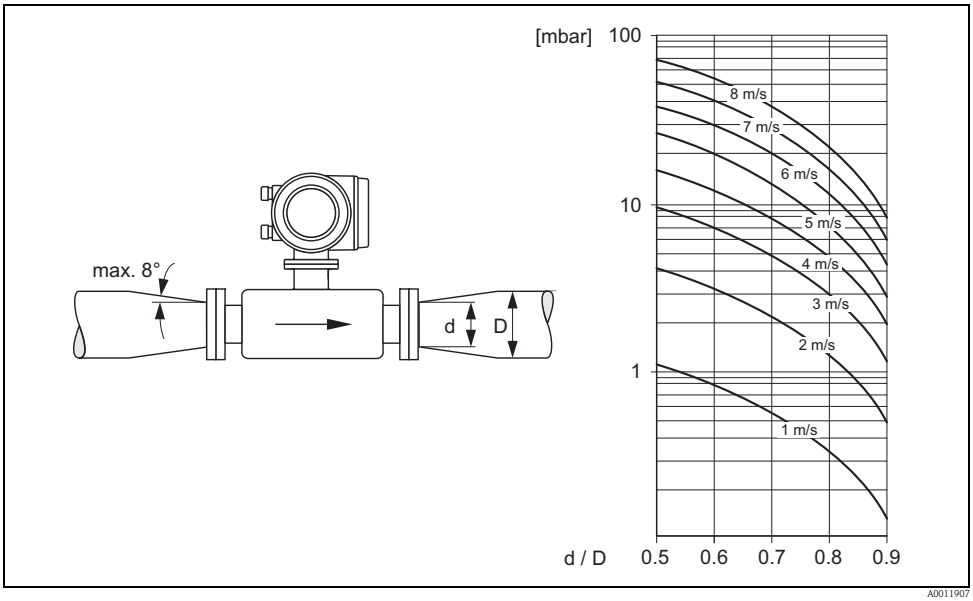
Inlet and outlet run

Adapters

Suitable adapters to DIN EN 545 (double-flange reducers) can be used to install the sensor in larger-diameter pipes. The resultant increase in the rate of flow improves measuring accuracy with very slow-moving fluids. The nomogram shown here can be used to calculate the pressure loss caused by reducers and expanders.

Note!
The nomogram only applies to liquids of viscosity similar to water.

1. Calculate the ratio of the diameters d/D.
2. From the nomogram read off the pressure loss as a function of flow velocity (downstream from the reduction) and the d/D ratio.

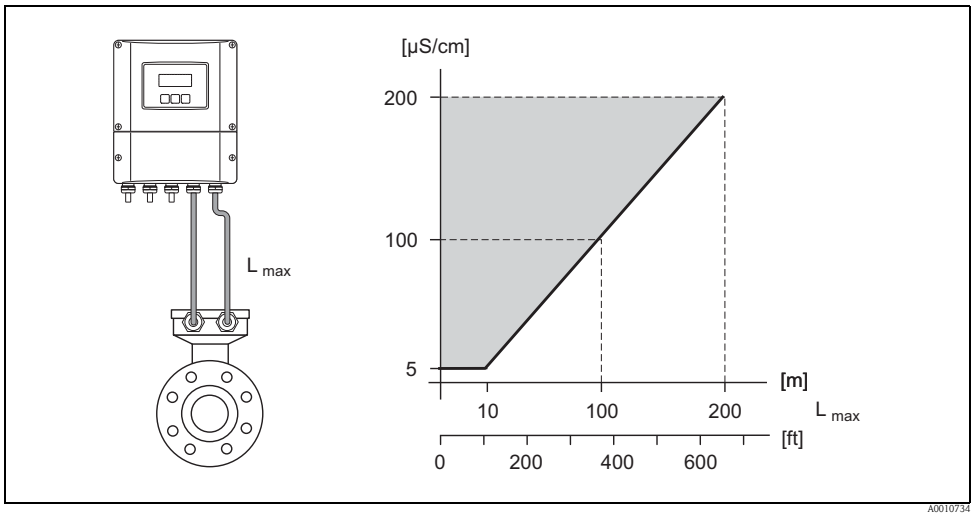


Pressure loss due to adapters

Length of connecting cable

When mounting the remote version, please note the following to achieve correct measuring results:

- Fix cable run or lay in armored conduit. Cable movements can falsify the measuring signal especially in the case of low fluid conductivities.
- Route the cable well clear of electrical machines and switching elements.
- If necessary, ensure potential equalization between sensor and transmitter.
- The permitted cable length L_{max} is determined by the fluid conductivity. A minimum conductivity of 20 µS/cm is required for measuring demineralized water.
- When the empty pipe detection function is switched on (EPD), the maximum connecting cable length is 10 m (33 ft).



Permitted length of connecting cable for remote version
Area marked in gray = permitted range; L_{max} = length of connecting cable in [m] ([ft]); fluid conductivity in [µS/cm]

Operating conditions: Environment

Ambient temperature range

Transmitter
- Standard: –20 to +60 °C (–4 to +140 °F)
- Optional: –40 to +60 °C (–40 to +140 °F)

Note!
At ambient temperatures below –20 °C (–4 °F)the readability of the display may be impaired.

Sensor
- Flange material carbon steel: –10 to +60 °C (14 to +140 °F)
- Flange material stainless steel: –40 to +60 °C (–40 to +140 °F)

Caution!
The permitted temperature range of the measuring tube lining may not be undershot or overshot
→ 21, Section "Medium temperature range".

Please note the following points:
- Install the device in a shady location. Avoid direct sunlight, particularly in warm climatic regions.
- The transmitter must be mounted separate from the sensor if both the ambient and fluid temperatures are high.

Storage temperature

The storage temperature corresponds to the operating temperature range of the measuring transmitter and the appropriate measuring sensors.

Caution!
- The measuring device must be protected against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- A storage location must be selected where moisture does not collect in the measuring device. This will help prevent fungus and bacteria infestation which can damage the liner.
- Do not remove the protective plates or caps on the process connections until the device is ready to install.

Degree of protection
- Standard: IP 67 (NEMA 4X) for transmitter and sensor.
- Optional: IP 68 (NEMA 6P) for sensor for remote version.
- For information regarding applications where the device is buried directly in the soil or is installed in a flooded wastewater basin please contact your local Endress+Hauser Sales Center.

Shock and vibration resistance

Acceleration up to 2 g following IEC 600 68-2-6

Electromagnetic compatibility (EMC)
- As per IEC/EN 61326 and NAMUR recommendation NE 21.

Operating conditions: Process

Medium temperature range

The permitted temperature depends on the lining of the measuring tube:
- Polyurethane: –20 to +50 °C (–4 to +122 °F) (DN 25 to 1200 / 1 to 48")
- Hard rubber: ±0 to +80 °C (+32 to +176 °F) (DN 50 to 2000 / 2 to 78")

Conductivity

The minimum conductivity is:
- ≥ 5 µS/cm for fluids generally
- ≥ 20 µS/cm for demineralized water

Note!
In the remote version, the necessary minimum conductivity also depends on the cable length (→ 19, Section "Length of connecting cable").

Medium pressure range (nominal pressure)

- EN 1092-1 (DIN 2501)
  - PN 6 (DN 350 to 2000 / 14 to 78")
  - PN 10 (DN 200 to 2000 / 8 to 78")
  - PN 16 (DN 65 to 2000 / 3 to 78")
  - PN 25 (DN 200 to 1000 / 8 to 40")
  - PN 40 (DN 25 to 150 / 1 to 6")
- ANSI B 16.5
  - Class 150 (DN 1 to 24")
  - Class 300 (DN 1 to 6")
- AWWA
  - Class D (DN 28 to 78")
- JIS B2220
  - 10 K (DN 50 to 300 / 2 to 12")
  - 20 K (DN 25 to 300 / 1 to 12")
- AS 2129
  - Table E (DN 80, 100, 150 to 400, 500, 600 / 3", 4", 6 to 16", 20", 24")
- AS 4087
  - PN 16 (DN 80, 100, 150 to 400, 500, 600 / 3", 4", 6 to 16", 20", 24")

Pressure tightness

Measuring tube lining: Polyurethane

Nominal diameter		Limit values for abs. pressure [mbar] ([psi]) at fluid temperatures:			
		25 °C (77 °F)		50 °C (122 °F)	
[mm]	[inch]	[mbar]	[psi]	[mbar]	[psi]
25 to 1200	1 to 48"	0	0	0	0

Measuring tube lining: Hard rubber

Nominal diameter		Limit values for abs. pressure [mbar] ([psi]) at fluid temperatures:					
		25 °C (77 °F)		50 °C (122 °F)		80 °C (176 °F)	
[mm]	[inch]	[mbar]	[psi]	[mbar]	[psi]	[mbar]	[psi]
50 to 2000	2 to 78"	0	0	0	0	0	0

Limiting flow

The diameter of the pipe and the flow rate determine the nominal diameter of the sensor.
The optimum flow velocity is between 2 to 3 m/s (6.5 to 9.8 ft/s). The velocity of flow (v), moreover, has to be matched to the physical properties of the fluid:

- v < 2 m/s (6.5 ft/s): for abrasive fluids such as potter's clay, lime milk, ore slurry etc.
- v > 2 m/s (6.5 ft/s): for fluids causing build-up such as wastewater sludges etc.

Flow characteristic values (SI units)

Diameter		Recommended flow	Factory settings		
		Min./max. full scale value	Full scale value Current output	Pulse value	Low flow
[mm]	[inch]	(v ~ 0.3 or 10 m/s)	(v ~ 2.5 m/s)	(~ 2 pulses/s)	(v ~ 0.04 m/s)
25	1"	9 to 300 dm³/min	75 dm³/min	0.50 dm³	1 dm³/min

Pressure loss

- No pressure loss if the sensor is installed in a pipe with the same nominal diameter.
- Pressure losses for configurations incorporating adapters according to DIN EN 545 (→ 18, Section "Adapters").

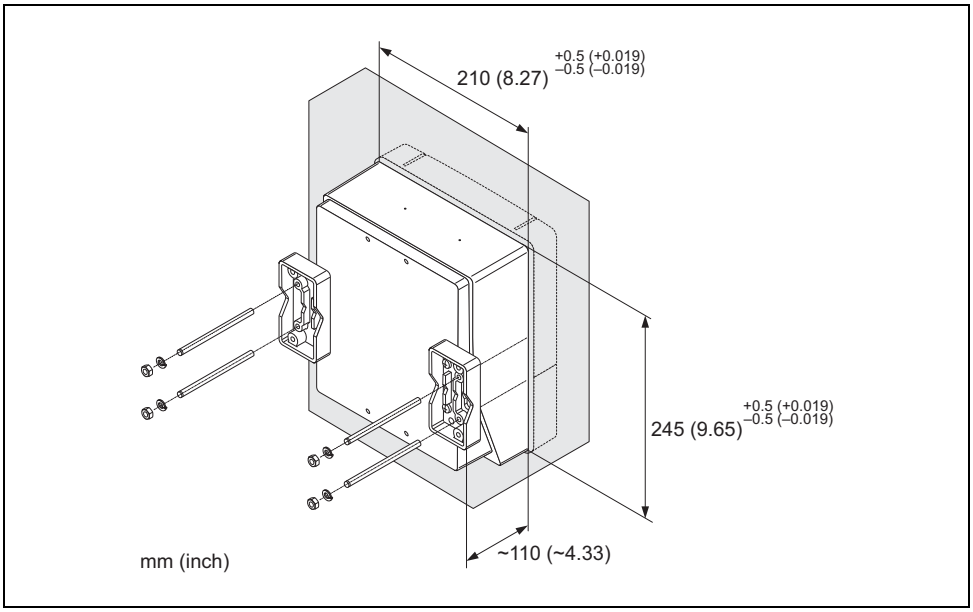
There is a separate mounting kit for the wall-mounted housing. It can be ordered from Endress+Hauser as an accessory. The following installation variants are possible:
- Panel-mounted installation
- Pipe mounting

Installation in control panel



A0001131

Pipe mounting

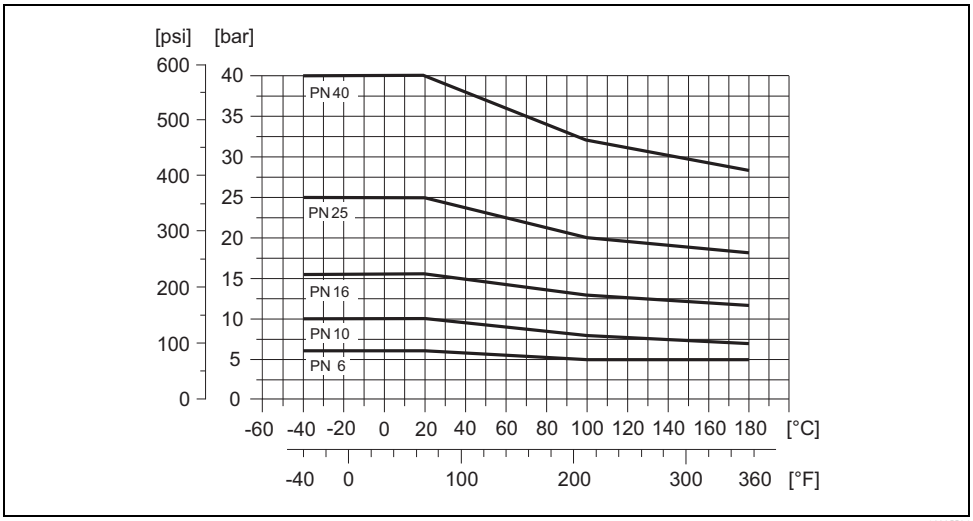
Material

- Transmitter housing
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mount housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 25 to 300 (1 to 12"): powder-coated die-cast aluminum
  - DN 350 to 2000 (14 to 78"): with protective lacquering
- Measuring tube
  - DN ≤ 300 (12"): stainless steel 1.4301 or 1.4306/304L; (for flanges made of carbon steel with Al/Zn protective coating)
  - DN ≥ 350 (14"): stainless steel 1.4301 or 1.4306/304L; (for flanges made of carbon steel with Al/Zn protective coating)
- Electrodes: 1.4435, Alloy C-22, Tantalum
- Flanges
  - EN 1092-1 (DIN 2501): 1.4571/316L; RSt37-2 (S235JRG2); C22; FE 410W B (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - ANSI: A105; F316L (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AWWA: 1.0425
  - JIS: RSt37-2 (S235JRG2); HII; 1.0425/316L (DN ≤ 300 (12"): with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AS 2129
    - DN 150 to 300, 600 (6 to 12", 24"): A105 or RSt37-2 (S235JRG2)
    - DN 50, 80, 100, 350, 400, 500 (2", 3", 4", 14", 16", 20"): A105 or St44-2 (S275JR)
  - AS 4087: A105 or St44-2 (S275JR)
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435/316L, Alloy C-22, Tantalum

Material load diagram

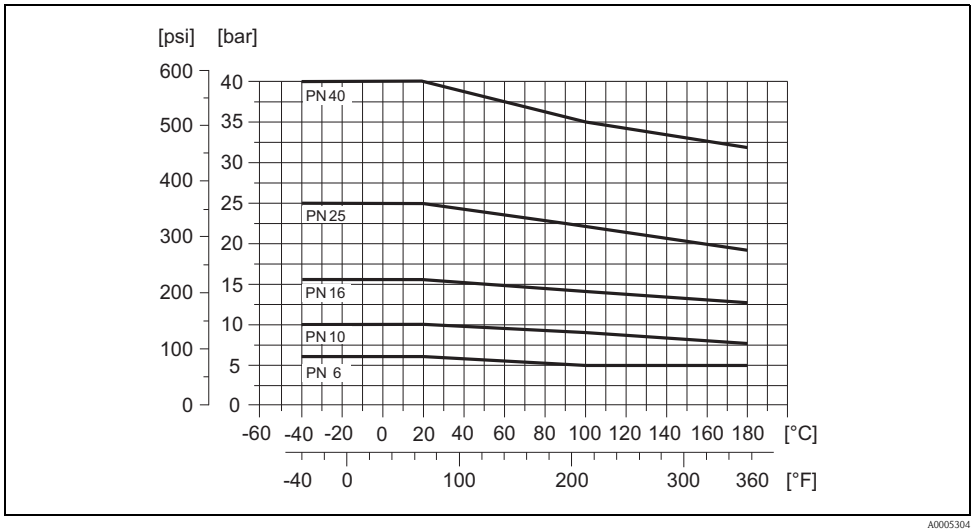
Caution!
The following diagrams contain material load diagrams (reference curves) for flange materials with regard to the medium temperature. However, the maximum medium temperatures permitted always depend on the lining material of the sensor and/or the sealing material (→ 21).

Flange connection to EN 1092-1 (DIN 2501)
Material: RSt37-2 (S235JRG2) / C22 / Fe 410W B

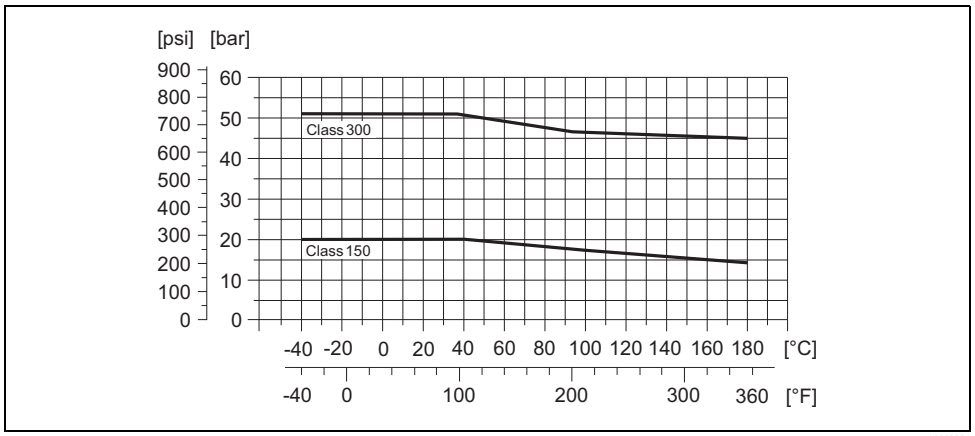


A0005594

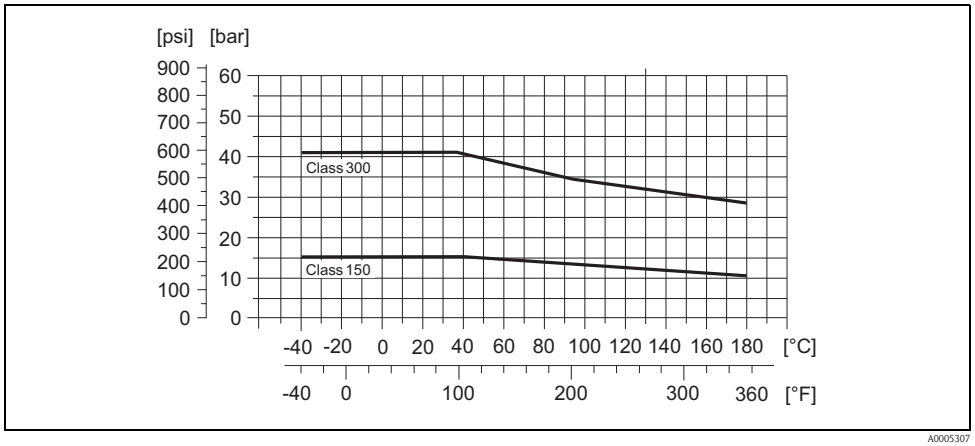
Flange connection to EN 1092-1 (DIN 2501)
Material: 316L / 1.4571



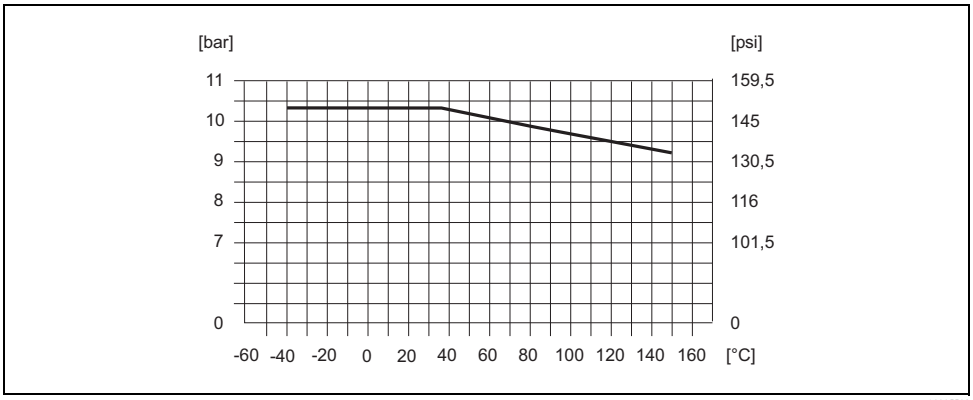
Flange connection to ANSI B16.5
Material: A 105



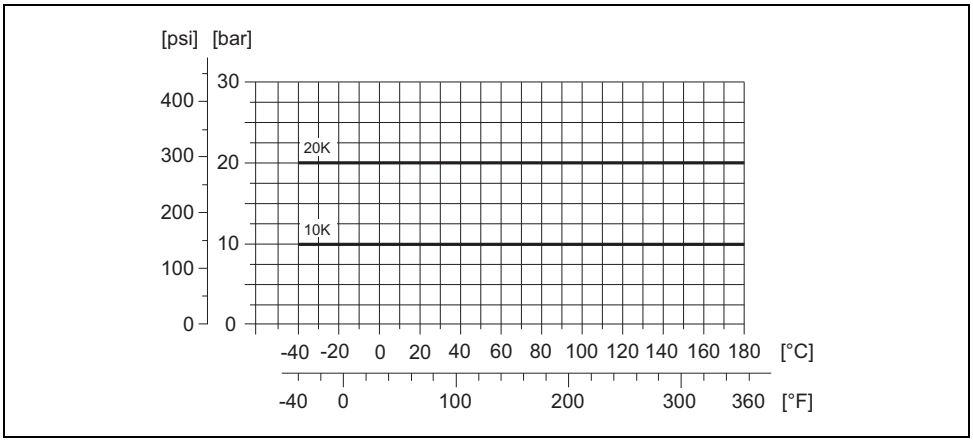
Flange connection to ANSI B16.5
Material: F316L



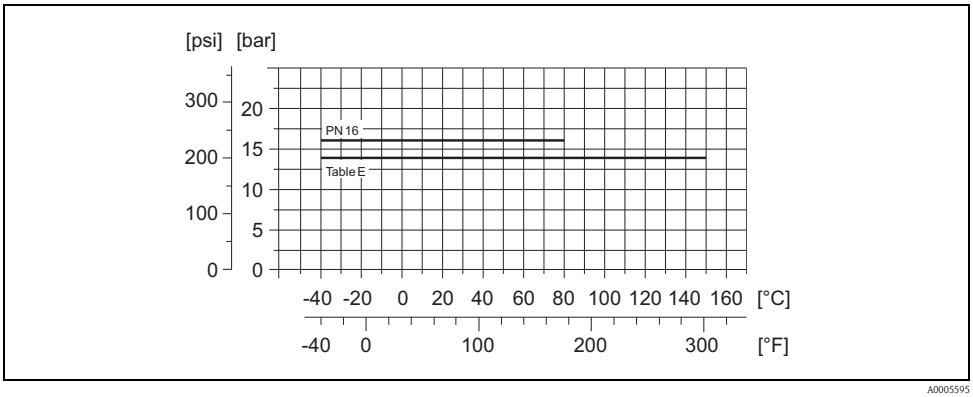
Flange connection to AWWA C 207, Class D
Material: 1.0425



Flange connection to JIS B2220
Material: RSt37-2 (S235JRG2) / HII / 1.0425 / 316L



Flange connection to AS 2129 Table E or AS 4087 PN 16
Material: A105 / RSt37-2 (S235JRG2) / St44-2 (S275JR)



Fitted electrodes

Measuring electrodes, reference electrodes and empty pipe detection electrodes:
- Standard available with 1.4435, Alloy C-22, tantalum
- Optional: exchangeable measuring electrodes made of 1.4435 (DN 350 to 2000 / 14 to 78")

Process connections

Flange connection:
- EN 1092-1 (DIN 2501), DN ≤ 300 (12") form A, DN ≥ 350 (14") form B
  (Dimensions to DIN 2501, DN 65 PN 16 and DN 600 (24") PN 16 exclusively to EN 1092-1)
- ANSI B16.5
- AWWA C 207, Class D
- JIS B2220
- AS 2129 Table E
- AS 4087 PN 16

Surface roughness

- Electrodes
  – 1.4435, Alloy C-22, tantal: ≤ 0.3 to 0.5 µm (≤ 11.8 to 19.7 µin)

(all data refer to parts in contact with medium)

Human interface

Display elements

- Liquid crystal display: backlit, two lines (Promag 50) or four lines (Promag 53) with 16 characters per line
- Custom configurations for presenting different measured-value and status variables
- Totalizer
  – Promag 50: 2 totalizers
  – Promag 53: 3 totalizers

Operating elements

Unified operation concept for both types of transmitter:

Promag 50:
- Local operation via three keys (−, +, E)
- Quick Setup menus for straightforward commissioning

Promag 53:
- Local operation via three keys (−, +, E)
- Application-specific Quick Setup menus for straightforward commissioning

Language groups

Language groups available for operation in different countries:

Promag 50, Promag 53:
- Western Europe and America (WEA):
  English, German, Spanish, Italian, French, Dutch, Portuguese
- Eastern Europe and Scandinavia (EES):
  English, Russian, Polish, Norwegian, Finnish, Swedish, Czech
- South and east Asia (SEA):
  English, Japanese, Indonesian

Promag 53:
- China (CN):
  English, Chinese

You can change the language group via the operating program "FieldCare".

Remote operation

- Promag 50: Remote control via HART, PROFIBUS DP/PA
- Promag 53: Remote control via HART, PROFIBUS DP/PA, MODBUS RS485, FOUNDATION Fieldbus

Certificates and approvals

CE mark

The measuring system is in conformity with the statutory requirements of the EC Directives. Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

C-tick mark

The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

Pressure measuring device approval

Measuring devices with a nominal diameter smaller than or equal to DN 25 correspond to Article 3(3) of the EC Directive 97/23/EC (Pressure Equipment Directive) and have been designed and manufactured according to good engineering practice. Where necessary (depending on the medium and process pressure), there are additional optional approvals to Category II/III for larger nominal diameters.

Ex approval

Information about currently available Ex versions (ATEX, IECEx, FM, CSA, NEPSI) can be supplied by your Endress+Hauser Sales Center on request. All explosion protection data are given in a separate documentation which is available upon request.

Other standards and guidelines

- EN 60529
  Degrees of protection by housing (IP code)
- EN 61010
  Protection Measures for Electrical Equipment for Measurement, Control, Regulation and Laboratory Procedures.
- IEC/EN 61326
  “Emission in accordance with requirements for Class A”.
  Electromagnetic compatibility (EMC requirements)
- NAMUR NE 21:
  Electromagnetic compatibility (EMC) of industrial process and laboratory control equipment.
- NAMUR NE 43:
  Standardization of the signal level for the breakdown information of digital transmitters with analog output signal.
- NAMUR NE 53:
  Software of field devices and signal-processing devices with digital electronics.
- ANSI/ISA-S82.01
  Safety Standard for Electrical and Electronic Test, Measuring, Controlling and related Equipment - General Requirements Pollution degree 2, Installation Category II.
- CAN/CSA-C22.2 No. 1010.1-92
  Safety requirements for Electrical Equipment for Measurement and Control and Laboratory Use. Pollution degree 2, Installation Category II

FOUNDATION Fieldbus certification

The flow device has successfully passed all the test procedures carried out and is certified and registered by the Fieldbus Foundation. The device thus meets all the requirements of the following specifications:

- Certified to FOUNDATION Fieldbus Specification
- The device meets all the specifications of the FOUNDATION Fieldbus H1.
- Interoperability Test Kit (ITK), revision status 5.01 (device certification number: on request)
- The device can also be operated with certified devices of other manufacturers
- Physical Layer Conformance Test of the Fieldbus Foundation

MODBUS RS485 certification

The measuring device meets all the requirements of the MODBUS/TCP conformity test and has the “MODBUS/TCP Conformance Test Policy, Version 2.0”. The measuring device has successfully passed all the test procedures carried out and is certified by the “MODBUS/TCP Conformance Test Laboratory” of the University of Michigan.

PROFIBUS DP/PA certification

The flow device has successfully passed all the test procedures carried out and is certified and registered by the PNO (PROFIBUS User Organisation). The device thus meets all the requirements of the following specifications:

- Certified to PROFIBUS PA, profile version 3.0 (device certification number: on request)
- The device can also be operated with certified devices of other manufacturers (interoperability)

Accessories

Various accessories, which can be ordered separately from Endress+Hauser, are available for the transmitter and the sensor. Your Endress+Hauser service organization can provide detailed information on the order codes in question.

Order Codes

NOTE: Endress+Hauser reserves the right to change or modify product, specifications, and ordering information at any time without notice.
Please consult Endress+Hauser or your local representative for the most recent information.

Please note that the Promag 50W/53W is also available with:
- Hard rubber and Polyurethane liners; ACS, KTW/W270 and WRAS B59620 approvals
- PED Cat. II / III material certificates
- ATEX and NEPSI hazardous area approvals
- DIN2501 and JIS B2220 process connections

Consult factory for information.

Promag 50W, 1" to 24"

Promag 50W [ ] - [010] [020] [030] [040] [050] [060] [070] [080] [090] [100] [110] [120]

Nominal Diameter
- 25 1"
- 40 1-1/2"
- 50 2"
- 80 3"
- 1H 4"
- 1F 6"
- 2H 8"
- 2F 10"
- 3H 12"
- 3F 14"
- 4H 16"
- 4F 18"
- 5H 20"
- 6H 24"

010 Liner
- D Hard rubber, NSF61 drinking water approval (not available for 1", 1-1/2" or 2" sensors)
- H Hard rubber (not available for 1", 1-1/2" or 2" sensors)
- P Polyurethane, NSF61 drinking water approval
- S Hard rubber HR (not available for 1", 1-1/2" or 2" sensors)
- U Polyurethane
- 9 Special version, to be specified

020 Process connection
- L Class 150 ANSI B16.5 CS steel A105 flanges
- M Class 300 ANSI B16.5 CS steel A105 flanges (not for 8" and larger)
- R Class 150 ANSI B16.5 316L SS flanges
- S Class 300 ANSI B16.5 316L SS flanges (not for 8" and larger)
- 9 Special version, to be specified

030 Electrodes / material
- 0 Measuring, reference and EPD electrodes / 316L SS
- 1 Measuring, reference and EPD electrodes / Alloy C22
- 2 Measuring, reference and EPD electrodes / tantalum
- 7 Measuring electrode, exchangeable / 316L SS (for hard rubber liner only, 14" and larger sensors, no EPD or reference electrodes, for safe areas only)
- G Measuring, reference and EPD electrodes, bullet nose / 316L SS
- H Measuring, reference and EPD electrodes, bullet nose / Alloy C-22
- 9 Special version, to be specified

040 Calibration
- A 3-point calibration, 0.5%
- B 3-point calibration, 0.2%
- D SCS/A2LA 3-point 0.5% calibration (ISO/IEC 17025) with certificate traceable according to ISO 9000 (specify range)
- E SCS/A2LA 3-point 0.2% calibration (ISO/IEC 17025) with certificate traceable according to ISO 9000 (specify range)
- 9 Special version, to be specified

050 Certificates
- 1 Standard, no certificate
- 2 3.1B material certificate for pipe and flanges
- 3 2.3 pressure test certificate (1.5 x PN, 3 minutes) for sensors up to 12" only
- 4 3.1B material and 2.3 pressure test certificate for sensors up to 12" only
- 5 CRN approval
- 8 CRN approval + material certificate + pressure test
- 9 Special version, to be specified

060 Approvals
- A For use in non-hazardous areas
- N FM explosion proof Class I, Div. 1 / CSA Class I, Div. 1 (only for aluminum field housing, compact version, not for 14" and larger sensors)
- R FM non-incendive Class I, Div. 2 / CSA Class I, Div. 2

070 Housing
- A NEMA 4X (IP 67) compact aluminum housing
- C NEMA 4X (IP 67) remote wall-mounted (only for approvals A or R)
- G NEMA 4X (IP 67) remote aluminum field housing for non-hazardous areas
- K NEMA 6P sensor, wall-mounted housing (only for approvals A or R)
- N NEMA 6P sensor, aluminum field housing, non-hazardous
- P NEMA 4X (IP 67) compact aluminum housing, HE (harsh environment), compact and remote sensor sizes up to 12" only *
- S NEMA 4X (IP 67) remote wall-mounted housing, HE (harsh environment), remote sensor sizes 14" to 78" (only for approvals A and R) *
- 1 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67), compact, aluminum field housing (only for approvals A and R)
- 3 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67), compact (only for approvals A and R)
- 5 -40°F (-40°C) ambient temperature, NEMA 4X (IP 67) wall mount housing, for NEMA 6P sensor (only for approvals A and R)
- 9 Special version, to be specified

080 Cable for remote
- 0 Without cable
- 1 15 foot coil and signal cable
- 2 30 foot coil and signal cable
- 5 Coil and signal cable, specify length (maximum 650 ft depending on conductivity of process material)
- 7 Coil and signal cable, flexible conduit, specify length (maximum 650 ft depending on conductivity of process material)
- 9 Special version, to be specified

090 Cable entries
- B 1/2" NPT
- L 1/2" NPT fieldbus connector (only for approval A and R)
- 9 Special version, to be specified

100 Power supply / display
- 7 85 to 260 VAC, without display, remote configuration only (not for wall mount or SS housing)
- 8 20 to 55 VAC / 16 to 62 VDC, without display, remote configuration only (not for wall mount or SS housing)
- A 85 to 260 VAC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- B 20 to 55 VAC / 16 to 62 VDC, with display, push button operation (language: EN, ES, FR, IT, NL, PT, DE)
- X Sensor only (without transmitter, only available up to 8")
- 9 Special version, to be specified

110 Software
- A Standard software
- X Sensor only (up to 8" only)
- 9 Special version, to be specified

120 Outputs / Inputs
- A Current HART, SIL, frequency
- D Current HART, SIL, frequency, status output, status input
- H PROFIBUS-PA (approvals A and R only)
- J PROFIBUS-DP (approvals A and R only)
- S Current HART, SIL, frequency; active I.S. (not for approvals A and R)
- T Current HART, SIL, frequency; passive I.S. (not for approvals A and R)
- W Current HART, SIL
- X Sensor only
- 9 Special version, to be specified

* Harsh environment (HE) option is available for process conditions where cool process temperatures in tropical (high humidity) environments or process fluids which undergo large cyclical temperature variations which can cause high amounts of moisture that could condense onto the measurement tube.

ASHCROFT®
Trust the shield.®

Type 1009 4½″ & 6″ Stainless Steel Gauge

PLUS! Performance

- *4½″ and 6″ SS gauges*
- *Dry and liquid-filled versions*
- *Micrometer adjustable pointer*
- *Variety of Bourdon tube materials*
- *ASME Grade 1A, ±1% of span accuracy*
- *New PLUS!™ Performance Option:*
  - *Liquid-filled performance in a dry gauge*
  - *Fights vibration and pulsations with out liquid-fill headaches*
  - *Order as option XLL*

The 4½″ and 6″ Ashcroft® Type 1009 gauges are suitable where ambient corrosion is a major concern. Its attractive stainless steel case and ring provides excellent resistance to chemical, weather and corrosion attack. This 1009 has many optional features that allow a user to develop a basic or special product specification. The 1009 is part of the extensive line of Ashcroft stainless steel pressure gauges.

The gauge is available dry, liquid-filled weatherproof or hermetically sealed and now with ***PLUS!***™ Performance option.

TEMPERATURE LIMITS

	Ambient	Process	Storage
Dry	–20°F/200°F[1] (–29°C/93°C)	–20°F/250°F[1] (–29°C/121°C)	–40°F/250°F (–40°C/121°C)
PLUS!™	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)
LF (glycerin)	20°F/150°F (7°C/66°C)	20°F/150°F (7°C/93°C)	0°F/150°F (–18°C/66°C)
(silicone)	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)
(Halocarbon®)	–40°F/150°F (–40°C/66°C)	–40°F/200°F (–40°C/93°C)	–40°F/150°F (–40°C/66°C)

Note: Other than discoloration of the dial and hardening of the gasketing that may occur as ambient or process temperatures exceeds 150°F, non-liquid-filled gauges with standard glass windows, can withstand continuous operating temperatures up to 250°F (121°C). Liquid-filled gauges can withstand 200°F (93°C) but glycerin fill and acrylic window will tend to yellow. Accuracy at temperatures above or below the reference ambient temperature of 68°F will be affected by approximately .4% per 25°F. Gauges with welded joints will withstand 750°F (450°F (232°C) with silver brazed joints) for short times without rupture, although other parts of the gauge will be destroyed and calibration will be lost. For continuous use and for process or ambient temperatures above 250°F (121°C), a diaphragm seal or capillary or siphon is recommended.

PRODUCT SPECIFICATIONS

Model Number:	1009
Accuracy:	1% full scale (Grade A, ASME B40.100)
Ranges:	Vacuum – 30,000 psi
Dial Size:	4½″ and 6″ diameter
Case:	Open front
Case Material:	304 SS
Weather Protection:	Dry Case: IP54 Liquid filled or hermetically sealed case: IP 65
Ring Type:	304 SS, bayonet
Window:	Glass
Dial:	Aluminum, white background, black figures and graduations.
Pointer:	Micrometer adjustable
Movement:	400 SS (conventional)
Bourdon Tube and Socket:	Bronze/Brass (A)[1] 316L SS/316L SS (S)[2] Monel®/Monel® (P)[2]
Connection Size:	¼, ½ NPT
Connection Location:	Lower and back

PRODUCT OPTIONS

***PLUS!* Performance:**	XLL
Fill:	L-Glycerin-Standard XGV-Silicone-Optional XGX-Halocarbon®-Optional
Weatherproof Hermetic Seal:	XLJ
Panel Mount Front Flange:	XFF
Panel Mount U-Clamp:	XUC
Surface Mount:	XBF
Oxygen Clean:	X6B
Window Acrylic:	XPD
Shatterproof Glass:	XSG

Type 100 Series Threaded Capsule Diaphragm Seal

TYPE 100 SHOWN

When isolation of the process from an instrument is required, Ashcroft® offers a comprehensive line of diaphragm seals. Seal types include threaded, flanged, in-line threaded, in-line flanged, in-line socket weld, in-line butt weld, saddle and sanitary seals. Also available is a complete offering of isolation or iso-rings and isolation or iso-spools.

APPLICATIONS

- Elevated process temperatures
- Corrosive service
- Isolation of the process for safety
- Suspended solids in the process
- Sanitary connections
- Minimize process dead leg
- Ease of cleaning between batches

FEATURES

- The top housing and diaphragm capsule are interchangeable with all Ashcroft bottom housings.
- A fill/bleed connection is standard, which permits filling the seal and instrument simultaneously after evacuation and allows the fill to flow into the completed unit.
- A Viton O-ring, compatible with all standard fill fluids, and a Teflon back-up ring provide a seal between the diaphragm capsule and the top housing.
- A thin Teflon PTFE gasket between the diaphragm and bottom housing ensures a leak-tight corrosion resistant seal even at high pressure.
- Top housing and pressure instrument are removable.
- Continuous-duty design will prevent loss of process fluid if pressure instrument is removed or fails.

SPECIFICATIONS

Model Number:	Type 100, 101, 102, 103, 104, 105, 106, 107, 108
Process Connection Size:	See Table A (Pg. 2)
Instrument Connection Size:	¼, ½ NPT
Diaphragm Material:	See Table B (Pg. 2)
Bottom Housing Materials:	See Table C (Pg. 2)
Filling Fluid:	Glycerin, Halocarbon, Silicone, Stylthern

OPTIONS	**Code**
316 stainless steel top housing	**YT**
Stainless steel clamp rings and flanged ring – includes 300 stainless steel clamping bolts (1500 psi max)	**SE**
300 series stainless steel clamping bolts (max pres is 1500 psi)	**SB**
Pipe plugs for flushing connections – pipe plugs are available in the same materials as bottom housings per Table C (Pg. 2)	**PU**
5000 psi pressure rating Threaded inlet and metal diaphragm only	**HP**
Welded instrument to diaphragm seal	**DU**
Dual flushing connections (½ NPT) (Limited to 2″ thru 3″ flanged seals	**DB**
Ring joint (Flanged seal only)	**RJ**
Flat face (Flanged seal only)	**FF**
Clean for gaseous oxygen or strong oxidizing agent applications	**6B**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

HOW TO ORDER:

1. **From Table A**...select TYPE NUMBER based on process connection, process connection size and diaphragm type/construction. (e.g., Threaded/1˝/capsule–code-10-100)
2. **From Table B**...select DIAPHRAGM MATERIAL. (e.g., 316L stainless steel–code S)
3. **From Table C**...select BOTTOM HOUSING MATERIAL. (e.g., 316 stainless steel–code S)
4. **From Table D**...select INSTRUMENT CONNECTION size. (e.g., 1/4 NPT–code 02T)
5. **From Table E**...select FILLING FLUID, if diaphragm seal will be attached to instrument. (e.g., Glycerin–code CG)

Typical code: 10–100SS–02T–CG

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

PRODUCT DESCRIPTION

Product description

The simplest possible method for level control! A mechanical switch in a plastic casing, freely suspended at the desired height from its own cable. When the liquid level reaches the regulator, the casing will tilt and the mechanical switch will close or break the circuit, thereby starting or stopping a pump or actuating an alarm device. No wear, no maintenance! In sewage pumping stations, for ground water and drainage pumping – in fact, for most level control applications – the ENM-10 is the ideal solution.

The regulator casing is made of polypropylene and the cable is sheathed with a special PVC or Nitrile/PVC rubber compound. The plastic components are welded and screwed together. Adhesive is never used. Impurities and deposits will not adhere to the smooth casing.

This level regulator is available in different versions, depending upon the medium in which it is to be used. As standard, the regulator can be obtained with 6, 13, 20, 30 or 50 metres (20, 42, 65, 100 or 167 feet) of cable for liquids with specific density between 0.95 and 1.10 g/cm3; for other specific densities and for the Ex-version, the regulator is only available with 20 metres (65 ft) of cable. The regulator can withstand up to 60°C (140°F).

Technical data

Liquid temperature:	min. 0°C (32°F) max. 60°C (140°F)
Liquid density:	min. 0.65 g/cm^3 max. 1.5 g/cm^3
Degree of protection:	IP68, 20 m (65 ft)
Interrupting capacity of micro switch:	AC, resistive load, 250V 10A AC, inductive load, 250V 3A cos ϕ = 0.5 DC, 30V 5A
With gold plated micro switch:	same as above, except: DC, 24V 10mA

Note that local regulations may limit the voltage.

Materials

Body:	Body:
Bending relief:	EPDM rubber
Cable:	special compound PVC or NBR/PVC nitrile/PVC rubber

Dimensions

Table 1

For density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
0.65–0.80	194 (7 10/16)	100 (4)
0.80–0.95	177 (7)	100 (4)
0.95–1.10	162 (6 3/8)	100 (4)
1.05–1.20	142 (5 9/16)	100 (4)
1.20–1.30	133 (5 1/4)	100 (4)

For density g/cm^3	Regulator length mm (in.)	Diameter mm (in.)
1.30–1.40	130 (5 2/16)	100 (4)
1.40–1.50	126 (5)	100 (4)

Weight: approx. 2 kg (4.5 lb) for a standard density regulator with 20 m cable.

Approvals: CE, CSA, SEMKO, NEMKO, DEMKO

LVD approval according to EN61058

CSA approval: Cert no. 1330172

Cl.I Zone 0, Gr. IIC;

CL.I Div.1 Gr A, B, C&D;

Cl.II Gr. E, F&G;

Cl.III when installed to the certified Intrinsically Safe relay, Ex ia, rated for the locations per submitter controll drawing and installation manual.

Intrincically safe circuits are required for the automatic control system. - Use a EX-safety barrier (e.g. Prod. no. 84 01 07).

0080

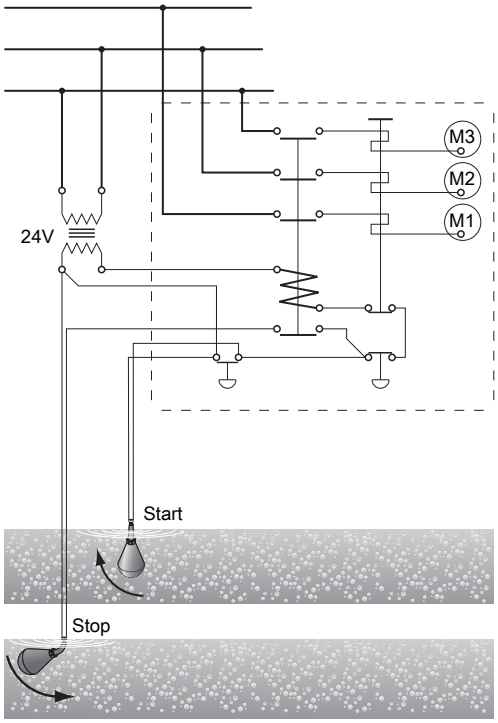
Figure 1

Wiring alternative

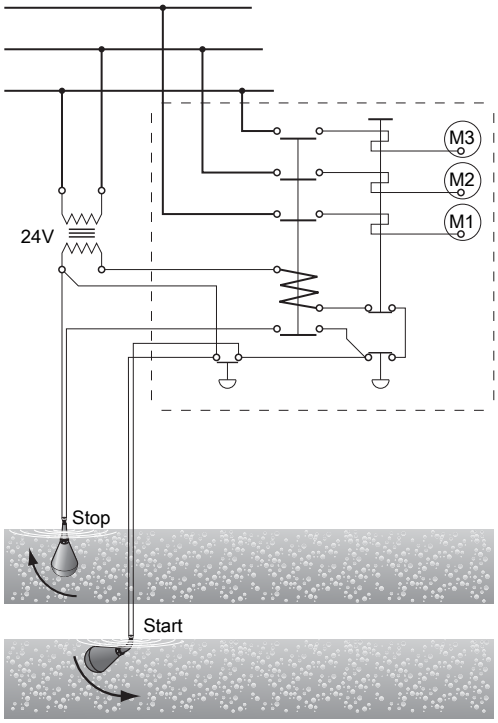
To conform to local regulations, the level regulators are normally connected through a transformer to a low-tension control circuit.

Two regulators are used; one for starting and one for stopping. A third regulator can be connected if an alarm is required at a given level.

Identical regulators can be used for all functions.



Connect the gray and black leads.



Connect the gray and brown leads.

Insulate the brown lead.
Figure 2: Connected for emptying

Insulate the black lead.

Maintenance and repair

ENM-10 is very durable and practically maintenance free. You only have to check on it occasionally, to ensure its continual operation.

- It is recommended to occasionally clean ENM-10, and especially when fat/grease covers the plastic surface.
- At the same time, make an occular inspection of the regulator to make sure neither cable, protective sleeve or plastic casing show any signs of damage.

- A damaged ENM-10 cannot be repaired in any way, due to the hermetic encapsulation. If the unit is found to be damaged, replace it with a new one.
- For Ex-installations, also make absolutely sure that the Ex-barrier (e.g. Prod. no. 84 01 07) is operating correctly - The LED changes when the switch is toggled.

The manufacturers reserve the right to alter performance specification or design without notice.

CHEMICAL RESISTANCE LIST

Chemical resistance list

The liquid in which level regulation is practiced most frequently is, of course, water. Of the millions of regulators in use all over the world today, it is estimated that nine out of ten work in water.

However, with a float body of polypropylene, a cable of PVC or NBR/PVC nitrile/PVC rubber and a bending relief of EPDM rubber, the ENM-10 is virtually insensitive to many aggressive liquids.

The table shows how resistant the ENM-10 equipped with either PVC or NBR/PVC nitrile/PVC rubber cable, is to different chemicals at two different temperatures.

The classification is broken down into the following categories:

0 = No effect, 1 = Minor to moderate and 2 = Severe effect. The sign – means that information is not available.

Keep in mind also that the density of the liquid determines the bouyancy of the regulator. The ENM-10 is made for seven different densities. See *Product description* (page 2).

Always observe local regulations:

Take particular note of:

- risk of fire/explosion
- hygiene requirements

Xylem |ˈzīləm|

1) The tissue in plants that brings water upward from the roots
2) A leading global water technology company

We're 12,000 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

For more information on how Xylem can help you, go to xyleminc.com

Technical Information

Liquiphant M
FTL50, FTL51, FTL50H, FTL51H

Vibronic

Point level switch for all kinds of liquids

Application

- Process temperatures from −50 °C to 150 °C (-58 to 302 °F)
- Pressures up to 100 bar (1450 psi)
- Viscosities up to 10,000 mm^2/s (cSt)
- For liquids with densities ≥ 0.5 g/cm^3(SGU)

FTL50: Compact design
FTL51: Extension pipe up to 3 m (9.8 ft) and up to 6 m (20 ft) on request
FTL50H, FTL51H: Certified for the food and pharmaceutical industries

Ideal substitute for float switches, as reliable function not affected by flow, turbulence, bubbles, foam, vibration, solids content or buildup.

Your benefits

- Recommended for safety systems requiring functional safety to SIL2/SIL3 as per IEC 61508/IEC 61511-1
- Design in accordance with ASME B31.3
- Recommended for use in sterile applications in the life science industry (design in accordance with ASME BPE)
- No adjustment: quick, low-cost startup
- No mechanically moving parts: no maintenance, no wear, long operating life
- Functional safety: Monitoring of tuning fork for damage
- Compact stainless steel housing (optional): the IP69K protection rating guarantees that the unit remains impermeable, even in the event of intensive cleaning or flooding for several hours.

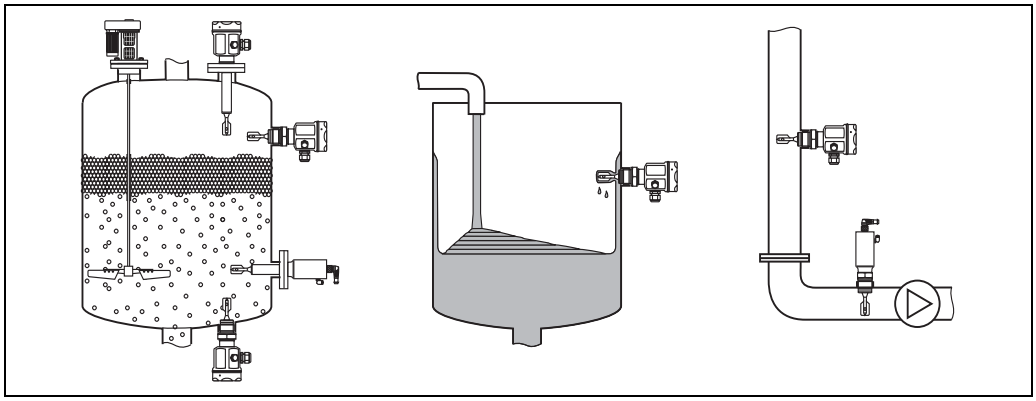
Application

Point level detection

Maximum or minimum detection in tanks or pipes containing all kinds of liquids, including use in hazardous areas, food and pharmaceuticals.



L00-FTL5xxxx-11-05-xx-xx-000

Function and system design

Measuring principle

The sensor's fork vibrates at its intrinsic frequency. This frequency is reduced when covered with liquid. This change in frequency causes the point level switch to switch.

Modularity

Point level switch
Liquiphant M FTL with electronic versions
FEL51, FEL52, FEL54

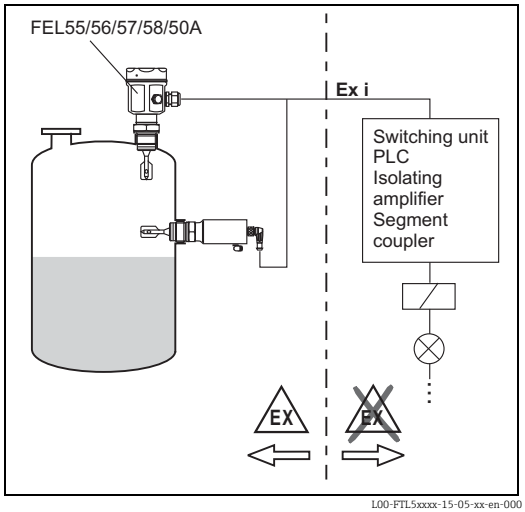
for connecting to a separate switching unit
or an isolating amplifier FEL50A
for connecting to a PROFIBUS PA segment



L00-FTL5xxxx-15-05-xx-en-000

Electronic versions	FEL51: Two-wire AC version; Switches the load directly into the power supply circuit via an electronic switch. FEL52: Three-wire DC version; Switches the load via the transistor (PNP) and separate connection e.g. in conjunction with programmable logic controllers (PLCs), DI modules as per EN 61131-2. FEL54: Universal current version with relay output; Switches the loads via 2 floating change-over contacts. FEL55: Signal transmission 16/8 mA on two-wire cabling e.g. in conjunction with programmable logic controllers (PLCs), AI modules 4 to 20 mA as per EN 61131-2. FEL56: For separate switching unit; signal transmission L-H edge 0.6 to 1.0 / 2.2 to 2.8 mA to EN 50227 (NAMUR) on two-wire cabling. FEL58: For separate switching unit; signal transmission H-L edge 2.2 to 3.5 / 0.6 to 1.0 mA to EN 50227 (NAMUR) on two-wire cabling. Checking of connecting cabling and other devices by pressing a key on the electronic insert. FEL57: For separate switching unit; PFM signal transmission; Current pulses superposed on the power supply along the two-wire cabling. Proof test from the switching unit without changing levels. FEL50A: For connecting to PROFIBUS PA; Cyclic and acyclic data exchange acc. to PROFIBUS-PA Profile 3.0 Discrete Input
Electronics for continuous density measurement	FEL50D: For connecting to Density Computer FML621
Galvanic isolation	FEL51, FEL52, FEL50A: between sensor and power supply FEL54: between sensor and power supply and load FEL55, FEL56, FEL57, FEL58, FEL50D: see connected switching unit
Design	FTL50: Compact FTL51: With extension pipe FTL50H: Compact, with polished tuning fork and hygienic process connections FTL51H: With extension pipe, polished tuning fork and hygienic process connections

Input

Measured variable	Level (limit value)
Measuring range (detection range)	FTL50: dependent on mounting point FTL51: dependent on mounting point and the extension pipe ordered. Standard extension pipe up to 3 m (9.8 ft) and up to 6 m (20 ft) on request.
Density	Setting on the electronic insert > 0.5 g/cm³ (SGU) or > 0.7 g/cm³ (SGU) (others on request)

Electronic insert FEL51 (AC 2-wire)

Power supply

Supply voltage: AC 19 to 253 V
Power consumption: < 0.83 W
Residual current consumption: < 3.8 mA
Short-circuit protection
Overvoltage protection FEL51: overvoltage category III

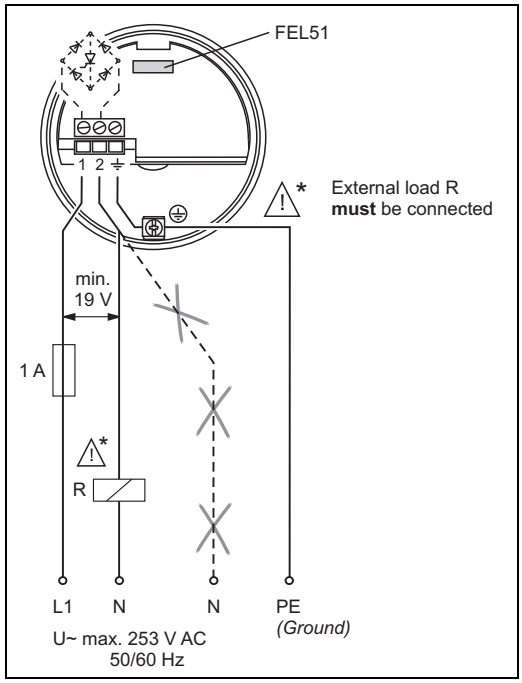
Electrical connection

Two-wire AC connection

Switches the load directly into the power supply circuit via an electronic switch.

Always connect in series with a load!

Check the following:
- The residual current in blocked state (up to 3.8 mA)
- That for low voltage
  - the voltage drop across the load is such that the minimum terminal voltage at the electronic insert (19 V) when blocked is not undershot.
  - the voltage drop across the electronics when switched through is observed (up to 12 V)
- That a relay cannot de-energize with holding power below 3.8 mA.
  If this is the case, a resistor should be connected parallel to the relay. An RC module is available under the part number: 71107226
- When selecting the relay, pay attention to the holding power / rated power (see "Connectable load")



L00-FTL5xxxx-04-05-xx-en-007

Output signal

I_L = load current (switched through)

< 3.8 mA = residual current (blocked)

☼ = lit

● = unlit

L00-FTL2xxxx-07-05-xx-xx-000

Safety mode	Level	Output signal	LEDs green	LEDs red
Max.		1 —I_L→ 2	☼	●
		1 - - < 3.8 mA - - → 2	☼	☼
Min.		1 —I_L→ 2	☼	●
		1 - - < 3.8 mA - - → 2	☼	☼

L00-FTL5xxxx-04-05-xx-xx-001

Signal on alarm

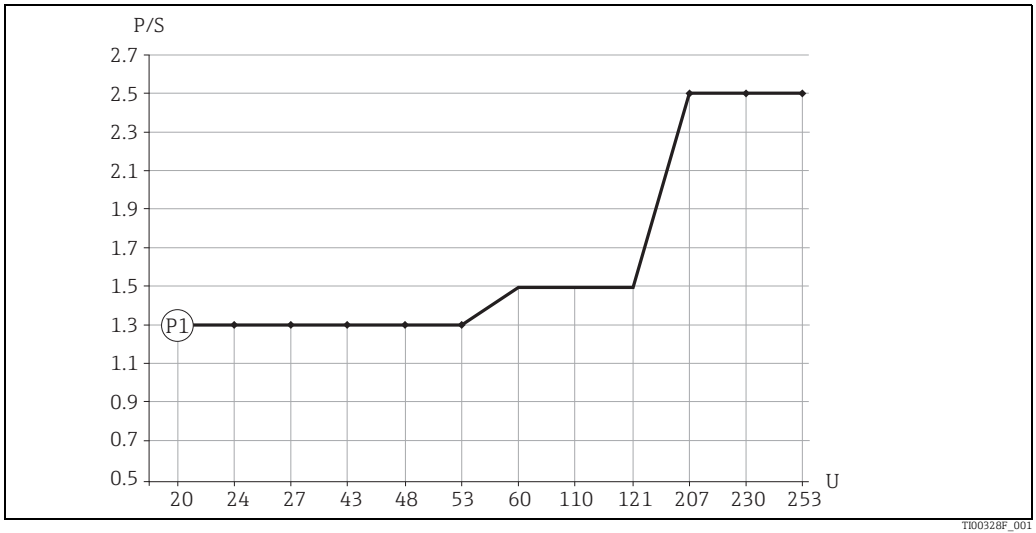
Output signal on power failure or in the event of damaged sensor: < 3.8 mA

Connectable load

- Voltage drop via FEL51 ≤ 12 V
- Residual current if electrical switch is blocked: ≤ 3.8 mA
- Load switched directly into the power supply circuit via the thyristor.
  Transient (40 ms) ≤ 1.5 A, ≤ 375 VA at 253 V or ≤ 36 VA at 24 V (not short-circuit-proof)

The load is switched via an electronic switch directly in the power circuit.
Always connect in series with a load!
Not suitable for connection to low-voltage PLC inputs!

Selection guide for relays



Minimum nominal power of load
P/S nominal power in [W] / [VA]
U operating voltage in [V]

Position	Operating voltage	Nominal power	
		min.	max.
P1	24 V	> 1.3 VA	< 6 VA
AC operation	110 V	> 1.5 VA	< 27.5 VA
	230 V	> 2.5 VA	< 57.5 VA

Relays with less nominal power can be operated via an RC module connected in parallel (optional).

Electronics FEL51 (AC, in compact housing)

Power supply

Supply voltage: AC 19 to 253 V
Power consumption: < 0.83 W
Residual current consumption: < 3.8 mA
Short-circuit protection
Overvoltage protection FEL51: overvoltage category III

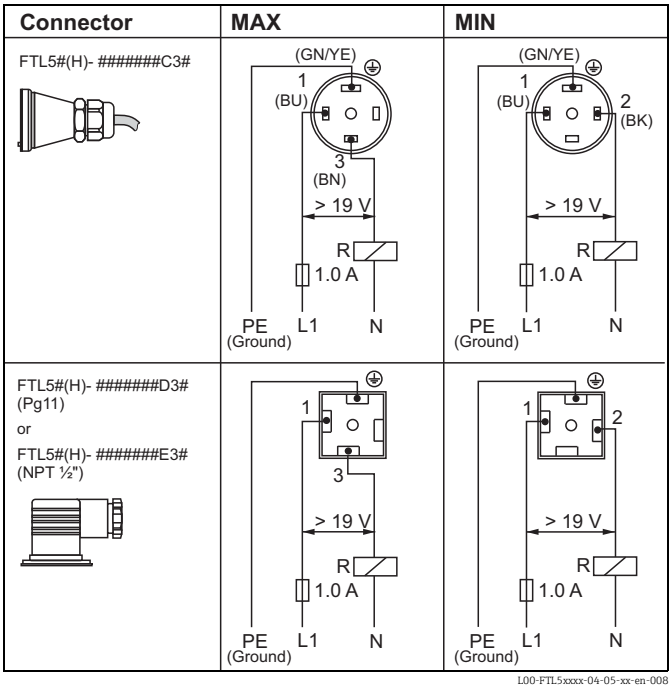
Electrical connection

Two-wire AC connection

Switches the load directly into the power supply circuit via an electronic switch.

Always connect in series with a load!

Check the following:
- The residual current in blocked state (up to 3.8 mA)
- That for low voltage
  - the voltage drop across the load is such that the minimum terminal voltage at the electronic insert (19 V) when blocked is not undershot.
  - the voltage drop across the electronics when switched through is observed (up to 12 V)



L00-FTL5xxxx-04-05-xx-en-008

- That a relay cannot de-energize with holding power below 3.8 mA.
  If this is the case, a resistor should be connected parallel to the relay (e.g. RC module: part number 71107226).

Output signal

L00-FTL5xxxx-04-05-xx-xx-001a

Signal on alarm

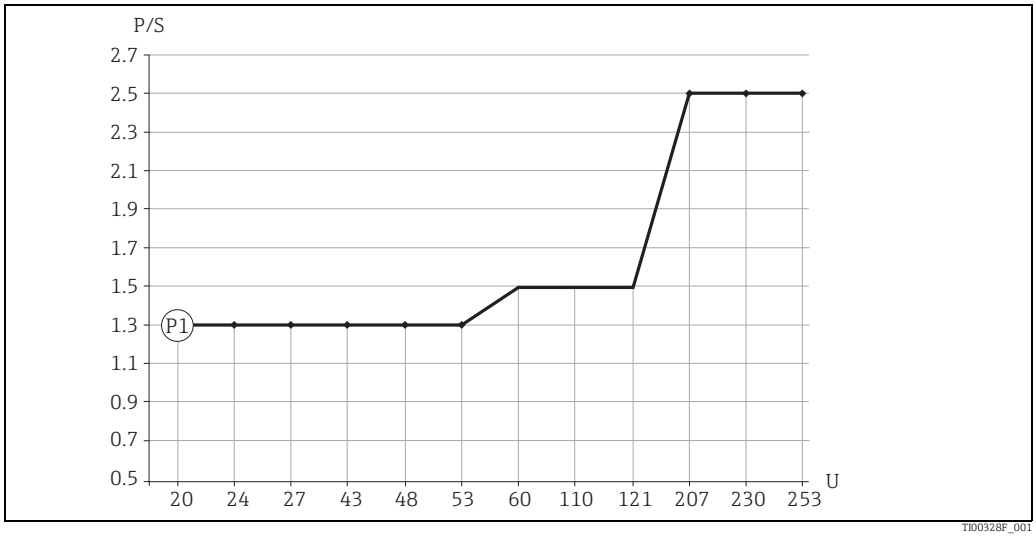
Output signal on power failure or in the event of damaged sensor: < 3.8 mA

Connectable load

- Voltage drop via FEL51 ≤ 12 V
- Residual current if electrical switch is blocked: ≤ 3.8 mA
- Load switched directly into the power supply circuit via the thyristor.
  Transient (40 ms) ≤ 1.5 A, ≤ 375 VA at 253 V or ≤ 36 VA at 24 V (not short-circuit-proof)

The load is switched via an electronic switch directly in the power circuit.
Always connect in series with a load!
Not suitable for connection to low-voltage PLC inputs!

Selection guide for relays



Minimum nominal power of load
P/S nominal power in [W] / [VA]
U operating voltage in [V]

Position	Operating voltage	Nominal power	
		min.	max.
P1 AC operation	24 V	> 1.3 VA	< 6 VA
	110 V	> 1.5 VA	< 27.5 VA
	230 V	> 2.5 VA	< 57.5 VA

Relays with less nominal power can be operated via an RC module connected in parallel (optional).

Electronic insert FEL52 (DC PNP)

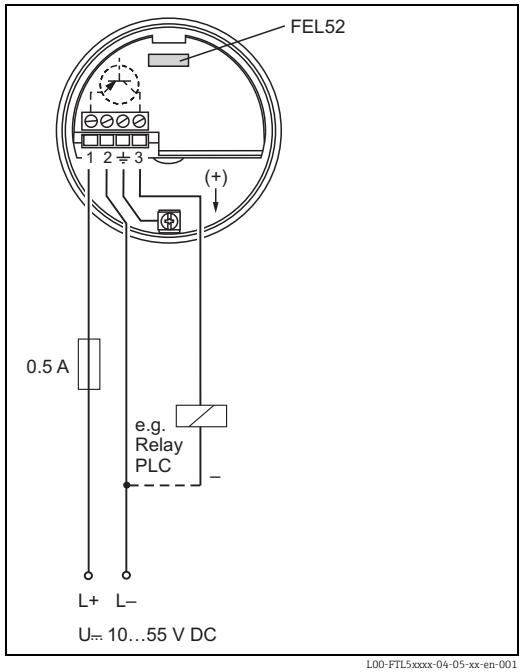
Power supply

Supply voltage: DC 10 to 55 V
Ripple: ≤ 1.7 V, 0 to 400 Hz
Current consumption: ≤ 15 mA
Power consumption: ≤ 0.83 W
Reverse polarity protection
Overvoltage protection FEL52: overvoltage category III

Electrical connection

Three-wire DC connection

Switches the load via the transistor (PNP) and separate connection.
Preferably used with programmable logic controllers (PLC),
DI modules as per EN 61131-2.
Positive signal at switching output of the electronics (PNP); Output blocked on reaching point level.



L00-FTL5xxxx-04-05-xx-en-001

Signal on alarm

Output signal on power failure or in the event of damaged sensor: < 100 µA

Connectable load

- Load switched via the transistor and separate PNP connection, ≤ DC 55 V
- Load current ≤ 350 mA (pulsed overload and short-circuit protection)
- Residual current < 100 µA (with transistor blocked).
- Capacitance load ≤ 0.5 µF at 55 V, ≤ 1.0 µF at 24 V
- Residual voltage < 3 V (with transistor switched through);

Electronic insert FEL54 (AC/DC with relay output)

Power supply

Supply voltage: AC 19 to 253 V, 50/60 Hz or DC 19 to 55 V
Power consumption: ≤ 1.3 W
Reverse polarity protection
Overvoltage protection FEL54: overvoltage category III

Electrical connection

Universal current connection with relay output

Power supply:
Please note the different voltage ranges for AC and DC.

Output:
When connecting an instrument with high inductance, provide a spark arrester to protect the relay contact.
A fine-wire fuse (depending on the load connected) protects the relay contact on short-circuiting.
Both relay contacts switch simultaneously.

* When jumpered, the relay output works with NPN logic.

** See "Connectable load"

L00-FTL5xxxx-04-05-xx-xx-005

Signal on alarm

Output signal on power failure or in the event of damaged sensor: relay de-energized

Connectable load

- Loads switched via 2 floating change-over contacts (DPDT).
- I~ ≤ 6 A (Ex de 4 A), U~ ≤ AC 253 V; P~ ≤ 1500 VA, cos φ = 1, P~ ≤ 750 VA, cos φ > 0.7
- I⎓ ≤ 6 A (Ex de 4 A) to DC 30 V , I⎓ ≤ 0.2 A to 125 V
- When connecting a low-voltage circuit with double insulation according to IEC 1010, the following applies: the sum of the voltages of the relay output and power supply is ≤ 300 V
- The electronic insert FEL52 DC-PNP is preferred for low DC load currents (e.g. when connecting to a PLC)
- Relay contact material: silver/nickel AgNi 90/10

Electronic insert FEL55 (8/16 mA)

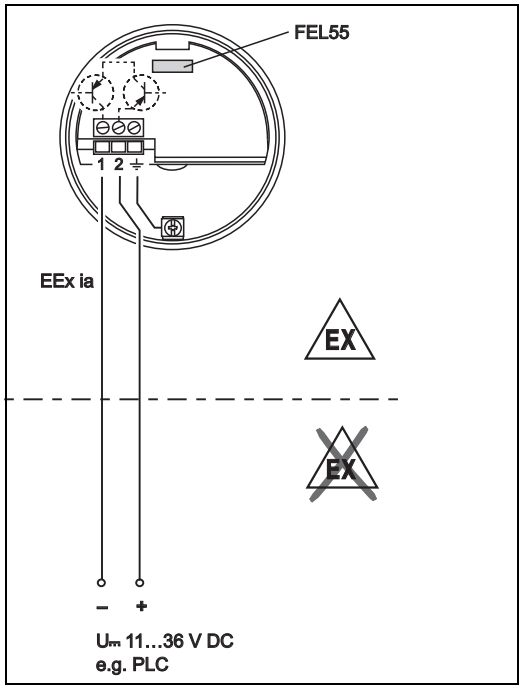
Power supply

Supply voltage: DC 11 to 36 V
Power consumption: < 600 mW
Reverse polarity protection
Overvoltage protection FEL55: overvoltage category III

Electrical connection

Two-wire connection for separate switching unit

For separate switching unit.
Signal transmission 16/8 mA on two-wire cabling.
For connection to programmable logic controllers (PLCs) for example,
AI module 4 to 20 mA to EN 61131-2.
Output signal jump from high to low current on point level.



L00-FTL5xxxx-04-05-xx-en-000

Output signal

~ 16 mA = 16 mA ± 5 %

~ 8 mA = 8 mA ± 6 %

☼ = lit

L00-FTL5xxxx-04-05-xx-xx-006

Signal on alarm

Output signal on power failure or in the event of damaged sensor: < 3.6 mA

Connectable load

- R = (U - 11 V) : 16.8 mA
- U = connection voltage: DC 11 to 36 V

Example: PLC with 250 Ω with 2-wire version

250 Ω = (U – 11V) / 16.8 mA
4.2 [Ω /A] = U – 11 V
U = 15.2 V

Electronic insert FEL56 (NAMUR L-H edge)

Power supply

Power consumption: < 6 mW at I < 1 mA; < 38 mW at I = 2.8 mA
Connection data interface: IEC 60947-5-6

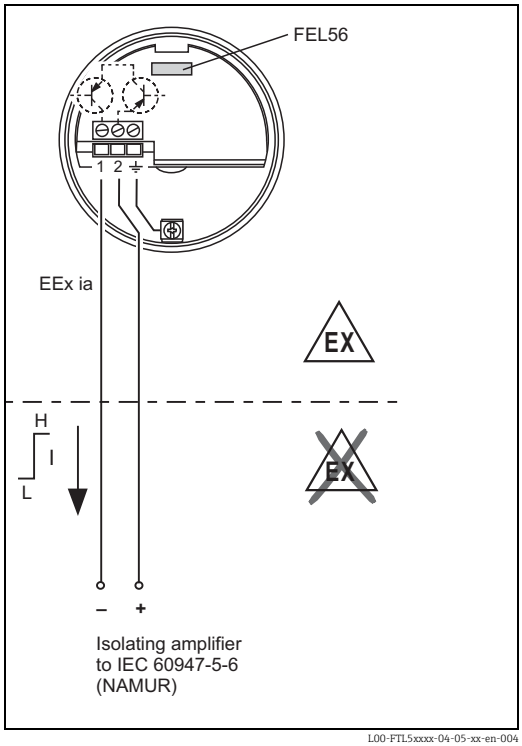
Electrical connection

Two-wire connection for separate switching unit

For connecting to isolating amplifiers acc. to NAMUR (IEC 60947-5-6), e.g. FTL325N, FTL375N from Endress+Hauser.
Output signal jump from low to high current on point level.

(L–H edge)

Connecting to multiplexer:
Set clock time to min. 2 s.



L00-FTL5xxxx-04-05-xx-en-004

Output signal

= lit
= flashes
= unlit

L00-FTL5xxxx-07-05-xx-xx-002

Safety mode	Level	Output signal	LEDs green	LEDs red

		+ 2 → 1 : 2.2 … 2.8 mA	◔	☼

L00-FTL5xxxx-04-05-xx-xx-003

Signal on alarm

Output signal in the event of damaged sensor: > 2.2 mA

Connectable load

- See Technical Data of the isolating amplifier connected according to IEC 60947–5–6 (NAMUR)

Electronic insert FEL58 (NAMUR H-L edge)

Power supply

Power consumption: < 6 mW at I < 1 mA; < 38 mW at I = 3.5 mA
Connection data interface: IEC 60947-5-6

Electrical connection

Two-wire connection for separate switching unit

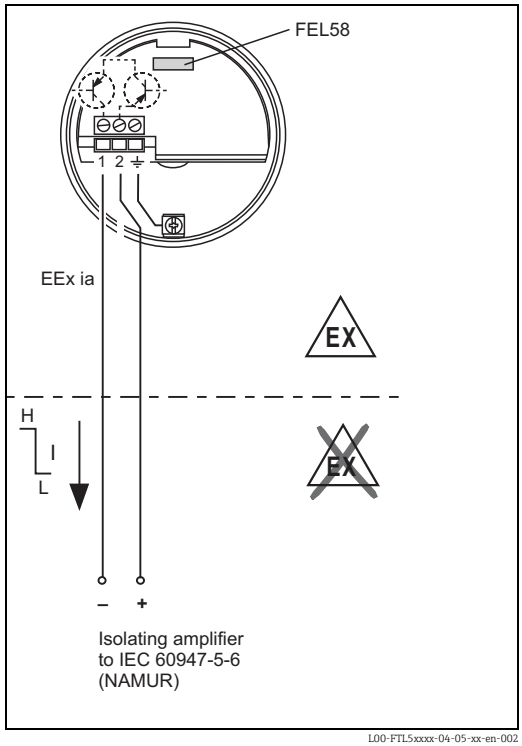
For connecting to isolating amplifiers as per NAMUR (IEC 60947-5-6), e.g. FTL325N, FTL375N from Endress+Hauser.
Output signal jump from high to low current on point level.

(H–L edge)

Additional function:
Test key on the electronic insert.
Pressing the key breaks the connection to the isolating amplifier.

✎ Note!
In Ex–d applications, the additional function can only be used if the housing is not exposed to an explosive atmosphere.

Connecting to multiplexer:
Set clock time to min. 2 s.



L00-FTL5xxxx-04-05-xx-en-002

Output signal

☼ = lit
☼ = flashes

Signal on alarm

Output signal in the event of damaged sensor: < 1.0 mA

Connectable load

- See Technical Data of the isolating amplifier connected according to IEC 60947–5–6 (NAMUR)
- Connection also to isolating amplifiers which have special safety circuits (I > 3.0 mA)

Electronics FEL58 (NAMUR H-L edge, in compact housing)

Power supply

Power consumption: < 6 mW at I < 1 mA; < 38 mW at I = 3.5 mA
Connection data interface: IEC 60947-5-6

Electrical connection

Two-wire connection for separate switching unit

For connecting to isolating amplifiers acc. to NAMUR (IEC 60947-5-6), e.g. FTL325N, FTL375N from Endress+Hauser. Output signal jump from high to low current on point level.

(H–L edge)

Additional function:
If the test magnet is held against the marking on the nameplate, the output signal is inverted.

Connecting to multiplexer:
Set clock time to min. 3 s.

The NAMUR interface has a defined power consumption rate. Thus, it is not possible to use the M12 connector with an integrated LED (52018763).

L00-FTL5xxxx-04-05-xx-xx-007a

Signal on alarm

Output signal in the event of damaged sensor: < 1.0 mA

Connectable load

- See Technical Data of the isolating amplifier connected according to IEC 60947–5–6 (NAMUR)
- Connection also to isolating amplifiers which have special safety circuits (I > 3.0 mA)

Electronic insert FEL57 (PFM)

Power supply

Supply voltage: DC 9.5 to 12.5 V
Current consumption: 10 to 13 mA
Power consumption: < 150 mW
Reverse polarity protection

Electrical connection

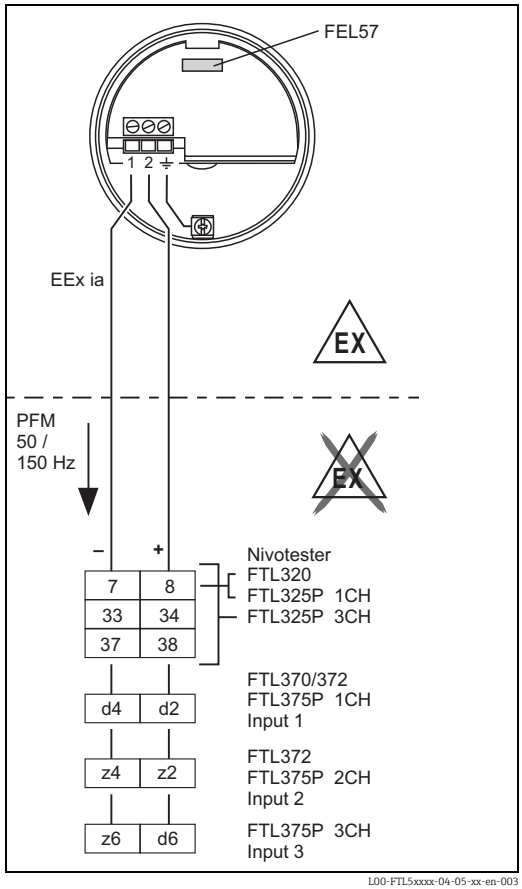
Two-wire connection for separate switching unit

For connecting to Endress+Hauser switching units Nivotester FTL320, FTL325P, FTL370, FTL372, FTL375P (also with proof test).

Output signal jump of the PFM signal from high to low frequency when sensor is covered. Switching between minimum/maximum safety in the Nivotester.

Additional function “proof test”:
After interruption of the power supply, a test cycle is activated which checks the sensor and electronics without any change in level.
Approved for overfill protection acc. to WHG (German Water Resources Act).
The following can be switched at the electronic insert:

- **Standard (STD):**
  Corrosion of the fork unlikely;
  simulation approx. 8 s
  tuning fork exposed – covered – exposed.
  For proof testing, the Nivotester tests the sensor's level notification function.
- **Extended (EXT)**:
  Corrosion of the fork possible;
  Simulation approx. 41 s: tuning fork exposed – covered – corroded – exposed.
  For proof testing, the Nivotester tests the sensor's level notification function and fault notification (alarm) function.

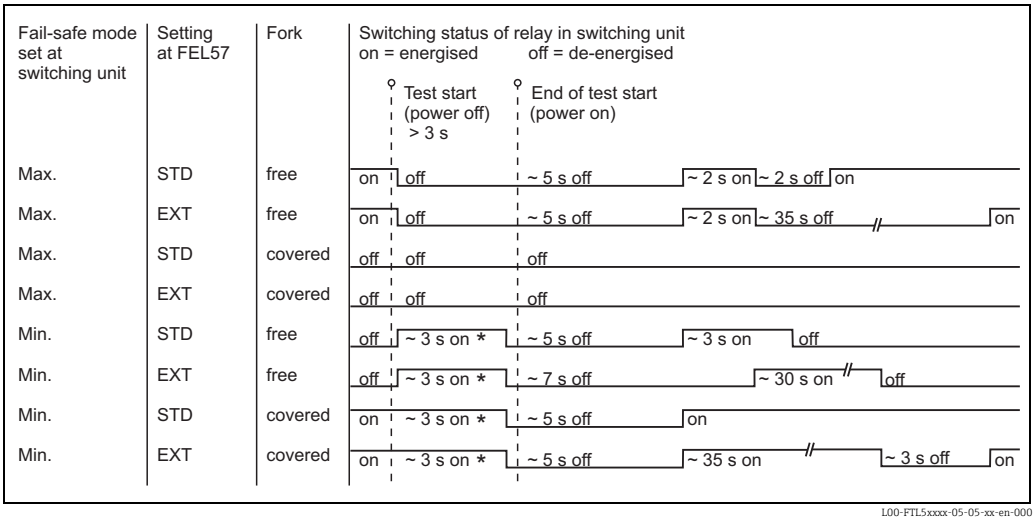


The check is activated and monitored at the switching unit.

The twin-core connecting cable (instrument cable) with a cable resistance of ≤ 25 Ω per core is connected to the screw terminals (conductor cross-sections 0.5 to 2.5 mm / 0.02 to 0.1 in) in the connection compartment. Protective circuits against reverse polarity, HF influences and overvoltage peaks are installed.
Maximum cable length up to 1000 m (3281 ft).

A shielded connecting cable is recommended in the event of strong electromagnetic interference. Here the shielding must be connected to the sensor and the power supply.

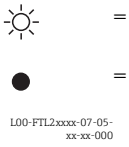
Switching behavior of the connected device:

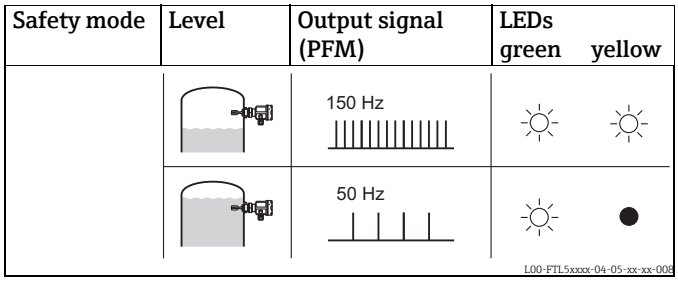


* De-energized on power supply failure

Please note this switching response and function of the plant especially when replacing a Liquiphant incorporating electronic insert EL17Z or FEL37 with a Liquiphant M incorporating electronic insert FEL57.

Output signal





Signal on alarm

Output signal on power failure or in the event of damaged sensor: 0 Hz

Connectable load

- Floating relay contacts in the connected switching unit Nivotester FTL320, FTL325P, FTL370, FTL372, FTL375P
- For contact load, see the Technical Data of the switching unit.

Electronic insert FEL50A (PROFIBUS PA)

Power supply

Bus voltage: DC 9 to 32 V
Bus current:
- 12.5 mA +/– 1.0 mA (software version: 01.03.00, hardware version: 02.00)
- 10.5 mA +/– 1.0 mA (software version: 01.03.00, hardware version: 01.00)

Electrical connection

Two-wire connection for power supply and data transfer

For connecting to PROFIBUS PA

Additional functions:

– Digital communication enables the representation, reading and editing of the following parameters: Fork frequency, switch-on frequency, switch-off frequency, switch-on time and switch-off time, status, measured value, density switch.

– Matrix locking possible
– Switch to WHG mode possible (WHG approval)
– For a detailed description, see BA198F

L00-FTL5xxxx-04-05-xx-xx-009

Signal on alarm

- Failure information can be opened using the following interfaces:
  Yellow LED flashing, status code, diagnostic code; see BA00198F

Electronic insert FEL50D (density)

Power supply

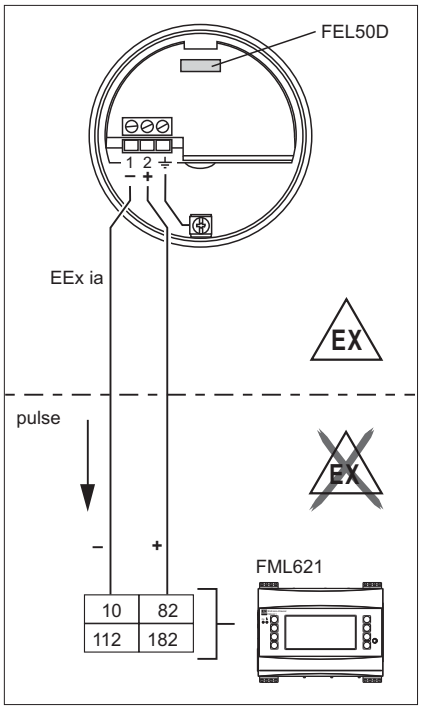
Frequency range: 300 to 1500 Hz
Signal level: 4 mA
Pulse height: 16 mA
Pulse width: 20 µS

Electrical connection

Two-wire connection at Density Computer FML621
For connecting to the density and concentration computer
FML621.

The output signal is based on pulse technology. With the aid of this signal, the fork frequency is constantly
forwarded to the switching unit.

Caution!
Operation with other switching units, such as FTL325P, is not permitted.
This electronic insert cannot be installed in devices that were originally used as a point level switch.



TI420Fen004

Signal on alarm

Output signal on power failure or in the event of damaged sensor: 0 Hz

Adjustment

In the Liquiphant M modular system, the option of an adjustment is also provided in addition to the electronics (see feature 60: "Accessories").

There are three types of adjustment:

Standard adjustment (see ordering information for additional option, basic version A)
- Here, two fork parameters are determined to describe the sensor characteristics, indicated in the adjustment report and provided with the product.
  These parameters must be transmitted to the Density Computer FML621.

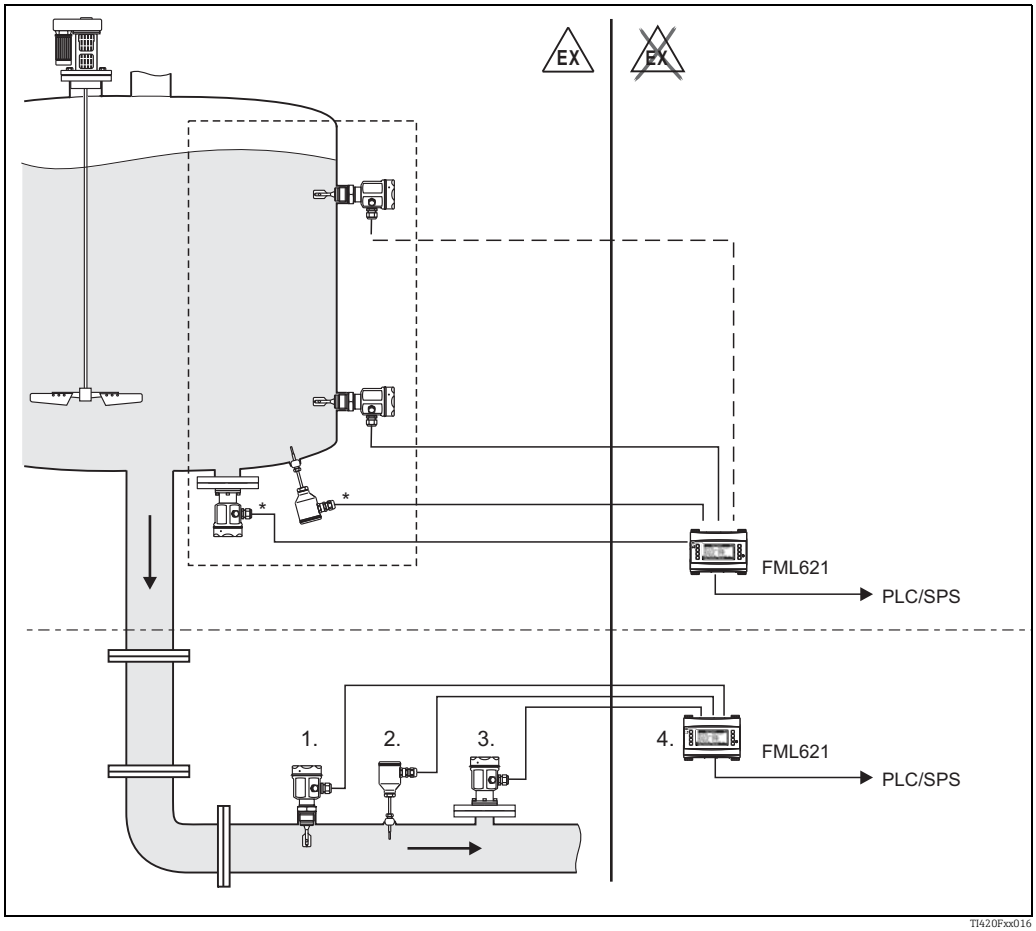
Special adjustment (see ordering information for additional option, special adjustment, density H_2O (K) or special adjustment, density H_2O with 3.1 certificate (L))
- Here, three fork parameters are determined to describe the sensor characteristics, indicated in the adjustment report and provided with the product.
  These parameters must be transmitted to the Density Computer FML621.
  Greater accuracy is achieved with this type of adjustment (see also "Performance characteristics").

Field Adjustment
- During field adjustment, a density value actually determined by the customer is entered and the system is automatically adjusted to this value (wet adjustment).

Note!
More information on Liquiphant M Density is available in Technical Information TI00420F. This can be downloaded from www.endress.com => Download.

Operating principle

Measuring the density of a liquid medium in pipes and tanks. Also suitable for use in hazardous areas, and preferably for applications in the chemical and food industry.



** Pressure and temperature information required depending on the application.*
1. Liquiphant M sensor with electronic insert FEL50D (pulse output);
2. Temperature sensor (e.g. 4 to 20 mA output);
3. Pressure transmitter (4 to 20 mA output);
4. Liquiphant density and concentration computer FML621 with display and operating unit

Light signals

LED	Symbol	Information
Yellow		Measurement valid
		Unstable process situation
		Maintenance required
Green		Power on
		Power off
Red		No fault
		Maintenance required
		Device failure

Connection and function

Connecting cables

- Electronic inserts: cross-section ≤ 2.5 mm² (14 AWG); strand in ferrule as per DIN 46228
- Protective ground in housing: cross-section ≤ 2.5 mm² (14 AWG)
- External equipotential bonding connection on housing: cross-section ≤ 4 mm² (12 AWG)

Safety mode

Minimum/maximum residual current safety selectable on electronic insert.
(with FEL57 on Nivotester only)

MAX = maximum safety:
The output switches to the power fail response when the fork is covered
For use with overfill protection for example

MIN = minimum safety:
The output switches to the power fail response when the fork is exposed
For use with dry running protection for example

Switching time

When fork is covered: approx. 0.5 s
When fork is exposed: approx. 1.0 s
Additionally configurable for PROFIBUS PA:
0.5-60 s

Other switching times available on request.

Switch-on behavior

When switching on the power supply, the output assumes the alarm signal.
After ≤ 3 s it assumes the correct switching mode (exception: FEL57)

Performance characteristics

Reference operating conditions

Ambient temperature: 23 °C (73 °F)

Medium temperature: 23 °C (73 °F)

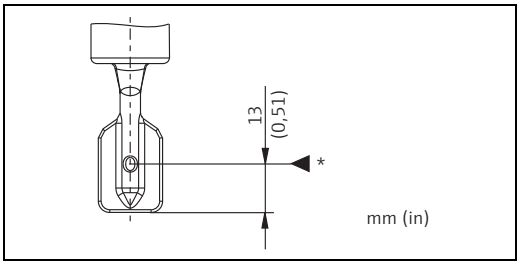
Medium density (water): 1 g/cm³ (SGU)

Medium viscosity: 1 mm²/s (cSt)

Medium pressure p_e: 0 bar (0 psi)

Sensor mounting: vertical from above

Density switch: to > 0.7 g/cm³ (SGU)



L00-FTL5xxxx-06-05-xx-xx-031

** Switch point under reference operating conditions*

Maximum measured error

Under reference operating conditions: max. +/−1 mm (0.04 in)

Repeatability

0.1 mm (0.004 in)

Hysteresis

approx. 2 mm (0.08 in)

Influence of medium temperature

max. +1.8 to −2.8 mm (−50 to +150 °C / -58 to 302 °F)

Influence of medium density

max. +4.8 to −3.5 mm ((0.5 to 1.5 g/cm³ (SGU))
max. +0.19 to -0.14 in

Influence of medium pressure

max. 0 to −2.5 mm (−1 to 64 bar (-14.5 to 928 psi))
max. 0 to -0.1 in

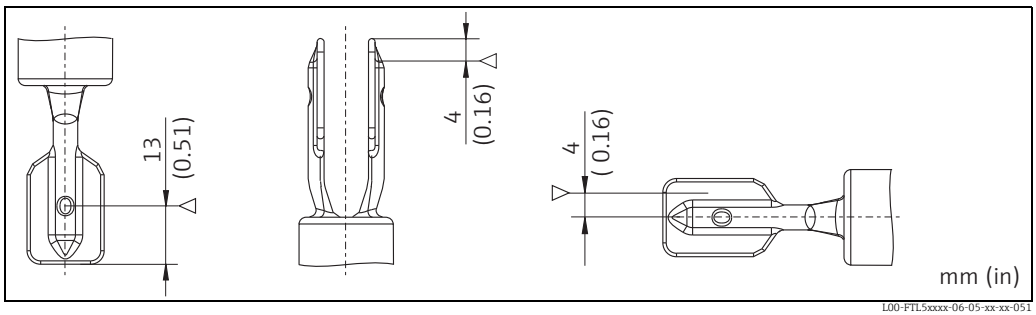
Operating conditions

Installation

Installation instructions

Switch points on the sensor depend on the mounting position, with reference to water,

Density 1 g/cm³ (SGU), 23 °C (73 °F), p_e 0 bar (0 psi).



Mounting from above *Mounting from below* *Mounting from the side*

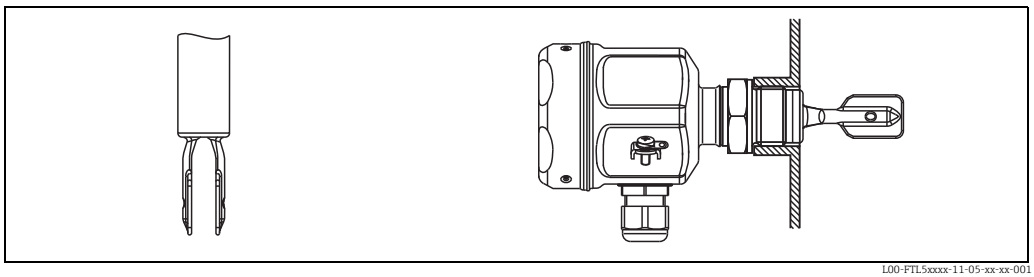
Note!
The switch points of the Liquiphant **M** are at other positions to those of the previous version Liquiphant **II**.

Examples of mounting

Examples of mounting with regard to the viscosity ν of the liquid and the tendency to form buildup

Optimum mounting, without problem even with high viscosity:

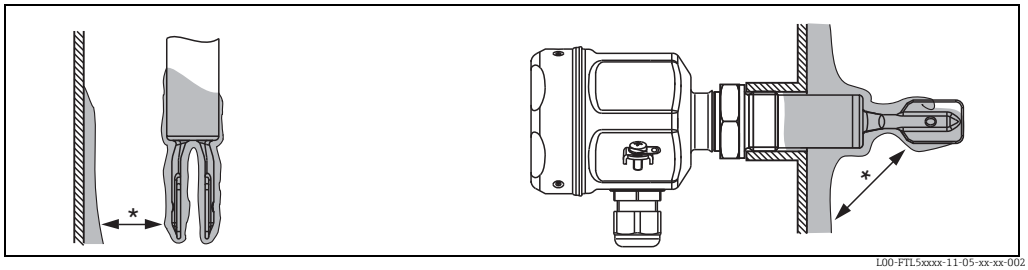
Position the fork so that the narrow edge of the tines is vertical to ensure that the liquid can run off easily.



Vertical from above *Flush-mounted from the side*

With buildup on the tank walls:

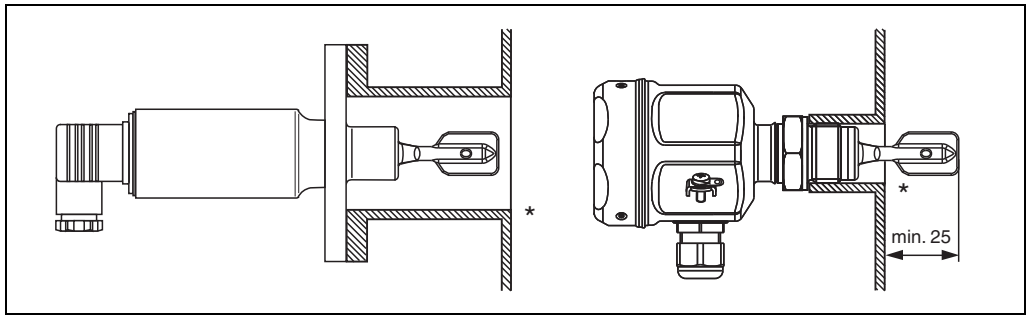
* Ensure that there is sufficient distance between the buildup expected on the tank wall and the fork.



Vertical from above *Protruding into the tank from the side*

Mounting positions in the case of low viscosity up to 2000 mm²/s (cSt):

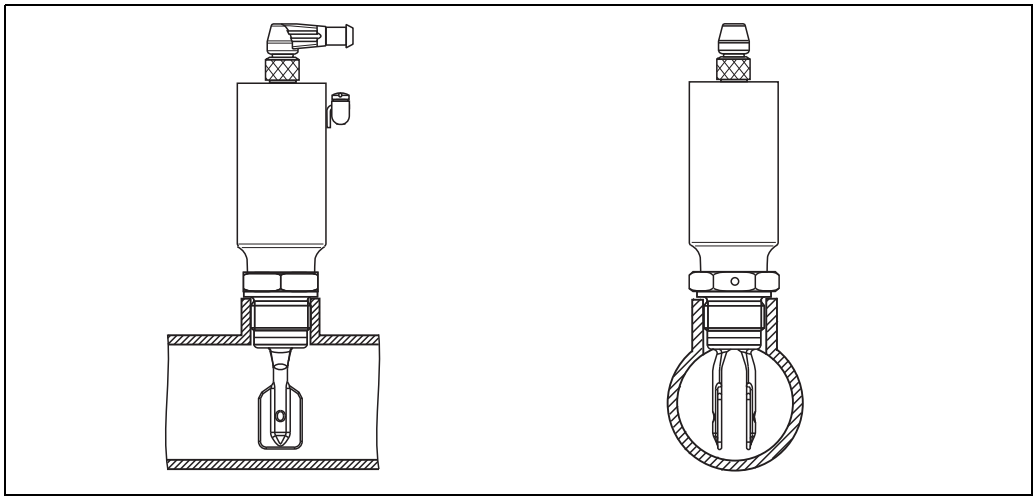
* Deburr the nozzle surfaces



L00-FTL5xxxx-11-05-xx-en-003

Mounting in piping from 2"

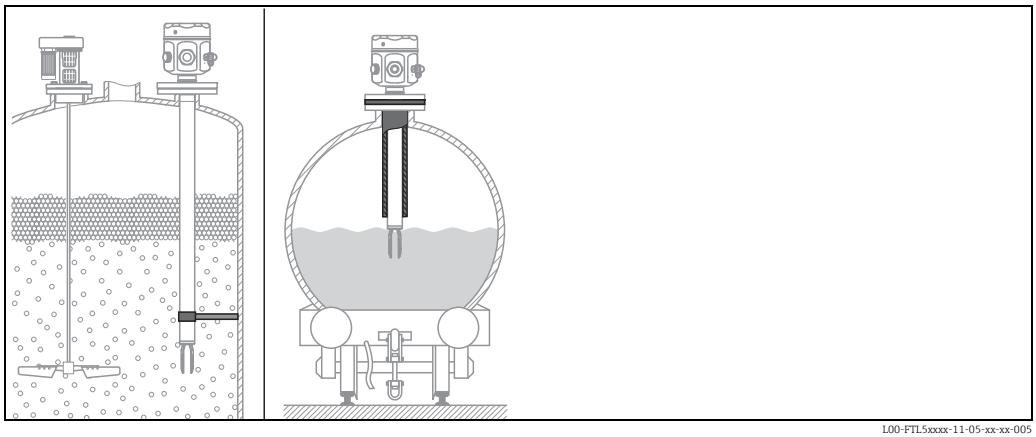
Flow velocities up to 5 m/s for viscosity of 1 mm²/s (cSt) and density 1 g/cm³ (SGU).
(Check the function for other medium conditions.)



L00-FTL5xxxx-11-05-xx-xx-004

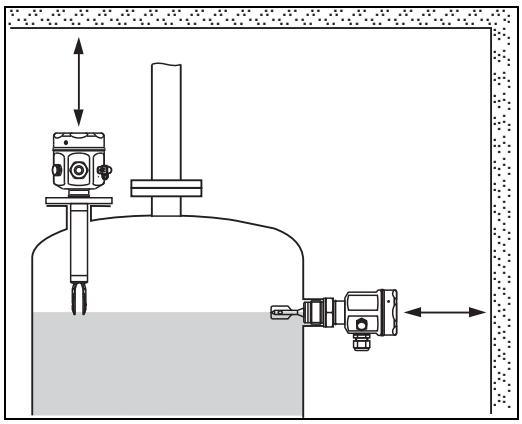
Dynamic load

Support the Liquiphant M FTL51(H) in the event of a severe dynamic load.



L00-FTL5xxxx-11-05-xx-xx-005

Ensure adequate space outside the tank for mounting, connection and configuration.



L00-FTL5xxxx-11-05-xx-xx-006

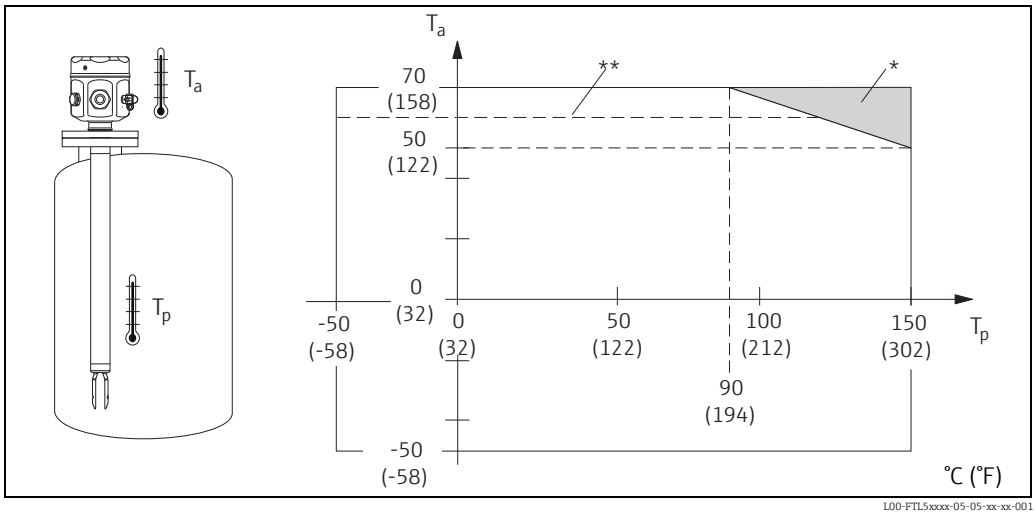
Orientation

- FTL50(H) and FTL51(H) with short pipe up to approx. 500 mm (19.7 in): any position
- FTL51(H) with long pipe: vertical

Environment

Ambient temperature range

Permitted ambient temperature T_a at the housing depending on the medium temperature T_p in the tank:



L00-FTL5xxxx-05-05-xx-xx-001

* Additional temperature range for devices with a temperature spacer or pressure-tight feedthrough.
** Maximum ambient temperature with FEL50D/FEL50A in hazardous areas.

Storage temperature

−50 to +80 °C (-58 to 176 °F)

Installation height as per IEC61010-1 Ed.3

Up to 2000 m (6600 ft) above sea level.

Can be extended up to 3000 m (9800 ft) above sea level if overvoltage protection is used, for example HAW562 or HAW569.

Climate class

Climate protection to IEC 68, Part 2-38, Fig. 2a

Aluminum housing T13 with separate connection compartment (Ex d)	–	X	–	X***	–	4X/6P

* As per EN60529
** As per NEMA 250
*** only with M20 cable entry or G1/2 thread
**** F13 housing only in conjunction with XP or Ex d approval

Vibration resistance

As per IEC 68, parts 2-6 (10 to 55 Hz, 0.15 mm (0.01 in), 100 cycles)
In the event of increased vibrations, the following additional option is recommended: feature "060" version "P" 100 bar (1450 psi) process pressure.

Electromagnetic compatibility

Interference emission to EN 61326, Electrical Equipment Class B
Interference immunity to EN 61326; Annex A (Industrial) and NAMUR Recommendation NE 21 (EMC)

Medium conditions

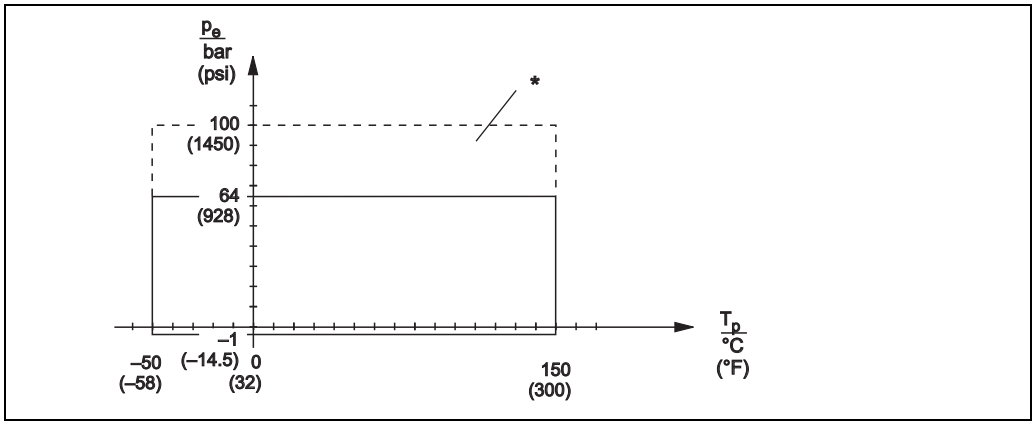
Medium temperature

−50 to +150 °C (-58 to 302 °F); for exceptions, see "Process connections"

Thermal shock

≤ 120 °C/s (248 °F/s)

Medium pressure p_e



L00-FTL5xxxx-05-05-xx-xx-003

* Permitted pressure rating when the "100 bar (1450 psi)" option is selected (see "Product structure FTL51", feature 060, from → 📄 43).
See "Process connections" → 📄 33 for exceptions.
Canadian CRN approval: Additional details on maximum pressure values are available in the download area of the product page at "www.endress.com".

Please refer to the standards listed for the permitted pressure values of the flanges at higher temperatures:

- pR EN 1092-1: 2005
  With regard to their stability-temperature property, the materials 1.4435 and 1.4404 are identical and are grouped together in EN 1092-1 Tab. 18 under 13E0. The chemical composition of the two materials can be identical.
- ASME B 16.5 - 2013 Tab. 2-2.2 F316
- ASME B 16.5 - 2013 Tab. 2-3.8 N10276
- JIS B 2220

The lowest value from the derating curves of the device and selected flange applies in each case.

Test pressure

p_e = 64 bar (928 psi):
- ≤ 100 bar (1450 psi) or 1.5 times the medium pressure p_e
- Sensor burst pressure at 200 bar (2900 psi)

p_e = 100 bar (1450 psi):
- ≤ 150 bar (2175 psi) or 1.5 times the medium pressure p_e)
- Sensor burst pressure at 400 bar (5800 psi)

Note!
The device function is restricted during pressure testing.

State of aggregation

Liquid

Density

0.7 g/cm³ (SGU) = delivery status

0.5 g/cm³* (SGU) can be adjusted via switches

* Density settings for the compact housing on request

Viscosity

≤ 10,000 mm²/s (cSt)

Solids content

≤ ø5 mm (0.2 in)

Lateral loading capacity

≤ 75 Nm

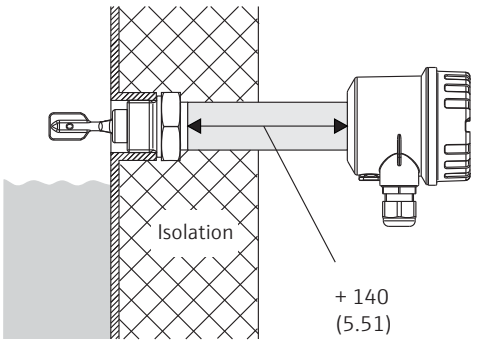
Bushings: temperature spacer, pressure-tight feedthrough

Temperature spacer
Provides sealed insulation for the vessel and normal ambient temperatures for the housing.

Pressure-tight feedthrough
Protects the housing from pressures up to 100 bar (1450 psi) if the sensor is damaged. Provides sealed insulation for the vessel and normal ambient temperatures for the housing.



L00-FTL5xxxx-06-05-xx-xx-091

Sensor length L for FTL51 and FTL51H, depending on process connection

Thread: G ¾ G 1	Thread: NPT ¾ NPT1 R ¾ R 1	Flanges and flange-like process connections
		From seal surface of thread adapter	From lower edge of thread	

Customized length L:
- 148 mm to 3000 mm (6 to 115in); special version (TSP) on request up to 6000 mm (235 in)
- Length tolerances L: < 1 m (–5 mm), 1 to 3 m (–10 mm) / < 3.3 ft (-0.2 in), 3.3 to 9.8 ft (-0.39 in)

Note!
The switch points of the Liquiphant M are at other positions to those of the previous version Liquiphant **II**.
Special length "L II":
With vertical mounting from above the same switch point as for the Liquiphant II
FTL360, FTL365, FDL30, FDL35

"L II" depends on process connection:

L = 115 mm (4.53 in) for flanges and flange-like process connections
L = 99 mm (3.9 in) for threads NPT and R (BSPT)
L = 118 mm (4.65 in) for threads G1 (BSP 1)
L = 115 mm (4.53 in) for threads G ¾ (BSP ¾)
L = 104 mm (4.09 in) for flush-mounted 1" (Endress+Hauser)

Weights

See "Ordering information" → 🖹 43ff

Materials and surfaces

Material specifications as per AISI and DIN-EN.

Parts in contact with process

- Process connection and extension pipe:
  - FTL5x → 316L (1.4404 or 1.4435) optional 2.4602 (AlloyC22)
  - FTL5xH → 316L (1.4435)
- Tuning fork: 316L (1.4435) optional 2.4602 (AlloyC22)
- Flanges: 316L (1.4404)
- Flange plating: AlloyC22
- Flat seal for process connection G ¾ or G 1: elastomer fiber, asbestos-free

Surface roughness

Choice of mechanically polished surface roughness (version → probe length → type):

- Ra < 1.5 µm (59.1 µin), with EHEDG approval
- Ra < 0.3 µm (11.8 µin), 3-A and EHEDG approval and CoC-ASME-BPE

Note!
The surface is electropolished if the additional option "B"
(CoC - ASME BPE) is selected in addition to surface roughness quality Ra < 0.3 µm (11.8 µin). The

surface roughness is then: Ra < 0.38 µm (15.0 µin).
With this combination, the wetted parts are made of 316L (1.4435) in accordance with BN2 (delta-ferrite content < 1 %).

Parts with no process contact

- Tuning fork/housing seal: EPDM
- Temperature spacer: 316 L (1.4435)
- Pressure-tight feedthrough: 316L (1.4435)
- Ground terminal on housing (external): 316L (1.4404)
- Cable glands
  - Housing F13, F15, F16, F17: polyamide (PA)
    With B or C approval (→ 📄 43 ordering information): nickel-plated brass
  - Housing F27: polyamide PA, with approval "B" or "C" 316L (1.4435)
  - Housing T13: nickel-plated brass
- Polyester housing F16: PBT-FR with PBT-FR cover or with PA12 transparent cover
  - Cover seal: EPDM
  - Nameplate glued: polyester film (PET)
  - Pressure compensation filter: PBT-GF20
- Stainless steel housing F15: 316L (1.4404)
  - Cover seal: silicone
  - Safety claw: 304 (1.4301)
  - Pressure compensation filter: PBT-GF20, PA
- Aluminum housing F17/F13: EN-AC-AlSi10Mg, plastic-coated
  - Nameplate: aluminum, anodized
  - Cover seal: EPDM
  - Safety claw: nickel-plated brass
  - Pressure compensation filter: silicone
- Stainless steel housing F27: 316L
  - Nameplate: 316L (1.4404)
  - Cover seal: FVMQ (optional: EPDM seal available as spare part)
  - Safety claw: 316L (1.4435)
- Aluminum housing T13: EN-AC-AlSi10Mg, plastic-coated,
  - Nameplate: aluminum, anodized
  - Cover seal: EPDM
  - Safety claw: nickel-plated brass
- Compact housing (valve connector or M12 connector): 316L (1.4435)

Process connections

- Parallel thread G ¾, G 1 to DIN ISO 228/I with flat seal to DIN 7603
- Tapered thread R ¾, R 1 to EN10226
- Tapered thread ¾ -14 NPT, 1 - 11½ NPT as per ASME B 1.20.1
- Flush-mounted installation with weld-in adapter to factory standard Endress+Hauser (G ¾, G 1)
- Flush-mounted installation with weld-in adapter to factory standard Endress+Hauser (1"), sensor can be positioned
- Tri-Clamp 1½", 2" to ISO 2852
- Threaded pipe joint DN 32, 40, 50 to DIN 11851
- Aseptic connection DN 50 to DIN 11864-1
  Form A for pipe DIN 11850
- SMS connection 2" (DN 51)
- DRD flange
- Varivent® DN 50 (50/40) to factory standard Tuchenhagen
- Flanges: as per EN/DIN 1092-1 from DN 25, as per ASME B 16.5 from 1", as per JIS B2220 (RF)
- Ingold DN25 fitting length 46 mm (1.81 in) with thread adapter nut G1 ¼

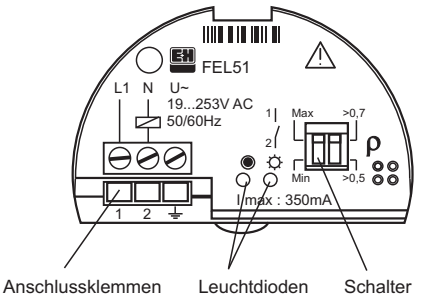
Further details at Ordering information → 📄 43.

Human interface

Electronic inserts

With FEL51, FEL52, FEL54, FEL55:

- 2 switches for safety mode and density change
- green LED to indicate operational status
- red LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective



L00-FTL5xxxx-03-05-xx-en-001

With FEL56:

- 2 switches for safety mode and density change
- green LED flashes to indicate operational status
- red LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective

With FEL57:

- 2 switches for density change and Testing
- green LED to indicate operational status
- yellow LED to indicate the covered status, flashes in the event of corrosion damage on sensor or if the electronics are defective

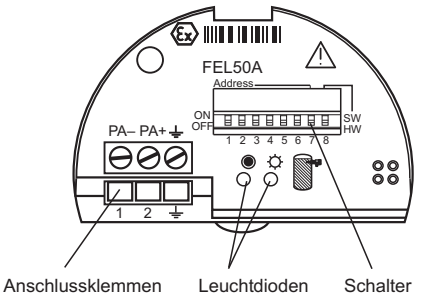
L00-FTL5xxxx-03-05-xx-xx-013

With FEL58:

- 2 switches for safety mode and density change
- green LED
  - flashes quickly to indicate operational status,
  - flashes slowly in the event of corrosion damage to the sensor of if the electronics are defective
- yellow LED to indicate the switching status, Test key – breaks the cable connection

With FEL50A:

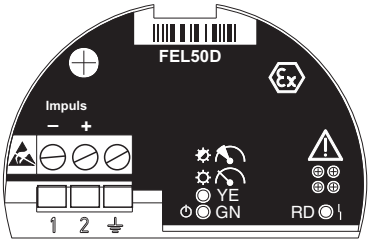
- 8 switches for configuring the device address
- green LED to indicate operational status, pulsing to indicate communication;
- yellow LED to indicate the switching status, flashes in the event of corrosion damage on sensor or if the electronics are defective



L00-FTL5xxxx-03-05-xx-en-002

With FEL50D:

- yellow LED: to indicate the validation of the measurement
- green LED: to indicate the operational status
- red LED: to indicate faults



TI328Fxx004

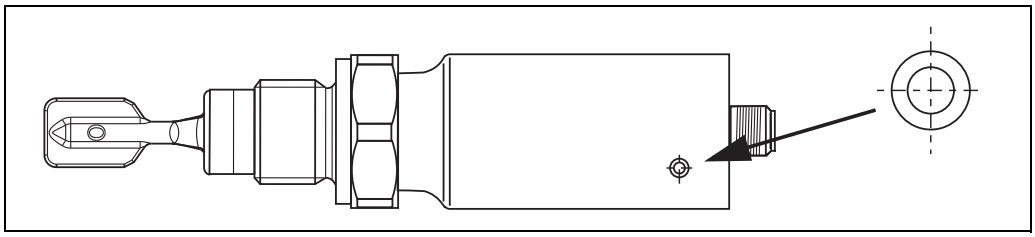
Compact housing

Function test with test magnet

Versions AC, DC-PNP and NAMUR:

During the test, the current state of the electronic switch is reversed.

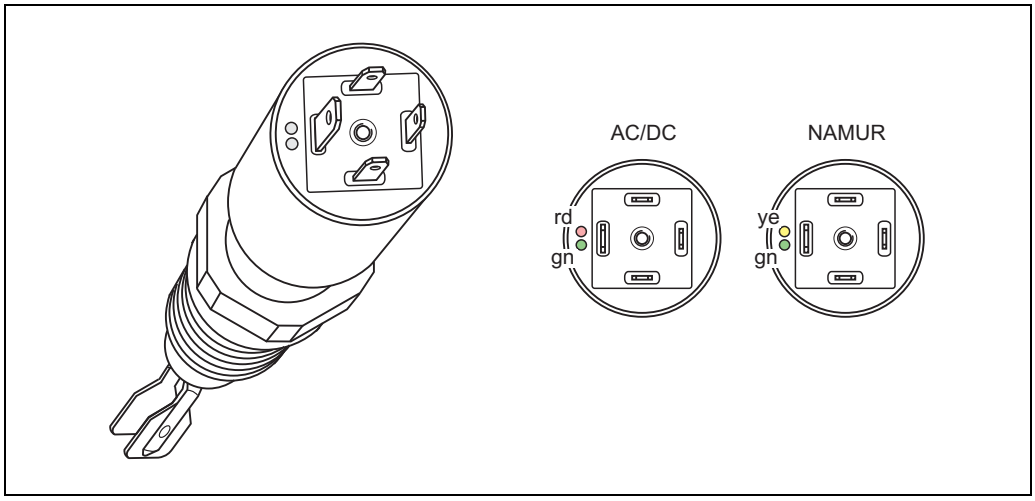
Hold the test magnet against the marking on the nameplate: The switching status is changed.



L00-FTL5xxxx-19-05-xx-xx-001

Light signals

Versions AC and DC-PNP with valve connector or cable tail



L00-FTL5xxxx-07-05-xx-xx-005

Green light (gn) lights up (AC/DC):

Liquiphant M is connected to the power supply and is operational.

Green light (gn) flashing (NAMUR):

Liquiphant M is connected to the power supply and is operational.

Red light (rd) lights up (AC/DC):

MAX application mode (overfill protection): sensor is immersed in liquid.
MIN application mode (dry running protection): sensor is not immersed in liquid.

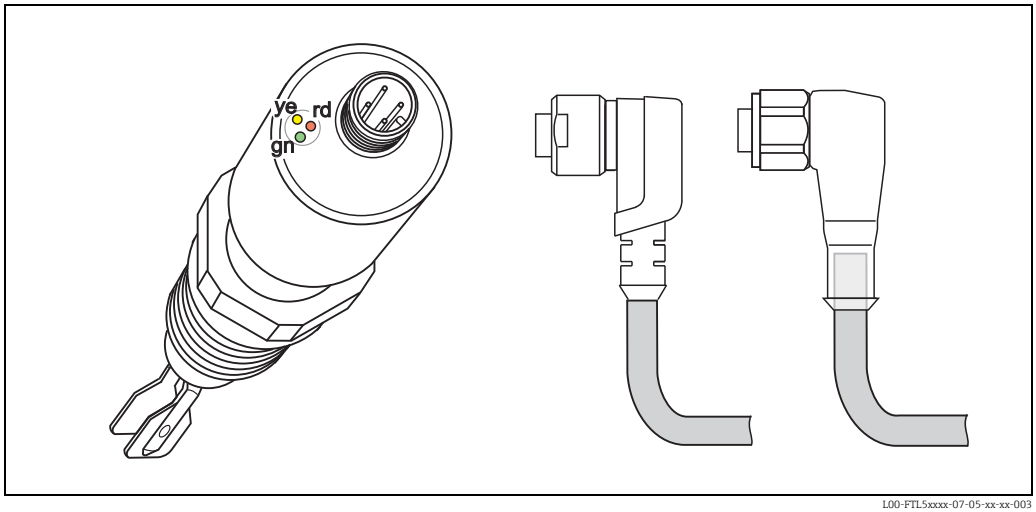
Yellow light (ye) lights up (NAMUR):

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.

Red light (rd) flashing (AC/DC):

Liquiphant M has detected a fault.

Version NAMUR and DC-PNP with M12x1 round connector 316L



L00-FTL5xxxx-07-05-xx-xx-003

Green light (gn) lights up (DC-PNP):

Liquiphant M is connected to the power supply and is operational.

Green light (gn) flashing with 1 Hz (NAMUR):

Liquiphant M is connected to the power supply and is operational.

Yellow light (ye) lights up (DC-PNP):

Sensor is immersed in liquid.

Yellow light (ye) lights up (NAMUR):

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.

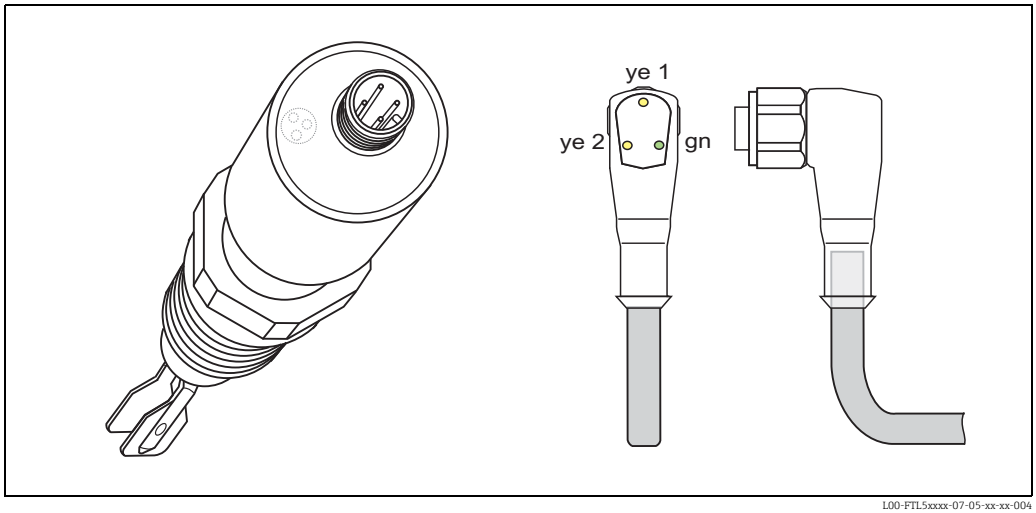
Red light (rd) flashing (DC-PNP):

Liquiphant M has detected a fault.

Green light (gn) flashing with 0.3 Hz (NAMUR):

Liquiphant M has detected a fault.

Version DC-PNP with M12x1 round connector 316L



L00-FTL5xxxx-07-05-xx-xx-004

Green light (gn) lights up:

Liquiphant M is connected to the power supply and is operational.

Yellow light (ye 1) lights up:

MAX application mode (overfill protection): sensor is not immersed in liquid.
MIN application mode (dry running protection): sensor is not immersed in liquid.

Yellow light (ye 2) lights up:

MAX application mode (overfill protection): sensor is immersed in liquid.
MIN application mode (dry running protection): sensor is immersed in liquid.

Green light (gn) lights up, both yellow lights (ye 1+2) do not light up:

Liquiphant M has detected a fault.

Operating concept

Onsite configuration

Certificates and approvals

CE mark

The measuring system meets the legal requirements of the applicable EC Directives. These are listed in the corresponding EC Declaration of Conformity along with the standards applied.
Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

C-tick mark

The measuring system complies with the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

General approvals

The following approvals are available for Liquiphant M FTL50H, FTL51H:

- EHEDG: certification (from TNO, The Netherlands), Report No. V99.394:
- 3A: 3A certificate (USA), Authorization no. 459: 74-06 Sensors and Sensor Fittings and Connections
- Certificate of Compliance as per ASME BPE-2012. (Order code: additional option = B)

Warning!
To avoid risk of contamination, install according to the "Hygienic Equipment Design Criteria (HDC)" as stated in the Subgroup Design Principles of the EHEDG, Doc. 8, July 1993.
The flow of liquid during cleaning is important and should be in compliance with the HDC.

Note!
- For CIP (Clean in Place) and SIP (Sterilize in Place) processes the pressure and temperature specifications of the process connections must be observed.
- Suitable fittings and seals must be used to ensure hygiene-compliant design according to 3A, EHEDG, ASME BPE etc.
- Surfaces with ASME-BPE option: Ra < 0.38 µm (< 15 µin) electropolished and passivated or Ra < 1.5 µm (59 µin) mechanically polished.

CRN approval

Versions with a CRN approval (Canadian Registration Number) are marked with a "*" in ordering information feature 20 "process connection" (s. Seite 43 ff.). CRN-approved devices are assigned the registration number 0F10525.5C on the nameplate.

Process seal according to ANSI/ISA 12.27.01

Practice in North America for the installation of process seals
Endress+Hauser devices are designed as either single seal or dual seal devices with an alarm in accordance with ANSI/ISA 12.27.01. This means that the user does need to install for an external secondary process seal in the thermowell which is required in ANSI/NFPA 70 (NEC) and CSA 22.1 (CEC). These devices comply with installation practice in North America and enable very safe, low-cost installation in pressurized applications with hazardous media.
Further information is provided in the Safety Instructions (XA) for the specific device → 58 ff.

Product	Type	Max. process pressure	Marking	Listing
Liquiphant M	FTL50-S/T##... FTL50-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM
	FTL51-S/T##... FTL51-P/Q/R##...	64/100 bar (928/1450 psi)	Single Seal	CSA/FM
	FTL50H-S/T##... FTL50H-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM
	FTL51H-S/T##... FTL51H-P/Q/R##...	64 bar (928 psi)	Single Seal	CSA/FM

Other certificates

- Material certificate as per EN 10204/3.1 for all wetted parts NACE MR0175/MR0103, AD2000
- Leak detection system in conjunction with WHG approval
  Approval number: Z–65.40–446 (see also "Ordering information" s. Seite 43 ff.)
- TSE Certificate of Suitability
  The following applies to wetted device components:
  – They do not contain any materials derived from animals.
  – No additives or operating materials derived from animals are used in production or processing.

Note!
Wetted device components are listed in the "Mechanical construction" (→ 30 ff.) and "Ordering information" (→ 43 ff.) sections.

Manufacturer declarations

The following documents are optionally available to order with the device:

- FDA conformity
- TSE-free: Materials not derived from animals
- Regulation (EC) no. 2023/2006 (GMP)
- Regulation (EC) No. 1935/2004 materials in contact with food

The applicable European guidelines and standards can be found in the relevant EU Declarations of Conformity.

Regulation (EC) no. 10/2011: The regulation on plastic materials does not apply to the Liquiphant FTL5x, as the wetted materials are made exclusively of stainless steel.
The silicone seals supplied comply with BFR recommendation XV (commodities based on silicones from the Federal Institute for Risk Assessment - BFR), and the EPDM seals provided comply with BFR recommendation XXI (commodities based on natural and synthetic rubber).

Use in hazardous zones

Pay particular attention to the information provided in the documentation: Safety Instructions, Control Drawings etc. → 58

ASME B 31.3

Design and materials in accordance with ASME B31.3 The welding seals are through-penetration welded and comply with ASME Boiler and Pressure Vessel Code Section IX and EN ISO 15614-1.

Pressure equipment directive

The pressure equipment directive 97/23/EC does not apply to the Liquiphant FTL5x, as it does not have a pressurized housing in accordance with Article 1, Paragraph 2.1.4 of the directive.

Ordering information

Note!
Versions that are mutually exclusive are not indicated in this list.

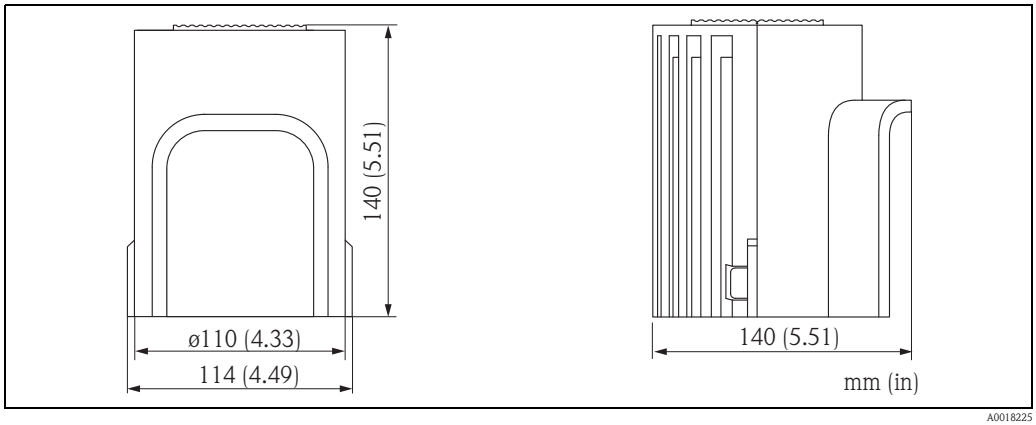
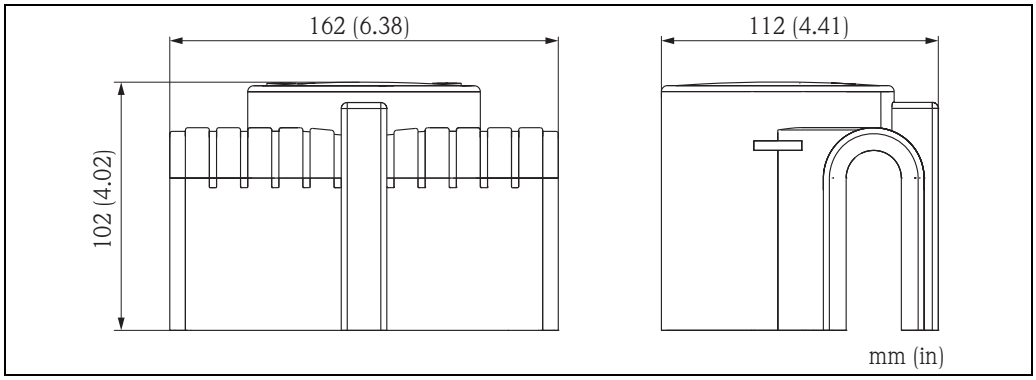
Weather protection cover

For F16 housing



Material	Order No.	Weight
PBT, gray	71127760	240 g (8.46 oz)

For F13, F17 and F27 housing



Material	Order No.	Weight
PA6, gray	71040497	300 g (10.58 oz)

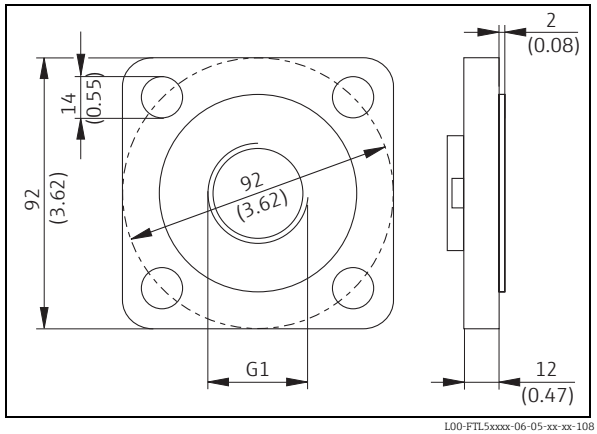
Lap joint flange

Order number: 918158-0000
With G 1 thread for mounting
a Liquiphant FTL50, FTL51
with process connection GR2

Pressure up to 40 bar (580 psi)

Material: corrosion-resistant steel
1.4301 (AISI 304)

Weight: 0.54 kg (1.19 lbs)

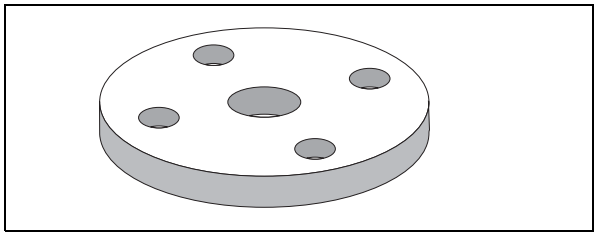


Lap joint flanges

With G 1 thread for mounting
a Liquiphant FTL50, FTL51
with process connection GR2

Material: corrosion-resistant steel
1.4571 (AISI 316Ti)

- Order number: 918143-0000
  Flange DN50 PN40, EN 1092-1
  Weight: 3.11 kg (6.86 lbs)
- Order number: 918144-0000
  Flange ASME 2", 150 psi, RF
  Weight: 2.38 kg (5.25 lbs)



L00-FTL5xxxx-03-05-xx-xx-015

Sliding sleeves for unpressurized operation

Switch point infinitely variable for
Liquiphant M FTL51

Material: corrosion-resistant steel

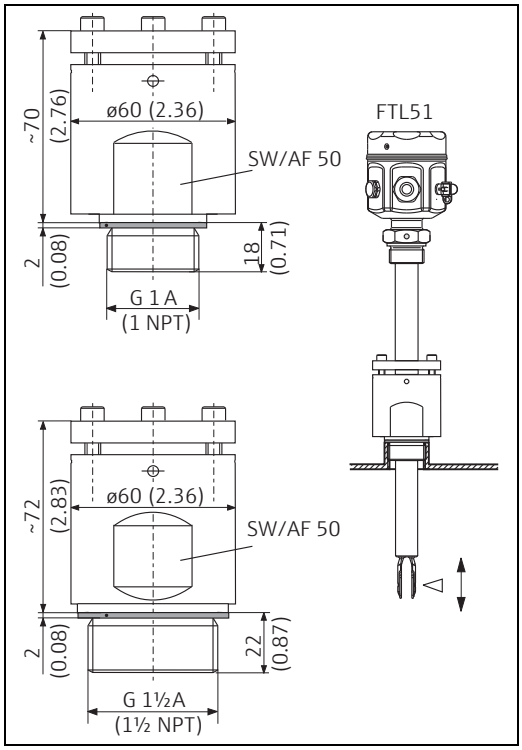
High pressure sliding sleeves

For continuous adjustment of the switch point of a Liquiphant M FTL51.
Also for use in hazardous areas. For further information → 📄 58ff. (ATEX, NEPSI).

Material: corrosion-resistant steel 1.4435 (AISI 316L) or AlloyC22

Weight for G 1, NPT 1: 1.13 kg (2.49 lbs)
Weight for G 1½, NPT 1½: 1.32 kg (2.91 lbs)

Seal package made of graphite



L00-FTL5xxxx-06-05-xx-xx-110

1 INTRODUCTION

1.1 Project definition

Veolia Water Technologies Canada (VWT) was contracted by Agnico Eagle Mines (AEM) to supply the equipment for the water treatment plant for Arsenic and TSS at the Amaruq Mine in Nunavut.

VWT is responsible for the engineering and supply of the equipment and the control system detailed in Veolia Proposal #TIH128505.

This functional description shall be read in conjunction with the related documents as listed in Section 1.3.

1.2 Process summary

AEM is currently developing the Amaruq Mine in Nunavut Canada as an open pit mine. With this new mine development AEM currently has a requirement to treat for TSS and Arsenic (As) concentration which is also expected to rise up. Therefore, an As and TSS treatment system is required before discharging the surface water to the environment.

The proposed treatment system includes:

- **A new metal precipitation reactor**. The purpose of this step is to precipitate the arsenic. The influent is sent to the Arsenic Removal Reactor. In this reactor, the influent water is mixed with ferric sulfate (Fe2(SO4)3). The ferric sulfate forms a floc of ferric hydroxide (Fe(OH)3) which acts both as a bridge to tie colloidal particles together and as an active surface which forms surface complexes with many metals, such as arsenic. The ferric sulfate also lowers the pH in the vicinity of 7.0 where the surface complexation is optimal for arsenate. In summer operation (ACTIFLO mode), some sludge from the sludge splitter box that collects the sludge from the ACTIFLO's is recycled to the metal precipitation reactor. This sludge recirculation makes it possible to increase the efficiency of the reactor and thereby reduce its size and especially prevent from having to use two units during the operation in ACTIFLO mode (high flow rate).
- **Two ACTIFLO's** (reused from the Meadowbank site). The water from the Metal Precipitation Reactor flows to the existing ACTIFLO's. The ACTIFLO is designed to remove suspended solids from the raw water. Sand-ballasted settling is a high-rate coagulation/flocculation/sedimentation process that utilizes microsand as a seed for floc formation. The microsand provides a surface area that enhances flocculation and acts as a ballast or weight. The resulting floc settles very fast, allowing for compact clarifier designs with high overflow rates and short detention times. The use of microsand also permits the unit to perform well under dramatically changing flow rates without impacting final effluent quality. The water flows to the first basin, the coagulation chamber where the reaction is optimized. The coagulated water then overflows to a second tank section called the injection tank. There, the microsand and flocculant aid polymer are added. The microsand provides a large contact area for floc attachment and acts as a ballast, thereby accelerating the settling of the flocs. The flocculant aid polymer binds the destabilized suspended solids to the microsand particles by forming polymer bridges. From the injection tank, the water

underflows to a third tank section called the maturation tank. In this section, the microsand and sludge flocs agglomerate and grow into high-density flocs known as microsand ballasted flocs. From the maturation zone, the water overflows to the settling section of the tank. In the settling zone, the microsand ballasted flocs settle quickly to the bottom of the unit. In the settling zone, the efficiency of settling is further increased by the use of the lamella tubes. The clarified water exits the system via a series of collection troughs or weirs. The clarified water is monitored for turbidity and is discharged by gravity to the clarified pump station. The sand-sludge mixture settles to the bottom of the clarifier. Scrapers force the sludge collected at the bottom of the clarifier into a centre cone from which it is continuously withdrawn and pumped to hydrocyclones where the sludge and microsand are separated by centrifugal force. After separation, the higher density microsand is discharged from the bottom of the hydrocyclone and reinjected into the process for reuse. The lighter density sludge is discharged from the top of the hydrocyclone and directed to the sludge management facilities. Also, to maintain a good extraction of sludge and good sand recirculation, the recirculation pumps on both existing ACTIFLO® units have been upgraded. The two 34 m^3/h each pumps installed on each ACTIFLO® from the Meadowbank project have been replaced by two new 70 m^3/h extraction pumps. This means that the recirculation line and hydrocyclones also had to be replaced.

- **A new sludge dewatering system.** The dewatering step aims to reduce sludge volume and produce a solid cake. In summer operation, the sludge from the two Actiflo's is sent to a sludge splitter box (existing tank reused). The sludge overflow of the splitter box flows back to the Metal Precipitation Reactor. The recycled sludge increases the reagent efficiency and promotes solid growth. It also helps to optimise the contact time between ferric hydroxide and arsenic to improve adsorption (this physical process is taking about an hour). It also thickens the sludge, so no thickener equipment is required before the dewatering stage. The remaining sludge is pumped to a storage double tank which is used as a feed tank to the centrifuges. In winter operation, the sludge from the Actiflo's (used as Multiflo's) is pumped directly to the storage double tank without going through the sludge splitter box and without being recirculated to the metal precipitation reactor. Then, both for summer and winter operation, the sludge from the storage double tank tank is pumped into two centrifuges capable of producing a cake of about 20±5 % dryness. The sludge dryness is dependent on the dewatering method, TSS content in the influent, flow rate and nature of the solid particles. In addition to the solids included in raw water, the sludge will contain adsorbed arsenic as well as ferric hydroxides from the coagulant addition. The lower the hydroxide fraction, the greater the dry solid content is achieved in the cake. The final cake dryness must be defined by carrying laboratory tests. The centrifuges are fed continuously with constant solid content slurry. A cationic polymer is injected in the feed pipe to increase the cake dryness. The separation between liquid and solid is achieved using centrifugal forces 500 to 3000 times the force of gravity. The thickened sludge produced by each centrifuge is carried away to a container for disposal through a screw conveyor. Centrate from the centrifuges and from the screw conveyors flows by gravity to sump pump pits. Centrate contains cationic polymer and can be recycled back upstream of the water treatment plant, in the metal precipitation reactor.
- **A new potassium permanganate ($KMnO_4$) preparation and dosing system**. $KMnO_4$ is used to oxidize the arsenic trivalent to produce arsenic pentavalent that is much easier to precipitate and separate from water. The selected oxidant to oxide As is Hydrex 9571. It is delivered dry in bags of 25 kg. The solution

preparation is be made using a new manual make-up system. The dosage is performed using a new dosing skid equipped with mechanical diaphragm metering pumps. The $KMnO_4$ dosing point is located upstream from the precipitation reactor.

- **A coagulant dosing system.** The selected coagulant is Hydrex 6266, a ferric sulfate coagulant. It will be received in bulk bags. The existing coagulant preparation system from the Meadowbank site is reused. For summer operation, the dosage is performed using a new dosing skid equipped with mechanical diaphragm metering pumps. For winter operation, the existing dosing system with progressive cavity pumps from the Meadowbank site is reused. The coagulant dosing point is located in the metal precipitation reactor.
- **A sulphuric acid dosing system.** Sulphuric acid is used for ferric sulfate preparation (coagulant). Sulphuric acid is a commodity and will be received in bulk containers of 1 m3 at 93 % concentration. The product can be used as is and the dosage will be performed using a new dosing skid equipped with mechanical diaphragm metering pumps. The sulphuric acid dosing point is located in the maturation tank of the coagulant preparation system.
- **A caustic soda (NaOH) preparation and dosing system.** The coagulant consumes alkalinity from the water. In the event that the water doesn't contain enough alkalinity, an alkali source, such as sodium hydroxide, will need to be added. The sodium hydroxide will be received dry in 25 kg bags. The existing preparation and dosing systems from the Meadowbank site are reused. The NaOH dosing point is located upstream from the precipitation reactor.
- **An anionic polymer preparation and dosing system.** The use of a flocculation agent is essential for a metal removal process. Polymer enables the attachment of the floc onto the microsand and as such is required in order to obtain good process performance. The polymer will be Hydrex 6105 or equivalent. It is a solid anionic polymer used to enhance flocculation and will be received in 25 kg bags. The existing Hydra-Pol automatic preparation system from the Meadowbank site is reused to prepare a 0.25 % solution. The automatic polymer preparation/dilution system is an automatically controlled batching unit capable of preparing polymers. For winter operation, the anionic polymer dosing system from the Meadowbank site is reused. For summer operation, a new dosing system with 3 dosing skids is used. The existing polymer preparation from the Meadowbank site is also reused for summer operation. The anionic polymer liquid solution injection points are located in the injection and maturation tanks of the two ACTIFLO's.
- **A cationic polymer preparation and dosing system.** Cationic polymer is required for the sludge dewatering step. A new Hydra-Pol automatic preparation system is used to prepare a 0.3-0.5 % solution. The water used for the polymer preparation needs to be filtered water with temperature between 10- 20 °C. The automatic polymer preparation/dilution system is an automatically controlled batching unit capable of preparing polymers. A new dosing system with 3 dosing skids is used. The cationic polymer liquid solution injection points are located upstream from the two centrifuges.

TSS: Total suspended solids
VFD: Variable Frequency Drive
WTP: Water Treatment Plant

1.5 Units

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dimensions : m
- Dosing rate: mL/L
- Flow rate (chemical dosing): L/h
- Flow rate (main process): m^3/h
- Level in the tanks: % or m
- pH: -
- Pressure: kPa
- Density: kg/m^3
- Temperature: °C
- Total suspended solids: mg/L
- Turbidity: NTU
- Volume: m3
- Weight : kg

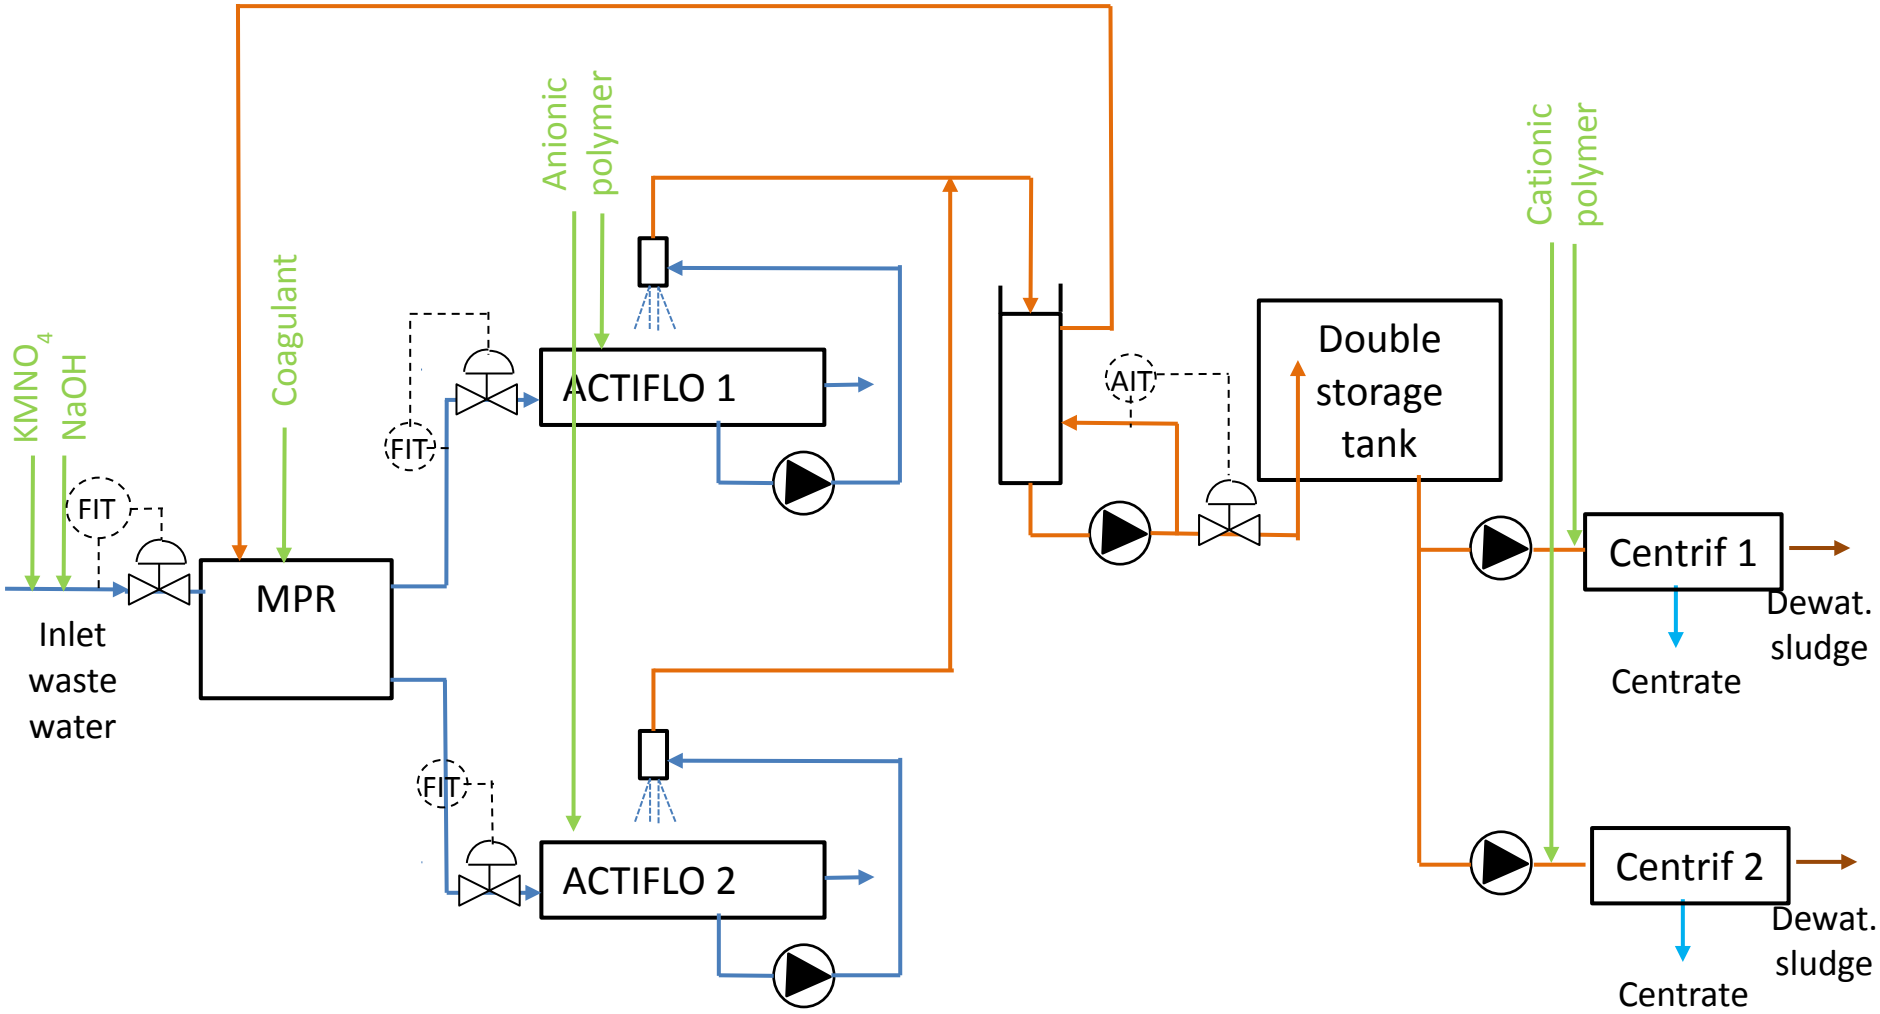
1.7 Overall plant control



2 FUNCTIONAL DESCRIPTION OF SYSTEMS

2.1 Metal precipitation reactor

2.1.1 Description

The purpose of this step is to precipitate the arsenic by using ferric sulfate coagulant. Coagulant is injected directly in the reactor.

Potassium permanganate ($KMnO_4$) is used to oxidize the arsenic trivalent to produce arsenic pentavalent that is much easier to precipitate and separate from water. $KMnO_4$ is injected upstream of the MPR. The operator will follow the ORP measurement in the MRP and adjust the $KMnO_4$ dosage concentration as required.

As the coagulant consumes alkalinity from the water, it may be necessary to add sodium hydroxide as an alkali source. NaOH is injected upstream of the MPR, proportionally to the raw water influent flow rate. The operator will select a NaOH dosage concentration set point based on the alkalinity of the water. A correction, based on the pH measurement in the MPR, is applied to the required NaOH injection flowrate.
The pH is measured at two locations in the MPR (inlet ant outlet compartments) by two distinct sensors.

The influent raw water flow rate is used:

- for the injection of chemicals proportionally to the raw water flow rate
- to control the opening of the MPR inlet flow control valve

2.1.2 Controls

FIC1-011 control loop will act on the opening of the MPR inlet flow control valve to adjust the influent flow rate to its set point (adjustable by the operator).

2.1.3 Fault response

The following are the faults that require control actions:

- MPR very high pH
- Failure of one of the MPR mixers
- Failure of two or three MPR mixers

MPR very high pH
An operator alarm is activated. Alarm auto-reset if pH goes back under the very high alarm set point.

Failure of one of the MPR mixers
An operator alarm is activated.

Failure of two or three MPR mixers
An operator alarm is activated and the Actiflo/Multiflo normal shutdown sequence is activated and the MPR inlet flow control valve is closed.

2.1.4 Interlocks

The MPR inlet flow control valve is interlocked with the MPR very high level. If the very high level switch is activated, control valve is closed.

2.2 ACTIFLO®

When the raw water inlet flow rate is below the capacity of one Actiflo® ACP-700R, the operator will keep only one Actiflo® in operation.
When the raw water inlet flow rate is above the capacity of one Actiflo® ACP-700R, the operator will have the two Actiflo's in operation.

Based on the inlet raw water TSS (measured by AIT1-013), the operator will choose to start one or two microsand recirculation pumps per ACTIFLO.

Refer to ACTIFLO® standard functional description for details.

2.3 MULTIFLO

Refer to MULTIFLO standard functional description.

2.4 Sludge transfer and dewatering

2.4.1 Sludge from ACTIFLO's to sludge double storage tank

2.4.1.1 Description

In summer operation, the sludge from the hydrocyclones of the Actiflo's flows by gravity to the sludge splitter box. From the sludge splitter box, the sludge is then pumped to a sludge double storage tank. The flow rate to the sludge storage tank is controlled through a control valve and a turbidity control loop. The overflow of sludge in the splitter box flows by gravity back to the MPR.
A recirculation loop on the sludge splitter box prevents sludge from settling. The sludge recirculation loop is equipped with a turbidity meter.

In winter operation, the sludge from the Actiflo's (used as Multiflo's) is pumped directly to the storage double tank without going through the sludge splitter box and without being recirculated to the metal precipitation reactor.

2.4.1.2 Control

AIC4-011 turbidity control loop will act on the opening of the splitter box outlet flow control valve to adjust the sludge flow rate being recirculated back to the MPR.
A turbidity set point will be entered by the operator. If the measured turbidity is below the set point, the control loop will close FCV4-011. This will increase the sludge recirculation to the MPR and increase the turbidity.
On the contrary, if the measured turbidity is above the set point, the control loop will open FCV4-011. This will decrease the sludge recirculation to the MPR and increase the sludge flow rate going to the sludge double storage tank.

There are two splitter box sludge extraction pumps. Based on the inlet raw water TSS (measured by AIT1-013), the operator will choose to start one or two microsand recirculation pumps for each ACTIFLO. If only one microsand recirculation pump of each ACTIFLO is in operation, the operator will start only one splitter box sludge extraction pump. If the two recirculation pumps of each ACTIFLO are in operation, the operator will start both splitter box sludge extraction pumps.

2.4.1.3 Fault response

When a splitter box sludge extraction pump fails, the other pump takes over the failing pump automatically and an alarm is activated. If the second pump fails too, a critical alarm is activated and the Actiflo's upstream are stopped on an emergency shutdown sequence and the MPR inlet flow control valve is closed.

2.4.1.4 Interlocks

The splitter box sludge extraction pumps are interlocked with the very low level of the sludge splitter box. If the very low level switch is activated, the pumps are stopped ~~and an emergency stop is triggered on the ACTIFLO's.~~

When the very high level switch of the sludge splitter box is activated, the Actiflo's upstream are stopped on an emergency shutdown sequence and the MPR inlet flow control valve is closed.

2.4.2 Sludge from sludge double storage tank to centrifuge

2.4.2.1 Description

Mixers located in the sludge double storage tank prevent sludge from settling. They are in operation as long as the liquid level in the tank is sufficient.
The sludge double storage tank has two compartments that are used in parallel. Each compartment of the tank is equipped with a level transmitter.
The sludge from the storage double tank is pumped into two centrifuges. Each centrifuge has its dedicated progressive cavity feed pump equipped with a VFD.

The sludge dewatering system is composed of two centrifuges in parallel.
The operator will choose manually on the HMI of the centrifuge PLC to operate one or two centrifuges depending on the incoming flow rate to the sludge double storage tank ($Q_{in,sludge\ storage}$) as described below:

- $Q_{in,sludge\ storage} \leq Q_{design,centrifuge}$: one centrifuge in operation ; when the flow rate to the sludge double storage tank is in the range of a single centrifuge capacity, the operator will operate with one centrifuge
- $Q_{in,sludge\ storage} > Q_{design,centrifuge}$: two centrifuges in operation ; when the flow rate to the sludge double storage tank is in the range of two centrifuge capacities, the operator will operate with both centrifuges.

In summer operation, the flow rate to the sludge double storage tank is read directly from the flow meter downstream from the sludge splitter box. In winter operation, the operator will be able to estimate the sludge incoming flow rate through the volume change over a certain period in the sludge double storage tank and after having withdrawn the outlet flow rate (capacity of the number of centrifuges in operation.

2.4.2.2 Fault response

When one mixer of the sludge double storage tank fails, an alarm is displayed on the operator HMI and the sludge transfer and dewatering system keeps running in a degraded operation mode.

When the two mixers of the sludge double storage tank fail, an alarm is displayed on the operator HMI and the WTP shutdown sequence is activated.

When a high level is reached in one of the compartments of the sludge double storage tank (high level of LIT5-013 or LIT5-023), an alarm is displayed on the operator HMI.

2.4.2.3 Interlocks

When the level in one compartment of the sludge double storage tank is below the very low level (LSLL switch activated), the associated mixer is stopped and an alarm is displayed on the operator HMI.

When both levels in the two compartments of the sludge double storage tank are below the very low level (LSLL switches activated), the centrifuge feed pumps are stopped and an alarm is displayed on the operator HMI.

When the level in one compartment of the sludge double storage tank is above the very high level (LSHH switch activated), the WTP emergency shutdown sequence is activated.and an alarm is displayed on the operator HMI.

2.5 Clarified water lifting pumps

Functional description by AEM.

2.6 Service water pumps

Functional description by AEM.

2.7 Chemical dosing systems

2.7.1 Caustic soda (NaOH) preparation and dosing system

2.7.1.1 Description

The existing caustic soda preparation and dosing system from Meadowbank is reused. It's composed of :

- A preparation tank with a mixer
- A dosing tank
- Three progressive cavity metering pumps. The capacity of each pump covers 100% of the process needs. One pump is in operation and the remaining pumps are in backup. The operator must change the positions of some manual valves and locally put the pump in auto to use backup

Dry caustic soda and service water are injected by the operator in the preparation tank. The mixer operates for a configurable time if the HMI button is switched to Auto.
When the caustic soda solution is homogenized, the operator transfers the solution to the dosing tank by operating manual isolation valves.

Caustic soda is proportionally dosed to the total raw water flow with a volume compensated integral control loop.
A correction is applied to the required NaOH injection flowrate (feedback control loop), based on the pH measurement by AIT1-014 (or AIT1-012, as selected by the operator) in the MPR. AIC1-014 (or AIC1-012) will control the pH value by modulating the speed of caustic soda dosing pumps P9-541 / P9-542 / P9-543.

The dosing point is located upstream from the MPR.

2.7.1.2 Calculation

Equation 1 (mode 1): Calculation of caustic soda flow based on a dosage concentration in mg/L

$$QC_{NAOH} = RC_{NAOH1} * Q_{FEED} / (DENS_{NAOH} * CS_{NAOH} * 10)$$

Where:
QC_{NAOH} = required dosing flowrate of the caustic soda solution (L/h)
RC_{NAOH1} = target dosage concentration of caustic soda in the process (mg/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter
$DENS_{NAOH}$= Density of the dosed caustic soda solution in kg/L
CS_{NAOH}= Caustic soda concentration in the stock solution in %

Equation 2 (mode 2): Calculation of NAOH flow rate based on a dosage concentration in µL/L

$$QC_{NAOH} = (RC_{NAOH2}) * (Q_{FEED})/1000$$

Where:
QC_{NAOH} = required dosing flowrate of the caustic soda (L/h)
RC_{NAOH2} = target dosage concentration of caustic soda in the process (µL/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter

Equation 3: Caustic soda pump speed

The formula below gives the reference speed for metering pumps, in percentage. Calibration of pumps must be done in order to get a linear reference speed curve, on the basis of the pump's capacity

$$(PS_{NAOH}) = 20 + (60 \times ((QC_{NAOH}) - (QC_{20\text{-}NAOH})) / ((QC_{80\text{-}NAOH}) - (QC_{20\text{-}NAOH})))$$

Where:
PS_{NAOH} = Dosing pump speed (%)
QC_{NAOH} = required flowrate of the caustic soda solution as calculated above (L/h)
$QC_{20\text{-}NAOH}$ = Measured caustic soda dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).
$QC_{80\text{-}NAOH}$ = Measured caustic soda dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the caustic soda dosing system:

(RC_{NAOH1}) target dosage concentration of caustic soda in the process (mg/L)
(RC_{NAOH2}) target dosage concentration of caustic soda in the process (µL/L)
($DENS_{NAOH}$) Density of the dosed caustic soda solution in kg/L

(**CS_{NAOH}**) concentration of the caustic soda solution in the stock solution in %
(**$QC_{20\text{- }NAOH}$**) Caustic soda flow rate at 20% dosing pump speed (L/h)
(**$QC_{80\text{- }NAOH}$**) Caustic soda flow rate at 80% dosing pump speed (L/h)

The operator will adjust **RC_{NaOH}** depending on the alkalinity of the raw water

2.7.1.3 Fault reponse

When the caustic soda preparation mixer faults:

- The mixer is stopped
- An operator alarm is displayed on the operator interface of the main PLC.

Each progressive cavity metering pump is in fault if:

- its high temperature switch is triggered
- its VFD overloads and trips out

When the pump faults:

- An alarm is displayed on the operator interface of the main PLC and the pump is stopped.
- If necessary, the operator can start the back-up metering pump after having operated the proper isolation valves of the dosing skid. The operator will switch the back-up metering pump to automatic mode in replacement of the pump that is in fault.

2.7.1.4 Interlocks

N/A

2.7.2 Coagulant preparation system

The existing coagulant preparation system from Meadowbank is reused. It consists of two tanks of 1000L. The first one prepares the batch and when done, transfers to the second tank for dosing

2.7.2.1 Preparation system sequence

Step #	Step Name	Actions Transition conditions	Preparation Water Valve	Coagulant dry feeder	Preparation mixer	Preparation transfer Pump	H2SO4 dosing
0	Waiting Time	Preparation system ready Waiting for preparation request	C	S	S	S	S

		Low level maturation tank AND No low solid level, dry feeder alarm, mixer alarm, transfer pump alarm or level-meter alarm.					
1	Water filling	Open preparation water valve	O	S	S	S	S

2.7.2.2 Pumps, mixers and motors

Coagulant preparation mixer
Tag: M9-511

Automatic mode

Mixer operates:

- If sequencer is on step 2, 3 or 4
- If E-stop is not activated

Coagulant mixer fault alarm

When the coagulant preparation mixer faults:

- The mixer is stopped
- An operator alarm is displayed on the operator interface of the main PLC
- The preparation sequence is stopped (refer to step 8)

Coagulant transfer pump

Tag: P9-515

Automatic mode
Pump operates:

- If sequencer is on step 6;
- If E-stop is not activated;
- If full level from dosing tank is not activated;
- If empty level from maturation tank is not activated;

Transfer pump fault alarm

The progressive cavity transfer pump is in fault if:

- its high temperature switch is triggered
- its motor faults

When the pump faults:

- An alarm is displayed on the operator interface and the pump is stopped.
- The preparation sequence is stopped (refer to step 8)

Coagulant blower
Tag: B9-513

Automatic mode
The blower operates for a configurable time when the unload bag button is activated

Coagulant blower fault alarm
When the blower faults, an alarm is displayed on the operator interface and the blower is stopped.

Coagulant dry feeder
Tag: DF9-511

Automatic mode
The dry feeder operates:

- If sequencer is on step 2
- If E-stop is not activated.

Dry feeder fault alarm
When the dry feeder faults:

- An alarm is displayed on the operator interface of the main PLC and the feeder is stopped.
- The preparation sequence is stopped (refer to step 8)

2.7.2.3 Valve

Coagulant solenoid preparation water valve
Tag: V9-518

Automatic mode
The valve is open:

- If sequencer is on step 1 to 3
- If E-stop is not activated.

The valve doesn't have status contact. The open fault is activated after a request to open and without change in the water level after a defined time.

Preparation water valve open fault
When the valve fails to open:

- The valve is deactivated
- An alarm is displayed on the operator interface
- The preparation sequence is stopped (refer to step 8)

2.7.2.4 Level transmitters/switches

Maturation tank level transmitter
Tag: LIT9-511

Out of range level transmitter
When the level transmitter is out of range:

- An alarm is displayed on the operator interface
- The preparation sequence is stopped (refer to step 8)

Very low level
When the very low level is reached:

- An alarm is displayed on the operator interface
- The transfer pump is stopped

Low level
When the low level is reached, an alarm is displayed on the operator interface

High level alarm
When the high level is reached, an alarm is displayed on the operator interface

Very high level alarm
When the very high level is reached:

- An alarm is displayed on the operator interface

- The coagulant preparation water valve is closed and the H_2SO_4 dosing is stopped.

Dosing tank level transmitter

Tag: LIT9-512

Out of range level transmitter

When the level transmitter is out of range:
- An alarm is displayed on the operator interface
- The transfer is stopped

Very low level

When the very low level is reached:
- The coagulant dosing pumps are stopped
- An alarm is displayed on the operator interface
- The Actiflo® units stop according to auto stop sequence

Low level

When the low level is reached:
- An alarm is displayed on the operator interface

High level

When the high level is reached:
- An alarm is displayed on the operator interface

Very high level alarm

When the very high level is reached:
- An alarm is displayed on the operator interface
- The transfer pump is stopped

Low solid coagulant level
Tag: LSL9-513

Low level

When the low level is reached:
- An alarm is displayed on the operator interface
- The dry feeder is stopped
- The preparation sequence is stopped (refer to step 8)

2.7.3 Coagulant dosing

2.7.3.1 Description

Coagulant is proportionally dosed to the total raw water flow rate.

For winter dosing, the existing coagulant dosing system from Meadowbank is reused. It's composed of 3 progressive cavity metering pumps (P9-511, P9-512, P9-513). The capacity of each pump covers XX% of the process needs. XX pumps are in operation and the remaining pump is in backup. The operator must change the positions of some manual valves and locally put the pump in auto to use backup.

For summer dosing, a new dosing system is used. It's composed of 2 metering pumps (P9-514, P9-516). The capacity of each pump covers 100% of the process needs. One pump is in operation and the remaining pump is in backup. The operator must change the positions of some manual valves and locally put the pump in auto to use backup.

The dosing point is located in the MPR.

2.7.3.2 Calculation

Equation 1 (mode 1): Calculation of coagulant flow based on a dosage concentration in mg/L

$$\mathbf{QC_{COAG} = RC_{COAG1} * Q_{FEED} / (DENS_{COAG} * CS_{COAG} * 10)}$$

Where:
QC_{COAG} = required dosing flowrate of the coagulant solution (L/h)
RC_{COAG1} = target dosage concentration of coagulant in the process (mg/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter
$DENS_{COAG}$= Density of the dosed coagulant solution in kg/L
CS_{COAG}= Coagulant concentration in the stock solution in %

Equation 2 (mode 2): Calculation of COAG flow rate based on a dosage concentration in µL/L

$$\mathbf{QC_{COAG} = (RC_{COAG2}) * (Q_{FEED})/1000}$$

Where:
QC_{COAG} = required dosing flowrate of the coagulant (L/h)
RC_{COAG2} = target dosage concentration of coagulant in the process (µL/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter

Equation 3: Coagulant pump speed

The formula below gives the reference speed for metering pumps, in percentage. Calibration of pumps must be done in order to get a linear reference speed curve, on the basis of the pump's capacity

$$\mathbf{(PS_{COAG}) = 20 + (60 \times ((QC_{COAG}) - (QC_{20\text{-}COAG})) / ((QC_{80\text{-}COAG}) - (QC_{20\text{-}COAG})))}$$

Where:
PS_{COAG} = Dosing pump speed (%)
QC_{COAG} = required flowrate of the coagulant solution as calculated above (L/h)
$QC_{20\text{-}COAG}$ = Measured coagulant dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).
$QC_{80\text{-}COAG}$ = Measured coagulant dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the coagulant dosing system:

(RC_{COAG1}) target dosage concentration of coagulant in the process (mg/L)
(RC_{COAG2}) target dosage concentration of coagulant in the process (µL/L)
($DENS_{COAG}$) Density of the dosed coagulant solution in kg/L
(CS_{COAG}) concentration of the coagulant solution in the stock solution in %
($QC_{20\text{-}COAG}$) Coagulant flow rate at 20% dosing pump speed (L/h)
($QC_{80\text{-}COAG}$) Coagulant flow rate at 80% dosing pump speed (L/h)

2.7.3.3 Fault response

Dosing pumps are stopped if the coagulant dosing tank level is very low (low low of LIT9-512)

Each metering pump is in fault if:

- its VFD overloads and trips out
- its high temperature switch is triggered (only for progressive cavity pumps)

When a pump faults:

- An alarm is displayed on the operator interface and the pump is stopped.
- If necessary, the operator can start the back-up metering pump after having operated the proper isolation valves of the dosing skid. The operator will switch the back-up metering pump to automatic mode in replacement of the pump that is in fault.

2.7.4 Anionic polymer preparation system

The existing TOMAL automatic polymer preparation system is reused (Tag JB9-521).

The automatic preparation system is independent from the main PLC. It is controlled by a relay panel of which a few signals are transferred to the PLC:

- Polymer preparation system feeder or mixer overload. An alarm is displayed on the operator interface.
- Low level of the polymer storage tank. An alarm is displayed on the operator interface and both Actiflo® units are stopped according to the normal shutdown sequence of the Actiflo.
- Polymer preparation system low service water pressure. An alarm is displayed on the operator interface.
- Polymer preparation system low powder level. An alarm is displayed on the operator interface.

2.7.5 Anionic polymer dosing system

2.7.5.1 Description

Anionic polymer is proportionally dosed to the total raw water flow rate.

For winter dosing, the existing anionic polymer dosing system from Meadowbank is reused. It's composed of 3 progressive cavity metering pumps (P9-521, P9-522, P9-523). Pump P9-521 is designed to operate for MULTIFLO1 and P9-523 for MULTIFLO 2. Pump P9-522 is the backup. Operator must change the positions of some manual valves and locally put the pump in auto to use backup.

The anionic polymer winter dosing system is equipped with water transport valves that help the polymer reach the Mulftiflo units. Solenoid valve V9-521 is related to the winter dosage in Multiflo 1 and solenoid valve V9-522 to the winter dosage in Multiflo 2. V9-521 is open when P9-521 is operating (or P9-522 if it's used in backup instead of P9-521). V9-522 is open when P9-523 is operating (or P9-522 if it's used in backup instead of P9-523).

For summer dosing, a new dosing system is used. It's composed of 3 progressive cavity metering pumps (P9-524, P9-525, P9-526). Pump P9-524 is designed to operate for Actiflo® 1 and P9-526 for Actiflo® 2. Pump P9-525 is the backup. Operator must change the positions of some manual valves and locally put the pump in auto to use backup

The anionic polymer summer dosing system is equipped with water transport valves that help the polymer reach the Actiflo units. Solenoid valve SV15-011 is related to the summer dosage in Actiflo 1 and solenoid valve SV15-021 to the summer dosage in Actiflo 2. SV15-011 is open when P9-524 is operating (or P9-525 if it's used in backup instead of P9-524). SV15-021 is open when P9-526 is operating (or P9-525 if it's used in backup instead of P9-526).

The anionic polymer dosing points are located in the injection tanks of the Actiflo's/Multiflo's.

2.7.5.2 Calculation

Equation 1 (mode 1): Calculation of anionic polymer flow based on a dosage concentration in mg/L

$$QC_{ANPOL} = RC_{ANPOL1} * Q_{FEED} / (DENS_{ANPOL} * CS_{ANPOL} * 10)$$

Where:
QC_{ANPOL} = required dosing flowrate of the anionic polymer solution (L/h)
RC_{ANPOL1} = target dosage concentration of anionic polymer in the process (mg/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter
$DENS_{ANPOL}$= Density of the dosed anionic polymer solution in kg/L
CS_{ANPOL}= Anionic polymer concentration in the stock solution in %

Equation 2 (mode 2): Calculation of ANPOL flow rate based on a dosage concentration in µL/L

$$QC_{ANPOL} = (RC_{ANPOL2}) * (Q_{FEED})/1000$$

Where:
QC_{ANPOL} = required dosing flowrate of the anionic polymer (L/h)
RC_{ANPOL2} = target dosage concentration of anionic polymer in the process (µL/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter

Equation 3: Anionic polymer pump speed

The formula below gives the reference speed for metering pumps, in percentage. Calibration of pumps must be done in order to get a linear reference speed curve, on the basis of the pump's capacity

$$(PS_{ANPOL}) = 20 + (60 \times ((QC_{ANPOL}) - (QC_{20\text{-}ANPOL})) / ((QC_{80\text{-}ANPOL}) - (QC_{20\text{-}ANPOL})))$$

Where:
PS_{ANPOL} = Dosing pump speed (%)
QC_{ANPOL} = required flowrate of the anionic polymer solution as calculated above (L/h)

$QC_{20\text{- ANPOL}}$ = Measured anionic polymer dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).
$QC_{80\text{-ANPOL}}$ = Measured anionic polymer dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the anionic polymer dosing system:
(**RC_{ANPOL1}**) target dosage concentration of anionic polymer in the process (mg/L)
(RC_{ANPOL2}) target dosage concentration of anionic polymer in the process (µL/L)
($DENS_{ANPOL}$) Density of the dosed anionic polymer solution in kg/L
(**CS_{ANPOL}**) concentration of the anionic polymer solution in the stock solution in %
(**$QC_{20\text{- ANPOL}}$**) Anionic polymer flow rate at 20% dosing pump speed (L/h)
(**$QC_{80\text{- ANPOL}}$**) Anionic polymer flow rate at 80% dosing pump speed (L/h)

2.7.5.3 Fault response

Dosing pumps are stopped if the anionic polymer dosing tank level is very low (very low level of PT9-522)

Each metering pump is in fault if:

- its VFD overloads and trips out
- its high temperature switch is triggered

When a pump faults:

- An alarm is displayed on the operator interface and the pump is stopped.
- If necessary, the operator can start the back-up metering pump after having operated the proper isolation valves of the dosing skid. The operator will switch the back-up metering pump to automatic mode in replacement of the pump that is in fault.

2.7.6 Sulfuric acid dosing system

2.7.6.1 Description

Sulfuric acid (H2SO4) is proportionally dosed to the quantity of coagulant solution produced.
The sulfuric acid dosing system is composed of two metering pumps. The capacity of each pump covers 100% of the process needs. One pump is in duty and the other is in backup.
The dosing point is located in the maturation tank of the coagulant preparation system.

2.7.6.2 Calculation

Equation 1: Calculation of sulfuric acid flow based on a dosage concentration in µL/L

$$QC_{H2SO4} = Q_{COAG,WATER} * RC_{H2SO4} / 1000$$

Where:
QC_{H2SO4} = required dosing flowrate of the sulfuric acid (L/h)
RC_{H2SO4} = target dosage concentration of sulfuric acid in the coagulant solution (µL/L)
$Q_{COAG,WATER}$= flow rate of service water when filling the coagulant maturation tank (m^3/h) calculated with Equation 2

Equation 2 calculation of the flow rate of service water when filling the coagulant maturation tank

$$Q_{COAG,WATER} = \Delta V_{mat,tank} / \Delta t_{mat,tank}$$

with:

$\Delta V_{mat,tank}$ (m^3), volume variation in the coagulant maturation tank for a water feeding duration of $\Delta t_{mat,tank}$ (h)

and $\Delta V_{mat,tank} = S_{mat,\ tank} * \Delta h_{mat,tank}$

with:

$S_{mat,\ tank}$ (m^2): coagulant maturation tank surface (m^2)

$\Delta h_{mat,tank}$ (m): level variation in the coagulant maturation tank for a water feeding duration of $\Delta t_{mat,tank}$ (h), as measured by level transmitter LIT9-511

Equation 3: Sulfuric acid pump speed

The formula below gives the reference speed for metering pumps, in percentage. Calibration of pumps must be done in order to get a linear reference speed curve, on the basis of the pump's capacity

$$(PS_{H2SO4}) = 20 + (60 \times ((QC_{H2SO4}) - (QC_{20\text{-}H2SO4})) / ((QC_{80\text{-}H2SO4}) - (QC_{20\text{-}H2SO4})))$$

Where:

PS_{H2SO4} = Dosing pump speed (%)

QC_{H2SO4} = required flowrate of the sulfuric acid solution as calculated above (L/h)

$QC_{20\text{-}H2SO4}$ = Measured sulfuric acid dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).

$QC_{80\text{-}H2SO4}$ = Measured sulfuric acid dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the sulfuric acid dosing system:

(RC_{H2SO4}) target dosage concentration of sulfuric acid in the process (µL/L)

($QC_{20\text{-}H2SO4}$) Sulfuric acid flow rate at 20% dosing pump speed (L/h)

($QC_{80\text{-}H2SO4}$) Sulfuric acid flow rate at 80% dosing pump speed (L/h)

2.7.6.3 Fault response

When the operating pump faults, an alarm is displayed on the operator interface.
The operator must change the positions of some manual valves and locally put the pump in auto to use backup.

2.7.6.4 Interlocks

When the chemical storage is equipped with a low level switch or a level transmitter, dosing pumps are automatically disabled from starting when the low level switch or the low level signal of the chemical storage transmitter is triggered.

2.7.7 Cationic polymer make-up system

2.7.7.1 Description

The Hydra-Pol® 3500 preparation system is an automatic machine for batch preparation of Polymer solutions. A screw doses dry Polymer powder into a cone, and then service water wets it in a water whirl. The mixture is discharged into a maturation tank where an agitator agitates the solution during a period of 40 -90 minutes. After this period the solution is transferred into a storage tank.

2.7.7.2 Controls

General

The polymer preparation is controlled by the preparation and transfer sequence outlined in the "Automatic start sequence" below. If equipment involved in the sequence faults during the sequence, an alarm is displayed on the operator interface and the operator must fix the problem and then manually start the sequence again. If this occurs the sequence will restart where it was interrupted unless otherwise indicated.

Calculations

Powder polymer is injected into a preparation/maturation tank using a dosing apparatus. The apparatus operating time is calculated based on its capacity and the desired concentration.

The operating dosing time is calculated with the following formula:

$$Ts = \frac{CONC \times ((LEVstop - LEV) \times Surf)}{Cap} \times 60$$

Ts:	Dosing apparatus operating time (sec.)
CONC:	Polymer concentration adjustable on operator interface (g/l)
LEV:	Preparation/maturation tank measured level (m)
LEVstop:	Preparation/maturation stop level set point (m)
Surf:	Preparation/maturation tank surface (m^2)
Cap:	Dosing apparatus capacity adjustable on operator interface (kg/min)

Note: This formula may also be used to perform a manual preparation in case of automatic system failure. To ensure dosing accuracy, the capacity must be validated by the operator

Automatic Conditions

Conditions for automatic start sequence

The automatic start sequence will be activated when the automatic starting condition is true (Level set point for sequence start-up is reached in the preparation/maturation tank) and the following conditions are met:

1. If remote run request bit is activated;

2. Polymer preparation system components are in Auto start mode.

Automatic start sequence

The automatic preparation system shall follow a given sequence to ensure a consistent Polymer solution. The preparation sequence is described in the following table:

Step #	Step name	Actions Transition conditions	Polymer mixer	Dosing screw	Service water valve	Powder supply valve	Transfer valve
0	Stand-by	Equipment shut off	S	S	C	C	C
		- Level set point for sequence start-up is reached in the preparation/maturation tank -Transfer valve is closed for 30 seconds					
1	Filling	-Remove completed preparation confirmation -Open preparation water valve	S	S	O	C	C
		Level above impeller					
2	Start mixing	Start preparation mixer	R	S	O	C	C
		- Mixer running confirmation - 10 second delay has elapsed					
3	Dosing	-Powder supply valve opened (if DosT not reached) -Start dosing apparatus (if DosT not reached)	R	R	O	O	C
		Dosing time elapsed (DosT) (retentive dosing timer) or High level in preparation/maturation tank					
4	Stop dosing	-Stop powder supply screw -Close powder supply valve	R	S	O	C	C
		Filling stop level					
5	Maturation	Close preparation water valve Start of maturation period	R	S	C	C	C
		Time elapsed 30–180 adjustable minutes (Retentive maturation delay)					
6	End	-Completed preparation confirmation	R	S	C	C	C
		Go to Step 0 at end of normal sequence and reset timers -Go to Step 7 at end of sequence by a fault					
7	**Sequence stopped on a fault**	- Wait for fault reset	S	S	C	C	C
		-Go to Step 1					

Legend

Motor	***Valve***
S: Stop	*C: Closed*
R: Running	*O: Open*

Table 2.7-1: Polymer Preparation Sequence

Note: if there is a power outage before the completed preparation confirmation is active, repeat at Step 1 when the power returns.

Transfer from preparation/maturation tank to storage tank

When the storage tank level reaches the transfer set point, and the completed preparation confirmation is active, the transfer valve opens until the preparation/maturation tank level set point for the start of the next sequence is

reached.

Note: if there is a power outage when the transfer is underway, the operator will manually resume the transfer where it was interrupted when power comes back.

Fault response

The faults associated with the Polymer makeup sequence are:

- Polymer feeder fault
- Low level of solid Polymer
- Low pressure of service water
- Transfer and water valve open/close fault
- Level transmitter fault
- High and Low level in storage tank
- Agitator M9-621 fault

Polymer feeder fault
Tag: FMM9-621/FSM9-621
The feeder and blending tool stop, Polymer preparation system fails and the sequence is stopped until the problem is fixed.

Transfer and water valve open/close fault
Tag: T9-621-V002/SV18-031/SV18-032
Polymer preparation system fails and the sequence is stopped until the problem is fixed.
Note: the valve fail positions are “Normally Closed”.

Low level of solid Polymer
Tag: LSL9-621
Polymer preparation system fails and the sequence is stopped until the problem is fixed.

Low pressure of service water
Tag: PSL18-031
Polymer preparation system fails and the sequence is stopped until the problem is fixed.

LIT Fault
Tag: LT9-621 / LT9-622
Transfer from maturation tank is prohibited, Polymer preparation system fails and the sequence is stopped until the problem is fixed.
An intervention from the operator is necessary to solve the problem and to complete the transfer manually.

Agitator fault
Tag: M9-621
Agitator stops, Polymer preparation system fails and the sequence is stopped until the problem is fixed.

Low level storage tank
Tag: LT9-622
The Polymer dosing pumps are stopped, Polymer preparation system fails and the sequence is stopped until the problem is fixed.

High level storage tank

Tag: LT9-622
Transfer from maturation tank is prohibited, Polymer preparation system fails and the sequence is stopped until the problem is fixed.

If the fault occurs while the system is in the automatic start sequence, the operator needs to solve the problem and reset the fault. The system will then automatically resume at step 1.

If the fault occurs while the system is out of the automatic start sequence, the operator needs to solve the problem and reset the fault. The operator will manually set the system in the required step.

2.7.8 Cationic polymer dosing system

2.7.8.1 Description.

Cationic polymer is proportionally dosed to the inlet flow rate of each centrifuge.
The cationic polymer dosing system is composed of three progressive cavity metering pumps (P9-621, P9-622, P9-623). P9-621 is dedicated to the dosage in centrifuge 1 and P9-623 in centrifuge. P9-622 is used in backup.

Calculations related to the cationic polymer dosing are detailed below:

Equation 1 (mode 1): Calculation of cationic polymer flow rate to centrifuge1 based on a dosage concentration in mg/L

$$QC_{CATPOL1} = RC_{CATPOL1} * Q_{CENTRIF1} / (DENS_{CATPOL} * CS_{CATPOL} * 10)$$

Where:
$QC_{CATPOL1}$ = required dosing flowrate of the cationic polymer solution in centrifuge1 (L/h)
$RC_{CATPOL1}$ = target dosage concentration of cationic polymer in the process (mg/L)
$Q_{CENTRIF1}$ = inlet flow rate to centrifuge1as measured by FIT5-011 (m^3/h)
$DENS_{CATPOL}$= Density of the dosed cationic polymer solution in kg/L
CS_{CATPOL}= Cationic polymer concentration in the stock solution in %

Note: calculation for centrifuge2 is similar. $QC_{CATPOL1}$ is replaced by $QC_{CATPOL2}$, required dosing flowrate of the cationic polymer solution in centrifuge2 (L/h). $Q_{CENTRIF1}$ is replaced by $Q_{CENTRIF2}$ measured by FIT5-021.

Equation 2 (mode 2): Calculation of cationic polymer flow rate to centrifuge1 based on a dosage concentration in µL/L

$$QC_{CATPOL1} = (RC_{CATPOL2}) * (Q_{CENTRIF1})/1000$$

Where:
$QC_{CATPOL1}$ = required dosing flowrate of the cationic polymer solution in centrifuge1 (L/h)
$RC_{CATPOL2}$ = target dosage concentration of cationic polymer in the process (µL/L)
$Q_{CENTRIF1}$ = inlet flow rate to centrifuge1as measured by FIT5-011 (m^3/h)

Note: calculation for centrifuge2 is similar. $QC_{CATPOL1}$ is replaced by $QC_{CATPOL2}$, required dosing flowrate of the cationic polymer solution in centrifuge2 (L/h). $Q_{CENTRIF1}$ is replaced by $Q_{CENTRIF2}$ measured by FIT5-021.

Equation 3: cationic polymer dosing pump speed

$$(PS_{CATPOL}) = 20 + (60 \times ((QC_{CATPOL}) - (QC_{20\text{-}CATPOL})) / ((QC_{80\text{-}CATPOL}) - (QC_{20\text{-}CATPOL})))$$

Where:
PS_{CATPOL} = Dosing pump speed (%)

QC_{CATPOL} = required flowrate of the cationic polymer solution as calculated above (L/h)
$QC_{20\text{-}CATPOL}$ = Measured cationic polymer dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).
$QC_{80\text{-}CATPOL}$ = Measured cationic polymer dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the cationic polymer dosing system:
(**$RC_{CATPOL1}$**) target dosage concentration of cationic polymer in the process in mg/L
(**$RC_{CATPOL2}$**) target dosage concentration of cationic polymer in the process in µL/L
(**$DENS_{CATPOL}$**) Density of the dosed cationic polymer solution in kg/L
(**CS_{CATPOL}**) Cationic polymer concentration in the stock solution in %
(**$QC_{20\text{-}CATPOL}$**) Cationic polymer flow rate at 20% dosing pump speed (L/h)
(**$QC_{80\text{-}CATPOL}$**) Cationic polymer flow rate at 80% dosing pump speed (L/h)

2.7.8.2 Fault response

Each progressive cavity metering pump is in fault if:

- Its high temperature switch is triggered
- Its VFD overloads and trips out

When the pump faults:

- An alarm is activated and the pump is stopped.
- The alarm stays active until the problem has been resolved and the alarm has been reset by the operator.
- If necessary, the operator can start the back-up metering pump after having operated the proper isolation valves of the dosing skid. The operator will switch the back-up metering pump to automatic mode in replacement of the pump that is in fault.

2.7.8.3 Interlocks

Cationic polymer dosing pumps are automatically disabled from starting when a very low level is reached in the cationic polymer storage tank.

2.7.9 Potassium permanganate ($KMnO_4$) preparation system

2.7.9.1 Description

The preparation system is an automatic machine for batch preparation of $KMnO_4$ solutions. A screw doses dry $KMnO_4$ powder into a cone, and then service water wets it in a water whirl. The mixture is discharged into a maturation tank where an agitator agitates the solution during a period of 1-30 minutes adjustable, necessary to dilute and homogenize $KMnO_4$ powder in the water. After this period the solution is transferred into a storage tank.

2.7.9.2 Controls

General

The $KMnO_4$ preparation is controlled by the preparation and transfer sequence outlined in the "Automatic start sequence" below. If equipment involved in the sequence faults during the sequence, an alarm is displayed on the operator interface and the operator must fix the problem and then manually start the sequence again. If this occurs the sequence will restart where it was interrupted unless otherwise indicated.

Calculations

Powder $KMnO_4$ is injected into a preparation/maturation tank using a dosing apparatus. The apparatus operating time is calculated based on its capacity and the desired concentration.

The operating dosing time is calculated with the following formula:

$$Ts = \frac{CONC \times ((LEVstop - LEV) \times Surf)}{Cap} \times 60$$

Ts:	Dosing apparatus operating time (sec.)
CONC:	$KMnO_4$ concentration adjustable on operator interface (g/l)
LEV:	Preparation/maturation tank measured level (m)
LEVstop:	Preparation/maturation stop level set point (m)
Surf:	Preparation/maturation tank surface (m^2)
Cap:	Dosing apparatus capacity adjustable on operator interface (kg/min)

Note: This formula may also be used to perform a manual preparation in case of automatic system failure. To ensure dosing accuracy, the capacity must be validated by the operator

Automatic Conditions

Conditions for automatic start sequence

The automatic start sequence will be activated when the automatic starting condition is true (Level set point for sequence start-up is reached in the preparation/maturation tank) and the following conditions are met:

3. If remote run request bit is activated;

4. $KMnO_4$ preparation system components are in Auto start mode.

Automatic start sequence

The automatic preparation system shall follow a given sequence to ensure a consistent $KMnO_4$ solution. The preparation sequence is described in the following table:

Step #	Step name	Actions Transition conditions	$KMnO_4$ mixer	Dosing screw	Service water valve	Powder supply valve
0	Stand-by	Equipment shut off	S	S	C	C
		- Level set point for sequence start-up is reached in the preparation/maturation tank -Transfer valve is closed for 30 seconds				
1	Filling	-Remove completed preparation confirmation -Open preparation water valve	S	S	O	C

		Level above impeller					
2	Start mixing	Start preparation mixer	R	S	O	C	C
		- Mixer running confirmation - 10 second delay has elapsed					
3	Dosing	-Powder supply valve opened (if DosT not reached) -Start dosing apparatus (if DosT not reached)	R	R	O	O	C
		Dosing time elapsed (DosT) (retentive dosing timer) or High level in preparation/maturation tank					
4	Stop dosing	-Stop powder supply screw -Close powder supply valve	R	S	O	C	C
		Filling stop level					
5	Maturation	Close preparation water valve Start of maturation period	R	S	C	C	C
		Time elapsed 1–30 minutes adjustable (Retentive maturation delay)					
6	End	-Completed preparation confirmation	R	S	C	C	C
		Go to Step 0 at end of normal sequence and reset timers -Go to Step 7 at end of sequence by a fault					
7	**Sequence stopped on a fault**	- Wait for fault reset	S	S	C	C	C
		-Go to Step 1					

Legend

Motor	***Valve***
S: Stop	*C: Closed*
R: Running	*O: Open*

Table 2.7-2: $KMnO_4$ Preparation Sequence

Note: if there is a power outage before the completed preparation confirmation is active, repeat at Step 1 when the power returns.

Transfer from preparation/maturation tank to storage tank

When the storage tank level reaches the transfer set point, and the completed preparation confirmation is active, the transfer valve opens until the preparation/maturation tank level set point for the start of the next sequence is reached.

Note: if there is a power outage when the transfer is underway, the operator will manually resume the transfer where it was interrupted when power comes back.

Fault response

The faults associated with the $KMnO_4$ makeup sequence are:

- $KMnO_4$ feeder fault
- Low level of solid $KMnO_4$
- Low pressure of service water
- Transfer and water valve open/close fault
- Level transmitter fault
- High and Low level in storage tank

- Agitator M9-591 fault

$KMnO_4$ feeder fault
Tag: FMM9-591/FSM9-591
The feeder and blending tool stop, $KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

Transfer and water valve open/close fault
Tag: T9-591-V002/SV15-041/SV15-042
$KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.
Note: the valve fail positions are “Normally Closed”.

Low level of solid $KMnO_4$
Tag: LSL9-591
$KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

Low pressure of service water
Tag: PSL15-041
$KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

LIT Fault
Tag: LT9-591 / LT9-592
Transfer from maturation tank is prohibited, $KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.
An intervention from the operator is necessary to solve the problem and to complete the transfer manually.

Agitator fault
Tag: M9-591
Agitator stops, $KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

Low level storage tank
Tag: LT9-592
The $KMnO_4$ dosing pumps are stopped, $KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

High level storage tank
Tag: LT9-592
Transfer from maturation tank is prohibited, $KMnO_4$ preparation system fails and the sequence is stopped until the problem is fixed.

If the fault occurs while the system is in the automatic start sequence, the operator needs to solve the problem and reset the fault. The system will then automatically resume at step 1.

If the fault occurs while the system is out of the automatic start sequence, the operator needs to solve the problem and reset the fault. The operator will manually set the system in the required step.

2.7.10 Potassium permanganate ($KMnO_4$) dosing system

2.7.10.1 Description

Potassium permanganate (KMNO4) is proportionally dosed to the total raw water flow rate.
The potassium permanganate dosing system is composed of two metering pumps. The capacity of each pump

covers 100% of the process needs. One pump is in duty and the other is in backup.
The dosing point is located upstream from the MPR.

2.7.10.2 Calculation

Equation 1 (mode 1): Calculation of potassium permanganate flow based on a dosage concentration in mg/L

$$QC_{KMNO4} = RC_{KMNO41} * Q_{FEED} / (DENS_{KMNO4} * CS_{KMNO4} * 10)$$

Where:
QC_{KMNO4} = required dosing flowrate of the potassium permanganate solution (L/h)
RC_{KMNO41} = target dosage concentration of potassium permanganate in the process (mg/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter
$DENS_{KMNO4}$= Density of the dosed potassium permanganate solution in kg/L
CS_{KMNO4}= Potassium permanganate concentration in the stock solution in %

Equation 2 (mode 2): Calculation of KMnO4 flow rate based on a dosage concentration in µL/L

$$QC_{KMNO4} = (RC_{KMNO42}) * (Q_{FEED})/1000$$

Where:
QC_{KMNO4} = required dosing flowrate of the potassium permanganate (L/h)
RC_{KMNO42} = target dosage concentration of potassium permanganate in the process (µL/L)
Q_{FEED}= inlet raw water flow rate (m^3/h) measured by the influent raw water flow meter

Equation 3: Potassium permanganate pump speed

The formula below gives the reference speed for metering pumps, in percentage. Calibration of pumps must be done in order to get a linear reference speed curve, on the basis of the pump's capacity

$$(PS_{KMNO4}) = 20 + (60 \times ((QC_{KMNO4}) - (QC_{20\text{-}KMNO4})) / ((QC_{80\text{-}KMNO4}) - (QC_{20\text{-}KMNO4})))$$

Where:
PS_{KMNO4} = Dosing pump speed (%)
QC_{KMNO4} = required flowrate of the potassium permanganate solution as calculated above (L/h)
$QC_{20\text{-}KMNO4}$ = Measured potassium permanganate dosing flowrate at 20% of the pump's calibration curve (L/h) (Entered by the operator on the interface).
$QC_{80\text{-}KMNO4}$ = Measured potassium permanganate dosing flowrate at 80% of the pump's calibration curve (L/h) (Entered by the operator on the interface)

The following parameters shall be available on the operator interface of the potassium permanganate dosing system:
(RC_{KMNO41}) target dosage concentration of potassium permanganate in the process (mg/L)
(RC_{KMNO42}) target dosage concentration of potassium permanganate in the process (µL/L)
($DENS_{KMNO4}$) Density of the dosed potassium permanganate solution in kg/L
(CS_{KMNO4}) Potassium permanganate concentration in the stock solution in %
($QC_{20\text{-}KMNO4}$) Potassium permanganate flow rate at 20% dosing pump speed (L/h)
($QC_{80\text{-}KMNO4}$) Potassium permanganate flow rate at 80% dosing pump speed (L/h)

2.7.10.3 Fault response

When the operating pump faults, an alarm is displayed on the operator interface.
The operator must change the positions of some manual valves and locally put the pump in auto to use backup.

2.7.10.4 Interlocks

When the chemical storage is equipped with a low level switch or a level transmitter, dosing pumps are automatically disabled from starting when the low level switch or the low level signal of the chemical storage transmitter is triggered.

3 SEQUENCES FOR SUMMER AND WINTER CONFIGURATIONS

3.1 Description

As summer and winter flowrates to be treated differ significantly, two distinct operating configurations are required. Start-up and shut-down sequences for summer and winter configurations are described below.

3.2 Summer configuration

The start-up sequence for the summer configuration is the following:

- Each Multiflo is switched to the Actiflo mode which means :
  - The Multiflo extraction pump is stopped
  - The operator closes the manual isolation valves of the Multiflo sludge extraction pump
  - The operator opens the manual isolation valves of the Actiflo microsand recirculation pumps
  - The start-up sequence of the ACTIFLO is activated (refer to the AEM Amaruq project - ACTIFLO® functional description)
- The sludge splitter box extraction pump is switched to Auto and it will start once the level in the splitter box rises above the very low level switch
- AIC4-011 turbidity control loop is activated
- Coagulant winter dosing pumps (P9-511, P9-512 and P9-513) are stopped and coagulant summer dosing pumps (P9-514 and P9-516) are started
- Anionic polymer winter dosing pumps (P9-521, P9-522 and P9-523) are stopped and anionic polymer summer dosing pumps (P9-524, P9-525 and P9-526) are started

3.3 Winter configuration

The start-up sequence for the winter configuration is the following:

- Each Actiflo is switched to the Multiflo mode which means :
  - The Actiflo microsand recirculation pumps are stopped
  - The operator closes the manual isolation valves of the Actiflo microsand recirculation pumps
  - The operator opens the manual isolation valves of the Multiflo sludge extraction pump
  - The start-up sequence of the MULTIFO is activated (refer to the MULTIFLO functional description)
- AIC4-011 turbidity control loop will be de-activated
- Until the sludge splitter box is drained by the operator, its extraction pump is kept running. This maintains

a sludge recirculation loop in the splitter box in order to prevent the settling of the sludge and the risk of plugging.

- Coagulant summer dosing pumps (P9-514 and P9-516) are stopped and coagulant winter dosing pumps (P9-511, P9-512 and P9-513) are started
- Anionic polymer summer dosing pumps (P9-524, P9-525 and P9-526) are stopped and anionic polymer winter dosing pumps (P9-521, P9-522 and P9-523) are started

INTRODUCTION

1.1 REFERENCE DOCUMENTS

Document Number	Name
5000218009_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram
5000218009_FD_0001_GEN_rev1	Project overall functional description

1.2 PROCESS OVERVIEW

Actiflo units are based on the ballasted flocculation process. The key feature of this process is that very fine sand (85 µm or 130 µm size), termed “microsand” is added to the raw water following coagulant addition. A polymer is also added that binds the microsand to the floc, creating a ballasted floc with greatly increased effective density. The ballasted flocculation process is capable of being shut down when treatment capacity is not needed and then rapidly restarted when needed.

Ballasted flocculation works with most types of waters but is most advantageous with raw waters that either experience high turbidity raw water conditions (up to 2 500 NTU) and/or rapidly changing raw water turbidity conditions. It is also suitable for low turbidity, highly colored raw waters.

It consists of a coagulation basin, an injection basin, a maturation basin, and a lamella tube clarifier. Coagulant is added at the inlet and subsequent formation of microfloc takes place in the coagulant basin prior to addition of microsand and polymer in the injection basin. The water then flows into the maturation tank where bridging between the microsand and the destabilized suspended solids occurs.

The ballasted flocs settle in the clarifier portion of the system where they are collected by a rake mechanism. Typically 3% to 6% of the unit’s design raw water flow is continuously withdrawn from the clarifier and pumped to a hydrocyclone system which separates the microsand from the sludge. The recovered microsand (typically 20% of the recycled flow) is reused in the process. A small quantity of the microsand is not recovered by the hydrocyclones and is discharged with the sludge. Thus the lost microsand needs to be made up by periodically adding it to the process (typically 1 to 3 mg/L). After sand separation, sludge are partially wasted and recycled with the sludge withdrawn from the clarifier. Approximately 1% to 2,4% of flow becomes waste or residuals stream.

1.3 LIST OF ABBREVIATIONS

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 LIST OF UNITS

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C
- Turbidity: mg/L or NTU

ACTIFLO® CONTROL DESCRIPTION

1.5 EQUIPMENT AND INSTRUMENT

Refer to the overall functional description of the project for tags and descriptions of the controlled equipment of each ACTIFLO.

1.6 OPERATING MODES OVERVIEW

There are two primary modes for each ACTIFLO®: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the ACTIFLO® system as a whole.

Local mode

In local Mode, the operator can operate individual equipment.

Equipment can be started manually at the LCP using the Hand position of the H-O-A.

HMI manual mode

The operator can operate individual equipment through HMI control if the Local switch on that equipment is in the Auto position. Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the ACTIFLO® system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper, and at least one sand pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI and at the LCP. All startup sequences are described below. Each ACTIFLO® train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	Manual		Semi-Auto
	Local	**HMI Manual**	
Control Functions	N/A	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	N/A	Allowed (virtual HOA on HMI)	Not Allowed
Local Operation of Individual Equipment	Allowed By HOA on LCP	N/A	Not Allowed

1.7 PERMISSIVE

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and at least one sand pump, are in Auto at the HMI and at the LCP.
- Mixers (whichever is in Auto at HMI and LCP), scraper, and the above mentioned sand pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

1.8 OPTIONS

Idle option

When the idle option is enabled, the Actiflo keeps the inlet valve open all the time.

Mixing option

When the mixing option is enabled, a unit in Semi-Auto mode left idle will start some mixer to move the sand into the tank to avoid the sedimentation.

1.9 SEMI-AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

1.9.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto at the LCP while the PLC is running in Semi-Automatic control of the ACTIFLO® system, the PLC will initiate a Shutdown Sequence as described in section 1.11.2.

Since the scraper will not be operational, the Shutdown Sequence will consist of the sand recirculation pumps running for the durations indicated in section 1.11.2.

If the lead sand pump is removed from Auto at the LCP, the PLC will sequentially initiate operation of the next available pump. If all sand pumps are removed from Auto or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if an ACTIFLO® system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

1.9.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the ACTIFLO® system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 1.11.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 1.11.2. Since the scraper will not be operational, the Shutdown Sequence will consist of the sand recirculation pumps running for the durations indicated in section 1.11.2.

Should lead sand pump fail, the PLC will issue an equipment alarm and sequentially initiate operation of the next available pump. If all sand pumps fail or no additional pumps are available, the PLC will initiate an emergency shutdown of all equipment.

NOTE: An AVAILABLE sand pump is defined as one that is placed in Auto at the LCP and does not have any existing un-reset alarm conditions.

1.10 RECIRCULATION PUMPS LOGIC

1.10.1 Duty/Assist Orientation

When two recirculation lines are provided they can be set with priority. The two sand pumps operate in a Duty / Assist orientation. If all sand pumps are in "auto" but not running, the pump set as priority (duty) will start when the start condition will be met. If the influent quality deteriorates, as indicated by an increase in raw water turbidity, the operator can use the second recirculation line by starting the second pump from the HMI.

The sand pumps priority (duty or assist) is changed manually by the operator anytime or is changed automatically when the plant stops.

1.11 SEQUENCES OF FUNCTIONS

1.11.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start the Duty Sand Pump**

If a failure occurs, the duty pump will be locked out in the PLC and the next available pump will be assigned as the lead pump. The PLC will then attempt to continue operation. This cycle will occur until a sand pump starts or all sand pumps have been locked out. If all sand pumps are locked out, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. Start the Chemical Feed Pumps
    b. Open Raw water Valve. Open Water Polymer Carrier Solenoid valve
    c. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the "Train Start" pushbutton.

1.11.2 Shutdown Sequence

Normal shutdown sequence
When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display "Train Stopping".

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
    a. Close the Influent Valve, Shutdown the Chemical Feed Pumps, Shutdown the mixers. Stop Water Polymer Carrier Solenoid valve.

2. Delay an (Operator Adjustable) (10-30 minutes):
    a. Shutdown the Scraper
    b. Start the Standby Sand Pump

3. Delay 5 minutes:
    a. Shutdown the Duty Sand Pump and Shutdown the standby Sand Pump

NOTE: This delay allows purging of sand and sludge contained in the settling tank and piping and re-deposits it back into the Maturation tank.

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the "Train Start" pushbutton without stopping the equipment already started.

Emergency shutdown sequence

The emergency shutdown sequence automatically cycles through the steps listed below.

1. System shutdown initiated:
   - **a.** Close the influent valve, shutdown the chemical feed pumps, shutdown the mixers, shutdown the scraper, shutdown the microsand recirculation pumps, close the water polymer carrier solenoid valves.

1.12 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

1.12.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The ACTIFLO® unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the ACTIFLO® unit was stopped by an Emergency alarm or Fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

1.13 SAFETY

1.13.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated on an equipment, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on the equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

1.13.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the ACTIFLO® system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately without a re-inventory of the sand to the maturation tank. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

1.14 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the ACTIFLO® system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidimeter and the raw water pH is obtained through the raw water pH meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

1.14.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.
2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the ACTIFLO® control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.
3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

1.15 INTERLOCKS

1.15.1 Actiflo® High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding Actiflo® unit according to the automatic stop sequence.

1.15.2 Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding Actiflo® control panel.

1.15.2.1 High High Scraper Torque

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay. Those adjustable variables are set on the microcontroller installed in the panel.

When the alarm is activated, the scraper is stopped and then the Actiflo® is stopped according to the automatic stop sequence.

1.15.3 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1.15.4 Scraper

The Scraper is interlocked with the microsand pumps; at least one microsand pump has to be running for the scraper to run.

SYSTEM AND COMMUNICATION

The ACTIFLO® control panel PLC is capable of providing the following global statuses over the main plant PLC network: Global "Ready," and Global "Fail."

A Global "Ready" status indicates the system is ready to accept a Global "Start/Stop" command from the main plant PLC.

When the ACTIFLO® system receives a Global "Start" command, the Start-Up Sequence is initiated as described in section 1.11.1 above; this holds true for both Start-Up under normal conditions as well as for Start Up after a power failure.

When the ACTIFLO® system receives a Global "Stop" command under normal conditions, the Shutdown Sequence is initiated as described in section 1.11.2 above.

1.16 HARDWIRE SIGNALS

The following electrical signals are used to communicate some information about the Actiflo trains:

Name	Type	Description	True
Start/Stop	DI	To Start/Stop the unit Remotely	Start the unit
Water Demand	DI	To require the production of water by the Actiflo	Start a production Sequence
Status - In Service	DO	Actiflo In Service Step	
Status - Alarm Active	DO	Warning or Fatal Alarm Active

1.1 REFERENCE DOCUMENTS

Document Number	Name
5000218009_PI_0001_GEN_VWT	PI001 _Process and Instrumentation diagram
5000218009_FD_0001_GEN	Project overall functional description

1.2 PROCESS OVERVIEW

To be completed

1.3 LIST OF ABBREVIATIONS

The following abbreviations are used in the text of this document.

- HMI: Human/Machine Interface
- H-O-A: Hand-Off-Auto
- PLC: Programmable Logic Controller
- LCP: Local Control Panel
- VFD: Variable Frequency Drive
- VWT: Veolia Water Technologies Canada

1.4 LIST OF UNITS

The following lists the parameters referred to in this document and the units they are measured in unless otherwise specified.

- Concentration (in general): mg/L
- Dosing rate: mL/L
- Flow rate (main process): m^3/h
- Flow rate (chemical dosing): LPH
- Level in the tanks: %
- pH: -
- Pressure: PSIg
- Temperature: °C

- Turbidity: mg/L or NTU

MULTIFLO CONTROL DESCRIPTION

1.5 EQUIPMENT AND INSTRUMENT

Refer to the overall functional description of the project for tags and descriptions of the controlled equipment of each MULTIFLO.

1.6 OPERATING MODES OVERVIEW

There are two primary modes for each MULTIFLO: Manual and Semi-Automatic. The Manual mode is designed for operation of individual equipment. The Semi-Auto mode is designed for operation of the MULTIFLO system as a whole.

Local mode

In local Mode, the operator can operate individual equipment.

Equipment can be started manually at the LCP using the Hand position of the H-O-A.

HMI manual mode

The operator can operate individual equipment through HMI control if the Local switch on that equipment is in the Auto position. Manual operation from the HMI provides the same equipment protection and alarming as Semi-Auto.

Semi-Auto

Semi-Auto mode allows the operator to initiate the MULTIFLO system start-up and shutdown sequences from HMI or remotely.

NOTE: Train equipment cannot be controlled manually while in Semi-Auto operation.

The coagulation mixer or injection mixer, maturation mixer, scraper and the extraction pump H-O-As must be in Auto to enable Semi-Automatic control of all respective equipment at the HMI and at the LCP. All startup sequences are described below. Each MULTIFLO train and its associated equipment are controlled as an independent system by the PLC.

The table below presents the control modes summary.

Table 1: Summary of Control Modes

	Manual		Semi-Auto
	Local	**HMI Manual**	
Control Functions	N/A	N/A	Allowed (PLC)
Initiation of Semi-Automatic functions	N/A	N/A	Operator or Remote Start-up Initiation Required
HMI Operation of Individual Equipment	N/A	Allowed (virtual HOA on HMI)	Not Allowed
Local Operation of Individual Equipment	Allowed By HOA on LCP	N/A	Not Allowed

1.7 PERMISSIVE

Permissive to allow initiation of the Semi-Automatic start sequence are:

- H-O-A selector switches for mixers, scraper and the extraction pump, are in Auto at the HMI and at the LCP.
- Mixers (whichever is in Auto at HMI and LCP), scraper, and the extraction pump do not have existing equipment alarms.
- Aforementioned equipment alarms must be manually reset.

1.8 SEMI-AUTO TRAIN RESPONSE TO EQUIPMENT CONDITIONS

1.8.1 Equipment Removed From Auto PLC Response

If the mixers and the scraper are removed from Auto at the LCP while the PLC is running in Semi-Automatic control of the MULTIFLO system, the PLC will initiate a Shutdown Sequence as described in section 1.10.2.

If the Multiflo extraction pump is removed from Auto, the PLC will initiate an emergency shutdown of all equipment.

NOTE: No alarm will be generated if a MULTIFLO system shutdown is initiated due to a piece of equipment being removed from Auto by the operator.

1.8.2 Equipment Failure PLC Response

If the coagulation mixer fails during Semi-Automatic control of the MULTIFLO system, the system will continue to run.

Should the injection mixer or the maturation mixer fail at any time during Semi-Automatic control of the MULTIFLO system, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 1.10.2.

Should the scraper fail at any time during operation or start-up, the PLC will issue an equipment alarm and will initiate a Shutdown Sequence as described in section 1.10.2.

Should the Multiflo extraction pump fail, the PLC will initiate an emergency shutdown of all equipment.

1.9 EXTRACTION PUMP LOGIC

The Multiflo extraction pump will operate in batches. The operator will be able to adjust the running time and the lag time between the batches on the HMI.

1.10 SEQUENCES OF FUNCTIONS

1.10.1 Start-up Sequence

If all permissive conditions are present and no respective equipment alarms exist, the HMI will display **"Train Ready"**. The Start-up Sequence can now be initiated via the HMI or remotely.

NOTE: To prevent damage to the equipment, the Train must have water in the tanks above the mixer impeller elevations prior to Start-up (to be checked by the operator).

To start the train when "Train Ready" is displayed on the HMI, the operator presses the "Train Start" pushbutton. A starting system displays "Train Starting" at the HMI. The start-up sequence automatically cycles through the steps listed below.

1. System Start-up Initiated:
    a. **Start the extraction pump**

If the pump fails to start, the PLC will immediately abort the start-up.

2. Delay 30 seconds (adjustable):
    a. **Start the Scraper**

If a Scraper failure occurs initiate a Shutdown Sequence.

3. Delay 10 seconds (adjustable):
    a. **Start the mixers**. These mixers start are respectively staggered by 5 seconds.

If a maturation Mixer failure occurs initiate a Shutdown Sequence.

4. Delay 10 seconds (adjustable):
    a. Start the Chemical Feed Pumps
    b. Open Raw water Valve.
    c. HMI will display **"Train Started"**

If any Duty Chemical Feed Pump is not available while in operation, the Stand-by pump shall be initiated. The duty pump will not be locked out so when the pump is placed back into Semi-Auto, it will resume operation. Duty chemical feed pump alternation is manual and available only at the HMI.

The Operator can terminate the start-up at any point in the sequence by pressing the "Train Stop" pushbutton. If any pertinent equipment fails during the start-up sequence, the PLC will

initiate a train shutdown. The operator can correct the failure, and then resume the start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton.

1.10.2 Shutdown Sequence

Normal shutdown sequence
When in Semi-Automatic mode, the operator may implement the Shutdown Sequence at any time from the HMI or remotely. During shutdown, the HMI will display “Train Stopping”.

The shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
   a. Close the Influent Valve, Shutdown the Chemical Feed Pumps, Shutdown the mixers.

2. Delay an (Operator Adjustable) (10-30 minutes):
   a. Shutdown the Scraper
   b. Shutdown the extraction pump

The operator can initiate the Train start-up sequence from the current shutdown sequence step by pressing the “Train Start” pushbutton without stopping the equipment already started.

Emergency shutdown sequence
The emergency shutdown sequence automatically cycles through the steps listed below.

1. System Shutdown Initiated:
   a. Close the influent valve, shutdown the chemical feed pumps, shutdown the mixers, shutdown the scraper, shutdown the microsand recirculation pumps, close the water polymer carrier solenoid valves.

1.11 ALARM/FAILURE CONDITIONS AND PLC RESPONSES

1.11.1 Alarm Priorities

Alarms are grouped in to 3 priority levels for various attention requirements:

Emergency alarms:

1. Needs immediate operator attention.
2. The MULTIFLO unit will initiate the emergency shutdown sequence.

Fatal alarms:

1. Needs immediate operator attention.
2. The MULTIFLO unit will initiate the stop sequence.

Warning alarms:

1. Does not need immediate operator attention.

If the MULTIFLO unit was stopped by an Emergency alarm or Fatal alarm, it will not restart automatically. The operator must remove alarm condition and reset the alarm. Then press the start button on the operator interface will restart the unit if all automatic start sequence conditions are satisfied. In case of remote control, the system will wait for rising edge of the remote start signal.

1.12 SAFETY

1.12.1 Emergency Stop

Emergency stop actions

When an emergency stop button is activated on an equipment, an alarm is triggered. The fault associated with this alarm will latch.

During emergency stop, many stopping actions are initiated on the equipment. These actions are presented in sections describing the relevant equipment.

Recovery after emergency stop

When all emergency stop buttons are back into normal position, the fault associated with an alarm is maintained until the operator presses the reset button.

1.12.2 Control Power Failure PLC Response

Should control power fail at any time during Semi-Automatic control of the MULTIFLO system, the PLC will issue an alarm and will initiate a Shutdown Sequence as described in this document. Systems with an Uninterruptable Power Supply (UPS) will see the alarm as the condition occurs. Systems without an UPS will see the alarm upon restoration of power. There

is a ten (10) second delay upon restoring power, and then the train will enter the Shutdown Sequence as described in this document. If the restored power does not include the actual motor controls, a run status will not be received by the PLC and equipment (pumps and scraper) will shut down immediately. If the unit is configured to resume via the HMI, it will automatically resume to the last known state. Otherwise the unit will remain in Stop.

1.13 CALCULATED PARAMETERS

The following sections explain the main calculations made in the control of the MULTIFLO system.

The PLC calculates the chemical feed rates and controls the chemical metering pumps using the following procedure. The chemical feed rate is based on:

1. The influent raw water flow rate
2. The chemical dose
3. The physical properties of the chemicals
4. The capacity and settings of the metering pump

The influent raw water flow rate is obtained through the raw water flow meter, which sends a signal to the PLC.

The influent raw water turbidity rate is obtained through the raw water turbidimeter and the raw water pH is obtained through the raw water pH meter.

The chemical dose, physical properties and metering pump capacity are input by the user/operator at the HMI.

The basic equation for the chemical feed rate is:

$$\text{Chemical feed rate} = \frac{\text{influent flow rate} \times \text{chemical dose}}{\text{stock chemical concentration}}$$

This equation is the general form for all chemical feed rates that use flow pacing control, including coagulant and polymer.

1.13.1 Flow Pace Control

The way the PLC uses these calculations to determine the chemical metering pump output is:

1. The chemical feed rate equations are programmed into the PLC.

2. The user/operator inputs the chemical dose, physical properties, and maximum chemical metering pump capacity at the HMI on the MULTIFLO control panel. The PLC calculates the specific chemical feed rate based on the user/operator inputs and the influent (raw water) flow to the train.
3. The calculated feed rate is then converted by the PLC into a percent speed, based on the maximum capacity of the metering pumps. This signal is then sent to the metering pump.

1.14 INTERLOCKS

1.14.1 Multiflo High Level Switch

A float over the settling tank is used as a High Level switch. When the switch is activated, stop the corresponding Multiflo unit according to the automatic stop sequence.

1.14.2 Scraper Torque

The torque detector/alarm is independent from the PLC. So it is enabled (will stop the scraper) through a hardwired interlock to the scraper starter in the corresponding Multiflo control panel.

1.14.2.1 High High Scraper Torque

A high torque alarm is activated when the torque is higher than the adjustable set point for more than the adjustable delay. Those adjustable variables are set on the microcontroller installed in the panel.

When the alarm is activated, the scraper is stopped and then the Multiflo is stopped according to the automatic stop sequence.

1.14.3 Maturation Mixer

The maturation mixer cannot run if the scraper is not running.

1.14.4 Scraper

The scraper is interlocked with the multiflo extraction pump; the pump has to be running for the scraper to run.

SYSTEM AND COMMUNICATION

The MULTIFLO control panel PLC is capable of providing the following global statuses over the main plant PLC network: Global “Ready,” and Global “Fail.”

A Global “Ready” status indicates the system is ready to accept a Global “Start/Stop” command from the main plant PLC.

When the MULTIFLO system receives a Global “Start” command, the Start-Up Sequence is initiated as described in section 1.10.1 above; this holds true for both Start-Up under normal conditions as well as for Start Up after a power failure.

When the MULTIFLO system receives a Global “Stop” command under normal conditions, the Shutdown Sequence is initiated as described in section 1.10.2 above.

1.15 HARDWIRE SIGNALS

The following electrical signals are used to communicate some information about the Multiflo trains:

Name	Type	Description	True
Start/Stop	DI	To Start/Stop the unit Remotely	Start the unit
Water Demand	DI	To require the production of water by the Multiflo	Start a production Sequence
Status - In Service	DO	Multiflo In Service Step	
Status - Alarm Active	DO	Warning or Fatal Alarm Active

NOTE

1- Client standard
2- Provide POWER ON pilot light
3- Provide all internal Ethernet cables
4- Observe the minimum clearance required by manufacturers
5- Provide 120 Vac outlet for laptop connection
6- Provide internal lighting
7- Provide control panel identification on front door

1 INTRODUCTION

This document describes the functions of the various components of the Actiflo® Package Plant clarifier, describes the procedures for the installation, start-up and standard operation of the system. It also plans preventive maintenance measures and describe procedures for the regular maintenance of the equipment.

The components of the Actiflo® Package Plant clarifier are supplied by Veolia Water Technologies Canada (VWTC). This equipment of superior quality and proven design will insure years of operation without problems. However, in order to maintain peak efficiency and performance of the system, it is imperative to take into consideration the preventive measures and procedures described in this manual. These measures include the operation and maintenance of its components.

To obtain any additional information regarding characteristics, operation or maintenance of this equipment, or if a problem persists, please do not hesitate to contact us.

The Actiflo® system is manufactured in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada – After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

1.1 OBJECTIVES OF THIS MANUAL

- Describe the installation of the unit and its ancillary components.
- Describe and explain the functions of the various components of the Actiflo® clarifier and reaction tanks, if installed.
- Describe the procedure for the start-up and standard operation of the system.
- Plan preventive maintenance measures and describe procedures for the regular maintenance of the equipment.

1.2 SAFETY

Operation of the Actiflo® system should be done by qualified personnel only.

It is imperative to ensure the security of all operators during the operation and maintenance of all mechanical equipment. In order to avoid accidents, it is important to determine the correct way to proceed and conveniently select appropriate clothing for the job. All workers having access to the equipment must scrupulously respect all the standard rules of safety as well as the precautions described in this manual.

Workers, which are directly responsible for the operation and maintenance of the equipment, must be aware of standard rules of safety.

The following safety rules should be followed:

- Safety devices such as handrail and belt guards should be installed and inspected regularly.
- Access to the building should be limited to authorize personnel only.
- Non-authorized personnel must never approach rotating shafts, connections, etc., in order to avoid injuries.
- The owner should implement a safety program and provide training for operation staff.
- Material Safety Data Sheets (MSDS) should be available for each chemical product.
- Appropriate protective gear including safety glasses, hard hat, boots, gloves, and ear protection should be worn at all times.

Protection systems or any other type of safety device supplied by the manufacturer must be carefully installed. If these are not supplied by the manufacturer, the user must supply and install the safety devices necessary for the protection of employees responsible for the operation of the equipment.

WARNING: The lamella pack is pre-installed in the settling tank section of the Actiflo® clarifier. It is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

WARNING: The operation staff should be aware that coagulant is highly corrosive and polymer solution can be very slippery. Spills should be cleaned immediately according to the MSDS instructions.

WARNING: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

1.3 STANDARDS

Unless specified otherwise, the equipment described in this manual is consistent with the most recent construction standards that are applicable, including:

American Society of Mechanical Engineers	ASME
Canadian Standards Association	CSA
Canadian Electrical Manufacturers Association	CEMA
National Electrical Manufacturers Association	NEMA
American Society for Testing and Materials	ASTM
American National Standard Institute	ANSI

Table 1: List of applicable standards

1.4 MODIFICATIONS DONE BY THE CLIENT

Please note that it is mandatory to contact Veolia Water Technologies Canada Inc. before undertaking any modification work to the equipment supplied in this project. In fact, any alteration made to any equipment (mechanical, control, computers, etc.) without prior notification and consent by VWTC voids the warranty of the mentioned equipment. Furthermore, the client is responsible for any additional cost necessary to restore the equipment to its original state.

1.5 FIELD INSTALLATION – PAINT PROTECTION

IMPORTANT NOTE TO CONTRACTORS

You are about to install Actiflo® Package Plant unit and is related equipment. Veolia Water Technologies Canada Inc. wants to warn you about potential problems related to installation of large steel units protected against corrosion by paint.

VWTC maintains a comprehensive quality program to prevent equipment from being affected by corrosion. Our fabrication methods are specially adapted to manufacturing of painted equipment. Every step of our fabrication and assembly process is checked to reduce corrosion issues. Each unit is also delivered under strict measures, meant to reduce potential corrosion problems and long product life.

However, we have identified that handling unit at job site is a key element of corrosion protection process. This operation completely escapes our control and is your responsibility. Consequently, we invite you to perform a thorough review of your installation procedures before handling VWTC products. Protecting units during and after installation is paramount to maintain corrosion risks to a bare minimum.

Likewise, after installation of units, you must insure complete equipment protection from working environment before unit is put into service. This will prevent damages caused by work not related to VWTC products taking place on site. Contractor is responsible for installation of any additional protection necessary at job site.

In order to maintain quality products free of defects, VWTC requests from contractor, that he takes all necessary measures to reduce risks of paint or equipment damage leading to steel corrosion. Among most important protection measures of paint protection, here are the principal ones:

- Making all men, working close to units, conscious of paint fragility and potential corrosion problems. Please encourage them to act with extreme care while working around installation.
- Protecting units from weld projection or falling debris, by covering unit with adequate plastic or cardboard hoods and padding.
- Protecting unit's tank bottom when installing mixers or other equipment inside unit.
- Keeping area and unit clean at all times.

All measures taken by contractor to insure paint protection will assure transfer to client of a quality product and will benefit to all.

1.6 WARRANTY

All equipment manufactured by **Veolia Water Technologies Canada Inc.** (herein defined as "Veolia Canada") is guaranteed to be free from defects in material and workmanship for a period of twelve (12) months from the date at which unit is placed in service, eighteen (18) months from the date of shipment, whichever occurs first. All equipment found with defects during this period will be replaced at

no extra charge when shipped prepaid FOB to the manufacturer's shop. All parts sold by Veolia Canada are warranted the same way for a period of three (3) months from date of shipment.

If the customer promptly notifies Veolia Canada in writing of a claimed defect in the equipment and said equipment is found not to be in conformity with this warranty, Veolia Canada will, at its option and expenses, repair or replace such defective part, prepaid FOB to the manufacturer's shop.

Veolia Canada must be given notice of such defect, and, where requested, such material must be returned to the manufacturer's shop, transportation charges prepaid, with written approval for the shipment by Veolia Canada

This warranty shall be void if start-up of equipment is not authorized by Veolia Canada, or if repairs and/or alterations are made without a written authorization by Veolia Canada. If the equipment or parts supplied by Veolia Canada are altered in any way without Veolia Canada consent, the present warranty will not be valid and have no effect.

The customer will use only Veolia Canada parts for all labour covered by this warranty.

The foregoing warranty excludes responsibility or liability for:

(a) Failures not reported promptly within the warranty period, above specified.
(b) Damage due to accident, abuse, shipment, improper installation or operation, or abnormal operation condition.
(c) Damage caused by client's replacement, repair or inspection of parts.
(d) Lesion or personal accidents, material damage or any direct or indirect expenses or loss of profit related to this warranty.
(e) Damage, loss, expenses, lesion or personal accidents directly or indirectly related to the installation, the operation or the failure of the equipment supplied by Veolia Canada

The foregoing warranty is exclusive and replaces all other warranties, expressed or implied, including but not limited to any warranty of bargaining or modification for a particular purpose.

This warranty does not cover the following:

(a) Costs of repair, modification or other work done or requested by the customer or the management and all indirect costs.
(b) All expenses related to regular maintenance of parts as prescribed in the operation and maintenance manuals supplied by Veolia Canada
(c) Costs of dismantling, installation, transportation and insurance.
(d) Travelling and living expenses for the personnel carrying out the repair under such warranty.
(e) This warranty is not a performance or production warranty.

Veolia Canada has the right to examine or to ask for details about defects before empowering the present warranty.

2 RECEIVING

Preliminary field-testing, inspection, and checkout of the unit, following installation, shall be performed by a qualified representative of both the supplier and the general contractor. Tests shall be conducted to demonstrate to the engineer that all system components furnished by the equipment supplier are fully operational, that all connecting piping is leak proof and properly anchored, and that the entire system furnished by the supplier is ready for continuous safe operation. The purpose of the checkout shall be to ensure that each individual system component has been correctly installed, shall operate fully in the manner intended, and is ready to perform its function as part of an integrated system when placed in continuous operation.

MISSING EQUIPMENT/SHIPPING DAMAGE NOTIFICATION

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to Veolia Water Technologies Canada (VWTC) within 10 days of receipt of equipment. If there is no documented notification of missing or damaged parts within 10 days, VWTC is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and VWTC.

Photographs and written documentation should be provided on all damaged equipment.

2.1 STORAGE

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification taken into account common environmental issues that may affect the system during storage, common sense should be the overriding factory in determining the best method to ensure the integrity and proper storage of the VWTC equipment.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of shipment, special precautions must be taken. If possible, all equipment should be stored indoors in a dry and sheltered environment having a relatively constant temperature (especially for gear reducers, motors, bearings, etc.).

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

The storage environment into which a system is placed can have a dramatic effect on the long-term usefulness of some spare parts. Key environmental factors are:

1) Temperature
2) Relative Humidity
3) Pollutants

The environmental indoor conditions should not exceed the following ranges:

Min/Max Temperature Range between:	8°- 28°C (46°- 82°F)
Relative Humidity Range between:	40% +/- 5% (RH)

A. OUTDOOR STORAGE:

Pre mounted settling or filtering tanks can be stored outside with the following storage specifications:

1) Drain water completely with special attention for sections without drain on lower point.
2) Remove all motored, electronic equipment and instruments and store them indoor (heated and ventilated area).
3) Tanks must be stored with adequate support underneath to prevent distortion and to raise equipment above any undesirable ground or floor conditions. It will also prevent flooding damages.
4) Completely cover the equipment with a tarp or similar protections shield to prevent direct exposure to the elements (dust, rain, snow, etc.). The tarp should fit tightly around the equipment to prevent accumulation beneath tarp.
5) Make sure that the plastic tarp is in perfect condition. Repair plastic tarp if needed.
6) Remove all snow, dust or water accumulation from the top of the units.

B. INDOOR STORAGE:

All other equipment have to be stored indoors in a climate controlled environment under a clean dust free non-aggressive and dry environment, including but not limited to electrical enclosures, spare parts, etc.

1) The equipment should be stored in a manner to be kept free from allowing insects, rodents, etc. from entering the equipment.
2) Cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination. However, never enclose the unit or components totally in plastic covers; always leave adequate ventilation of air to prevent condensation.
3) Storage volume depends on the size of the project.
4) Equipment must be checked on a weekly basis for tarp/wrap integrity and accumulation.
5) To avoid damage, do NOT stack crates.
6) To avoid damage, do NOT stack enclosures.
7) Do not store spares in barns, equipment sheds or any other building without the capacity for heating and cooling as needed.

C. SPECIAL MAINTENANCE REQUIREMENTS DURING STORAGE:

Mixers, Scraper and Recirculation Pumps

Long term storage methods must be applied to the unit including complete fill with lubricant. Protect machined surfaces and rotate shafts periodically (every month). Five (5) complete rotations of the output shafts are recommended each time.

Periodic checks should be made to ensure that no rusting or other damage has occurred. Should such be noted, corrective action should be quickly initiated. Prior to putting unit into service, drain lubricant and refill to proper level as determined by the mounting position. Refer to manufacturer documentation.

All motors must be removed and store indoor (in a heated and ventilated area). All motors must be run every 3 month as a preventive measure against the formation of corrosion.

Instrumentation

All instruments must be store inside. Refer to manufacturer documentation.

Electrical Equipment and Spare Parts

It is required that all electrical equipment is stored indoors in a climate controlled environment under a clean dust free non-aggressive and dry environment, including but not limited to electrical enclosures, spare parts, etc.

1) The electrical equipment should be stored in a manner to be kept free from allowing insects/rodents from entering the equipment.
2) Completely cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination.
3) Storage volume depends on the size of the project.
4) Equipment should be checked on a weekly basis for tarp/wrap integrity and accumulation.
5) To avoid damage, do not stack crates.
6) To avoid damage, do not stack enclosures.
7) Do not store spares in barn, equipment sheds or any other building without the capacity for heating and cooling as needed.

Others Equipments

It is recommended that tanks and pumps be stored indoors and on a raised surface to avoid flooding however if this cannot be done, they must be places on secure, high ground and meet all other specifications provided in this document. The responsible party must be sure to elevate the equipment off of the ground.

If the equipment are stored outdoor they must be kept on a high ground not susceptible to flooding and elevate the equipment at least 10 inches (250 mm) of the ground. If there is reason known to the responsible party that more than 10 inches of elevation is required, appropriate measures should be taken. Completely cover the equipment with a tarp or similar protections shield to prevent direct

exposure to the elements (dust, rain, snow, etc.). The tarp should fit tightly around the equipment to prevent accumulation beneath tarp. Equipment to be checked on a weekly basis for tarp integrity and accumulation.

To avoid possible module damage, do not stack module crates.

Equipment Cleaning

VWTC is not responsible for cleaning of any equipment prior to installation and start-up due to the storage of the equipment. This is the complete responsibility of others.

The cleaning of the equipment, if necessary, must be completed prior to the VWTC start-up technician arriving at site.

Handling

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the various items.

Control panels are shipped in a separate crate or wrapped for protection and should be removed from the flat bed with a fork lift along with all other items. Weight dependent upon system configuration.

3 GENERAL INSTALLATION

The Actiflo® package plant may be pre-mounted. However, for freight purpose and practical reasons, the installation of some items must be completed on site by the contractor. Please find below the list of tasks that need to be performed by the contractor at job site:

- Installation should be performed by qualified contractors.
- The contractor must ensure that the necessary lifting equipment is available on site to carry out the installation.
- All nuts & bolts need to be verified, accounted for and tightened.

WARNING:	The settling tubes are very flammable, do not use any open flames near it and do not allow any welding works in the nearby area unless safety precautions have been taken. Once the settling tubes are submerged in water (normal use), this warning is no longer applicable.

- Refer to all field installation drawings for the installation of each Actiflo® unit.
- If any paint touch-ups are required, refer to documentation for recommended paint preparation and application instructions.
- After installation completion, clean the tank sections of all debris and objects that could damage the rotating mechanisms, damage pumps or clog the recirculation line.
- Microsand is supplied in 50 lbs. bags in quantities required for the first fill. Sand will be added to the maturation tank during process start up. Sand should be poured slowly once tank is filled with water. Initial sand loading should be performed with supervision of start-up personnel.

4 UNIT HANDLING

- Install each unit at the designated location at site. Lifting lugs are on top of each unit to facilitate handling and shall be removed after proper installation of Actiflo® unit in order to install the handrails.
- For equipment handling please refer to the following sketch and pictures for proper handling of the tank.
- The general contractor is responsible for the equipment unloading and handling.

WARNING: Do not use the welded lugs on Actiflo® package unit sides to lift the tank. These are for transportation purpose only.

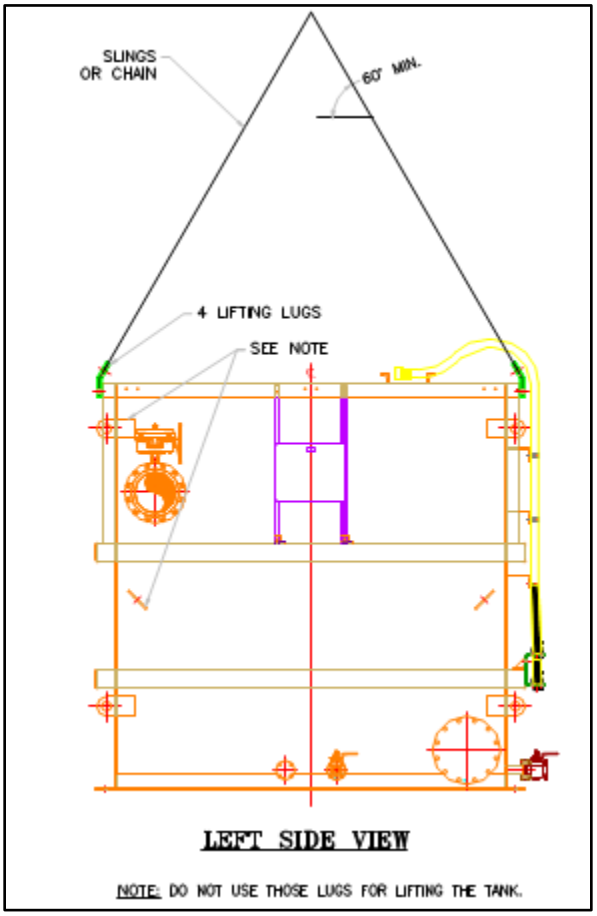

Figure 1: Actiflo® lifting lugs location

ATTENTION: DO NOT LIFT THIS WAY

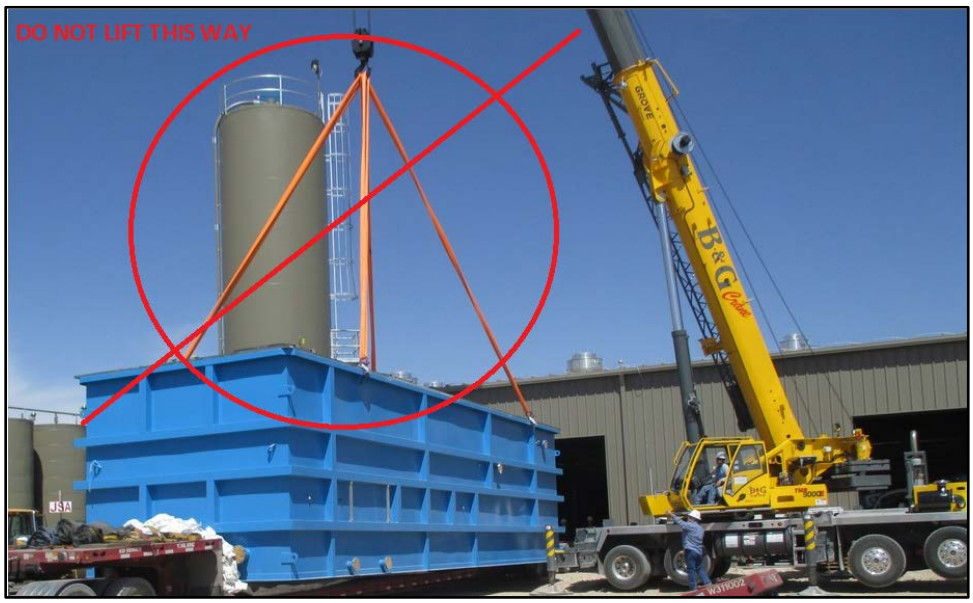

Figure 2: Actiflo® lifting (1)

PROPER LIFTING: ALWAYS HAVE AT LEAST TWO LIFTING POINTS

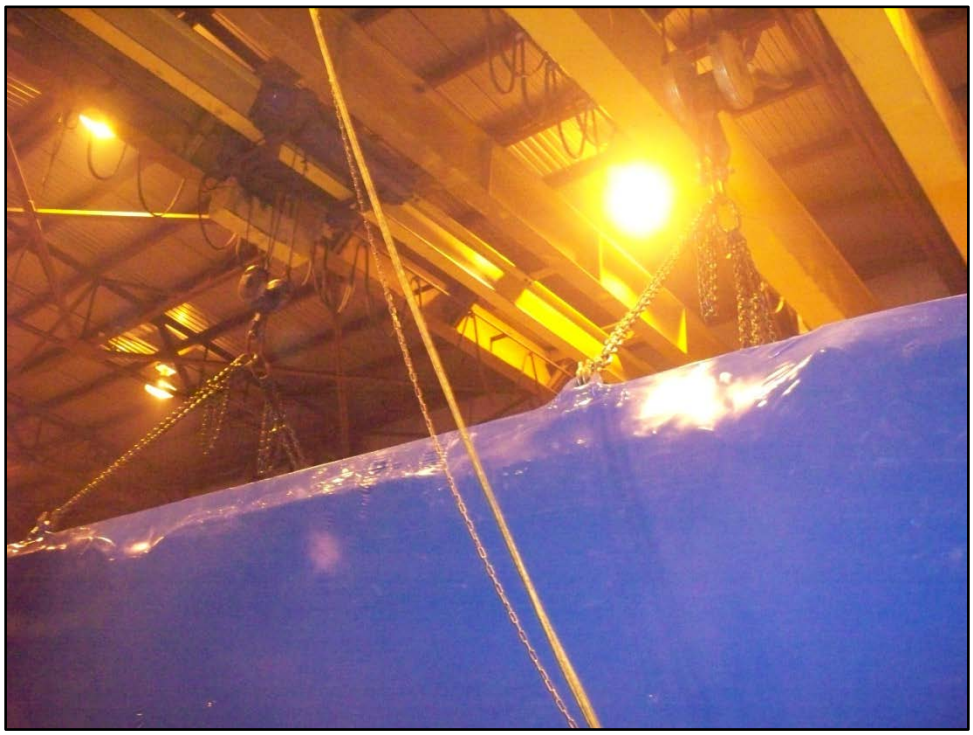

Figure 3: Actiflo® lifting (2)

Figure 4: Actiflo® lifting (3)

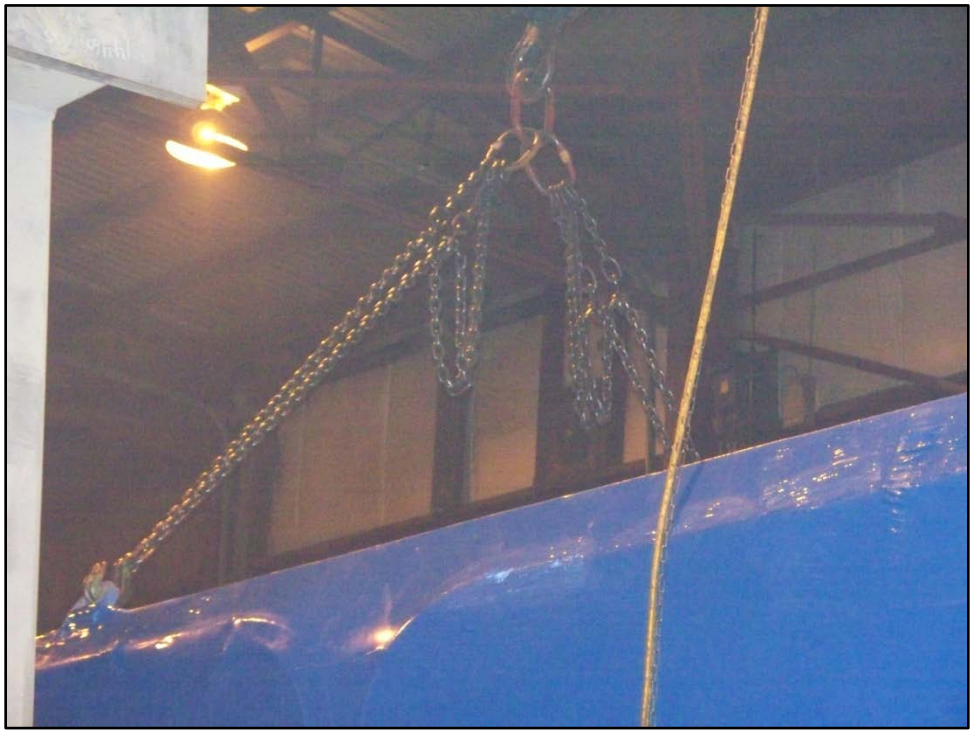

Figure 5: Actiflo® lifting (4)

Figure 6: Actiflo® lifting (5)

4.1 LEVELING

- Unit base frame must be leveled within proper tolerance (max. 1/8” every 15 ft).

4.2 ANCHORING TO CONCRETE FLOOR

- Refer to field installation drawing for tank anchors location.
- Drill appropriate holes in concrete support piers, in line with the anchoring holes of the Actiflo® base and fasten the tank structure with anchors (may be provided by others).
- Add leveling/finishing grout under the base frame where required.

4.3 UNWRAPPING

- Unwrap the equipment and remove any temporary supports and plywood protections from the unit. Be cautious when removing instrumentation protection.

5 MECHANICAL INSTALLATION

5.1 GRATING

- Install grating on each unit. The grating may already be mounted as part of shop assembly.

5.2 HANDRAIL

- Install hand railing on each unit at the site. Please refer to the field installation drawings.

5.3 SETTLING SECTION

- Lamella packs are already installed in settling section.
- If required, be very cautious when manipulating the lamella packs in cold temperatures. They become very brittle and may break easily.

Warning: Lamella pack is highly flammable. Submerge with water as soon as possible.

5.4 TROUGH

- The troughs already installed in the settling section should be leveled using the adjustment nuts. All troughs must be at the same elevation. Tolerance should be 1/8”, so that water is distributed evenly within settling section.

5.5 SCRAPER DRIVE INSTALLATION

- Remove the transportation plate from the rake assembly.
- Lower the shaft of the rake using the eyebolt.
- Connect the rake drive to the shaft.
- Remove the eyebolt from the rake shaft.
- Add the lubricant in the primary gear box. Use Chevron lubricating oils FM Grade ISO 460 or equivalent FDA approved. Please be careful about the amount of oil that is put in the scraper drive assembly as too much oil may overflow into the tank. The oil level should correspond to about half of the height of the gear.
- Rectify alignment if necessary.
- All electrical connections must be completed.
- Rotation of the rake must be clockwise (CW).
- Ensure that there is no contact between the rake arm and the bottom of the hopper.
- Clean the tank sections of all debris and objects that could damage the rotating mechanisms.

- Inspect the recirculation inlet pipe. It should be free of any debris.

Note:	Pay particular attention to remove temporary material (wood, cardboard) at the bottom of the scraper that was used to prevent movement during transport.

5.6 HYDROCYCLONE SUPPORT

- Refer to the field installation drawings for proper hydrocyclone installation.
- Install the hydrocyclone assembly support on the maturation tank with supplied screws, nuts and washers at the site.
- Install the piping connections. It is important to drop one (1) meter (approximately 3 feet) at the sludge outlet of each hydrocyclone, to avoid backflow through hydrocyclone. Discharge of sludge pipe must not be submerged.

Note:	Disruption in hydrocyclone pressure distribution will potentially affect separations performances, hence adequate return of microsand to the process.

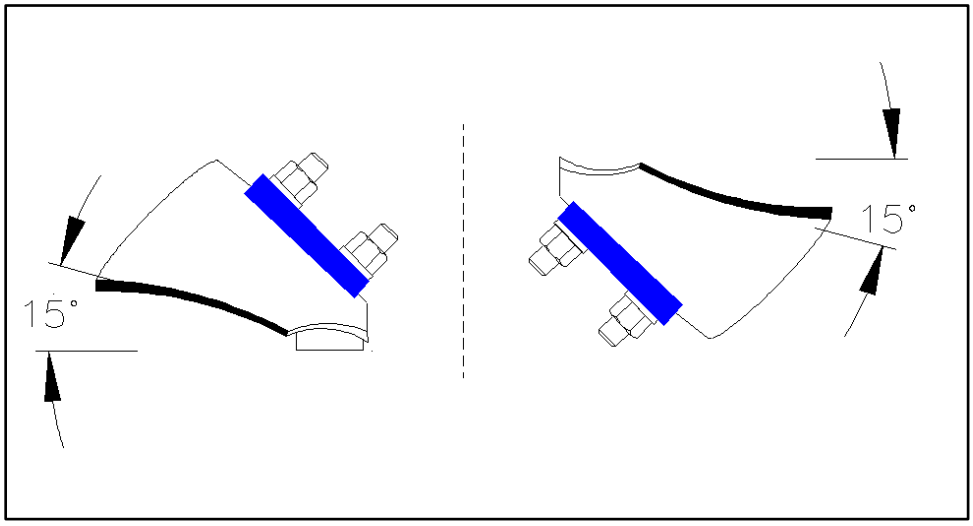
5.7 COAGULATION / INJECTION / MATURATION TANK MIXER

- Refer to field installation drawings for proper mixers installation.
- The mixers are delivered separately. The shafts are already assembled to the gear box. The contractor must assemble the impellers on the shafts at job site.
- Install the motor on the appropriate tank mixer following instructions given in the supplier's equipment manual.
- Verify the mixer blade installation and orientation.
- Verify that set screws are well tightened to secure the hub onto the shaft.
- Follow manufacturer recommendations for oil check and fill up procedure (manufacturer manual).
- All electrical connections must be completed.
- Refer to the following sketches for proper hubs installation in section 5.8.

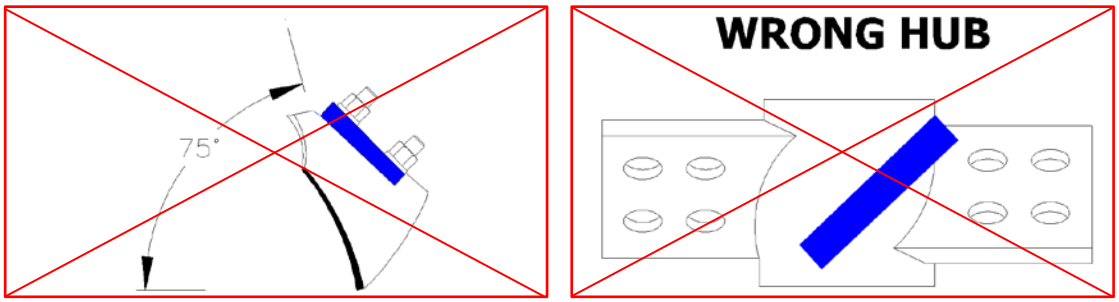
5.8 IMPELLER INSTALLATION

WARNING:

- Ensure the use of a right hub (\ ) in the tanks.
- The leading edge of the blade shall be at 15° from horizontal and not at 75°.
- The screws and nuts must be installed on the wing with nuts on the opposite side from the blade or with screw head contacting blade or on blade side.



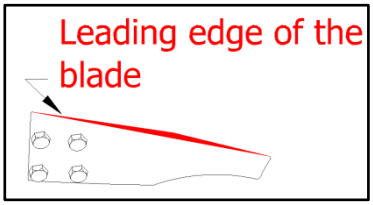
INSTALLATION: TWO POSSIBLE CHOICES



WRONG HUB INSTALLATION

Figure 7: Mixer hub installation

LEGEND	
CW-UP	Clockwise – Up
CW-DWN	Clockwise – Down
CCW-UP	Counterclockwise – Up
CCW-DWN	Counterclockwise – Down



POSSIBLE MIXER INSTALLATION:

Refer to the field installation drawings for your particular application.

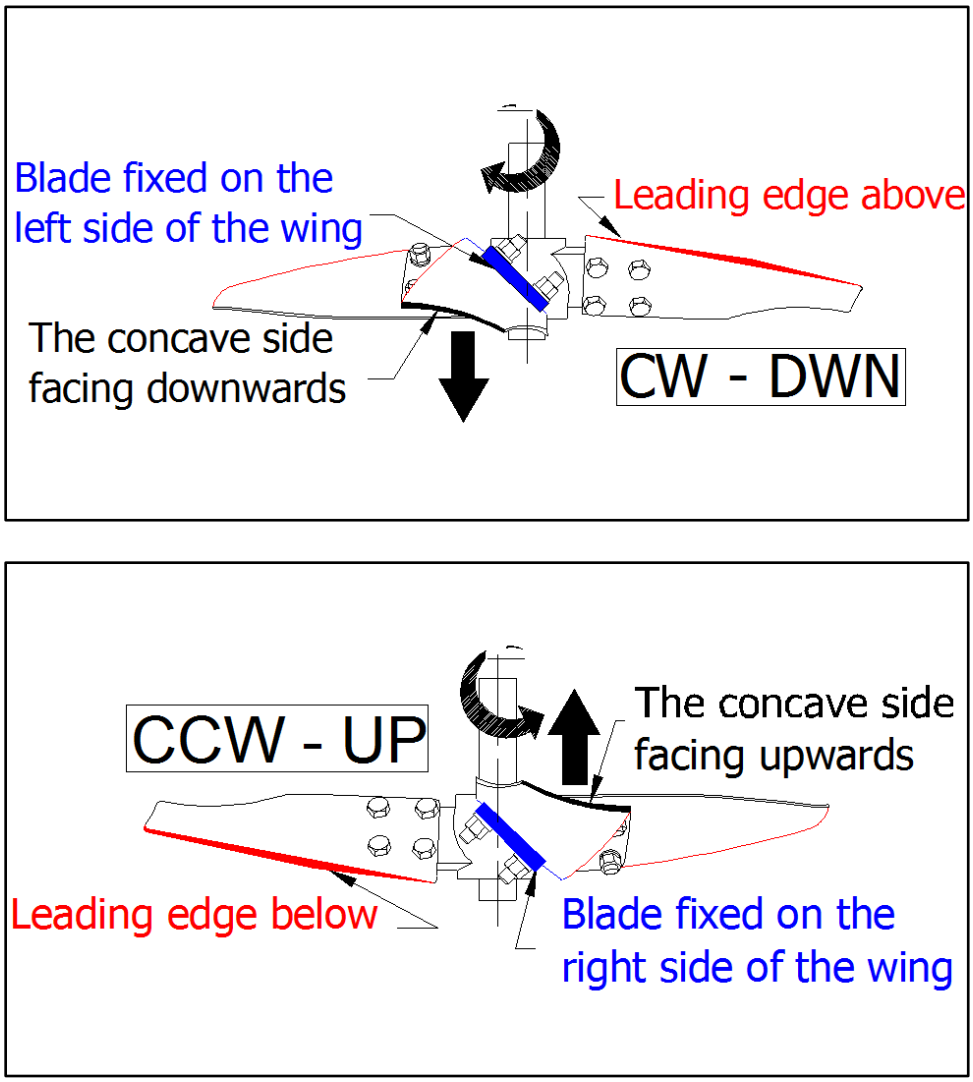


Figure 8: Mixer blade installation

5.9 STAIRS (Optional)

- Refer to field installation drawings for proper stairs installation.
- The stairs are delivered separately. The contractor must assemble and install the stairs at job site. Grout may be used underneath stairs legs to make sure that top of grating on tank matches stairs elevation.

5.10 LADDER AND SAFETY GATE (Optional)

- Install the ladder in place and fasten to unit at job site. Install the safety gate (optional) in the access opening of the ladder with the supplied screws and nuts. Refer to the field installation drawings.

6 PERIPHERAL EQUIPMENT INSTALLATION

6.1 MICROSAND RECIRCULATION PUMP SYSTEM

- Refer to field installation drawings for proper microsand recirculation pump system location and installation.
- Pump base frame must be leveled within proper tolerance.
- Drill appropriate holes in concrete floor and fasten the pump and flexible pipe supports with anchors.
- Connect the drip pan to a drain to avoid any leakage on the floor.

6.2 COAGULATION pH METER

- Refer to field installation drawings for proper coagulation pH meter installation.
- Install the coagulation pH meter with probe mounted to handrail on the settling tank side using supplied screws, nuts and washers. Refer to field installation drawings for proper location and installation.

6.3 CLARIFIED WATER TURBIDIMETER

FOR 1720E

- Install on a support on the effluent side of the tank. Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.

FOR SOLITAX

- Install the turbidimeter with probe mounted to handrail on the settling tank side using supplied screws, nuts and washers. Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.

6.4 RAW WATER TURBIDIMETER (Optional)

FOR SS7

- Install on a support beside the raw water valve. Refer to field installation drawings for proper location and installation.
- The connection and installation in the inlet piping to the sample port are by others and should respect manufacturer recommendations.

FOR SOLITAX

- Install in line pipe. Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.
- The connection and installation are by others.

6.5 RAW WATER FLOWMETER (Optional)

- Follow manufacturer installation recommendations (refer to manufacturer manual), to ensure adequate operation.

6.6 CLARIFIED WATER FLOWMETER (Optional)

- Follow manufacturer installation recommendations (refer to manufacturer manual), to ensure adequate operation.

6.7 PRESSURE SWITCH (Optional)

- Install on a support on the same side of the tank as the recirculation pump. Refer to field installation drawings and manufacturer installation recommendations, for proper location and installation.

6.8 PRESSURE TRANSMITTER (Optional)

- Install on the piping at the outlet of each recirculation pump. Refer to field installation drawings for proper location and installation.

7 PIPING CONNECTION

Note: Remove the flange protecting grease prior to the installation of the valves and pipes.

7.1 WATER COLLECTOR

- Install a pipe from the Actiflo® unit effluent flange to the clarified water collector.

7.2 TANK DRAIN

- Install a pipe from the tank drain valves to the trench drain.

7.3 SETTLED WATER TANK PARTIAL DRAIN

- Install a pipe from the pre-installed partial drain valve, located on Actiflo® effluent side, to the trench drain.

7.4 HYDROCYCLONE SLUDGE OUTLET

- Install a pipe from the hydrocyclone chamber sludge outlet flange to the trench drain.

Important: Provide sufficient pipe slope and size to prevent any backflow to the hydrocyclone chamber. It is important to drop one (1) meter (approximately 3 feet) at the sludge outlet of each hydrocyclone to avoid backflow through hydrocyclone. Discharge of sludge pipe must not be submerged.

7.5 POLYMER FEEDING

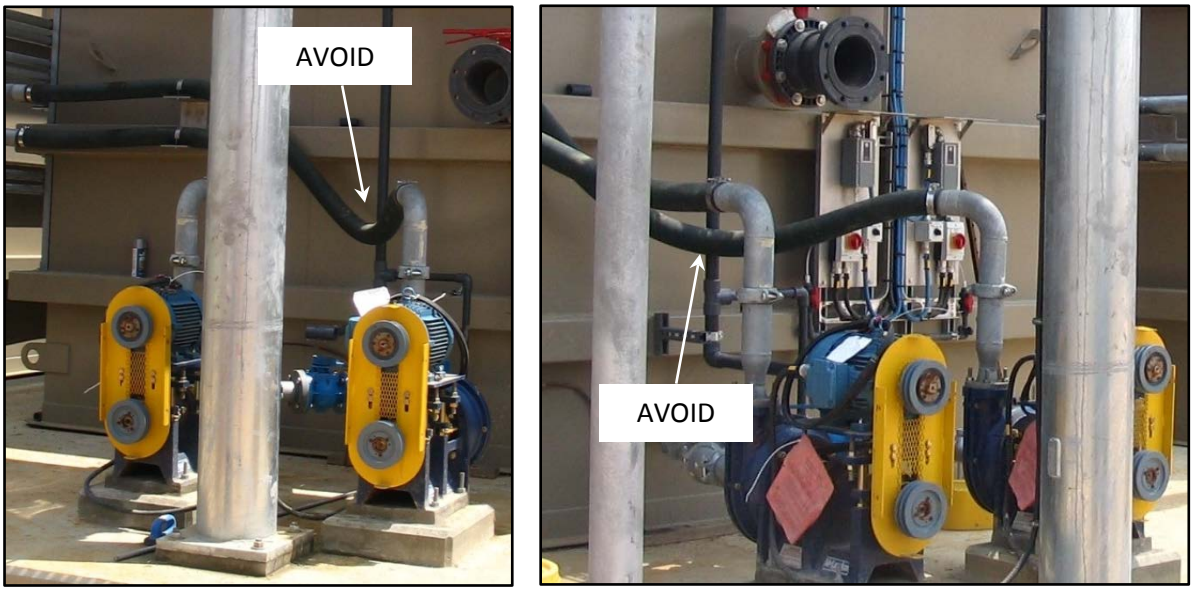
- Connect the supplied polymer injection tubing from the Actiflo® maturation and injection reservoirs to the appropriate hydrocyclone assembly support polymer distributor outlet.
- Supply polymer feeding pipe from the polymer metering pump skid outlet to the hydrocyclone assembly support polymer distributor inlet for the Actiflo® unit.

7.6 RECIRCULATION FLEXIBLE PIPE

- Refer to field installation drawings for proper recirculation pipe installation.
- Inspect the recirculation inlet pipe. It should be free of any debris.
- Connect the flexible pipe section using the connections provided.

- Pipe straps are supplied on the unit to secure the pipe along the tank wall. Install the recirculation flexible pipe in order to avoid any pipe drop that could cause sand accumulation and vibrations.
- Refer to the following pictures for proper installation.

MICROSAND RECIRCULATION PUMP ADEQUATE HOSE INSTALLATION



MICROSAND RECIRCULATION PUMP INCORRECT HOSE INSTALLATION

Figure 9: Microsand recirculation pump hose installation

7.7 CLARIFIED WATER TURBIDIMETER

FOR SS7

- Pipe the clarified water turbidimeter to an appropriate drain.
- Complete piping, if necessary, from the coupling located on the unit to the turbidimeter sampling inlet.

Important:	Provide sufficient slope to ensure correct draining. If connected to another drain line, make sure to avoid any backflow to the instrument. To avoid turbidimeter clogging, sample water piping must be connected prior to any coagulant or other viscous chemical product addition.

FOR SOLITAX

- N/A

7.8 RAW WATER TURBIDIMETER (Optional)

FOR SS7

- Pipe the raw water turbidimeter to an appropriate drain.
- Pipe the raw water turbidimeter bubble trap to appropriate sampling point connection.

FOR SOLITAX

- Refer to pipe orientation for supplied bracket to be mounted on inlet piping.

7.9 LAMELLA CLEANING SYSTEM (Optional)

- Refer to field installation drawings for proper system location and installation.
- Close all valves situated on the cleaning system conduct.
- Inspect the pipe inlet; it should be free of any debris.
- Connect the compressed air supply to pipe.
- Before feeding the system with air, reopen valves and refer to operation and maintenance manual.

Table 2: Torque values for 304 and 316 stainless steel bolt

Notes:

1) Suggested maximum torque values is a guide based upon lab testing on dry or near dry fasteners wiped clean.
2) The use of this information is at sole risk of the user.
3) Values through 7/16" diameters are stated in inch-pounds; 1/2" diameter and over are stated in foot-pounds.

9 ELECTRICAL INSTALLATION

Note: Electrical work should be performed by a qualified contractor. Refer to control panel and electrical diagram for proper wiring installation.

9.1 GROUNDING

- Connect tanks earthing lugs in order to ground the tank.

9.2 CONTROL PANEL

- Supply wiring between unit (junction box optional) and the control panel.
- Supply power (575V or 460V / 3 ph / 60 Hz) to the control panel. Refer to technical datasheet.
- Before permanently wire the control panel, verify the rotation of each motor (clockwise or counter clockwise).

9.3 TANK MIXER

- Connect each mixer motor to control panel or junction box.

Warning: Never run a mixer without the tank being completely filled with water.

9.4 SCRAPER

- Connect scraper motor to control panel or junction box.

9.5 RECIRCULATION PUMP

- Connect each recirculation pump motor.

9.6 CLARIFIED WATER TURBIDIMETER

- Recommended supplier wiring instructions are given in the supplier manual.

Warning: Never cut the original cable between turbidimeter unit and its power supply unit. This cable must remain at full length.

9.7 COAGULATION pH METER

- Connect coagulation pH meter to junction box.

9.8 WATER LEVEL SWITCH

- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.9 RAW WATER FLOWMETER (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.10 RAW WATER TURBIDIMETER (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.11 PRESSURE TRANSMITTER (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended supplier wiring instructions are given in the supplier manual.

9.12 PRESSURE SWITCH (Optional)

- Supply wiring between unit and control panel.
- Complete connection if any.
- Recommended suppliers wiring instructions are given in the supplier manual.

10 ACTIFLO® CLARIFICATION PROCESS

10.1 GENERAL INFORMATION

The Actiflo® process is a compact system that will provide quality clarified water by a flocculation and high rate settling process.

Suspended particles and dissolved solids, previously destabilized with the injection of a coagulant in the raw water, are fixed to the microsand with the help of a flocculant (polyelectrolyte) added to the water. The floc being formed is subsequently separated from the water by counter-current lamellar settling with an ascending hydraulic flux.

Excellent efficiency of the Actiflo® process is reached using two proven techniques:

- Injection of microsand serves as support to the ballasted flocs and works as weight in order to create a very dense floc, thus providing a very high rate of settling.
- Lamellar settling allows increased settling surface in a reduced tank volume by using a set of inclined parallel tubes.

10.2 OPERATION PRINCIPLES

Raw water goes through four (4) successive steps that are part of the Actiflo® treatment process:

10.2.1 COAGULATION

Raw water is mixed with a coagulant using a rotating mixer in a rectangular-shaped tank. This insures a homogeneous diffusion of the coagulant in the water. The standard hydraulic retention time for this step is approximately two (2) minutes at nominal flow rate.

10.2.2 INJECTION

A precise amount of microsand and flocculant (polyelectrolyte) are added and mixed in the water using a rotating mixer in a rectangular-shaped tank. The energy induced by the mixer accelerates the contact between the flocs, the polyelectrolyte and microsand, thereby ensuring the formation of ballasted flocs. The standard hydraulic retention time for this step is approximately two (2) minutes at nominal flow rate.

10.2.3 MATURATION

The flocs previously formed are then maintained in suspension for a certain time in a large rectangular tank with the help of a rotating mechanical mixer. The smooth agitation of the water insures a gradual increase in floc size, reaching floc maturation. The standard hydraulic retention time for this step is approximately six (6) minutes at nominal flow rate.

10.2.4 COUNTER-CURRENT LAMELLAR SETTLING

Ballasted flocs precipitate to the bottom of a hopper and the clarified water is collected at the surface using troughs. The sludge is drawn out of the hopper by a pump and is directed toward a series of hydrocyclones. The hydrocyclones located above the injection tank separate the microsand from the sludge. The microsand is recirculated into the system via the underflow of the hydrocyclones while the sludge is evacuated through the overflow. The hydraulic retention time for the settling step is about three (3) minutes at nominal flow rate.

10.3 CHARACTERISTICS AND PERFORMANCES

By combining ballasted flocculation with lamellar settling, the Actiflo® process allows the system to operate at increased loading rates. This design feature can be very beneficial when raw water turbidity and flow rate vary greatly.

The Actiflo® process also accepts activated carbon dosages aimed at reducing taste and odours.

While at design flow, the time to complete all three (3) stages of treatment, i.e. coagulation / injection / maturation, is only 10 minutes. This very short hydraulic retention time enables the process to respond quickly to adjustments in chemical dosages. Ballasted flocculation produces high quality clarified water, even when operating under difficult conditions, such as very cold and/or very coloured waters or waters with a high turbidity.

Actiflo® pilot plant tests have demonstrated the efficiency of this process as well as its ability to rapidly respond to changes in raw water flow rate and/or characteristics.

11 DESCRIPTION OF COMPONENTS

11.1 ACTIFLO® CLARIFIERS

11.1.1 GENERAL DESCRIPTION

An Actiflo® clarifier is composed of coagulation, injection and maturation tanks, a lamellar settling tank with a hopper, a series of lamellar tubes and troughs for the collection of clarified water, a microsand recirculation circuit, piping and a control panel.

11.1.2 COAGULATION TANK

Raw water enters the Actiflo® at the bottom of the coagulation tank. Coagulant is added upstream of this tank to improve contact time.

The coagulation tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is downward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the coagulation tank, allows draining this tank through the existing draining network.

11.1.3 INJECTION TANK

Coagulated water enters the top portion of the injection tank by going over a flooded overflow, which communicates directly with the coagulation tank. An accurate amount of microsand and polymer is added at the tank water surface. The polymer may also be directly added in the bottom injection or maturation tanks.

The injection tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is upward.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and operates at a constant speed. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator.

A manual drainage valve, located in the injection tank, allows draining this tank and the maturation tank through the existing draining network.

11.1.4 MATURATION TANK

Water and flocculated solids originating from the injection tank enter at the bottom of the maturation tank through a common opening.

The maturation tank is equipped with a mechanical mixer composed of a shaft and a four-bladed propeller made of stainless steel. The mixer is vertically mounted and the induced water flow direction is downward. The maturation tank is equipped with baffles to insure better mixing.

The mixer is driven by a motor and a helical gear speed reducer. It is a totally enclosed fan cooled motor (TEFC) and may operate at a constant or variable speed. An adjustment to the rotating speed can be proven necessary when the incoming water flow rate is greatly reduced. In this case, it might be advantageous to compensate for losses in hydraulic energy by increasing the speed of rotation of the maturation mixer. In case of thermo-mechanical overload, the motor stops automatically and an alarm warns the operator. The unit automatic shutdown sequence is also initiated.

A manual drainage located, in the injection tank, allows draining the maturation tank through the existing draining network.

11.1.5 SETTLING TANK

The settling tank is composed of a set of lamella tubes, a sludge collection system and a clarified water collector.

The water coming from the maturation tank contains a suspension of microsand-ballasted flocs and enters the settling tank after going through a vertical baffle. The solids settle in the hopper while clarified water flows through the lamella pack to the clarified water troughs.

11.1.5.1 Lamella Pack

The lamella pack consists of several polystyrene tubes positioned at an angle of 60° from horizontal plane. They are disposed in such a way that they form hexagonal-shaped cells (honeycomb). Smaller solids that did not settle directly in the hopper will deposit on the lamella pack surface and subsequently settle in the sludge collection hopper by their own weight. Clarified water flows upwards to the collection troughs and out of the clarifier.

Warning: The lamella pack is installed in the settling tank section of the Actiflo® clarifier. It is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

11.1.5.2 Sludge Collection Hopper

The collection of sludge takes place within a pyramidal hopper located at the base of settling tank where the settling solids are pumped to the hydrocyclones.

11.1.5.3 Circular Scraper

The settling tank has a circular scraper equipped with a stainless steel drive shaft and scrapers. Rubber scrapers are fitted onto the metal support. The scraper is mounted vertically. The scraper moves the microsand that has settled at the bottom of the hopper to its center where a basin captures the accumulated sludge. The scraper is powered by a gear motor combination. This motor is totally enclosed fan cooled (TEFC).

11.1.5.4 Clarified Water Troughs

Clarified water is collected above the lamella modules by stainless steel troughs. The dimension and position of the square-edged notches are designed in order to obtain an optimal hydraulic distribution of the flow rate inside the settling tank.

11.1.5.5 Partial Drainage

A manual valve, installed below the settling lamellas, allows for partial draining of the settling tank to facilitate the preventive maintenance of the lamellar plates.

11.1.5.6 Complete Drainage

There is two (2) ways to achieve a complete drainage of the clarifier:

1) By opening the coagulation, injection and hopper drain manual valves.
2) By opening the coagulation and injection manual drainage valves and turning the recirculation pump on.

Warning: It is important that the recirculation pump does not operate without water.

11.1.6 MICROSAND RECIRCULATION PIPING

11.1.6.1 Collection of Sludge and Microsand

Sludge containing microsand is collected in the hopper and pumped to the hydrocyclones through galvanized steel pipes and flexible non-abrasive pipes that can withstand highly abrasive conditions.

In case of clogging, a clean-out assembly is provided to backwash and flush the suction line by connecting a pressurized service water hose.

11.1.6.2 Microsand Recirculation Pumps

The clarifier is provided with a centrifugal pump (second pump optional) equipped with a pulley and drive belt arrangement. A backup pump is also supplied. The backup pump may be used to supplement the first pump if higher influent solids are experienced. The impeller and the inside of the volute are coated with a material (usually natural rubber) resistant to microsand abrasion. The motor is totally enclosed fan cooled (TEFC). In case of a thermo-mechanical overload, the motor will automatically shut down and an alarm will warn the operator.

The recirculation pump operates at a constant pressure. An increase in pressure may be caused by an obstruction of the discharge pipe and a decrease in pressure may be caused by unpriming of the pump or an obstruction of the inlet pipe. An optional pressure switch/pressure transmitter could be located at the pump discharge. If the measured pressure becomes too low, the pump stops and an alarm will warn the operator.

11.1.6.3 Hydrocyclones

The sludge and microsand are pumped by the recirculation pump to a dedicated hydrocyclone where the microsand is separated from the sludge particles. This process allows the recycling of clean microsand back into the system. Sludge-microsand separation is accomplished by a vortex effect exerting a centrifugal force on the mixture of particles.

The microsand grains, more dense than sludge particles, descend along the internal surface of the hydrocyclone, while the sludge particles ascend. The microsand is returned to the injection tank while the sludge is evacuated out of the system through the hydrocyclone overflow piping.

11.1.7 MICROSAND

The recycling of microsand into the injection tank along with the polyelectrolyte solution (polymer), serves as support for the flocs formation. The floc, ballasted with the microsand grain, becomes considerably heavier and therefore can settle more rapidly. The microsand has the following characteristics:

- Effective size: 85 µm or 135 µm (refer to technical datasheet)
- Uniformity coefficient: < 1.6
- Available in bags of 22.7 kg (50 lbs)

A small portion of the microsand is lost in the process; therefore periodic addition of microsand in the system is required. Microsand is available from VWTC.

Warning: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

11.1.8 COAGULANT

The coagulant to be used can either be alum $Al_2(SO_4)_3 \bullet 14\ H_20$, PASS (Poly Aluminum Silicate Sulphate) or PAC (Poly Aluminum Chloride). It is injected at the head of the process directly into the pipe leading to the tank.

By reacting with the alkaline components of the water, the coagulant forms a precipitate, which sticks to the colloidal particles in suspension and organic components in the raw water, thereby producing a floc. In some cases, an alkali (i.e. caustic soda) must be added to the water upstream of the clarifier, prior to the addition of coagulant.

The coagulant gets rapidly dispersed in the water when it is introduced into the coagulation tank.

Warning: The operation staff should be aware that coagulant is highly corrosive. Spills should be cleaned immediately according to the MSDS instructions.

11.1.9 FLOCCULANT (POLYELECTROLYTE)

The polyelectrolyte is a white powder generally sold in 50 lbs bags. The powder is naturally hygroscopic so it must be stored in a dry environment.

Polyelectrolyte is pumped into the injection and maturation tank along with the microsand. It forms a coating on the microsand particles in order to activate them and facilitate fixing of the floc onto the sand particle surface. Other injection points of polymer can also be used, that is, at the inlet of the maturation tank and at various locations inside the maturation tank.

Warning: The operation staff should be aware that polymer solution could be very slippery. Spills should be cleaned immediately according to the MSDS instructions.

11.1.10 CONTROL PANEL

The Actiflo® clarifier operation is fully automated but manual control is possible from the control panel interface. The control panel normally includes but is not limited to components such as fuses, starters, selectors, warning lights, PLC (Programmable Logic Controller) and operator interface.

The electrical circuit of the control panel performs the necessary functions for a fully automatic operation and equipment protection of the Actiflo® unit. The control panel gives the operator access to every mechanical component of the system. In addition, all the alarms are channelled through the control panel, which in turn warns the operator in the event of equipment malfunction.

Refer to the functional description of control system in the «Electricity and Control» section of the complete operation and maintenance manual for a control panel detailed description.

12 START-UP & OPERATION

12.1 START-UP

12.1.1 PRELIMINARY VERIFICATION

Before starting the Actiflo®, the following points must be checked:

- Remove any debris from the settling tank to prevent hydrocyclone clogging.
- Every section of the Actiflo® must be filled with water.
- Valves configuration on the microsand recirculation lines is adequate.
- Chemical metering systems must be ready to operate.
- Chemical storage tanks must be full.
- Chemical metering pumps must be calibrated and set for the desired dosage. These can however be adjusted once that the system is operational.
- All the field instruments must be calibrated (flowmeter, pressure transmitter).
- Verify the oil level in the mixers gear reducers and the grease in the recirculation pumps.
- Verify the rotation of each mixer.
- Verify the rotation of each recirculation pump; remove the belt to prevent impeller unscrewing if the rotation is the wrong way.
- Verify the proper installation of the mixer impellers, especially the height above tank floor (refer to technical sheet and field installation drawing).
- Adjust motor overload protection to the proper value as indicated on each motor nameplate.
- Record the pressure at the hydrocyclone inlet gauge. Refer to technical datasheet.

Once all these conditions have been checked, the system can be put into operation.

12.1.2 INITIAL MICROSAND LOADING

The standard microsand load in an Actiflo® clarifier is approximately 2000 lbs per MGD of design or 5 kg per m^3/h, flow rating of unit.

The addition of microsand is done by pouring it directly in the injection tank until the required concentration is reached. It is preferable to begin by adding a small quantity of microsand and measure the resulting microsand concentration in the hydrocyclone underflow after a whole recirculation cycle has been completed (15 to 20 minutes). The quantity of microsand should be increased until the optimal concentration in the underflow is reached (typically 80 to 200 ml/litre).

Warning: The microsand may contains fine particles of silica. Therefore, it must be handle safely and with caution by qualified staff. Consult the MSDS for further instructions.

12.1.3 AUTOMATIC START-UP

Refer to the functional description of control system of the «Electricity and Control» section of the complete operation and maintenance manual to start the Actiflo® system in automatic mode.

12.2 NORMAL OPERATION

Note:	In the case of a discrepancy between this section of the manual and the functional description of control system, the latest shall prevail.

12.2.1 ACTIFLO® CLARIFIERS

12.2.1.1 Microsand Monitoring

Although a minor amount of microsand is constantly discharged out of the process and a sand concentration between 5 and 15 g/L is sufficient for satisfactory operation of the Actiflo® process, the microsand concentration should always be maintained at recommended levels (5 to 15 g/L). This insures that the system is always prepared to treat the worst possible raw water conditions. Therefore, the operators should monitor the microsand concentration 2-3 times per day. The concentration can easily be estimated using the following methods.

A. Sampling from Hydrocyclone Inlet Sampling Valve

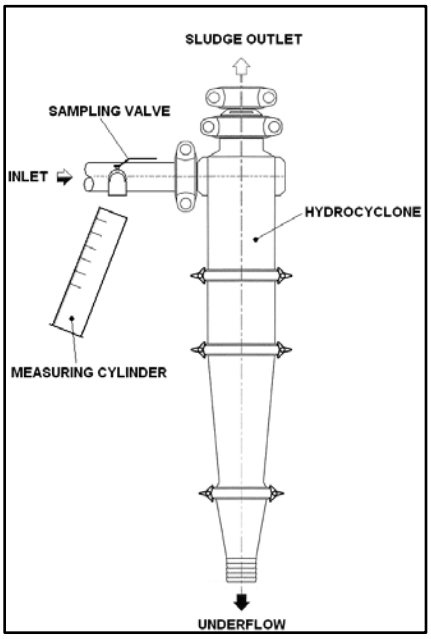

Figure 10: Microsand sampling from hydrocyclone inlet sampling valve

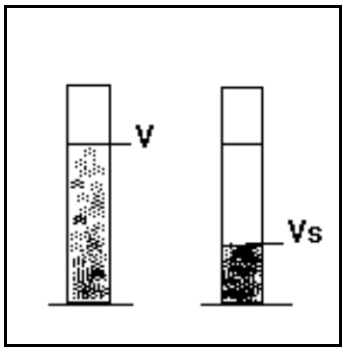
a. Verify that each operating hydrocyclone has an uninterrupted conical discharge. If you have a splashguard covering the apex tip, place it in the up position to verify this and make sure it stays in that position.
b. Obtain a 1000-2000 ml graduated cylinder to take the hydrocyclone inlet sample.
c. Open the ball valve located at the inlet piping of the hydrocyclone and fill the cylinder as close to the 1000 ml or 2000 ml mark as possible without over spilling. Caution: the 1000 ml cylinder may fill quickly and with force.
d. Allow the sample to settle for 3 minutes.
e. Record the volume of the settled sand (Vs) in ml along with the total sample volume (V) in ml. Refer to next figure.



f. Repeat steps c) through e) on the same hydrocyclone two (2) more times.
g. Use the same sampling procedure as you did on the first hydrocyclone and repeat steps c) through f) for all hydrocyclones in operation on the system. For example, if you have two hydrocyclones operating on a given system you should have six (6) values for Vs and six (6) values for V.
h. To determine the concentration of sand in the entire system you must next average all collected values of Vs. Also, average all collected values of V. Now you can use the following two (2) equations to first determine Cs (microsand concentration in the hydrocyclone inlet) and lastly Cm (microsand concentration in the Actiflo® system).

Note: For the most accurate determination of microsand in any given system the sampling procedure above should be performed three (3) times throughout a 24 hour period. Three (3) separate values of Cm should be averaged to determine one final microsand concentration for the day. It is also important to record and trend the final daily value of Cm to give indication of microsand loss over an extended period of time.

B. Sampling from Hydrocyclone Underflow

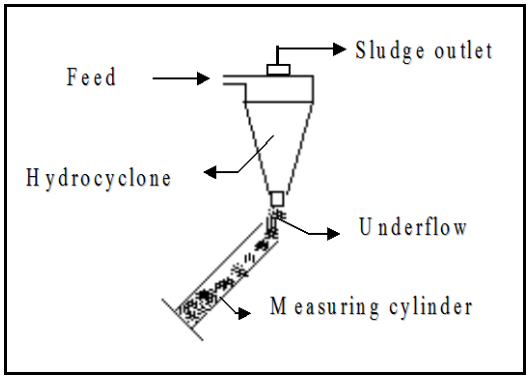


Figure 11: Microsand sampling from hydrocyclone underflow

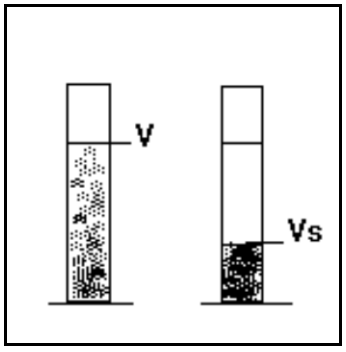
a. Verify that each operating hydrocyclone has an uninterrupted conical discharge. If you have a splashguard covering the apex tip, place it in the up position to verify this. After verification the splashguard should be returned to the down position prior to sampling.
b. Obtain a 1000-2000 ml graduated cylinder to take the hydrocyclone underflow sample. The underflow discharge must be sampled entirely and not partially. However, it is important to be consistent and obtain the sample from the identical section of the underflow discharge every time a grab is taken. If the underflow discharge is constantly or periodically roping, the underflow discharge should be sampled with a swirling motion that catches the outer and center portions of the underflow in each sample.
c. Fill the cylinder as close to the 1000 ml or 2000 ml mark as possible without over filling/spilling. Caution: the 1000 ml cylinder may fill quickly and with force.
d. Allow the sample to settle for 3 minutes.
e. Record the volume of the settled sand (Vs) in ml along with the total sample volume (V) in ml. Refer to next figure.



f. Repeat steps c) through e) on the same hydrocyclone two (2) more times.
g. Use the same sampling procedure as you did on the first hydrocyclone and repeat steps c) through f) for all hydrocyclones in operation on the system. For example if you have two (2) hydrocyclones operating on a given system you should have six (6) values for Vs and six (6) values for V.

h. To determine the concentration of sand in the entire system you must next average all collected values of Vs. Also, average all collected values of V. Now you can use the following two (2) equations to first determine Cs (microsand concentration in the hydrocyclone underflow) and lastly Cm (microsand concentration in the Actiflo® system).

C. Sand Concentration of Hydrocyclone Inlet

The microsand concentration of the hydrocyclone entrance is calculated with the following formula:

$$C_S = \frac{1000}{V} \times V_S \times 1.5$$

Where:
C_s: Microsand concentration in the hydrocyclone entrance (g/l)
V: Sample volume taken in a graduated cylinder (ml)
V_s Volume of the settled microsand after settling for 3 minutes (ml)
1.5: Density of the settled microsand (kg/l)

System Sand Concentration

Knowing the flow rate of the hydrocyclone entrance (gpm) and the microsand concentration (g/l) of the hydrocyclone entrance, the microsand concentration (g/l) in the Actiflo® system is determined using the following formula:

$$C_m = \frac{Q_{Hydro} \times N \times C_S}{Q_{in}}$$

Where:
C_m: Microsand concentration in the Actiflo® system (g/l)
C_s: Microsand concentration in the hydrocyclone entrance (g/l)
Q_{Hydro}: Hydrocyclone entrance flowrate (gpm)
N: No. of hydrocyclones in operation
Q_{in}: Influent flow rate (gpm)

D. Sand Concentration of Hydrocyclone Underflow

The microsand concentration of the hydrocyclone underflow is calculated with the following formula:

$$C_S = \frac{1000}{V} \times V_S \times 1.5$$

Where:
C_s: Microsand concentration in the hydrocyclone underflow (g/l)
V: Sample volume taken in a graduated cylinder (ml)
V_s: Volume of the settled microsand after settling for 3 minutes (ml)
1.5: Density of the settled microsand (kg/l)

System Sand Concentration

Knowing the flow rate of the hydrocyclone underflow (gpm) and the microsand concentration (g/l) of the hydrocyclone underflow, the microsand concentration (g/l) in the Actiflo® system is determined using the following formula:

$$C_m = \frac{UF \times N \times C_s}{Q_{in}}$$

Where:
C_m: Microsand concentration in the Actiflo® system (g/l)
C_s: Microsand concentration in the hydrocyclone underflow (g/l)
UF: Hydrocyclone underflow flowrate (gpm)
N: No. of hydrocyclones in operation
Q_{in}: Influent flow rate (gpm)

E. Microsand Addition

Some microsand is lost at the hydrocyclone overflow and at the Actiflo® effluent. Periodic microsand addition is required to compensate for these losses (in typical conditions, normal loss is from 3 to 6 g/m^3). The addition of microsand is done directly in the flocculation tank. Since microsand contains a small proportion of very fine particles, the turbidity of the clarified water could increase slightly for a short period following the addition of microsand.

In standard operation mode, if a sustained increase of the raw water turbidity happens, it may be necessary to increase the concentration of microsand in the system to maintain the removal efficiency.

12.2.1.2 Microsand Recirculation Pumps

Each Actiflo® has one (1) or two (2) recirculation pumps and associated piping. It is essential that a recirculation pump be in operation continuously. When the pump stops, sludge and microsand accumulate in the hopper; this may clog the recirculation line. When the recirculation pump needs to be stopped, the mixer in the maturation tank must be stopped first, followed by the scraper. The scraper will operate for a short period of time before stopping the pump. This allows the hopper to be emptied before stopping the pump. The duration may be adjusted by the operator on the control panel.

Recirculation Pumps Options:

If the pumps are protected by a pressure switch (optional) / pressure transmitter (optional), alarms will be issued in any of the following situations:

- Thermo-mechanical overload of the pump: this is normally a sign of overheating of the pump motor and can be caused by a mechanical breakdown or a pressure surge. The operator must correct this problem by verifying the pump and motor as well as the outlet piping and then reactivate the overload relay located inside the control panel.

- Low pressure at the pump outlet: this can be caused by incomplete priming of the pump or closed isolation valve or clogging of the pump suction line. The operator must make sure that there is no obstruction at the inlet of the pump and in such case, the sludge suction piping must be cleaned according to the following procedure:

  - Stop the pump.
  - Close the valve on the pump suction side.
  - Connect a service water hose to the clean-out outlet.
  - Open the service water valve.
  - Let the service water run for approximately five (5) minutes.
  - Put the equipment back into normal operation.
  - Restart the pump.

The low pressure alarm set point is adjustable via the low pressure switch and is usually set at 3 to 5 psi below the normal operating pressure of the pump. When an alarm is activated, the pump stops automatically and the alarm light blinks on the control panel. The operator must acknowledge the alarm by pressing the ALARM ACKNOWLEDGE button located on the control panel, fix the problem and then reset the system by pressing the ALARM RESET button. The pump will restart automatically.

12.2.1.3 Hydrocyclones

The operator must make sure that the hydrocyclone outlets are free of obstruction at all times. Debris, as small as 13 mm (1/2"), can clog the underflow.

Waste sludge is evacuated from the Actiflo® at the hydrocyclone overflow (70% to 90% of the hydrocyclone flow rate). A small amount of microsand is lost at the overflow. It is important to check on a daily basis if the loss is higher than normal. This can be verified by collecting a 1 L sample of the overflow into an *Imhoff* cone and measuring the volume of settled microsand after 2 or 3 minutes. Record the value and compare it with past measurements. Refer to troubleshooting section.

The same procedure is used to measure the concentration of sand at the hydrocyclone underflow (10% to 30% of the hydrocyclone flow rate):

- Collect a 1 L sample from the underflow (mixture of microsand and water).
- Allow the sample to settle for 2 or 3 minutes and then measure the volume of settled microsand.
- The volume of microsand should range between 80 and 200 ml/L of water (5 to 15 g/L).

Warning:	It is important to keep the cone underflow of the hydrocyclone at all times during operation of the Actiflo®. In absence of this cone, a premature wear of the tank wall may occur due to the sandblasting of the hydrocyclone.

12.2.1.4 Mixers

The mixers all have a specific rotation direction and speed. In the event of a mixer motor overload, the mixer automatically stops and an alarm warns the operator. The operator must press the ALARM ACKNOWLEDGE button, correct the problem and then reset the system by pressing ALARM RESET button. If the operator cannot correct the problem, the Actiflo® should be shut down, as it is impossible to produce clarified water with a mixer out of service.

12.2.1.5 Circular Scraper

When an overload occurs to the scraper motor or when a very high torque is detected, the motor shuts down automatically and an alarm warns the operator and the Actiflo® will stop as per the stop sequence.

12.2.1.5.1 SGT90 and Moeller Easy Relay Configuration (UNITED STATES)

a) Scraper Load Cell Adjustment (HIGH TORQUE)

Procedure to adjust the HIGH TORQUE alarm set point on the Moeller Easy Relay

Figure 12: Moeller Easy Relay

In normal operation, the display indicates the values of inputs/output. To change the values of alarm set points:

12.2.1.5.2 HPL 220 Configuration (CANADA)

Mode	Function	Parameter	▼	▲	Display	Default
Meas'mt	Display measurement		Min. peak	Max. peak	Meas'mt [%]	
Limits	Limit 1 prog./display	Off,5-100%	Decrease	Increase	Limit 1	80
Limits	Limit 2 prog./display	Off,5-100%	Decrease	Increase	Limit 2	Off
Ts [S]	Start timer	0.0-25.0 Sec.	Decrease	Increase	Ts [Sec]	2.0 Sec.
Tr [S]	Alarm reaction timer 1	0.0-25.0 Sec.	Decrease	Increase	Tr [Sec]	0.1 Sec.
Tr [S]	Alarm reaction timer 2	0.0-25.0 Sec.	Decrease	Increase	Tr [Sec]	0.1 Sec.
Hyst's	Hysteresis 1	5-50%	Decrease	Increase	Hyst's [%]	10
Hyst's	Hysteresis 2	5-50%	Decrease	Increase	Hyst's [%]	10
Units						
Full scale	Max. input	20-100%	Decrease	Increase	'Full scale'	100
Offset	Offset adjustment ±	±10%(F.S.)	Decrease	Increase	Meas'mt [%]	---
Input	Input select	Vdiff, 10V, 20mA	Vdiff-10V-20mA	20mA-10V-Vdiff	"Inp"	Vdiff

Figure 13: HPL 220 Configuration parameters

a) Typical Adjustment

- Limits 1: Refer to the technical product data sheet
- Limits 2: Refer to the technical product data sheet
- Ts: 0
- Tr 1: 0
- Tr 2: 0
- Hyst's 1: 5
- Hyst's 2: 5
- Full Scale: 30 mV (with 500 N load cell and 10 VDC)
- Offset: 0
- Input: Vdiff

b) Limit 1 & 2 Adjustment

The limit 1 and 2 values can be adjusted by 0.5% increment and need to be set in the range from 0.5% to 100% of the load cell total value.

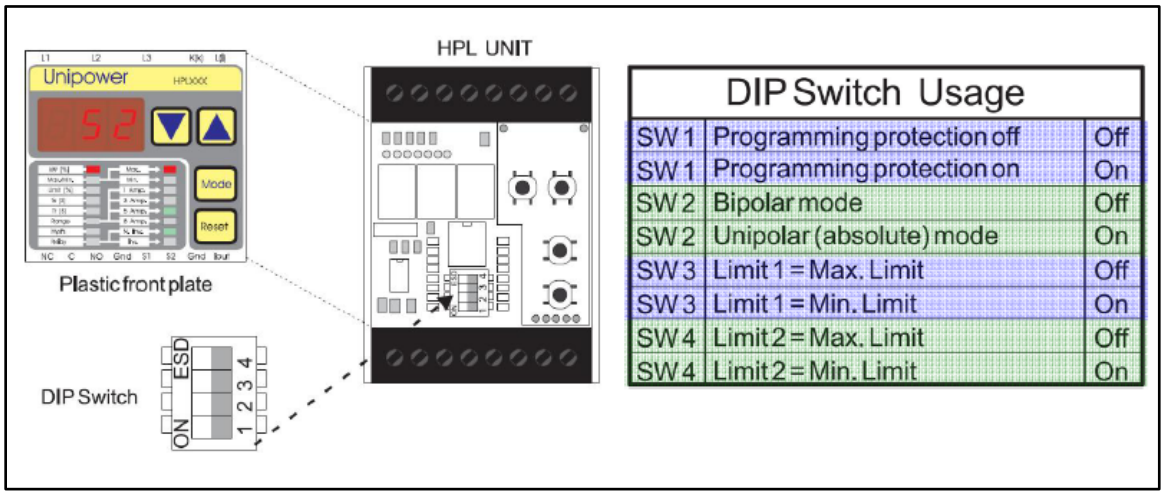
For example: The load should be limited at 238 N and the load cell can accept up to 500 N.

$$HPL_{Limit} = \frac{F_{Required}}{F_{Full\ Load}} \times 100$$

$$HPL_{Limit} = \frac{238}{500} \times 100 = 47.6\% \approx 48\%$$

The percentage value remain between the 0, 5% to 100% which is acceptable.

c) Dip Switch



DIP Switch Usage

SW 1	Programming protection on	On
SW 2	Bipolar mode	Off
SW 2	Unipolar (absolute) mode	On
SW 3	Limit 1 = Max. Limit	Off
SW 3	Limit 1 = Min. Limit	On
SW 4	Limit 2 = Max. Limit	Off
SW 4	Limit 2 = Min. Limit	On

Figure 14: HPL 220 DIP Switch settings

1) Turn-off the HPL 220
2) Remove the cover
3) Set the dip switches according to the following:
   - SW1: **OFF**
   - SW2: **ON**
   - SW3: **OFF**
   - SW4: **OFF**
4) Reassemble the HPL 220

12.2.2 DOSAGE OF CHEMICALS

12.2.2.1 Coagulant

The coagulant is injected into the raw water feed line.

In either case, the dosage to be used varies according to the characteristics of the raw water. An increase in turbidity of the raw water must signify an increase in product dosage. The proper dosage is determined by a jar test.

The concentration of coagulant at the inlet of the system is calculated from the flow rate of the raw water and metering pumps:

$$Coagulant\ Concentration\ (mg/L) = \frac{Metering\ Pump\ Rate\ (mg/h)}{Raw\ Water\ Flow\ Rate\ (L/h)}$$

12.2.2.2 Flocculant (polyelectrolyte)

The polyelectrolyte is used in solution with a concentration ranging from 0.5 to 2.5 g/L, the produced solution is viscous. In order to obtain a high quality polymer, it is recommended to use non chlorinated filtered water for its preparation and transport. The concentration of polyelectrolyte in the clarifier should be between 0.40 to 0.90 mg/L. Depending on the quality of the raw water, this concentration can be increased or decreased. The polyelectrolyte concentration in the system is calculated from the flow rate of the raw water and metering pumps:

$$Polyelectrolyte\ Concentration\ (mg/L) = \frac{Metering\ Pump\ Rate\ (mg/h)}{Raw\ Water\ Flow\ Rate\ (L/h)}$$

The ideal dosage of polyelectrolyte can be determined with a jar test (refer to the jar test procedure in this manual).

Insufficient polymer dosage will cause free flocs to appear that are not ballasted by the microsand and which will not be correctly eliminated in the settling tank. The clarified water might have a higher turbidity and/or color, and an important aluminum concentration.

However, excess in polyelectrolyte dosage can produce very sticky sludge, which is difficult to recycle.

12.2.2.3 Alkali, pH Adjustment

The water pH is the most important factor to consider in a coagulation process. When using alum, maximum coagulation efficiency is reached when pH readings are between 5.5 and 7.0. If the raw water has a low pH, it is important to increase it by adding an alkaline product (ex. caustic soda, etc.) to the water upstream of the coagulation step.

Upstream of the coagulation step, the hydraulic residence time of the alkali must be long enough, allowing time for it to completely dissolve in the water, increasing the precision in the adjustment of the water pH.

13 SURVEY OF OPERATIONS

In order to insure a reliable survey of the Actiflo® system operation and to provide the operators with a useful data bank, we suggest to the operators to record the following parameters:

ON A HOURLY BASIS:

- Turbidity, raw water
- Color, raw water
- pH, raw water
- Turbidity, clarified water
- Color, clarified water
- PH, clarified water

EVERY EIGHT HOURS:

- Flow rate, raw water
- Flow rate, coagulant metering pump and calculated concentration
- Flow rate, polyelectrolyte metering pump and calculated concentration
- Flow rate, alkali metering pump and calculated concentration
- Alkalinity, clarified water
- Pressure at the recirculation pump outlet
- Pressure at the hydrocyclones inlet
- Microsand concentration at the hydrocyclone underflow

ON A DAILY BASIS:

- Total quantity of clarified water
- Mixers speed
- Electric current drawn by the mixers
- Other parameters of interest: dissolved iron and manganese, total organic carbon, etc.
- Alkalinity, raw water
- Average raw water flow

ON A WEEKLY BASIS:

- Flow rate of the hydrocyclone underflow
- Flow rate of the hydrocyclone overflow

13.1 AUTOMATION

Refer to the functional description of control system in the «Electricity and Control» section of the complete operation and maintenance manual.

13.2 SHUT DOWN

In manual mode, when the microsand recirculation pump needs to be stopped, the following procedure must be followed in order to prevent possible clogging problems:

- Stop the mixer in the maturation tank. This allows the microsand to settle in the maturation tank instead of in the hopper.
- After approximately 30 minutes, verify that the underflow of the hydrocyclone does not contain any microsand.
- The microsand recirculation pump can then be stopped without any risk of clogging the recirculation line.

13.3 TROUBLESHOOTING

13.3.1 INCREASE IN CLARIFIED WATER TURBIDITY

If the turbidity of the clarified water should increase suddenly, verify the following parameters:

- The flow rate of raw water: if it is greatly increased or diminished, dosage flow rate of coagulant and polyelectrolyte should be adjusted in consequence.
- The flow rate of coagulant and polyelectrolyte: the metering pumps must inject an accurate dosage of these chemicals, such that the desired concentrations in the system can be obtained.
- The quality of raw water: if the turbidity, colour and/or the alkalinity of the raw water are increased or decreased, it is normally necessary to adjust the concentration of coagulant in the system. This dosage can be predetermined with the help of a jar test. However, a change in the quality of the raw water does not usually require an adjustment in polyelectrolyte concentration.
- The concentration of microsand in the underflow of the hydrocyclone: this must approach a value between 80 and 200 ml/L (5 to 15 g/L). Deterioration in the raw water quality can necessitate an increase in the quantity of microsand in the system.
- Sludge-sand recirculation rates: these flow rate generated by the recirculation pump must be kept constant.
- Maturation mixer rotation speed: mixer speed can be read directly on the display of the corresponding variable frequency drive.

13.3.2 INCREASE IN CLARIFIED WATER COLOUR

Clarified water color (apparent and true) is one of the parameters to follow since it indicates the performance of the Actiflo® process and the proper dosage of coagulant and pH adjustment. The next figure shows the troubleshooting guide if clarified water color increases and actions to take.

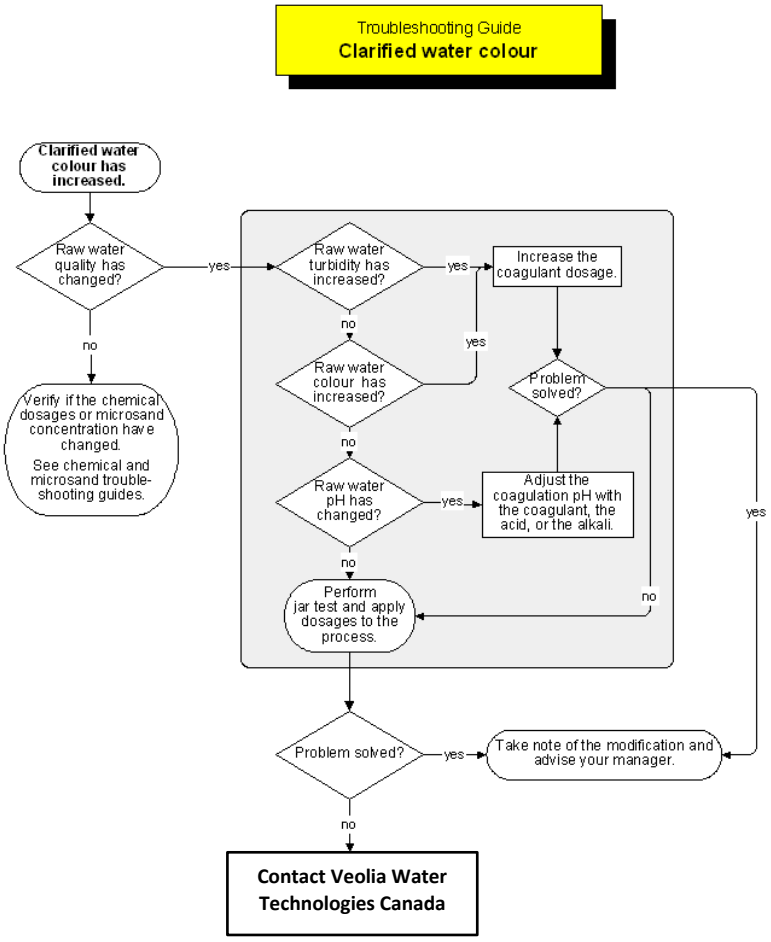

Figure 15: Clarified water colour - Troubleshoothing guide

13.3.3 STOPPING OF MICROSAND RECIRCULATION PUMP

In manual mode, when the microsand recirculation pump needs to be stopped, one must, in order to prevent possible clogging problems, proceed as follow:

- Stop the mixer in the maturation tank. This allows the microsand to settle in this tank instead of in the hopper.
- After approximately 30 minutes, verify that the underflow of the hydrocyclone does not contain any more sand.
- Afterwards, one can stop the pumping of sand without any risks of clogging the microsand recirculation circuit.

13.3.4 POWER FAILURE

Refer to the functional description of control system in the «Electricity and Control» section of the complete operation and maintenance manual.

14 JAR TEST PROCEDURE

14.1 INTRODUCTION

In order to simulate the Actiflo® process, a modified jar test procedure was developed. The procedure can be useful for optimizing process chemistry (pH, chemical dosages, etc.), which will produce settled water low in turbidity and with a high filterability index. Furthermore, the modified jar test procedure has the capability to evaluate or predict process performances of an existing Actiflo® unit and bring accurate diagnosis on operating troubleshooting.

14.2 MATERIAL REQUIRED

- Phipps & Bird jar test apparatus or equivalent lab stirrer allowing up to 300 RPM rotational speed
- Circular beakers (1 litre)
- Microsand
- Polymer (Allied Colloids, serial LT or equivalent)
- Coagulant (Alum, ferric chloride, PAC, PASS 100 or equivalent)
- Acid or base for pH and alkalinity adjustment (NaOH, aluminates, HCl, H_2SO_4, lime, carbonate, bicarbonate, CO_2, or equivalent)
- Turbidimeter (Hach 2100AN or equivalent)
- pH-meter (serial Hach EC or equivalent) and calibration solutions (pH=4, pH=7 and pH=10)
- Chronometer or stopwatch
- Micro pipettes 5 ml-1000 ml
- Disposable syringes 1 ml-5 ml

14.3 LABORATORY PROCEDURES

1. Record settled and raw water parameters values at the plant (turbidity, colour, dissolved aluminum, etc.) if the purpose of this test is to simulate the full scale unit.
2. Fill up the beakers with raw water.
3. Set the beakers on the bench.
4. Make sure raw water temperature corresponds to the desired temperature.
5. Set the paddle between 0.5 and 1.0 cm from the bottom of the beaker.
6. Start mixing and adjust rotation speed to 150 rpm.
7. If needed, add acid, base or equivalent and adjust at the optimum coagulation pH.
8. Add coagulant simultaneously in all beakers with micro-syringes from 0, 0.5, 1.0, 2.0 or 5 minutes after reaching the right pH in accordance with contact times simulated.
9. “A” minutes after adding coagulant (“A” corresponding to full-scale plant retention time in coagulation tank at the desired flow), add all microsand and half the quantity of polymer using a syringe.

10. After a delay of “B” minutes (“B” corresponding to full-scale plant retention time in injection tank at the desired flow), add the rest of polymer.
11. After a maturation contact time of “C” minutes (“C” corresponding to full-scale plant retention time in maturation at the desired flow), stop stirring and allow the water to settle for the next 3 minutes.
12. Sample settled water from 5 to 10 cm below the supernatant surface using a 100 ml syringe. Proceed slowly. Make required analysis.

Note: Contact times “A”, “B” and “C” will be explained and a table given for various flow conditions, during operator training sessions. Values for operation at typical design rate of 40 m/h are as follows: A: 2 min.; B: 2 min.; C: 6 min.

14.4 ANALYSIS

Turbidity, colour and other parameters.

1. Measure turbidity (NTU) using a turbidimeter.
2. Measure apparent colour (ACU) using a spectrometer.
3. Measure pH using pH meter.
4. Measure any other required parameters.

15 MAINTENANCE

15.1 ACTIFLO® CLARIFIER

15.1.1 LAMELLA PACK

WARNING

- Comply with all safety rules and policies if you need to access the settling tank.
- If you must go under the lamellas, make sure of the support beams integrity and the cleanliness of the lamellas.
- Before lowering the water under the lamellas, make sure you have removed some of the accumulated sludge in the lamellas (visible from the top of the clarifier) to reduce the supported weight.
- In the case of excessive plugging, the sludge weight can damage the lamellas and in extreme cases, collapse and cause serious injury to anyone under the modules.
- If lamellas are exposed to very cold temperatures, do not proceed with dewatering the lamellas because the cold makes them too fragile. It is then cleaned by keeping a layer of water above and uses the water jet to create pulsations in the lamella cells to loosen sludge.

15.1.1.1 Lamellas fouling

To maintain the Actiflo® performance, the lamellas should be cleaned regularly. The nature of the raw water, the quality of the clarified water produced and the flow rates handled are factors influencing the fouling. The lamellas fouling can be of two types:

- Visible (observable fouling from above lamellas)
- Invisible (fouling in the lower area of the lamellas)

The visible fouling may be an indicator of an invisible fouling in the lower area. In the case of significant invisible fouling, the lamellas can be damaged.

15.1.1.2 Cleaning frequency

There is a need for a regular cleaning of the lamella modules, by water jet or air jet, to maintain the Actiflo® clarifier performance. The recommended cleaning frequency is once every week. This may be more or less spaced according to the fouling rate observed. The cleaning frequency interval is the operator responsibility, although a minimum frequency is recommended.

15.1.1.3 Required equipment

Depending on whether the cleaning is carried out by air or water, it is suggested to use a PVC pipe fitted at its upstream end of a hose connector and elbow, nozzle or sprayer at its downstream end to direct water or air along the inclined axis of the lamellas. The length of PVC pipe should be sufficient for it to be handled from the top of the Actiflo® unit while allowing access to the bottom of the modules.

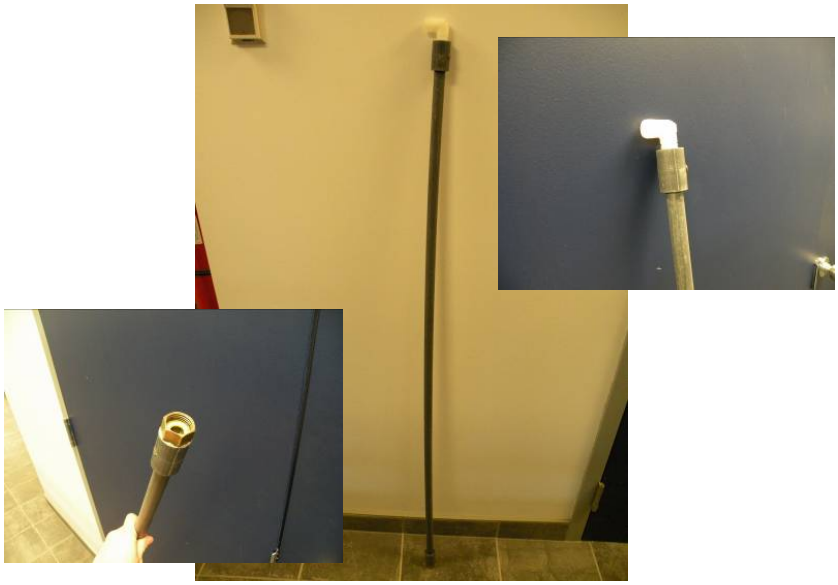

Figure 16: Suggested material for lamella cleaning

15.1.1.4 Lamella cleaning procedure

Lamellas cleaning can be achieved in 3 ways:

- Manual cleaning with water;
- Manual cleaning with air;
- Automatic cleaning with integrated system under the lamella modules (optional).

15.1.1.5 Manual cleaning with water

The cleaning procedure with water is:

1. Stop the Actiflo® unit according to the normal procedure;
2. Start the microsand recirculation system, in manual mode, including the scraper, if necessary, to assist in the disposal of cleaning sludge;
3. Slowly drain the basin using the partial drain located under the lamellas so as to have a lowering rate of 2 to 5 cm/min and start cleaning during emptying;
4. Open water jet on a wall of the decanter to prevent damage to the lamellas;

5. Clean the lamellas with a low pressure water jet (approximately 20 to 25 psi) using a cleaning tool (refer to previous figure). Repeat to clean every lamella. The water jet should be directed parallel to the lamella axis to clean the entire length;
6. With the aid of a high intensity light beam, validate the quality of the cleaning. When the lamellas are properly cleaned, it is possible to see through them;
7. Once completed, close the water jet on a wall of the decanter to prevent damage to the lamellas;
8. Finally, return the Actiflo® unit to service, to the sewer or to production depending on the quality of clarified water to be produced.

15.1.1.6 Manual cleaning with air

The cleaning procedure with air is:

1. Stop the Actiflo® unit according to the normal procedure;
2. Start the microsand recirculation system, in manual mode, including the scraper, if necessary, to assist in the disposal of cleaning sludge;
3. Insert the cleaning tool through the lamellas so that it goes below the lamella module and then inject air. Repeat to clean every lamella section;
4. Slowly drain the basin using the partial drain located under the lamellas so as to have a lowering rate of 2 to 5 cm/min;
5. Clean the lamellas with a low pressure water jet (approximately 20 to 25 psi) using a cleaning tool (refer to previous figure). Repeat to clean every lamella. The water jet should be directed parallel to the lamella axis to clean the entire length;
6. With the aid of a high intensity light beam, validate the quality of the cleaning. When the lamellas are properly cleaned, it is possible to see through them;
7. Once cleaning is completed, return the Actiflo® unit to service, to the sewer or to production depending on the quality of clarified water to be produced.

15.1.1.7 Automatic Cleaning with Integrated System under the Lamella Modules (Optional)

Please contact Veolia Water Technologies Canada to validate if this option is applicable. Refer to section 1 for contact.

The automatic cleaning system will clean the lamella modules according to a programmed sequence. The variation of the water level and air injection will be used for cleaning.

- The partial drain valve: used to drain the settling tank of the Actiflo® unit down to a few inches under the lamella.
- Backwash air valve: inject air under the lamellas with proper flow rate and pressure. Refer to technical datasheet.

Manual backwash sequence:

- Stop the Actiflo® unit according to the normal procedure.
- Open the partial drain valve to lower the level under the through.
- Open the backwash air valve and continue lowering the water level.
- Close the backwash air valve.
- Continue draining for a short time (with partial drain).
- Close the partial drain valve.
- Restart the Actiflo® unit.

Note:	Open confirmation from partial drain valve is needed to allow the opening of the air valve. Close confirmation from partial drain valve is needed to allow Actiflo® to restart.

15.1.1.8 Severe Obstruction

If the lamellas are severely obstructed or if the cleaning system is temporally down. It is recommended, every week, to stop the unit and partially drain the clarifier such that the lamellas are exposed (with the partial drain valve on the hopper). The lamellas can then be cleaned using a garden hose at 30 to 40 psi (maximum pressure). Remove any substance that is stuck to the settling module and which could interfere with the process efficiency.

15.1.2 MIXERS

For each mixer:

- Make sure that the gearbox remains clean.
- Check on a regular basis the oil level in the gearbox.
- Change the oil in the gearbox.
- Refer to the mixer manufacturer manual for complete inspection and maintenance requirements.

15.1.3 MICROSAND RECIRCULATION PUMPS

- Every day, proceed to a visual inspection of the packing adjustment.
- Every 1000 hours of service (every 6 weeks at 24 hr/day), lubricate the bearings and check belt tension.
- Twice a year, proceed to an inspection of the pump: dry seal, impeller, rubber coating, bearings, etc.
- Refer to the pump manufacturer manual for complete inspection and maintenance requirements.

15.1.4 HYDROCYCLONES

- After the first year, inspect the inside surface. Replace worn sections if needed. The first inspection will determine the frequency of replacement.
- Refer to the hydrocyclone manufacturer manual for complete inspection and maintenance requirements.

15.1.5 SCRAPER

- Every 8700 hours of operation, change the oil in the gear motor.
- Refer to the gear motor manufacturer manual for complete inspection and maintenance requirements.

15.2 CONTROL PANEL

For each panel, including junction boxes:

- Replace fuses when needed.
- In case of an electrical problem other than a fuse, contact a certified electrician and verify the circuits.
- Refer to the electrical drawings.

15.3 INSTRUMENTATION

For each instrument equipped with a controller/transmitter:

- Calibrate instrument on a regular basis.
- Refer to the manufacturer manual for calibration instructions and maintenance requirements.

15.4 VALVES

15.4.1 MANUAL VALVES

- No preventive maintenance required.
- Refer to the manufacturer manual, if needed.

15.4.2 AUTOMATIC VALVES

- Refer to the manufacturer manual for complete inspection and maintenance requirements.

15.5 PERIPHERAL EQUIPMENT

- Any other peripheral equipment needing maintenance should be inspected on a regular basis.
- Refer to the manufacturer manual for complete inspection and maintenance requirements.

15.6 PAINT INSPECTION

To maintain the life expectancy or life-cycle of Sherwin Williams Macropoxy 646 PW or Duraplate UHS coating system applied as an internal lining system for potable or fresh water tank, a well-planned inspection schedule is required. When the coating system is applied adequately to properly prepare steel substrate, it can last up to 15 years or more.

The recommend inspection schedule is:

- Inspect after 12 months following the initial application of the coating system. If the substrate is exposed, if the surface is damage or require repairs, perform spot repairs according to the coating system manufacturer instructions specified in the following section.
- Repeat inspection every 3 years and repair.

15.7 PAINT REPAIR PROCEDURE

This procedure applies to Sherwin Williams Macropoxy 646 PW or Duraplate UHS coating system applied as an internal lining system for potable or fresh water tank.

If the painted surface is damage or require repairs perform the following:

1. Clean the surface with solvent according to surface preparation standard SSPC SP1 to remove any contamination.
2. Perform abrasive blasting of the surface according to surface preparation standard SSPC SP10 or perform power tool cleaning to bare metal as per SSPC SP11.
3. Surface preparation must create or expose existing profile to meet the minimum requirement set in the Sherwin Williams product data sheet.
4. Lessen the unevenness between the existing coating and steel by sanding the edges of the existing coating to a smoother transition.
5. Sand 5 to 10 cm on the existing coating surrounding the repair area in order to obtain a matte and rough surface.
6. Clean again the surface according to SSPC SP1 to remove any contamination or dust.
7. Apply Macropoxy 646 PW or Duraplate UHS, depending on the paint type used in the project, to restore specified dry film thickness (DFT) measurement.

15.8 LUBRICATION

- Refer to the following table for the lubrication schedule.
- Refer to the manufacturer equipment manual for complete lubrication, inspection and maintenance requirements.

15.8.1 LUBRICATION SCHEDULE

Equipment to be serviced	Component serviced	Type of lubrication	Lubricant manufacturer	Lubricant brand name	Quantity of lubricant	Lubrication schedule	Comments
Scraper (SEW Eurodrive)	Reducer box (Applicable for ACP-400R and up)	Food grade oil	Chevron	FM Grade ISO 460 or equivalent	8 - 14 L (2.1 - 3.7 gallons)	Change oil every 8700 hours of continuous operation	Fill by the glass window up to the oil level plug or to about half of the height of the slewing ring (10L approx.)
	Gearmotor	Food grade oil	Klüberoil	4UH1-460 N	1.9 L (0.5 gallon) for primary gear reducer and 14.0 L (3.7 gallons) for secondary reducer	Check oil and oil level every 6 months Change oil every 3 years	When changing oil, also replace oil seal (do not install it in the same track).
	Gearmotor bearings	Food grade grease	Aral	Aralube BAB EP2	Low RPM bearings: Fill the cavities between the rolling elements one-third full with grease High RPM bearings: Fill the cavities between the rolling elements two-third full with grease	Replace anti-friction bearing grease every 3 years	Regreasing recommended at the same time as changing the oil or replacing bearings
	Motor bearings	Food grade grease	Aral	Aralube BAB EP2		Every 10000 hours of operation, check ball bearings and change if necessary	The motor anti-friction bearings are covered on both sides and cannot be regreased

Table 3: Lubrication schedule

Equipment to be serviced	Component serviced	Type of lubrication	Lubricant manufacturer	Lubricant brand name	Quantity of lubricant	Lubrication schedule	Comments
Mixers (Envirequip)	Motor bearings						The bearings are sealed for life. No additional lubrication required.
	Reducer box	Food grade oil	Chevron	FM ISO FM 220	5.4 L (1.4 gallons)	Check oil and oil level every 6 months Change oil every 2 years or 10000 hours	
	Reducer box bearings	Food grade grease	Mobil	Grease FM 222 (NLGI 2)	The bearing cavity should be packed to approximately 1/3 full with grease	Regrease bearings every 6 months	
Mixers (PMSL) (Food Grade)	Motor bearings	Grease	Esso	Alvania R3	0.14 oz - 0.32 oz (4.0 g - 9.0 g) (refer to manufacturer's instruction)	Regrease bearings every 12000 hours	Motors are not equipped with grease fittings. Lubrication is carried out during periodical overhauls when the motor is taken apart.
	Reducer box	Food grade oil	Chevron	Lubricating Oil FM	19 L (5 gallons) Except ACP2-75: 26.5 L (7 gallons)	Check oil level weekly (mixer must be off) Change oil in mixer drive every 6 months or 2500 hours.	After the initial break-in period, two weeks of operation, the oil should be changed while the equipment is at operating temperature.
	Reducer box bearings	Food grade grease	Bell Ray	No-Tox HD Grease #2		Add grease to all bearings, couplings, and seals every 6 months or 2500 hours.	

Table 3: Lubrication schedule

Equipment to be serviced	Component serviced	Type of lubrication	Lubricant manufacturer	Lubricant brand name	Quantity of lubricant	Lubrication schedule	Comments
Mixers (PMSL) (Synthetic)	Motor bearings	Grease	Esso	Alvania R3	0.14 oz - 0.32 oz (4.0 g - 9.0 g) (refer to manufacturer's instruction)	Regrease bearings every 12000 hours of operation	Motors are not equipped with grease fittings. Lubrication is carried out during periodical overhauls when the motor is taken apart.
	Reducer box	Synthetic grade oil	Chevron	Tegra 320	19 L (5 gallons) Except ACP2-75 : 26.5 L (7 gallons)	Check oil level weekly (mixer must be stopped) Change oil in mixer drive every 6 months or 2500 hours.	After initial start-up, sample the oil after the first 100 hours or three months of operation; thereafter, take samples for analysis every 2500 hours of operation or six months, whichever occurs first. Note that the initial oil analysis results may show remnants of the factory preservative oil.
	Reducer box bearings	Food grade grease	Chevron	Black Pearl EP (NLGI 2)		Add grease to all bearings, couplings and seals every 6 months or 2500 hours.	
Recirculation pump (McLanahan)	Pump	Grease	Shell	Alvania Grease 3 (NLGI 2)	Inject grease by six strokes of a regular size grease gun (2" diameter body)	Regrease bearings every 1000 hours of operation	
	Motor bearings	Grease	Esso	Polyrex® EM (NLGI 2)			Does not require lubrication as bearing life is 20000 hours
Recirculation pump (Seepex)	Pump	Grease	Please refer to manufacturer's operation and maintenance manual				
	Motor bearings	Grease	Esso	Polyrex EM (NLGI 2)	0.61 oz (17.3 g)	Regrease bearings every 4750 hours of operation

1 INTRODUCTION

This document provides handling, storage, installation, operation and maintenance instructions for the Hydra-Pol™ polymer preparation system. The components of the Hydra-Pol™ are supplied by Veolia Water Technologies Canada (**VWTC**).

To obtain any additional information regarding characteristics or instructions on this equipment, please do not hesitate to contact us.

The system was designed in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

2 SAFETY

2.1 INTRODUCTION

It is important that the operator has understood the instructions of use, security and maintenance before using the Hydra-Pol™ system. The manufacturer cannot be held responsible for use or improper maintenance resulting from a breach or non-compliance with instructions. The Operation and Maintenance manual contents must be kept permanently close to the system in a safe place.

It is important for Operations and Maintenance individuals to understand the nature of the chemicals they are working with. Hydra-Pol™ systems are for the preparation and dosage of different chemicals, some of which can pose extreme slip/trip hazards if spilled. Other chemicals create fine dust and pose a risk to respiratory health.

The safety rules and guidelines issued to the operators are the primary precautions that are necessary for the prevention of accidents. The operators should be very familiar with these rules. The safety pictograms used in the plant are to be respected at all times.

Operators should always wear the safety equipment that is provided or required by their management. Such items as hard hats, safety shoes, safety glasses, gloves, breathing protection, protective clothing, protection harness and hearing protection are very basic and go a long way in preventing accidents.

Operators should be aware of the location of eye wash stations, safety showers, self-contained breathing apparatus, first aid stations, and other safety equipment furnished for the plant.

Good housekeeping will also eliminate safety hazards such as tripping or slipping. When spills happen, the floor should be cleaned as soon as possible (see Chemicals Hazards section).

2.1.1 Utility Hazards

Utility hazards exist on a system including high-voltage electricity, pressurized water, and high pressure air. Care should be taken when utilizing this system.

2.1.1.1 Electrical

Electrical connections must be made by certified electricians in compliance with all applicable codes and regulations. Electrical equipment should never be worked on unless it is turned off and locked and tagged out. The lockout system key should belong to the person doing the repair or the on-site electrician. This will remove the potential danger for electrical shock or accidental start-up.

Even though most electrical motors and switch boxes are designed to be water tight, the presence of water around electrical equipment always presents a hazard and therefore should be used with care.

2.1.1.2 Pressurized Water

Only the proper pressure fittings should be used in the piping system. Leaks should be repaired as soon as possible. Isolation valves on piping that are being repaired should be shut tight and locked out. Lock out the water inlet and remove pressure before starting any maintenance.

2.1.2 Equipment Hazards

2.1.2.1 Rotating Parts

<u>General instructions</u>

Since the system includes equipment with rotating parts (Dry polymer feeder and mixer), operators should avoid wearing loose clothing and jewellery. Loose clothing can present one of the biggest safety hazards that exist when working near equipment in process.

<u>Dry polymer Feeder</u>

- Never introduce hands into a running micro-batch feeder.
- Never open the inspection hatch when the feeder is running.
- It is however necessary fitting upstream the machine a fix safety grid or a hopper high enough to prevent damages to limbs according to the Machine Directive inforce. The same approach is necessary for the outlet: it is required using a vertical outlet or similar systems meant to prevent foreign bodies from entering the machine and cause damage to it, to persons or to their limbs. Always ensure the Machine Directive in force is being followed.
- Lock out the system before starting any maintenance.

<u>Mixer</u>

- Never introduce hands into the preparation tank if the system is not locked out.
- Lock-out the motor starter before starting any maintenance.

2.1.2.2 Operation and Maintenance

The system in its normal use can present a hazard if not operated or repaired in a safe manner.

All equipment should only be operated and repaired according to the recommended procedures of the manufacturer, and by qualified individuals.

Only recommended spare parts should be used.

Maintenance on pumps, piping, etc. should be performed only after valves are locked and tagged or slip blanks are installed to completely isolate the equipment being worked on. Instrumentation and controls should always be kept in good working order to help assure the safe operation of equipment. Never remove instruments or controls out of service until having communicated with the operator and have established a plan to define the operation maintenance steps. If air operated valves are used for isolation, the air line should be removed to prevent inadvertent operation of the valves. When possible the valve can also be locked in position.

When maintenance is finished on equipment, the protective caps provided must be reinstalled. If a protection must be left off, unwary personnel should be notified by using safety pictograms or installing temporary protection. Equipment should never be inspected or maintenance attempted while the equipment is operating. All pumps and various automatic valves may cause harm to an operator if care is not taken.

2.1.3 Chemical Hazards

Dry Polymer Material Safety Data Sheets (MSDS) should be available close to the system.

Since chemicals or chemical dosage are used during normal operation of treatment facility, the risks of exposure to toxic chemicals or chemical burns are present.

All plant personnel should be required to wear proper protective clothing when handling or working near these chemicals. A minimum wardrobe should include, but not be limited to, a plastic hard hat, coat, boots and gloves of a resistant material as well as a pair of safety glasses. Safety glasses, even with shields, are not adequate for use in areas where very acidic or basic materials are handled.

In the presence of water, polymer becomes very slippery. Spill recovery or remediation kits that include cat litter, rock salt and absorbent pads are very helpful in preventing trip/slip risks that result from polymer spills. In case of spill, wear appropriate personal protective equipment. Ventilate area. Prevent material from entering sewers, remove as much dry polymer as possible with a vacuum.

If the polymer has been wetted, the operator will remove as much as possible the wet polymer with a can and then, he will add an absorbent material (cat litter). He will let it soak it up for a while before he will shovel it into a disposal container. After the spill has been dried then a floor drain will allow washing the containment with a hose garden (warmest water possible).

3 SHIPPING

Most of the equipment and material for this project will be drop shipped from **VWTC** facilities and delivered directly to the site.

- All items delivered will be clearly identified with **VWTC**'s name, **VWTC**'s project name, **VWTC**'s project number.
- All shipments will have a clear Packing List identifying all parts in the shipment.
- All equipment will be tagged with the corresponding tag numbers shown on the design drawings (if applicable).

If there are more stringent requirements in the contract documents, they will take precedence over the above. If any of these requirements are not being followed, please notify the **VWTC** Project Manager immediately.

4 RECEIVING

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to Veolia Water Technologies Canada within five (5) working days of receipt of equipment. If there is no documented notification of missing or damaged parts within five (5) working days, Veolia Water Technologies Canada is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and Veolia Water Technologies Canada.

Photographs and written documentation should be provided for all damaged equipment.

5 HANDLING

5.1 GENERAL

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the items.

The Contractor is responsible for unloading and handling the equipment.

5.2 STAINLESS STEEL MATERIAL HANDLING

In order to minimize potential corrosion damage or unsightly surface marking, measures shall be taken to prevent contamination by iron, aluminium, copper, chlorides, and sulphides from lifting equipment. Stainless steel slippers or wooden packers should be used on forklift trucks to prevent contamination. Any resultant incidental contamination shall be removed at the earliest opportunity.

6 STORAGE

6.1 GENERAL

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment. While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the **VWTC** equipment.

For contractual purposes, **VWTC** demands the Client to send pictures of major equipment once it is placed in storage, any time it gets moved during storage and again prior to removing from storage. For outside storage, pictures must be sent every month. Alternatively, a written document (check list, etc.) confirming that proper storage conditions are maintained will suffice. Failing to do so would cancel the proposed warranty.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of receipt at Site, special precautions must be taken.

Although some equipment can be stored outdoors, indoor storage is preferred for most equipment.

The storage environment into which a system is placed can have a severe effect on the long-term usefulness of some parts. Key environmental factors are:

- Temperature
- Relative humidity
- Pollutants

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

Indoor storage refers to storage in a climate controlled environment in a clean, non-aggressive, dry (non-condensing) and sheltered environment having a relatively constant temperature (especially for gear reducers, motors, bearings, etc.). Storage volume depends on the size of the project.

The environmental indoor conditions should not exceed the following ranges:

Min/Max Temperature Range between:	5°- 40°C
Relative Humidity (RH) Range between:	35% - 70%

1. Equipment should be stored in such a manner that it is free from allowing insects/rodents etc. from entering the equipment.
2. Cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination. However, never enclose the unit or components totally in plastic covers; always leave adequate ventilation of air to prevent condensation.

Equipment must be checked on a weekly basis for tarp/wrap integrity and accumulation of dust or contaminants.

To avoid damage, do NOT stack crates.

To avoid damage, do NOT stack enclosures.

Do not store equipment or spares parts in barns, equipment sheds, or any other building without the capacity for heating and cooling as needed.

6.2 STAINLESS STEEL MATERIAL STORAGE

Stainless steel materials and products shall be stored separately from carbon steels and nonferrous materials. Materials should be stored under conditions that minimise the accumulation of dust and deposits. Any resultant incidental contamination shall be removed at the earliest opportunity.

6.3 SPECIAL MAINTENANCE REQUIREMENTS DURING STORAGE

After three (3) months of storage, long term storage methods must be applied to the unit including complete fill with lubricant. Protect machined surfaces and rotate shafts periodically (every month). Five (5) complete rotations of the output shafts are recommended each time.

Periodic checks should be made to ensure that no rusting or other damage has occurred. Should such be noted, corrective action should be taken immediately. Prior to putting the unit into service, drain lubricant and refill to the proper level as determined by the mounting position. Refer to manufacturer documentation.

All motors must be run every 3 month as a preventive measure against the formation of corrosion.

6.4 EQUIPMENT CLEANING

VWTC is not responsible for cleaning of any equipment prior to installation and start-up due to the storage of the equipment. This is the complete responsibility of others.

7 HYDRA-POL™ PRINCIPLE AND DESCRIPTION

7.1 POLYMER HYDRATION PRINCIPLE

Dry polymers must be diluted with water before use. The Hydra-Pol™ system is designed to handle all kind of dry polymer encountered in water treatment application (cationic, anionic and non-ionic). The uses of the Hydra-Pol™ polymer make up system allow activating between 90% and 100% of the dry polymer and help to minimize shipping and handling costs.

The challenge of dry polymer wetting is that the best activation each dry polymer particle should be wetted individually. When a clump of particles is wet, it forms an agglomeration called fisheyes that will dissolve slowly.

To avoid large agglomeration, the first polymer wetting and dilution must be done with a ratio between the service water and the dry polymer dosage. The wetting cone is designed for an optimal dissolving of dry polymer. The whirl created in the cone a high shearing stream that allows the polymer dispersion. After the powder dosage it cleans the cone. After the fast dispersion, the polymer hydration starts by forming a gel layer all around the polymer particles.

This dilution ratio is different depending on the type of polymer and the particle size. Anionic polymer must be more diluted than cationic polymer (see Table below).

The wetted polymer needs an aging time to reach its full activity; this aging time depends also on polymer type.

Polymer Powder	First Dilution	Aging Time
Anionic	0.2% – 0.25%	60 – 90 min
Cationic	0.3% – 0.5%	45 – 60 min

The polymer hydration changes its properties:

- Increase in molecule weight
- Charge interaction increase molecule size
- Entanglement in molecule increase viscosity
- Increase of conductivity

Dry polymers are susceptible to caking if stored under humid conditions. Caking interferes with the dilution process. It is recommended to store dry polymer in dry environment and respect powder life time.

7.2 DESIGN SUMMARY

7.2.1 Datasheet

If this polymer preparation system is integrated to a processing plant, refer to the Detailed Technical Documentation section of the Operation and Maintenance Manual for the preparation system datasheet.

7.2.2 P&ID

If this polymer preparation system is integrated to a processing plant, refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the preparation system drawings.

7.2.3 General Arrangement Drawings

If this polymer preparation system is integrated to a processing plant, refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the preparation system drawings.

7.3 COMPONENTS DESCRIPTION

The components of the Hydra-Pol™ system provide four main functions:

- Dry polymer storage and dosing
- Polymer wetting and transfer to the maturation tank
- Polymer maturation
- Polymer solution storage

7.3.1 Dry Polymer Storage and Dosing

7.3.1.1 Hopper with Vacuum or Bulk Bag Unloader

An integrated vacuum can fill a storage hopper located above the feeder. This vacuum allows manual transfer of polymer from dry bulk bags or other containers to the Hydra-Pol™ system.

The Hydra-Pol™ system is available with a bulk bag unloader option. It may be configured with a hoist and trolley or with a special frame for forklift loading. Each bulk bag unloader includes four (4) attachment points that raise the bulk bag to the polymer preparation system. An iris valve allows the discharge of the powder to a storage hopper.

7.3.1.2 Volumetric Feeder

WAM, model MBF, is a volumetric feeder that doses a dry material at a constant rate. It includes a homogenizer agitator installed in a hopper for a better material flow. The feed screw is made of stainless steel 304. The feeder includes, at the outlet, a T nozzle which directs the flow of the material, allows for isolation of the dosing screw, and has an inspection window where the powder dosing can be observed. The feeder contains a level switch, preventing the volumetric feeder from running when empty. A transition hopper is optional. It can be integrated with the volumetric feeder. It is made of stainless steel 304 and has a capacity of 100 L.

The feeder is also composed of a plunger which closes the T nozzle (at the exit of the metering) of the wetting cone. The operation of this device is controlled by a solenoid valve that allows a flow of water to the cylinder.

7.3.2 Polymer Wetting and Transfer to the Maturation Tank

7.3.2.1 Isolation Valve

An isolation ball valve is placed at the entry of the system to close the water inlet to the Hydra-Pol™. Two (2) others valves are placed at the outlet of the storage tank to drain or to close the conduit of the system. The valve is made of PVC with EPDM seals.

7.3.2.2 Solenoid Valve

Two solenoid valves are placed in the system. The first valve monitors the pressure of the inlet to the service water line. When the switch detects a fault, a switch commands the solenoid valve to close.

The second valve is used to let the water flow to the cylinder that triggers the opening of the dispenser. The return of this cylinder water flow goes to the wetting cone.

7.3.2.3 Service Water Pressure Switch

The pressure switch activation will trigger an error message and close the service water inlet valve if the inlet pressure is below its set point.

7.3.2.4 Pressure Gauge

The gauge is used to read the water inlet pressure.

7.3.2.5 Wetting Cone and Eductor

The wetting cone is a device that wets the metered powder and prevents material accumulation in the cone at the feeder output. It includes a tangential inlet to the cone that is controlled by a manual ball valve. It is very important to have the right amount of flow from this inlet into the cone to avoid having too little flow and a resulting accumulation of half-dry powder. However too much flow is also an issue, as it can cause water to splash up out of the cone and into the T nozzle.

An eductor, installed at the bottom of the wetting cone, draws the powder into the water flow through the system.

7.3.2.6 Check Valve

A check valve is placed after the output of the eductor. It prevents the return of the solution into the wetting cone when the system stops.

7.3.2.7 Static Mixer

The static mixer is a device which uses the flow energy to mix the water and the pre-wet polymer powder by means of mixing elements.

7.3.2.8 Level Switch

A level switch is installed in the hopper to signal the operator and stop the system when the level of powder becomes too low.

7.3.3 Polymer Maturation

7.3.3.1 Preparation Tank

The cylindrical preparation tank, made of stainless steel, allows the maturation process of the polymer solution. As stated in section 7.1, this timing depends on the volume of the batch, type of polymer and dosage. The tank plastic cover includes an access trap made of stainless steel. A butterfly valve is installed at the bottom of the tank to allow the transfer of the polymer solution to the storage tank. A hydrostatic pressure transmitter installed at the bottom of the tank to measure the level in the tank. An overflow is installed at the top of the tank.

7.3.3.2 Mixer

A mixer is installed on the cover of the preparation tank to allow maturation of the polymer solution. During the batching sequence, the mixer does not begin to run until the water level has reached the impellers. This level is set during commissioning and also dictates the point during the batching sequence when the volumetric feeder begins dosing.

7.3.3.3 Butterfly Valve

An open/closed actuated butterfly valve allows the solution transfer from the preparation tank to the storage tank when tanks are superimposed.

7.3.3.4 Conductivity Probe (optional)

A conductivity probe is installed in the preparation tank. Given experience, this conductivity probe will be able to reflect how the batch turned out. The conductivity is dependent on the service water, the temperature, the mixing/blending of the polymer, the polymer type and the dosage of polymer.

7.3.3.5 Pressure Transmitter

A hydrostatic pressure transmitter installed at the bottom of the tank measures the level in the tank. This level is set on commissioning and is integral to the batching sequence.

7.3.4 Polymer Solution Storage

7.3.4.1 Storage Tank

The cylindrical storage tank, made of stainless steel, allows the storage of the polymer solution. A support structure mounts the preparation tank above the storage tank. However, with tanks that have a larger capacity, tanks can be installed side by side and a pump allows the solution to be transfer from the

preparation tank to the storage tank. Anchor points are provided for fastening. An overflow is installed at the top of the tank.

7.3.4.2 Pressure Transmitter

A hydrostatic pressure transmitter installed at the bottom of the tank measures the level in the tank. This level is set on commissioning and controls when the batch in the preparation tank is transferred to the storage tank.

7.3.4.3 Control Panel

A control panel allows the fully automated system operation. It also allows the transmission of alarm signals to an external system.

8 INSTALLATION

8.1 SERVICE WATER

The Hydra-Pol™ system needs a clean water supply for the polymer activation a clean water supply. This water must meet quality criteria. The installer must connect the water supply as indicated on the general arrangement drawing.

8.1.1 Flowrate and Inlet Pressure

The required flow and pressure indicated on the technical data sheet are important to ensure proper system operation. These conditions must be met as a requirement for starting a batching sequence. When setting these inlet water standards, the dynamic head losses have to be taken into account. Non-compliance can lead to overflows at the wetting cone or plugging of the wetting cone due to improper blending. Inlet pressure is not to exceed 120 psig working pressure and must exceed 65 psig.

8.1.2 Water Temperature

The water temperature for the polymer make-up must preferably be between 10°C and 30°C. The ideal temperature is 15°C.

8.1.3 Water Quality

The service water should have preferably a low residual chlorine content (<0.5 mgCl_2/L). Chlorine can quickly deteriorate polymer solutions and thus reduce their effectiveness. Water having a high content of hardness (> 300 ppm $CaCO_3$) or alkalinity (>75 ppm) should also be avoided.

Parameter	Impact	Upper Allowable Limit
Total Hardness	High hardness causes precipitation in makedown vessels (most prevalent in high charge products)	<300 mg/L as Ca CO_3
pH	Low pH causes precipitation in makedown vessels	Makedown water pH in range of 6.0 to 8.0
Conductivity	High conductivity slows dissolution and reduces viscosity Low conductivity slows dissolution and reduces viscosity	< 10,000 µS/cm See following notes on conductivity
Chloride	No specific impacts distinct from that of conductivity as indicated above.	None specified. Refer to Conductivity limits.
Suspended Solids	High TSS promotes flocculation in makedown tank. Possible plugging of feed system.	< 5 mg/l (filtration at 100 µm).
Temperature	Warmer water promotes dissolution. Low temperature result in increased mixing time and potential for incomplete dissolution. Higher solution viscosities develop in low temperature solutions.	10 to 30°C
Metals(Fe^{2+}, Cu^{2+}...)	Cleavage of polymer chain and loss of activity.	< 1 mg/l each
Residual Oxidant	Degradation of polymer chain.	< 0.5 mg/l
Microbiological Activity	Degradation of polymer chain	< 10^3 CFU/ml aerobic or SRB

8.2 RECOMMENDED ARRANGEMENT

The installation should be performed by qualified personnel.

Select a location providing:

- An easy access to the system and an easy polymer handling.
- At least a clearance of one meter in front of the electrical panel.
- At least 72 inches of clearance behind the feeder for the maintenance.

In the presence of water, polymer becomes very slippery, it is recommended to take this hazard into account in the equipment layout.

It is recommended:

- To build a curb all around the area or install a plastic secondary containment.
- To secure the access to the top of tanks without entering into the secondary containment.
- To install a resistant coating and easy-to-wash on floors and curbs.
- To install tempered water hose close to the system.
- To install a closed floor drain in the secondary containment into which deteriorated polymer and the total volume of the Hydra-Pol™ tanks can be emptied.
- To design a concrete pad under the polymer tank to avoid flood damage to the instruments.
- To do not install equipment in areas of extreme heat, cold, dust or humidity. Avoid areas where objects or fluids can drop from overhead. Units are to be installed as close to the point of application as possible.

After selecting the optimal location, the installer will:

- Unpack the components.
- Install the preparation tank above the storage tank (if any) on a sturdy level surface. Fasten to prevent movement.
- Position powder dosing skid as the corresponding drawings on a sturdy level surface. Fasten to prevent movement.

8.3 PIPES CONNECTIONS

The installer has to connect the following pipes:

- Service water inlet.
- Tanks overflows and drains (they should be directed to an appropriate location according to local regulations).
- Pipe between the dosing system and the preparation tank. The dosing system should be located as close as possible from the preparation tank to reduce at the maximum the interconnecting pipe as shown on the General Arrangement drawing. Any extension of the pipe could bring an additional backpressure on the educator and change its performance.
- Transfer pipe between the two tanks (model over Hydra-Pol™ 7500).

8.4 ELECTRICAL REQUIREMENT

Electrical connections and maintenance must only be performed by qualified personnel. Electrical elements have to be connected according to local regulations. The Hydra-Pol™ system is usually provided with its own control panel.

The electrician has to connect:

- The mixer motor to the control panel
- Main power supply to the control panel
- Cables of instruments to the control panel

It is recommended to ground the dosing system frame and the two tanks (if made of steel).

9 INSTALLATION AND PRE START-UP INSPECTION

9.1 PRE-OPERATIONAL CHECKOUT

Included in appendices of this manual are standard **VWTC** checklist forms to be completed by the installer and returned to **VWTC** project manager prior **VWTC** onsite installation inspection. **VWTC** will schedule our field service visits prior to return of completed checklists but it is our policy to not dispatch field personnel to the jobsite until the completed and signed checklist is received by our project manager or field service manager.

9.2 START-UP CHECKOUT

9.2.1 Mechanical, Electrical and Control Start-Up

The mechanical and electrical start-up of the polymer make-up system includes the connection, verification and inspection of the following elements:

- Mounting
- Motors
- Mixers
- I/O Check
- Tubing and process connections
- Power connections and supply
- Valves
- Instrument calibration

9.2.1.1 Initial Checking and Adjustment

Prior to calibration the following elements will be verified:

FUNCTIONAL START-UP CHECKOUT	
Vacuum	Check that the air filter is in place.
	Check suction of the system. Do not put your hands on the suction nozzle.
Hoist & Trolley	Check that the hoist and the trolley operate correctly.
Feeder	Check whether foreign substances or water have entered the feeder. In such a case, clean thoroughly.
	Avoid any friction between the metering screw and the body. This requires opening the hopper and removing the T nozzle. Inspecting the screw/auger to be sure that it is flush with the walls of the hopper and inside the T nozzle is very important because removing the material can be difficult and risky.
	Check that the inspection hatch is closed (stainless steel feeder only).
	Check oil level in gear reducer.
	Check that the metering screw rotates counter clockwise when looking from the rear of the drive unit.
	Check that the feeder is working properly.
	Minimum speed and maximum speed must be verified.
Wetting Cone	Check that the wetting cone is completely clean and free from dirt or foreign objects.
	Check that the water flows tangentially into the cone.
	Ensure that the water speed is sufficient to create a vortex.
	Ensure that water speed is not too great to create splashing up into the T nozzle.
	Check that the metered powder falls vertically in the middle of the wetting cone.
Eductor	Check that the eductor is completely clean and free from dirt or foreign objects.
	Check that the service water pressure is higher than 65 psig in operation.
	Check that the eductor is working properly.
Piping	Check that the pipework are completely clean and free from dirt or foreign objects.
Manual valves	Check that all manual valves are working properly.
	The manual valves control the whirl and blending of the powder. Ensure that the flow is appropriate.
Automatic valves	Check that all automatic/electric valves are connected to the control panel.
	Check that all automatic/electric valves are working at proper times and the limit switches are set.
Instruments	Check that all instruments are properly calibrated.
	Check that all instruments are properly installed.
Pressure switch	Check that the pressure switch works properly by closing the water inlet valve.
	Check that the pressure switch is connected to the control panel.
	Check that the pressure switch works properly.
	Check the pressure gauge is working correctly.
Mixer	Check all bolts and nuts are properly tightened.
	Check the oil level in the gearbox.
	Check if installation of the mixer shaft is adequate.
	Check the direction of rotation of the agitator.
	Adjust the motor overload protection to the value shown on each motor nameplate.
	During start-up, listen for unusual noises and check for excessive vibration.
	Check the temperature of the motor and the gear reducer. The temperature should not exceed 180°F (82°C).
Static mixer	Check that the static mixer works properly.
Level transmitter	Check the calibration of the level transmitter.

9.2.2 Hydraulic Test

Due to the nature of the materials used in the Hydra-Pol™ systems, it is important that the hydraulic integrity of the system is verified even before the Control Start-Up is performed. The hydraulic inspection and testing is comprised of the following elements:

- Connect all fittings and walk the piping to be sure that the hydraulic pathway meets operational specifications.
- Verify that the service water system is ready to provide water and that the client is ready to accept water into their downstream system.
  - NOTE: this step is of extreme importance as during the construction phase, often communication with other workers is complicated and difficult. Be sure that you yourself check the discharge point and that no one is working in the area and that all risks are mitigated.
- Briefly allow water through the system by manually operating the valves. Check for leaks. Provided no leaking or loose connections are found, continue to the next step.
- Verify that the preparation tank and storage tank are clean and have head space to accept a few minutes of water. Manually operate the valves and booster pumps to allow for the operational pressure of the system is met. Walk the Hydra-Pol™ to verify that all tubing fittings are tight, that the T nozzle plunger is pulled back, and that the whirl in the wetting code is adequate.
  - NOTE: this step is of importance. If the whirl of the wetting cone is not adequate, then the wetting cone will clog with polymer and the clean-up will take hours.
- Allow the preparation and storage tank to fill with service water. Check that the level set-points give the desired volume for the sequencing and batching in the Process Start-Up section.
- Stop the system and do a final walk-through of all hydraulic and mechanical integrity.

9.2.3 Control Start-Up

The control start-up for the polymer make-up system include; connection, verification and inspection of the following elements:

- The alarms, start-up and shut down of the motors.
- The transmission of the electric signals of the different components as well as their configuration parameters if needed.
- The pumps alarm transmission to the plant system.
- I/O verification of instrumentation.
- Sequencing.
- The proper functioning of the electrical and process alarms.
- The variable frequency drives connection.
- The control panel.
- Other elements of control, if required.

Start-up and shut down sequencing will be checked:

- Normal start and stop sequencing.
- Alarms stop sequencing.
- Clearing alarms and restarting the process.

9.2.4 Process Start-Up

Once the mechanical, electrical, hydraulic and control start-up of the preparation system have been completed, the equipment commissioning can begin. The following steps will be performed.

9.2.4.1 Screw Calibration Procedure

Tests will be performed using water for the initial testing and the specific chemical for the final test.

- Calibration of the dosing screw at minimum, full range and intermediate speeds to set the functional output curve.
- Preparation unit concentration and dosage settings.

Powder polymer is injected into a preparation tank using a dosing apparatus. The apparatus operating time is calculated based on its capacity and the desired concentration.

9.2.4.1.1 Dosage Calculation

The operating dosing time is calculated based with the following formula:

$$T_s = \frac{CONC \times \left(\left(LEV_{stop} - LEV \right) \times SURF \right)}{CAP} \times 60$$

T_s:	Dosing apparatus operating time (sec)
CONC:	Polymer concentration adjustable to operator interface (g/l)
LEV:	Preparation tank current level (m)
LEV_{stop}:	Preparation stop level set point (m)
SURF:	Preparation tank surface (m^2)
CAP:	Dosing apparatus capacity adjustable to operator interface (kg/min)

Note: This formula may also be used to perform a manual preparation in case of automatic system failure. To ensure dosing accuracy of the tank, capacity must be validated by the operator.

9.2.4.1.2 Feeder Capacity

The feeder capacity must be checked by weighing the discharged amount of polymer powder/time.

The operator must repeat four (4) times the following procedure:

- Set a frequency on the VFD – Start with 60 Hz.
- Hold a sample shovel just under the outlet of the powder feeder.
- Then turn the switch for FEEDER to position H for a specific time.
- Weigh the contents in the sample shovel.

EXAMPLE (dry polymer):

Obtained value 2000 g/20 sec = 6 kg/min = feeder capacity

Assume that 0,3% concentration is to be mixed in a 400 L tank (see the actual value on the data sheet). The amount needed for each batch will be:

$$\frac{0.3 \times Size\ of\ tank\ (dm^3)}{100} = \frac{0.3 \times 400}{100} = 1.2\ kg$$

The dosing time of the powder feeder will then be:

$$\frac{1.2\ [Amount\ of\ polymer\ in\ kg]}{6\ [Capacity\ of\ feeder\ in\ kg/min]} = 0.2\ minute$$

This dosing time is set on the interface. Record the test procedures and test results/settings within the manual.

9.2.5 Process Start-Up Records

The personal in charge of the commissioning will furnish inspection sheets for equipment including:

- Project name
- Tag number and description
- Manufacturer
- Model and serial number
- Date, time and person who will perform calibration
- Calibration data to include:
  - Input, output and error at minimum, intermittent and maximum output range
- Space for comments
- Certification by installer and acknowledgment by contractor and date
- Adjustment of the service water flow rate and pressures (if required)

10 TROUBLESHOOTING GUIDE

COMPONENT	ISSUES	POSSIBLE CAUSES	ACTION
SERVICE WATER INLET	Service water low pressure.	Service water feed system low pressure.	Inspect service water system and booster pumps.
		Obstruction.	Clean pipes.
VACUUM	Reduction of the suction capacity at the vacuum filling of the polymer powder.	Clogging of the dust filter.	Remove the external filter and clean. Verify that the lid and viewport have no leaks.
		Max level in the powder hopper is exceeded and/or malfunctioning level sensors.	Stop the filling. Inspect the feedback from level indicators. If not reflective of material's level, inspect wiring and ability to detect material.
		The feeder shutter at the outlet of the feeder is not shut.	Filling must not be done while the feeder is operating. Wait until the feeder has stopped.
WETTING CONE	Clogging of the wetting cone.	The feeder shutter at the outlet of the feeder is not shut.	Check the function of the solenoid valve to the feeder shutter, or clean the shutter from possible polymer powder clogging.
		The water whirl in the wetting cone is too small.	Check water pressure.
FEEDER	Feeder does not run.	No power to the feeder.	Check the button or the on / off switch of the machine is turned on.
			Check that the isolating switch is in the on position.
			Check that the inverter is not set to 0 Hz.
			Check if there are short circuits, blown fuses or tripped breakers.
			Check that the power supply corresponds to control and motor requirements.

			Check if there are error messages in the drive controller screen.
	Feeder screw or agitator is damaged.	Foreign body inside feeder.	Remove foreign body and replace damaged components
	Feeder screw or agitator stops.	Hygroscopic material inside feeder has absorbed humidity.	Unload feeder completely when shutting down for long periods.
	Feeder – Rotating components unscrewed, no material handled.	Motor incorrectly wired.	Rewire (metering screw must turn counter clockwise when viewed from behind drive unit).
	Feeder – Sticking of hygroscopic products; Agglomeration of viscous materials; Contamination of the product.	Long shutdown period.	Unload feeder completely when shutting down for longer periods.
	Feeder makes scraping or grinding noise.	Foreign body inside feeder. Poor alignment of gearbox, hopper wall welding.	Visually inspect the hopper and the level of the auger by removing the T nozzle.
TANK	Maturation tank or storage tank overflow.	Level transmitter default.	Inspect level transmitter.
	Incorrect concentration of the polymer solution.	Wrong dosing time set point	Calibrate the dosing screw and adjust parameter.
		Polymer density change.	Calibrate the dosing screw and adjust parameter.
TRANSFER VALVE	Transfer valve not closing tight.	Debris present in the valve.	Remove the foreign object and check for possible damages.
		The adjustment of the travel stop is incorrect.	Adjust the actuator travel stop according to the manufacturer's instructions.
		Prepared polymer solution concentration is too high	Adjust the concentration

Note: If the preparation sequence is interrupted by a power failure or by component failure then the current polymer batch will be lost and will have to be drained. Broken components will have to be replaced before starting a new polymer batch.

11 MAINTENANCE

Any manipulation of metering equipment and chemicals should be done by qualified and trained personnel. Refer to product MSDS for safe material handling.

ITEM	DESCRIPTION	WEEKLY	MONTHLY	BI-MONTHLY	YEARLY	COMMENTS
MIXER	Gearbox visual inspection and noise	X				
	Check gearbox oil level	X				
PREPARATION TANK AND STORAGE TANK	Empty storage and preparation tanks. Check the presence of foreign matter at the bottom. Clean if necessary.				Every 6 months	Dispose of chemical residues appropriately
PIPING	Check for leaks.	X				
	Rinse pipes with lukewarm water.				Every 6 months	
LEVEL TRANSMITTER	Calibrate on a regular basis and / or when readings become inaccurate (specific to each type of use).				Every 6 months	
STATIC MIXER	Visual check. Clean if required	X				
FEEDER	If the feeder uses MBTX, MBTN or MBTT type shaft seals, check these on a monthly basis to make sure they are in good working condition.		X			Grease monthly
DISSOLVER CONE	Inspect the cone for the presence of polymer agglomeration. In case of loss of suction, remove and clean eductor with hot water. Inspect weekly to ensure that there is no accumulation of polymer or fouling and, if necessary, clean by draining the cone and the eductor with water.	X				
VALVES	Inspected and clean if required. Refer to supplier's maintenance manual.				Every 6 month	
DOSING SKID FRAME OR BULK BAG UNLOADER	Check the appearance of the structure, paying particular attention to the state of welds.		X			
	Check that all bolts are correctly tightened, in particular the vibrator fixing bolts.		X			

12 SPARE PARTS

It is highly recommended to keep in stock spare parts in sufficient quantity for all critical components to the proper functioning of the system.

Only the use of original Veolia spare parts will ensure proper and reliable operation of the system.

When ordering a spare part, please give the following information:

- Veolia's project number
- Veolia's project name
- Part number

3.0	**FEEDER CALIBRATION PROCEDURE**		
3.1	Place polymer powder in storage hopper		Follow IOM for specific requirements
3.2	Put water inlet valve in manual mode "OPEN" position		
3.3	Check service water pressure when valve placed in OPEN position		
3.4	Check water whirl in wetting cone		
3.5	Adjust manual wetting cone valve for desired whirl level		
3.6	Check service water is going to mixing tank		
3.7	Wait water level in mixing tank reaches mixer level + 100 mm (fully covering the impeller)		
3.8	Place mixer selector in manual mode "START" position		
3.9	Put feeder discharge valve in manual mode "OPEN" position		
3.10	Check feeder discharge valve is "OPEN"		
3.11	Place blending motor (if applicable) selector in manual mode "START" position		
3.12	Install powder test sampling collection device at feeder discharge		
3.13	Place feeder motor selector in manual mode "START" position		
3.14	Let feeder run for 2-3 minutes until flowrate reach steady state is reached		
3.15	Place feeder motor selector in manual mode "STOP" position		
3.16	Dispose collected powder in storage hopper		
3.17	Install powder test sampling collection device at feeder discharge		
3.18	Place feeder motor selector in manual mode "START" position		
3.19	Run feeder for 1 minute and weigh collected powder sample		
3.20	Dispose collected powder in storage hopper		
3.21	Place feeder motor selector in manual mode "STOP" position		
3.22	Repeat 4 times the powder sampling procedure (1 min for each test)		
3.23	Remove highest and lowest weighted values and determine feeder real capacity by calculating the average value between the three closest values		
3.24	Insert feeder real capacity value in Hydra-Pol HMI (feeder calibration screen)		

N°	ITEMS	X	COMMENTS
3.25	Place all motor selectors on "STOP"		
3.26	Place all valve switches on "OFF"		
3.27	FEEDER CALIBRATION PROCEDURE IS COMPLETED		
4.0	**AUTOMATIC START-UP PROCEDURE**		
4.1	Put all valve selector switches in "AUTO" position		
4.2	Put all motor selector switches in "AUTO" position		
4.3	Check service water pressure when valve placed in AUTO position		
4.4	Check water whirl in wetting cone		
4.5	Adjust manual wetting cone valve for desired whirl level		
4.6	Check service water is going to mixing tank		
4.7	Confirm that mixer starts automaticaly		
4.8	Confirm that feeder discharge valve opens		
4.9	Confirm that blending motor starts		
4.10	Confirm that feeder starts		
4.11	Confirm that powder is fed to wetting system		
4.12	Confirm that feeder motor stops when feeding time is completed		
4.13	Confirm that blending motor stops		
4.14	Confirm that feeder discharge valve closes		
4.15	Confirm that water inlet valve closes when water level reaches HIGH LEVEL		
4.16	Confirm that mixer stops when mixing time is completed		
4.17	Confirm that mix tank discharge valve opens when mixing time is completed and liquid level in storage tank is under low level storage tank		
4.18	Confirm that mix tank discharge valve closes after transfer		
4.19	Confirm that new batch restarts automaticaly		
4.20	AUTOMATIC START-UP PROCEDURE IS COMPLETED		
5.0	**HYDRASTAT START-UP PROCEDURE**		
5.1	Calibrate probes according to MFG procedure		
5.2	Start SC-200 according to MFG procedure		
5.3	Wait until 2-3 automatic batches are completed		
5.4	Put Hydra-Stat in "Autocalibration mode" on HMI		
5.5	Hydra-Stat will generate setpoints and reference curve		
5.6	If make-up concentration is changed, new auto-calibration is required

1 INTRODUCTION

This document provides installation, operation and maintenance instructions for a dosing skid equipped with a solenoid driven diaphragm metering pump (electromagnetic pump). For specific information regarding the pump installed on the dosing system, refer to the manual of the manufacturer.

The skid components are supplied by Veolia Water Technologies Canada (VWTC).

Skid design and equipment selection are done by VWTC.

To obtain any additional information regarding characteristics or instructions on this equipment, please do not hesitate to contact us.

The system was designed in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

2 SAFETY

2.1 INTRODUCTION

Your safety is of the utmost concern. Dosing pumps and systems can handle harsh or toxic chemicals and exposure can lead to serious injury or death. Always wear appropriate protective clothing (for example, safety glasses, gloves, coveralls, etc.) and follow safe handling procedures. Pay attention to what you're doing and note safety advisories where they are shown throughout this manual. Some examples of safety issues and precautions for chemical dosing systems are:

- Do not use dosing skid systems for flammable liquids.
- Prior to working on any portion of the skid system, disconnect pump(s) from power supply, de-pressurize the system and drain chemicals from the lines.
- Inspect tubing regularly and replace as necessary. When inspecting tubing, wear protective clothing and safety glasses.
- If skid system is exposed to sunlight, use UV-resistant tubing.
- Follow directions and warnings provided with chemicals from the chemical manufacturer. User/Owner is responsible for determining chemical compatibility with chemical feed pump(s) and system components.
- Secure chemicals, metering pump(s) and system, making them inaccessible to children, pets, and unauthorized personnel.
- Always wear protective clothing, including gloves and safety goggles when working on or near chemical metering pump(s) and system.
- All connections (threaded, screwed or bolted) may only be loosened when the system is not under pressure.
- Installation and start-up of chemical dosing system will require both mechanical (plumbing) and electrical work. Only qualified and licensed plumbers and electricians should perform this.

2.2 FALL HAZARDS

Common causes of slips are due to wet or oily surfaces and occasional spills.

Operators should reduce the risk of slipping on wet flooring by:

- Cleaning all spills immediately.
- Marking spills and wet area by using a cone or other warning device.

2.3 CHEMICALS HAZARDS

WHMIS Material Safety Data Sheets (MSDS) should be available for each chemical product. Since chemicals or chemical dosage are used during normal operation of treatment facility, the risks of fire, explosion and exposure to toxic chemicals or chemical burns are present. Chemicals typically used with dosing system are coagulant and polymer.

Operators should be made aware of the following:

- All chemicals which are used and any potentially dangerous reaction that could occur.
- Toxicity of all chemicals that are used or could be formed via reactions.
- Acidic or basic properties of all materials used.
- Potential fire or explosion hazards posed by the chemicals.
- Antidotes for exposure to toxic materials.
- Protective clothing that is recommended.
- Chemicals spills may be slippery.

2.4 ELECTRICAL CONNECTIONS

Electrical connections must be made by certified electricians in compliance with all applicable codes and regulations.

3 SHIPPING

Most of the equipment and material for this project will be drop shipped and delivered directly to the site.

- All items delivered will be clearly identified with VWTC's name, VWTC's project name and VWT's project number.
- All shipments will have a clear packing list identifying all parts in the shipment.
- All equipment will be tagged with the corresponding tag numbers shown on the design drawings (if applicable).

If there are more stringent requirements in the contract documents, they will take precedence over the above. If any of these requirements are not being followed, please notify the VWTC project manager immediately.

4 RECEIVING

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to VWTC within 10 days of receipt of equipment. If there is no documented notification of missing or damaged parts within 10 days, VWTC is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and VWTC.

Photographs and written documentation should be provided on all damaged equipment.

5 HANDLING

5.1 GENERAL

The Contractor is responsible for the equipment unloading and handling.

5.2 POLYPROPYLENE MATERIAL HANDLING

Care should be taken to avoid damages to the surface of the polypropylene panels due to dragging or from sharp objects.

6 STORAGE

6.1 GENERAL

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the VWTC equipment.

For contractual purposes, VWTC demands the Client to send pictures of major equipment once it is placed in storage, any time it gets moved during storage and again prior to removing from storage. For outside storage, pictures must be sent every month. Alternatively, a written document (check list, etc.) confirming that proper storage conditions are maintained will suffice. Failing to do so would cancel the proposed warranty.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of receipt on site, special precautions must be taken.

Although some equipment can be stored outdoors, indoor storage is preferred for most equipment.

The storage environment into which a system is placed can have a severe effect on the long-term usefulness of some spare parts. Key environmental factors are:

- Temperature
- Relative humidity
- Pollutants

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

6.1.1 INDOOR STORAGE

Indoor storage refers to storage in a climate controlled environment under a clean non-aggressive, in a dry (non-condensing) and sheltered environment having a relatively constant temperature (especially for gear reducers, motors, bearings, etc.).

The environmental indoor conditions should not exceed the following ranges:

Min/Max temperature range between: 5°- 40°C
Relative humidity range between: 35% - 70% (RH)

1. Equipment should be stored in a manner to be kept free from allowing insects/rodents etc. from entering the equipment.
2. Cover the equipment with a tarp or similar protective shield to prevent direct exposure to dust or any other contamination. However, never enclose the unit or components totally in plastic covers; always leave adequate ventilation of air to prevent condensation.
3. Equipment stored near a window should be protected from UV rays.
4. Storage volume depends on the size of the project.
5. Equipment must be checked on a weekly basis for tarp/wrap integrity and accumulation.
6. To avoid damage, do NOT stack crates.
7. To avoid damage, do NOT stack enclosures.

8. Do not store spares in barns, equipment sheds, or any other building without the capacity for heating and cooling as needed.

6.2 EQUIPMENT CLEANING

VWTC is not responsible for cleaning of any equipment prior to installation and start-up due to the storage of the equipment. This is the complete responsibility of others.

7 INSTALLATION

7.1 GENERAL

The installation of the chemical dosing skids must be completed on site by the installation contractor.

Please find below the list of tasks that need to be performed by the contractor at job site:

- Installation should be performed by a qualified contactor.
- The installation contractor must ensure that the necessary lifting equipment is available on site to carry out the installation.
- All nuts & bolts need to be verified, accounted for and tightened.

7.2 SYSTEM OVERVIEW

The system is designed to pump chemicals at precisely controlled rates into another process or system.

Proper arrangement of piping and appurtenances on both the supply side and the process side are critical to the successful operation of the overall system. These are the responsibility of the installer of the system, and attention should be paid to the comments below:

Most VWTC pre-engineered skids will have electromagnetic pump(s) mounted on them at the factory, and the pump(s) will be connected to the piping integral to the skid with tubing.

7.2.1 SUPPLY SIDE

Dosing chemicals are usually sourced from a barrel or tote container. The source may be located above the centerline of the pump(s) which is referred to a 'flooded suction' or it may be located slightly below the centerline of the pump(s) which is referred to as 'suction lift'. Connections to and from the solution tank are most commonly made with hard piping. The solution tank should be covered to prevent contamination.

7.2.1.1 FLOODED SUCTION

This is the most trouble free type of installation. Since the supply line tubing is filled with chemical, priming is accomplished quickly and the chance of losing prime is reduced.

Recommended for very low flow rate applications, e.g. 2 ml/hr, or where pumping solutions such as sodium hypochlorite or hydrogen peroxide which can form air bubbles.

Supply line should gradually slope downward from the solution tank to the skid suction connection.

It is strongly recommended to add a drain provision on the suction side to facilitate emptying and flushing of the system for maintenance.

The next figure illustrates a typical pump skid system for flooded suction (chemical source above the pump centerline).

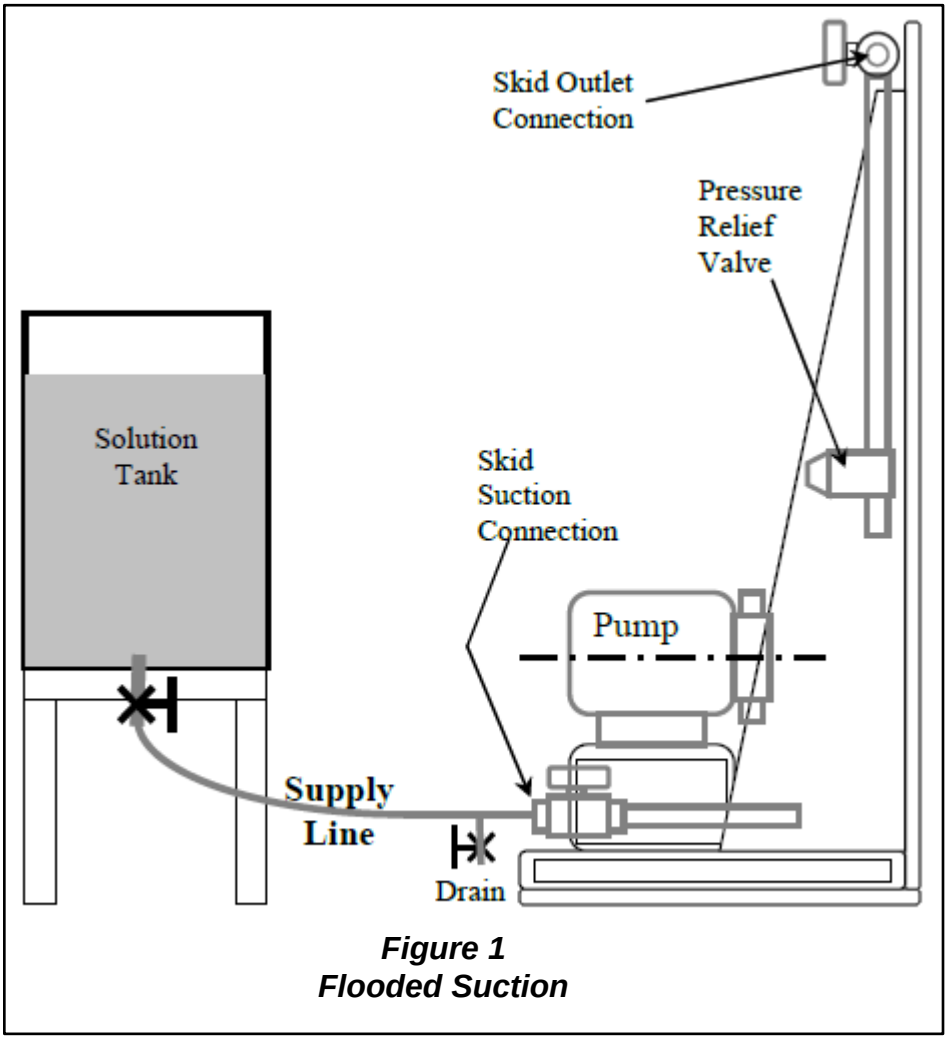

Figure 1
Flooded Suction

7.2.1.2 SUCTION LIFT

This is the most common arrangement for chemical metering applications since there is less chance of spillage.

Note that the maximum recommended lift is 5 feet (1.5 m). Verify specific recommended lift in pump manual.

Since the supply line will be in a vacuum condition, attention should be paid to the vapor pressure of the pumped liquid. Vapor formation in the supply line will prevent the pump from pumping.

Supply line should gradually slope up to the skid suction connection to prevent air pocket(s) which can impede flow.

It is strongly recommended to add a drain provision on the suction side to facilitate emptying and flushing of the system for maintenance.

The next figure illustrates a typical pump skid system with a suction lift arrangement.

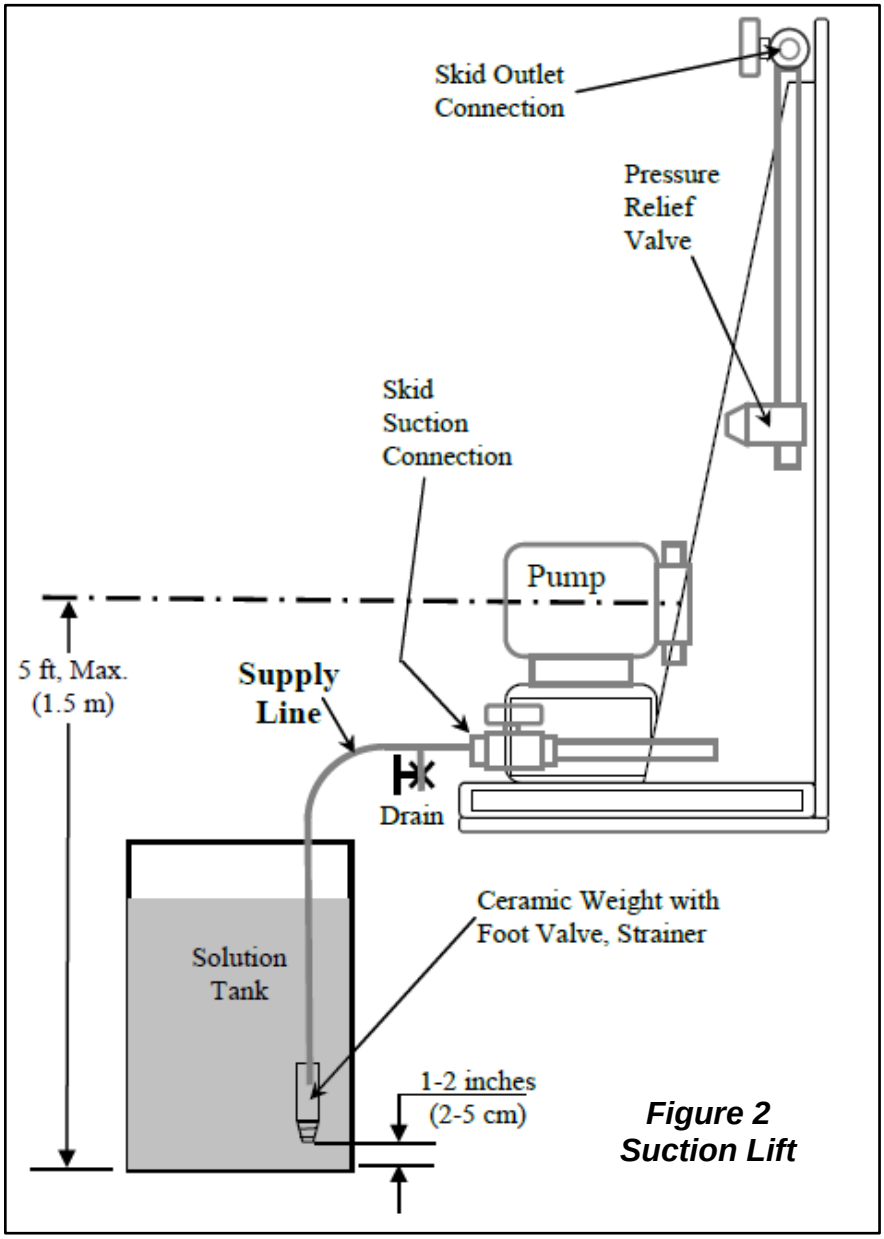

Figure 2
Suction Lift

Process Side

The injection point in the served process or system must be higher than the top of the solution supply tank to prohibit gravity feeding unless suitable backpressure is always present at the injection point.

In applications where the injection point is below the solution supply tank (e.g. injection into a well) or where the injection point may be at reduced pressure (e.g. injection into the suction side of a pump), installation of a back pressure/anti-siphon valve in the process feed line will prevent gravity feeding.

Note comments on process side piping/tubing on the next illustration.

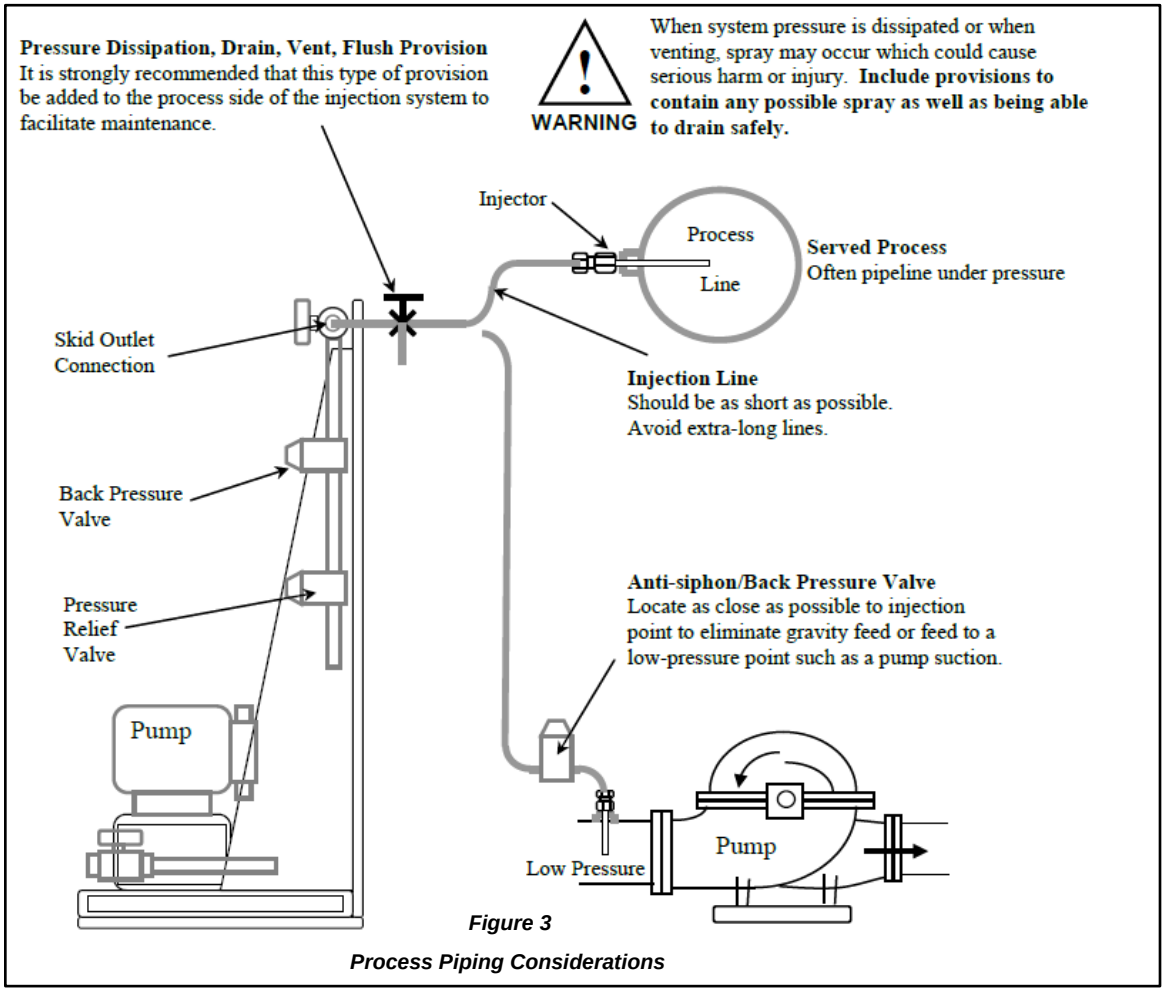

Figure 3

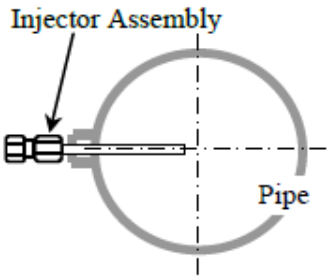
Process Piping Considerations



Injection Point

Injected chemicals may be corrosive to piping. To minimize corrosive effects, locate injector tip near center of process flow where velocities and mixing are at their highest rate. Trim tip as necessary. For larger pipe installations, longer injection assemblies are available.

Figure 4
Injection Point

Installation

Prior to attempting installation, familiarize yourself with the layout and components furnished with your pre-engineered skid system. These vary from system to system. Review the documentation supplied with your order.

Skid systems (and pumps) have been tested with water at the factory.

Some dosing chemicals will react with water, e.g., acids, polymers, etc. Check MSDS for the chemical to be handled. If adverse reaction with water is indicated, ensure that all portions of the skid piping, its components (and the pump) are free from the water prior to filling skid system with chemical.

Securely attach skid in its installation position to prevent falling or tipping.

Installation area should provide ease of access to skid components (and pumps) and the area should be kept free of clutter to enable safe operation and maintenance.

Note that skids are designed for ambient temperatures of 104°F (40°C) maximum. It is preferable that skid systems (and pumps) be located out of direct sunlight. If skid system is exposed to sunlight, provide protection for the pump/motor to prevent overheating and if skid is exposed to sunlight, use UV resistant tubing.

Connect the pump suction and discharge (refer to next figure) to the corresponding piping connections on the skid-mounted piping. Refer to installation drawing for location(s) of these piping connections. This is usually done with tubing, however always ensure that the connection material is compatible with the chemical to be pumped and suitable for the pressures and temperatures. Tubing connection fittings are usually plastic in which case they should be hand-tight only.

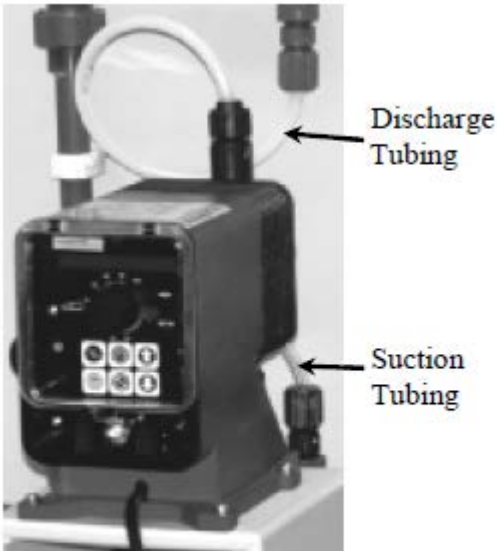


Figure 5
Typical Pump-to-Skid Tubing Connections

7.2.2 INTERCONNECTING PIPING

The next series of steps are the connection of your piping/tubing which include the chemical supply line, discharge line, pressure relief/bypass line and an air bleed return line.

These are your responsibility:

Ensure that for all piping, tubing, fittings and other appurtenances, their materials are compatible with the liquid to be pumped and the design is suitable for the pressures and temperatures of the application. System design must ensure safety for operation and maintenance as well as for anyone who may be in proximity to the system. Failure to do so may result in damage to equipment, personal injury or death.

7.2.3 SUCTION LINE

This line connects the source of the dosing chemical to the pre-engineered skid. Please refer to Figure 1 and Figure 2 on pages 10 and 11 respectively. If the source is below the centerline of the pump (suction lift condition), ensure that the suction line has a gradual rise up to the skid suction connection. If the source is above the centerline of the pump, ensure that the suction line has a gradual slope down to the skid suction connection. The purpose of this is to prevent air pocket(s) in the suction line which could affect proper operation of the pump. Include whatever provisions you consider necessary to facilitate the maintenance and operation such as isolation valve(s), drain and/or flush connections, etc., making sure that this sub-system enables SAFE OPERATION.

A foot valve is supplied with pumps, for use in suction lift arrangement.

7.2.4 DISCHARGE LINE

This line connects the skid to your served process. Please refer to the general description on page 12 and 13 and Figure 3 and Figure 4. This line should include the injector assembly that is usually furnished with the pump. If the injection point is below the dosing chemical source or if injecting into a low pressure area such as the suction of a pump, an anti-siphon/back pressure valve should be located as close as possible to the injection point to prevent unwanted chemical feeding. Include whatever provisions you consider necessary to facilitate maintenance and operation such as isolation valve(s), drain and/or flush connections, etc., making sure that this sub-system enables SAFE OPERATION.

7.2.5 AIR BLEED VALVE BYPASS LINE (if applicable)

Although most metering pumps are self-priming, they cannot pump against pressure when handling air in the priming cycle. An air bleed is necessary to enable the pump to prime, and an air bleed valve is provided for this. During the priming process, the air bleed valve is opened with the opening knob. Air will pass through the air bleed bypass line until the pump body is filled with process fluid. When the process fluid flows through the bypass line without any air bubbles, the pump is primed. The opening knob is then closed and the pump is ready for operation. Connect the air bleed bypass line to a suitable receptacle. This is often the suction source but can be a separate container. Firmly fix the outlet of the air bleed bypass line within the receiving receptacle to prevent any possible spraying.

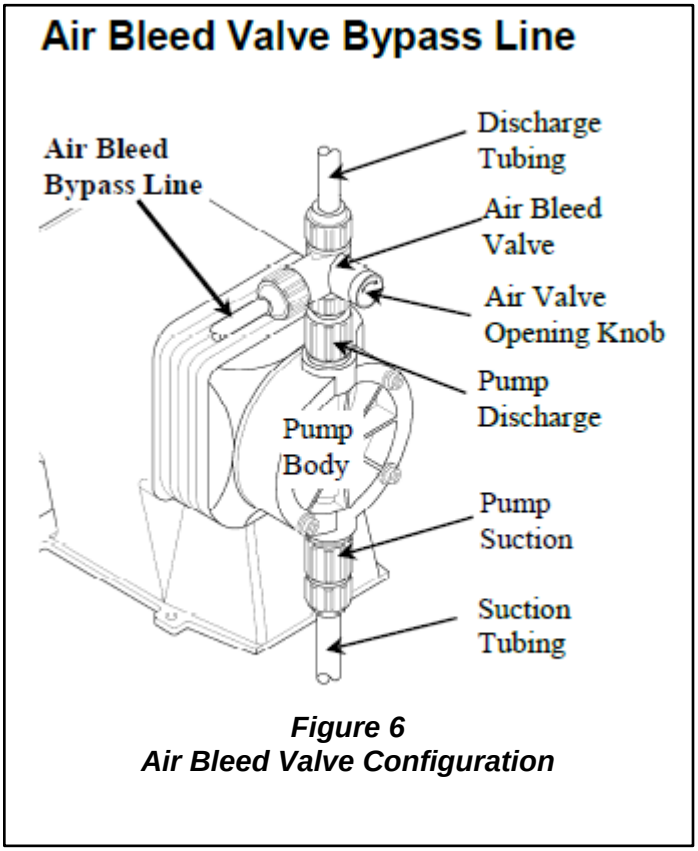

Figure 6
Air Bleed Valve Configuration

Check all piping and tubing connections on the skid to ensure they are tight.

Check all other system piping and/or tubing connections to ensure they are tight.

7.3 START-UP

7.3.1 INITIAL PRIME

The pump must be primed before it can function within the system. This will require an initial start of the pump.

Thoroughly review the installation, operation and maintenance manual for your pump prior to starting. Follow pump start-up instructions. Failure to do so may result in damage to equipment or serious injury.

Flooded Suction System

1. Close skid discharge valve and column isolation valve.
2. Open air bleed valve (turn opening knob counter clockwise, refer to Figure 6).
3. Open all valve(s) on the suction side – Skid suction connection valve and any valve(s) in your suction line.
4. Connect pump/motor to power source (pump/motor off).
5. Start pump using manufacturer's recommendations for initial operation settings.
6. Observe flow through air bleed bypass. When solid stream (no air bubbles) is observed, pump is primed.
7. Shut off pump.
8. Close air bleed valve (turn opening knob clockwise).

System with Suction Lift

With a suction lift configuration, the entire suction arrangement (suction line and skid suction piping) as well as the pump must be purged of air before the pump can function. The pump can evacuate the air, however this may take considerable time.

Optional:
If the dosing chemical can be handled safely, it may be helpful to add dosing chemical to the suction assembly via the top of the calibration column. This requires the installation of a foot valve at the entrance to the suction line within the chemical source container. Open the air bleed valve turning the opening knob counter clockwise (refer to Figure 6). Open column isolation valve. Open all valves in the suction line. Add dosing chemical into the top of the calibration column until liquid remains visible. Follow steps, below. Note that air bleed valve is open.

1. Close skid discharge valve and column isolation valve.
2. Open air bleed valve (turn opening knob counter clockwise, refer to Figure 6).
3. Open all valve(s) on the suction side – skid suction connection valve and any valve(s) in your suction line.
4. Connect pump/motor to power source (pump/motor off).
5. Start pump using manufacturer's recommendations for initial operation settings.
6. Observe flow through air bleed bypass. When solid stream (no air bubbles) is observed, pump is primed.
7. Shut off pump.
8. Close air bleed valve (turn opening knob clockwise).

7.3.2 SETTING VALVES

If furnished with your pre-engineered skid system, the pressure relief valve and back pressure valve will be pre-set at the factory. These pressure settings are related to the piping and components furnished with your skid as well as the pump(s) if furnished with the skid. Your system requirements may require changes to these settings and the valves will have to be re-set after maintenance. A general description and the setting procedures for these components are as follows:

Pressure Relief Valve (PRV)

A pressure relief valve must always be used with a chemical metering system that uses a positive displacement pump. This device is designed to protect the pump and system from over pressurization and it must be set to relieve at the maximum allowable pressure for the weakest point in the total system. This may be in your piping on the discharge side of the skid.

It is extremely important that you determine this pressure limitation and set the PRV accordingly.

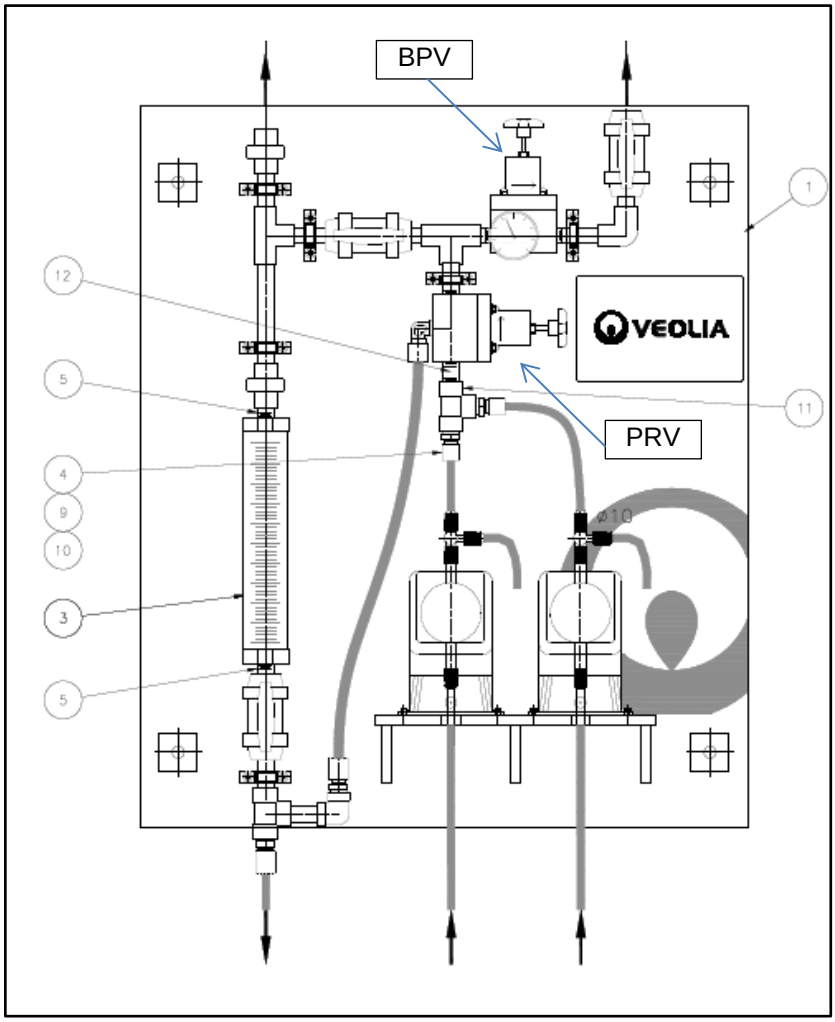

Figure 7 - Skid component locations (TYPICAL)

Back Pressure Valve (BPV)

The back pressure valve enables the pump to work against a constant pressure and will also function as an anti-siphon valve. This is especially important for injection systems that operate at low pressures or where there may be fluctuations in injector system pressure. The BPV is typically set at 50 PSIG, but a lower set pressure may be required depending upon your pump and your system configuration.

7.3.3 SETTING VALVES PROCEDURE

Prior to setting valve pressure, the skid discharge piping should be filled with liquid.

1. Set pulsation dampener air pressure (see above).
2. Adjust PRV and BPV to their lowest pressure setting (fully open).
3. Adjust skid discharge valve and/or system piping to allow venting from the skid discharge piping.
4. With pump primed, run pump until air is evacuated from the skid discharge piping.
5. Shut off pump.

7.3.3.1 SET PRESSURE RELIEF VALVE (PRV)

With pressure relief valve and back pressure valve fully open (lowest pressure setting):

1. Close skid discharge valve.
2. Start pump, monitor skid discharge gauge pressure. It should pulse slightly.
3. Gradually increase pressure at PRV until the skid pressure gauge reads the maximum allowable pump and/or system pressure at the highest pulsation pressure.
4. Shut down pump.
5. PRV is now set.

7.3.3.2 SET BACK PRESSURE VALVE (BPV)

After the pressure relief valve has been set, check to see that the BPV is fully open (lowest pressure setting):

1. Adjust skid discharge valve and/or system piping to allow free discharge from the skid discharge piping. Capture free discharge in an appropriate manner.
2. Start pump, monitor skid discharge gauge pressure.
3. Gradually increase pressure at BPV until correct pressure is indicated on the skid discharge gauge.
4. Shut down pump.
5. BPV is now set
6. Re-adjust system discharge piping/tubing to enable flow into the served process.

Check all system piping/tubing connections to ensure that they are properly tightened (hand-tight for plastic fittings) and leak-free.

Pumping system is now ready for operation.

7.3.4 FLOW CALIBRATION

Chemical metering systems are designed to provide chemicals to a process at precise flow rates. Metering pump output (flow rate) can be set as a function of both stroke lengths and stroke frequency. A calibration column is used to determine pump flow rate and to enable flow rate adjustments. The column must be filled with the dosing chemical prior to performing the calibration.

Use extreme care when handling chemicals.
Avoid any spray, splatter or spilling.
Always wear appropriate protective clothing.

Filling calibration Column

For a skid system with a cross-connect, the calibration column is filled by the pump.

1. Turn the column isolation valve to allow flow from the cross-connect into the calibration column.
2. Then turn the flow diverter valve to direct flow from the discharge header through the cross-connect into the calibration column.
3. Once the liquid level in the calibration column reaches slightly above the topmost scale mark, turn the flow diverter valve to re-direct flow into the system. Do not overfill.
4. Close column isolation valve.
5. Calibration column is filled and ready for the calibration procedure.

Note: While the calibration column is being filled in this manner, dosing chemical will not be provided to the served process.

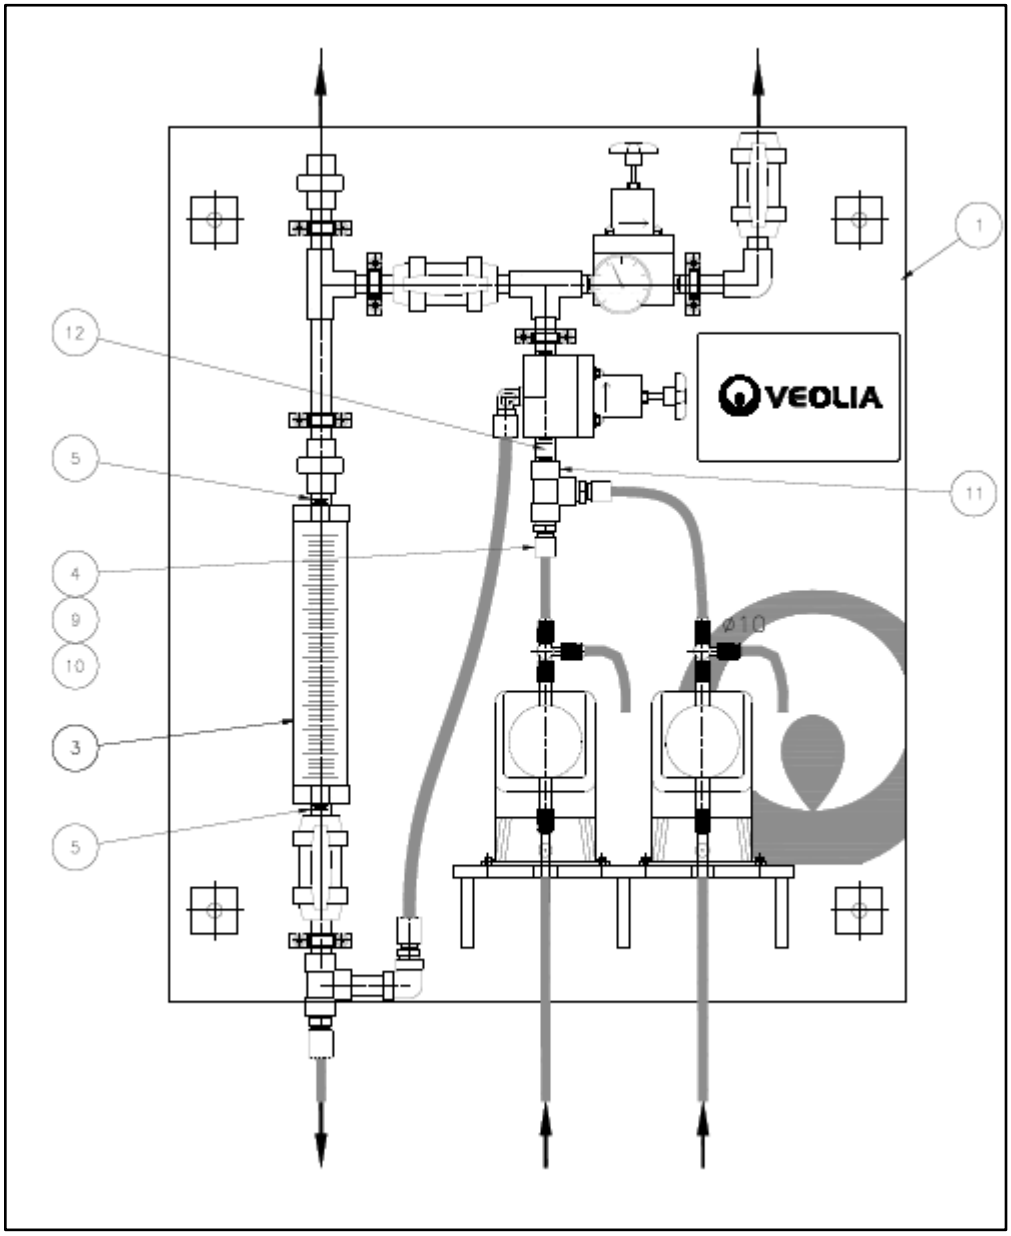

Figure 8 - Skid system with cross-connect (EXAMPLE)

For systems on suction lift (refer to Figure 2 on page 11)

1. Partially fill the calibration column through the top.
2. Open the column isolation valve briefly to vent any air that may be present in the suction header piping. Close the column isolation valve.
3. Fill the calibration column too slightly above the top scale mark.

Calibration column is filled and ready for the calibration procedure.

7.3.5 FLOW CALIBRATION PROCEDURE

The calibration column is filled to slightly above the top mark of the scale. The pump is then run in the system while being fed from the calibration column. After a 30 second time period, the liquid level reading on the scale will be a direct readout of the pump flow rate in US Gal/hr (note that a milliliter scale is also shown on the calibration column).

With the pump running in the system:

1. Open the column isolation valve so that the column feeds into the suction header, and immediately close the skid suction valve (refer to Figure 9 and 10).
2. Observe the liquid level in the calibration column. When it reaches the top scale mark, begin timing.
3. Allow 30 seconds to pass.
4. Open the skid suction valve and immediately close the column isolation valve.
5. Read pump output flow rate directly on the scale in US Gal/hr.

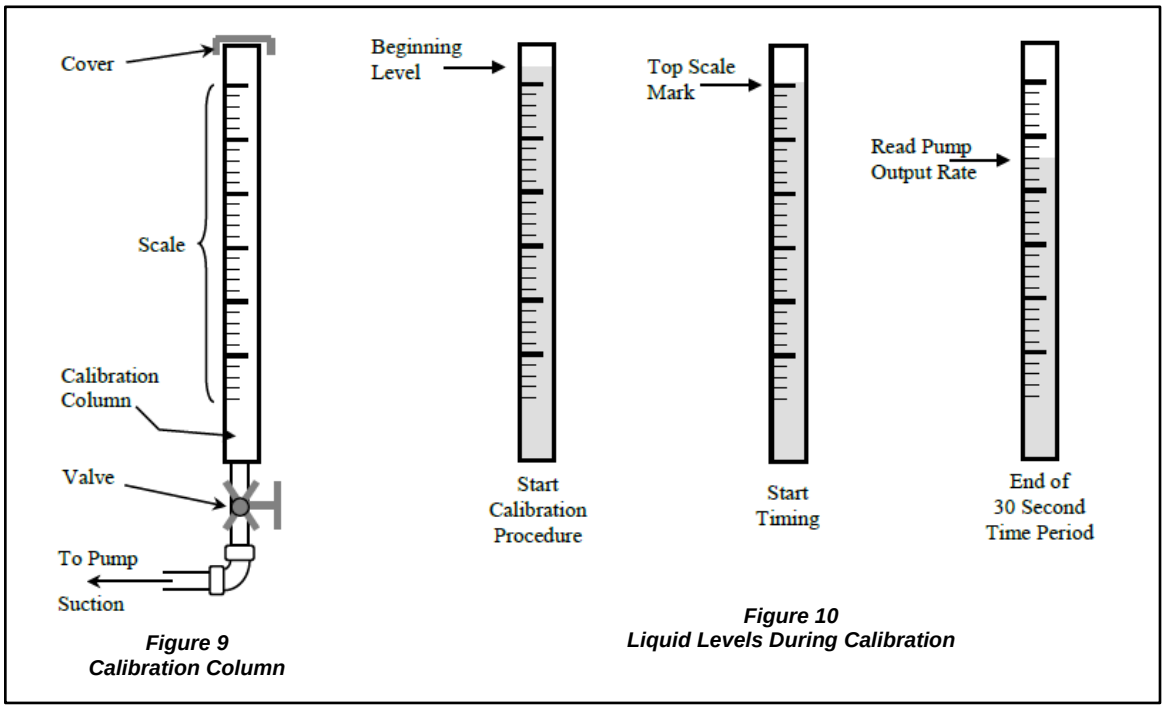

Figure 9
Calibration Column

Figure 10
Liquid Levels During Calibration

Once the calibration is complete, compare the reading to the desired rate for your system. Refer to your pump operation manual and adjust flow rate up or down accordingly (this is usually done by changing stroke frequency). After pump adjustment is made, repeat calibration procedure. Continue until the desired flow rate is achieved.

7.4 ROUTINE MAINTENANCE

Before performing any Maintenance on your skid system or pump,

Skid components, pump(s) and your process piping may be under pressure!
Prior to working on any portion of the skid system, disconnect pump(s) from power supply, de-pressurize the entire system and drain chemicals from the lines.
Flush and neutralize as necessary.
Always wear suitable protection (gloves, safety glasses/goggles, etc.).

Routine maintenance will depend upon your service requirements: dosing chemical(s) being handled, environmental conditions, duty cycle(s) of pump(s), etc. When working on any component of your system, i.e., pump, valves, pulsation dampener, refer to the installation, operation and maintenance manual for that particular item. Some operational and maintenance checks that need to be performed are:

ITEM	MAINTENANCE	DAILY	WEEKLY	MONTHLY	YEARLY
Strainer	Check this for the presence of trapped solids and clean as necessary.		X		
Piping/Tubing Integrity	Routinely check piping, tubing, isolation valves and connections for leaks. Replace tubing as necessary.		X		
System Operation	Perform flow calibration regularly to ensure that dosing chemical is being added at the proper rate.			X	
Pressure Relief and Back Pressure Valves	Check to ensure that bolts are tight. Recommend monthly. Diaphragms should be replaced on an annual basis.				X
Calibration Column	If handling sticky chemicals, may require cleaning to view liquid level inside. Perform as				

ITEM	MAINTENANCE	DAILY	WEEKLY	MONTHLY	YEARLY
	necessary.				
Foot Valve	The pumps come equipped with a foot valve for the suction line. This valve should be checked for solids build up and blockages.		**X**		

7.5 TROUBLESHOOTING GUIDE

PROBLEM	POSSIBLE CAUSE	REMEDY
Pump doesn't deliver product	Air entering suction line	Check fittings for tightness Check integrity of tubing Check level in suction source-must be above foot valve at inlet
	Air trapped in suction line	Re-configure suction line to eliminate air pocket(s)
	Suction line kinked or clogged	Inspect, replace tubing
	Chemical source empty	Refill, re-prime pump
	Pump not primed, air/gas in system	Re-prime pump
	Air/gas bubbles forming in chemical	Reduce suction lift or change to flooded suction Consider chemical storage temperature
	Strainer clogged	Check strainer, clean
	Pressure Relief Valve Open	Check Pressure Relief Valve integrity Check Pressure Relief Valve setting
	Pump problem(s) may be: Diaphragm wear, rupture Check valves worn or clogged Low pump flow setting Voltage/electrical difficulty	Refer to pump instructions
Piping Vibration/chatter	Pulsation Dampener malfunction	Check Pulsation Dampener Integrity Check Dampener air pressure
Injection rate too high, too low	Pump output setting incorrect	Perform flow calibration
	Chemical concentration too high, low	Adjust chemical source strength
	Siphoning into well or low pressure point	Add Back Pressure Valve at injection point.
	Injector clogged, scaled, restricted	Check injector for solids or corrosion Clean as necessary or replace
Injection rate varies	Back Pressure Valve	Check Back Pressure Valve integrity Check Back Pressure Valve setting
Tubing failure	Sunlight/UV exposure	Change to UV-resistant tubing
	Corrosive attack	Determine material compatibility, change as necessary
Leaky fittings	Loose fittings	Tighten fittings-plastic fittings should be hand-tight only
	Corrosive attack	Determine material compatibility, change as necessary

1 INTRODUCTION

This document provides installation, operation and maintenance instructions for a chemical dosing skid equipped with Pulsafeeder Pulsar Shadow mechanical diaphragm metering pump(s). For specific information regarding the pump installed on the dosing system, refer to the manual of the manufacturer.

The skid components are supplied by Veolia Water Technologies Canada (VWTC).

To obtain any additional information regarding characteristics or instructions on this equipment, please do not hesitate to contact us.

The system was designed in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

2 SAFETY

2.1 INTRODUCTION

Your safety is of the utmost concern. Dosing pumps and systems can handle harsh or toxic chemicals and exposure can lead to serious injury or death. Always wear appropriate protective clothing (for example, safety glasses, gloves, coveralls, etc.) and follow safe handling procedures. Pay attention to what you're doing and note safety advisories where they are shown throughout this manual. Some examples of safety issues and precautions for chemical dosing systems are:

- Do not use dosing skid systems for flammable liquids.
- Prior to working on any portion of the skid system, disconnect pump(s) from power supply, de-pressurize the system and drain chemicals from the lines.
- Inspect tubing regularly and replace as necessary. When inspecting tubing, wear protective clothing and safety glasses.
- If skid system is exposed to sunlight, use UV-resistant tubing.
- Follow directions and warnings provided with chemicals from the chemical manufacturer. User/Owner is responsible for determining chemical compatibility with chemical feed pump(s) and system components.
- Secure chemicals, metering pump(s) and system, making them inaccessible to children, pets, and unauthorized personnel.
- Always wear protective clothing, including gloves and safety goggles when working on or near chemical metering pump(s) and system.
- All connections (threaded, screwed or bolted) may only be loosened when the system is not under pressure.
- Installation and start-up of chemical dosing system will require both mechanical (plumbing) and electrical work. Only qualified and licensed plumbers and electricians should perform this.

2.2 FALL HAZARDS

As per OSHA statistic's, the majority of falls results from trips and slips. Common causes of slips are due to wet or oily surfaces and occasional spills.

Operators should reduce the risk of slipping on wet flooring by:

- Cleaning all spills immediately.
- Marking spills and wet area by using a cone or other warning device.

2.3 CHEMICALS HAZARDS

WHMIS Material Safety Data Sheets (MSDS) should be available for each chemical product. Since chemicals or chemical dosage are used during normal operation of treatment facility, the risks of fire, explosion and exposure to toxic chemicals or chemical burns are present. Chemicals typically used with dosing system are coagulant and polymer.

Operators should be made aware of the following:

- All chemicals which are used and any potentially dangerous reaction that could occur.
- Toxicity of all chemicals that are used or could be formed via reactions.
- Acidic or basic properties of all materials used.
- Potential fire or explosion hazards posed by the chemicals.
- Antidotes for exposure to toxic materials.
- Protective clothing that is recommended.
- Chemicals spills may be slippery.

2.4 ELECTRICAL CONNECTIONS

Electrical connections must be made by certified electricians in compliance with all applicable codes and regulations.

3 SHIPPING

Most of the equipment and material for this project will be drop shipped and delivered directly to the site.

- All items delivered will be clearly identified with VWTC's name, VWTC's project name and VWT's project number.
- All shipments will have a clear Packing List identifying all parts in the shipment.
- All equipment will be tagged with the corresponding tag numbers shown on the design drawings (if applicable).

If there are more stringent requirements in the contract documents, they will take precedence over the above. If any of these requirements are not being followed, please notify the VWTC Project Manager immediately.

4 RECEIVING

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to VWTC within five (5) working days of receipt of equipment. If there is no documented notification of missing or damaged parts within five (5) working days, VWTC is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and VWTC.

Photographs and written documentation should be provided for all damaged equipment.

5 HANDLING

5.1 GENERAL

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the items.

The Contractor is responsible for unloading and handling the equipment.

5.2 POLYPROPYLENE MATERIAL HANDLING

Care should be taken to avoid damages to the surface of the polypropylene panels due to dragging or from sharp objects.

6 STORAGE

6.1 GENERAL

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the VWTC equipment.

For contractual purposes, VWTC demands the Client to send pictures of major equipment once it is placed in storage, any time it gets moved during storage and again prior to removing from storage. Alternatively, a written document (check list, etc.) confirming that proper storage conditions are maintained will suffice. Failing to do so would cancel the proposed warranty.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of receipt at site, special precautions must be taken.

The chemical dosing skid shall be stored indoor at a temperature above 5°C. The storage environment into which a system is placed can have a severe effect on the long-term usefulness of some spare parts. Key environmental factors are:

- Temperature
- Relative humidity
- Pollutants

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

6.2 PVC PIPING STORAGE CONDITIONS

Pipe units should be stored and placed on level ground. Caution shall be taken to avoid compression, damage or deformation to the ends of the pipes. Racks or dunnage shall be used to prevent damage to the bottom pipes during storage and to support them. Supports should be spaced to prevent pipe bending.

When exposure in excess of one year to direct sunlight is unavoidable, the pipes should be covered with an opaque material while permitting adequate air circulation above and around the pipes as required preventing excess heat accumulation. The interior of the pipes, as well as all end surfaces, should be kept free from dirt and foreign matter until the pipes are ready to be used.

7 SKID OVERVIEW

The dosing skid system is designed to pump chemicals at precisely controlled rates into another process or system.

Proper arrangement of piping and appurtenances on both the supply side are critical to the successful operation of the overall system. These are the responsibility of the owner/operator of the system, and attention should be paid to the comments below:

SUPPLY SIDE

Dosing chemicals are usually sourced from a storage tank. When the source is located above the centerline of the pump(s) this is referred to as a 'flooded suction'. Connections to and from the solution tank are most commonly made with hard piping. The feed tank should be covered to prevent contamination.

Supply line should gradually slope downward from the feed tank to the skid suction connection.

It is strongly recommended to add a drain provision on the suction side to facilitate emptying and flushing of the system for maintenance.

8 INSTALLATION

Prior to attempting installation, familiarize yourself with the layout and components furnished with your dosing skid system. These vary from system to system and review the documentation supplied with your system. Inspect your skid system for damages which may have occurred during transit. If damages are discovered, immediately file a claim with the carrier and contact Veolia Water Technologies for any required parts or components.

Skid systems, including pump(s), have been tested with water prior to shipment.

Some dosing chemicals will react with water, e.g., acids, polymers, etc. Check the MSDS for the chemical to be handled. If adverse reaction with water is indicated, ensure that all portions of the skid piping, its components and the pump, are free of water prior to filling the skid system with chemical.

Skid systems may be wall or floor mounted. Mounting holes are provided or can be drilled on the skid for both types of mounting. Securely attach the skid in its installation position to prevent falling or tipping.

The installation area should provide ease of access to skid components, including pump(s), and the area should be kept free of clutter to enable safe operation and maintenance.

Note that pumps/motors are designed for ambient temperatures of 104°F (40°C) maximum. It is preferable that skid systems and pump(s) be located out of direct sunlight. If the skid system is exposed to sunlight, provide protection for the pump/motor to prevent overheating and if the skid is exposed to sunlight, use UV resistant tubing.

If skid is exposed to sunlight, use UV-resistant tubing.

Most chemical dosing skids will have pump(s) mounted on them before shipment, and the pump(s) will be connected to the skid integral piping with tubing.

8.1 OWNER-INSTALLED PIPING / TUBING

The next series of steps are the connection of your piping/tubing which include the chemical supply line, discharge line, pressure relief/bypass line and an air bleed return line.

These are your responsibility and ensure that for all piping, tubing, fitting and other appurtenances, their materials are compatible with the liquid to be pumped and the design is suitable for the pressures and temperatures of the application. System design must ensure safety for operation and maintenance as well as for anyone who may be in proximity to the system. Failure to do so may result in damage to equipment, personal injury or death.

8.2 SUCTION LINE

This line connects the source of the dosing chemical to the dosing skid. Include whatever provisions you consider necessary to facilitate the maintenance and operation such as isolation valve(s), drain and/or flush connections, etc., making sure that this sub-system enables safe operation.

8.3 DISCHARGE LINE

This line connects the dosing skid to the served process. Include whatever provisions you consider necessary to facilitate maintenance and operation, such as isolation valve(s), drain and/or flush connections, etc., making sure that this system enables **SAFE OPERATION**.

9 INITIAL START-UP

The pump must be primed before it can function within the system. This will require an initial start of the pump.

Thoroughly review the installation, operation and maintenance manual for your pump prior to starting. Follow pump start-up instructions. Failure to do so may result in damage to equipment or serious injury.

FLOODED SUCTION SYSTEM

1. Close skid discharge valve and column isolation valve.
2. Connect pump/motor to power source (pump/motor off).
3. Start pump using manufacturer's recommendations for initial operation settings.
4. Shut off pump.

9.1 SETTING VALVES

If furnished with your dosing skid system, the pressure relief valve and back pressure valve will be preset prior to shipment. These pressure settings are related to the piping and components furnished with your skid as well as the pump(s) if furnished with the skid. Your system requirements may demand changes to these settings and the valves will have to be reset after maintenance such as diaphragm replacement. A general description and the setting procedures for these components are as follows.

9.2 PRESSURE RELIEF VALVE

A pressure relief valve (PRV) must always be used with a chemical metering system that uses a positive displacement pump. This device is designed to protect the pump and system from over pressurization and it must be set to relieve at the maximum allowable pressure for the weakest point in the total system. This may be in your piping on the discharge side of the skid. The pressure relief valves are factory set and cannot be modified. If the pressure set point is surpassed, the valve will need to be replaced. The pressure setting is indicated on the P&ID drawings.

Most dosing skid systems include a pressure relief valve and suction header where the PRV is directly connected from the discharge header to the suction header. If your skid system does not include a suction header, or if you are providing your own PRV, relief flow from the pressure relief port on the PRV must be directed to either the suction source or a separate receptacle. This is usually done with tubing.

Care must be taken to channel any free flow from the pumping system into an appropriate receptacle. Eliminate any possibility of splashing, spraying or spillage. Always wear suitable protective equipment (gloves, safety goggles/glasses, coveralls, etc.) when working with or around chemical dosing systems.

Check all system piping/tubing connections to ensure that they are properly tightened (handtight for plastic fittings) and leak free.

Pumping system is now ready for operation.

9.3 FLOW CALIBRATION

Chemical metering systems are designed to provide chemicals to a process at precise flow rates. Metering pump output (flow rate) can be set with a variable frequency drive (VFD). A calibration column is used to determine pump flow rate and to enable flow rate adjustments.

The procedures for filling the calibration column and for calibrating the pumps are described below. Review both complete procedures before proceeding with next steps.

FILLING THE CALIBRATION COLUMN BY OPENING THE COLUMN ISOLATION VALVE

- Use extreme care when handling chemicals.
- Avoid any spray, splatter or spilling.
- Always wear appropriate protective clothing.

FOR SYSTEMS WITH FLOODED SUCTION:

1. Open column isolation valve.
2. Liquid level in the column should rise to the level in the suction source. This may be higher than the top of the column, so prevent overfill by closing the column isolation valve when the liquid level in the calibration column reaches slightly above the top scale mark.
3. If the liquid level in the suction source is lower than the top scale mark, close the column isolation valve and add liquid through the top of the column to a point slightly above the top scale mark.

Calibration column is filled and ready for the calibration procedure.

9.4 VARIABLE FREQUENCY DRIVE SETTINGS

When powered up, the operator should check the direction of rotational direction of the pump. The following checklist indicates the steps to set the VFD parameters of an AC Tech drive. Other VFD may require different parameters.

1. Set start control source to terminal strip or local keypad.
2. Set acceleration parameter.
3. Set deceleration parameter.
4. Set motor overload in %.
5. Set start method on start on power up.
6. Set input function to 4-20 mA.
7. Set relay output to run (energizes when the drive is running).
8. Set drive mode to vector speed.
9. Set motor rated voltage.
10. Set motor rated current.
11. Set motor rated speed.
12. Run motor auto-calibration.

For more information refer to the VFD manual.

10 OPERATION PROCEDURES

The calibration column is filled to slightly above the top mark of the scale. The pump is then run in the system while being fed from the calibration column. After a 30 second time period, the liquid level reading on the scale will be a direct readout of the pump flow rate in US Gallons/hr (note that a millilitre scale is also shown on the calibration column).

With the pump running in the system:

1. Open the column isolation valve so that the column feeds into the suction header and immediately close the skid suction valve.
2. Observe the liquid level in the calibration column. When it reaches the top scale mark, begin timing.
3. Allow 30 seconds to pass.
4. Open the skid suction valve and immediately close the column isolation valve.
5. Read pump output flow rate directly on the scale in US Gallons/hr.

Once the calibration is complete, compare the reading to the desired rate for your system. Refer to your pump operation manual and adjust flow rate up or down accordingly (this is usually done by changing the frequency). After pump adjustment is made, repeat calibration procedure. Continue until the desired flow rate is achieved.

11 ROUTINE MAINTENANCE

Before performing any maintenance on your skid system or pump(s), skid components, pump(s) and your process piping may be under pressure!

Prior to working on any portion of the skid system:

- Disconnect pump(s) from power supply.
- De-pressurize the entire system.
- Drain chemicals from the lines.
- Flush and neutralize as necessary.
- Always wear suitable protection (gloves, safety glasses/goggles, etc.).

Routine maintenance will depend upon your service requirements: dosing chemical being handled, environmental conditions, duty cycle(s) of pump(s), etc. When working on any component of your system, i.e., pump(s) and valves, refer to the installation, operation and maintenance manual for that particular item.

Some operational and maintenance checks that need to be performed are:

Piping/Tubing Integrity: Routinely check piping, tubing, isolation valves and connections for leaks. Replace tubing as necessary. Recommend weekly check.

System Operation: Perform flow calibration regularly to ensure that dosing chemical is being added at the proper rate. Recommend monthly.

Pressure Relief: Check to ensure that bolts are tight. Recommend monthly. Diaphragms should be replaced on an annual basis.

Calibration Column: If handling sticky chemicals, may require cleaning to view liquid level inside. Perform as necessary.

Mechanical Diaphragm Metering Pump: Maintenance shall be as recommended in Manufacturer O&M Manual.

Note: Special tools may be required for dismantling and re-assembly of the pump. Before starting the dismantling, refer to the installation, operation and maintenance manual of the pump.

12 TROUBLESHOOTING GUIDE

DIFFICULTY	PROBABLE CAUSE	REMEDY
Pump does not start	Coupling disconnected	Connect coupling
	Faulty power source	Check power source
	Blown fuse and circuit breaker	Replace - Eliminate overload
	Broken wire	Locate and repair
	Wired improperly	Check diagram
	Pipe line blockage	Open valves
No Delivery	Motor not running	Check power source and wiring diagram
	Supply tank empty	Fill tank
	Lines clogged	Clean and flush
	Closed line valves	Open valves
	Ball check valves held open with solids	Clean and inspect
	Vapor lock, cavitation	Increase suction pressure
	Prime lost	Reprime, and check for leak
	Strainer clogged	Remove and clean. Replace screen if necessary
Low delivery	Motor speed too low	Check voltages, frequency, wiring and terminal connections. Check nameplate vs specifications
	Check valves worn or dirty	Clean, replace if damaged
	Calibration system error	Evaluate and correct
	Product viscosity too high	Lower viscosity by increasing product temperature. Increase pump and/or piping size
	Product cavitating	Increase suction pressure. Cool product as necessary
Delivery gradually drops	Check valve leakage	Clean, replace if damaged
	Leak in suction line	Locate and correct
	Strainer fouled	Clean or replace screen
	Product change	Check viscosity
	Supply tank vent plugged	Unplug vent
Delivery erratic	Leak in suction line	Locate and correct
	Product cavitating	Increase suction pressure
	Entrapped air or gas in product	Consult factory for suggested venting
	Motor speed erratic	Check voltage and frequency
	Fouled check valves	Clean, replace if necessary
Delivery higher than rated	Suction pressure higher than discharge pressure	Install backpressure valve or consult factory for piping recommendations
	Back pressure valve set too low	Increase setting
	Back pressure valve leaks	Repair, clean or replace
Pump loses internal oil	Diaphragm ruptured	Replace
	Leaky seal	Replace
	Cover gasket leaks	Replace or retighten
	Pump overfilled	Remove excess oil
Noisy gearing, knocking	Discharge pressure too high	Reduce pressure
	Water hammer	Install pulsation dampener
	Stroke length at partial setting	Non-destructive knocking is characteristic of lost motion pumps
	No oil or level incorrect	Replace or refill oil
Pump noisy	Pipe size too small	Increase size of piping - Install pulsation dampener
	Pipe runs too long	Install pulsation dampener in line
	Surge chambers flooded	Replace with air or inert gas. If a pulsation dampener is installed, replace diaphragm and recharge
	No surge chambers used	Install pulsation dampener
Motor overheats	Pump overloaded	Check operating conditions against pump design
	High or low voltage	Check power source
	Loose wire	Trace and correct
	Excessive discharge pressure	Correct conditions so ratings of pump are note exceeded

If problem(s) persist, please contact Veolia Water Technologies

13 LUBRICATION SCHEDULE - INSPECTION

ITEM	ACTION	FREQUENCY	TYPE OF LUBRICANT
Wet end inspection	Inspection (If diaphragm has failed, replace eccentric oil)	Refer to section 11	Refer to eccentric oil change
Check valve	Inspection	Refer to section 11	See note
Oil seals (qty 4) Pump shaft seal Motor adapter seal Gearbox oil seal Eccentric box seal	Inspection	Refer to section 11	See note
Motor bearing	Inspection/Lubrication	Refer to section 11	Lubricant (refer to motor nameplate)
Eccentric oil	Change oil	2 years (normal service) 1 year (severe service)	Pulsalube 9M (refer to Pulsafeeder Shadow maintenance manual)
Gear oil	Change oil	5 years (normal service) 2 years (severe service)	Pulsalube 8G (refer to Pulsafeeder Shadow maintenance manual)

Note: PULSAR Shadow KOPkits contain all replacement parts normally used in a preventive maintenance program

14 SPARE PARTS

It is highly recommended to keep in stock spare parts in sufficient quantity for all critical equipment to the proper functioning of the process.

Only the use of original Veolia spare parts will ensure proper and reliable operation.

When ordering a spare part, please give the following information:

- Veolia project number.
- Project name.
- Part number

15 DRAWINGS

If this dosing system is integrated to a processing plant, refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the dosing system drawings.

16 COMPONENTS TECHNICAL DATA SHEET

If this dosing system is integrated to a processing plant, refer to the Detailed Technical Documentation section of the Operation and Maintenance Manual for the dosing system data sheets.

17 MANUFACTURERS OPERATION AND MAINTENANCE MANUAL

If this dosing system is integrated to a processing plant, refer to the Manufacturer Operation and Maintenance Manual section of the Operation and Maintenance Manual for the dosing system manufacturer manuals.

1 INTRODUCTION

This document provides installation, operation and maintenance instructions for a polymer dosing skid equipped with Seepex progressive cavity pump(s). For specific information regarding the pump installed on the dosing system, refer to the manual of the manufacturer.

The skid components supplied by Veolia Water Technologies Canada (VWTC).

To obtain any additional information regarding characteristics or instructions on this equipment, please do not hesitate to contact us.

The system was designed in Canada by:

Veolia Water Technologies Canada
4105, Sartelon
Saint-Laurent, Qc.
Canada H4S 2B3
Phone: 514-334-7230
Fax: 514-334-5070

For technical support or service needs, for spare parts or to get assistance during your warranty period, you may contact us at the following number during regular business hours or write us at:

Veolia Water Technologies Canada After Sales Support
1-844-SER-VWT9 | 1-844-737-8989 | vwtservicecanada@veolia.com

Our business hours are from
Monday to Friday
8:30am to 5pm EST

2 SAFETY

2.1 INTRODUCTION

Your safety is of the utmost concern. Dosing pumps and systems can handle harsh or toxic chemicals and exposure can lead to serious injury or death. Always wear appropriate protective clothing (for example, safety glasses, gloves, coveralls, etc.) and follow safe handling procedures. Pay attention to what you're doing and note safety advisories where they are shown throughout this manual. Some examples of safety issues and precautions for chemical dosing systems are:

- Do not use dosing skid systems for flammable liquids.
- Prior to working on any portion of the skid system, disconnect pump(s) from power supply, de-pressurize the system and drain chemicals from the lines.
- Inspect tubing regularly and replace as necessary. When inspecting tubing, wear protective clothing and safety glasses.
- If skid system is exposed to sunlight, use UV-resistant tubing.
- Follow directions and warnings provided with chemicals from the chemical manufacturer. User/Owner is responsible for determining chemical compatibility with chemical feed pump(s) and system components.
- Secure chemicals, metering pump(s) and system, making them inaccessible to children, pets, and unauthorized personnel.
- Always wear protective clothing, including gloves and safety goggles when working on or near chemical metering pump(s) and system.
- All connections (threaded, screwed or bolted) may only be loosened when the system is not under pressure.
- Installation and start-up of chemical dosing system will require both mechanical (plumbing) and electrical work. Only qualified and licensed plumbers and electricians should perform this.

2.2 FALL HAZARDS

As per OSHA statistic's, the majority of falls results from trips and slips. Common causes of slips are due to wet or oily surfaces and occasional spills.

Operators should reduce the risk of slipping on wet flooring by:

- Cleaning all spills immediately.
- Marking spills and wet area by using a cone or other warning device.

2.3 CHEMICALS HAZARDS

WHMIS Material Safety Data Sheets (MSDS) should be available for each chemical product. Since chemicals or chemical dosage are used during normal operation of treatment facility, the risks of fire, explosion and exposure to toxic chemicals or chemical burns are present. Chemicals typically used with dosing system are coagulant and polymer.

Operators should be made aware of the following:

- All chemicals which are used and any potentially dangerous reaction that could occur.
- Toxicity of all chemicals that are used or could be formed via reactions.
- Acidic or basic properties of all materials used.
- Potential fire or explosion hazards posed by the chemicals.
- Antidotes for exposure to toxic materials.
- Protective clothing that is recommended.
- Chemicals spills may be slippery.

2.4 ELECTRICAL CONNECTIONS

Electrical connections must be made by certified electricians in compliance with all applicable codes and regulations.

3 SHIPPING

Most of the equipment and material for this project will be drop shipped and delivered directly to the site.

- All items delivered will be clearly identified with VWTC's name, VWTC's project name and VWT's project number.
- All shipments will have a clear Packing List identifying all parts in the shipment.
- All equipment will be tagged with the corresponding tag numbers shown on the design drawings (if applicable).

If there are more stringent requirements in the contract documents, they will take precedence over the above. If any of these requirements are not being followed, please notify the VWTC Project Manager immediately.

4 RECEIVING

The condition of all delivered equipment must be verified by the responsible party upon arrival at site. Verification that all equipment has been delivered as per contract must also be done upon arrival at site. Notification of missing or damaged items must be sent to VWTC within five (5) working days of receipt of equipment. If there is no documented notification of missing or damaged parts within five (5) working days, VWTC is not responsible for replacement of any items found to be missing or damaged at the time of installation and start-up of the supplied equipment. It is the responsibility of the party receiving the equipment to ensure all packaging is opened at the time of receipt to uncover and document any and all damages to the Freight Company and VWTC.

Photographs and written documentation should be provided for all damaged equipment.

5 HANDLING

5.1 GENERAL

Equipment will arrive at the project site in several different shipments, from various freight companies and in several different packaging containers. Typically a flatbed truck is used which requires a fork lift or a crane to remove the items.

The Contractor is responsible for unloading and handling the equipment.

5.2 POLYPROPYLENE MATERIAL HANDLING

Care should be taken to avoid damages to the surface of the polypropylene panels due to dragging or from sharp objects.

6 STORAGE

6.1 GENERAL

The following instructions outline the duties and responsibilities of the responsible party for equipment storage. The responsible party shall assume responsibility for the equipment upon arrival at the project site. These instructions shall define the minimum expectations for storage of all equipment.

While this storage specification takes into account common environmental issues that may affect the system during storage, common sense should be the overriding factor in determining the best method to ensure the integrity and proper storage of the VWTC equipment.

For contractual purposes, VWTC demands the Client to send pictures of major equipment once it is placed in storage, any time it gets moved during storage and again prior to removing from storage. Alternatively, a written document (check list, etc.) confirming that proper storage conditions are maintained will suffice. Failing to do so would cancel the proposed warranty.

Should it be necessary to delay installation and subsequent operation of a unit for more than one month from date of receipt at site, special precautions must be taken.

The polymer dosing skid shall be stored indoor at a temperature above 5°C. The storage environment into which a system is placed can have a severe effect on the long-term usefulness of some spare parts. Key environmental factors are:

- Temperature
- Relative humidity
- Pollutants

Air may contain excessive moisture, pollutants, microorganisms, and other particulates that accelerate the deterioration of some materials. Humidity and pollutants can produce an aggressive atmosphere.

6.2 PVC PIPING STORAGE CONDITIONS

Pipe units should be stored and placed on level ground. Caution shall be taken to avoid compression, damage or deformation to the ends of the pipes. Racks or dunnage shall be used to prevent damage to the bottom pipes during storage and to support them. Supports should be spaced to prevent pipe bending.

When exposure in excess of one year to direct sunlight is unavoidable, the pipes should be covered with an opaque material while permitting adequate air circulation above and around the pipes as required preventing excess heat accumulation. The interior of the pipes, as well as all end surfaces, should be kept free from dirt and foreign matter until the pipes are ready to be used.

7 SKID OVERVIEW

The dosing skid system is designed to pump chemicals at precisely controlled rates into another process or system. Dilution water provides a minimum dilution ratio of 3:1 of dilution water to dosing chemical.

Proper arrangement of piping and appurtenances on both the supply side are critical to the successful operation of the overall system. These are the responsibility of the owner/operator of the system, and attention should be paid to the comments below:

SUPPLY SIDE

Dosing chemicals are usually sourced from a preparation system. When the source is located above the centerline of the pump(s) this is referred to as a 'flooded suction'. Connections to and from the solution tank are most commonly made with hard piping. The solution tank should be covered to prevent contamination.

Supply line should gradually slope downward from the solution tank to the skid suction connection.

It is strongly recommended to add a drain provision on the suction side to facilitate emptying and flushing of the system for maintenance.

8 INSTALLATION

Prior to attempting installation, familiarize yourself with the layout and components furnished with your dosing skid system. These vary from system to system and review the documentation supplied with your system. Inspect your skid system for damages which may have occurred during transit. If damages are discovered, immediately file a claim with the carrier and contact Veolia Water Technologies for any required parts or components.

Skid systems, including pump(s), have been tested with water prior to shipment.

Some dosing chemicals will react with water, e.g., acids, polymers, etc. Check the MSDS for the chemical to be handled. If adverse reaction with water is indicated, ensure that all portions of the skid piping, its components and the pump, are free of water prior to filling the skid system with chemical.

Skid systems may be wall or floor mounted. Mounting holes are provided or can be drilled on the skid for both types of mounting. Securely attach the skid in its installation position to prevent falling or tipping.

The installation area should provide ease of access to skid components, including pump(s), and the area should be kept free of clutter to enable safe operation and maintenance.

Note that pumps/motors are designed for ambient temperatures of 104°F (40°C) maximum. It is preferable that skid systems and pump(s) be located out of direct sunlight. If the skid system is exposed to sunlight, provide protection for the pump/motor to prevent overheating and if the skid is exposed to sunlight, use UV resistant tubing.

If skid is exposed to sunlight, use UV-resistant tubing.

Most chemical dosing skids will have Seepex pump(s) mounted on them before shipment, and the pump(s) will be connected to the skid integral piping with tubing.

8.1 OWNER-INSTALLED PIPING / TUBING

The next series of steps are the connection of your piping/tubing which include the chemical supply line, discharge line, pressure relief/bypass line and an air bleed return line.

These are your responsibility and ensure that for all piping, tubing, fitting and other appurtenances, their materials are compatible with the liquid to be pumped and the design is suitable for the pressures and temperatures of the application. System design must ensure safety for operation and maintenance as well as for anyone who may be in proximity to the system. Failure to do so may result in damage to equipment, personal injury or death.

8.2 SUCTION LINE / TRANSPORT WATER LINE

This line connects the source of the dosing chemical to the dosing skid. Include whatever provisions you consider necessary to facilitate the maintenance and operation such as isolation valve(s), drain and/or flush connections, etc., making sure that this sub-system enables safe operation.

8.3 DISCHARGE LINE

This line connects the dosing skid to the served process. Include whatever provisions you consider necessary to facilitate maintenance and operation, such as isolation valve(s), drain and/or flush connections, etc., making sure that this system enables **SAFE OPERATION**.

9 INITIAL START-UP

The pump must be primed before it can function within the system. This will require an initial start of the pump.

Thoroughly review the installation, operation and maintenance manual for your pump prior to starting. Follow pump start-up instructions. Failure to do so may result in damage to equipment or serious injury.

FLOODED SUCTION SYSTEM

1. Close skid discharge valve and column isolation valve.
2. Connect pump/motor to power source (pump/motor off).
3. Start pump using manufacturer's recommendations for initial operation settings.
4. Shut off pump.

9.1 SETTING VALVES

If furnished with your dosing skid system, the pressure relief valve and back pressure valve will be preset prior to shipment. These pressure settings are related to the piping and components furnished with your skid as well as the pump(s) if furnished with the skid. Your system requirements may demand changes to these settings and the valves will have to be reset after maintenance such as diaphragm replacement. A general description and the setting procedures for these components are as follows.

9.2 PRESSURE RELIEF VALVE

A pressure relief valve (PRV) must always be used with a chemical metering system that uses a positive displacement pump. This device is designed to protect the pump and system from over pressurization and it must be set to relieve at the maximum allowable pressure for the weakest point in the total system. This may be in your piping on the discharge side of the skid. The pressure relief valves are factory set and cannot be modified. If the pressure set point is surpassed, the valve will need to be replaced. The pressure settling is indicated on the P&ID drawings.

Most dosing skid systems include a pressure relief valve and suction header where the PRV is directly connected from the discharge header to the suction header. If your skid system does not include a suction header, or if you are providing your own PRV, relief flow from the pressure relief port on the PRV must be directed to either the suction source or a separate receptacle. This is usually done with tubing.

Care must be taken to channel any free flow from the pumping system into an appropriate receptacle. Eliminate any possibility of splashing, spraying or spillage. Always wear suitable protective equipment (gloves, safety goggles/glasses, coveralls, etc.) when working with or around chemical dosing systems.

Check all system piping/tubing connections to ensure that they are properly tightened (handtight for plastic fittings) and leak free.

Pumping system is now ready for operation.

9.3 FLOW CALIBRATION

Chemical metering systems are designed to provide chemicals to a process at precise flow rates. Metering pump output (flow rate) can be set with a variable frequency drive (VFD). A calibration column is used to determine pump flow rate and to enable flow rate adjustments.

The procedures for filling the calibration column and for calibrating the pumps are described below. Review both complete procedures before proceeding with next steps.

FILLING THE CALIBRATION COLUMN BY OPENING THE COLUMN ISOLATION VALVE

- Use extreme care when handling chemicals.
- Avoid any spray, splatter or spilling.
- Always wear appropriate protective clothing.

FOR SYSTEMS WITH FLOODED SUCTION:

1. Open column isolation valve.
2. Liquid level in the column should rise to the level in the suction source. This may be higher than the top of the column, so prevent overfill by closing the column isolation valve when the liquid level in the calibration column reaches slightly above the top scale mark.
3. If the liquid level in the suction source is lower than the top scale mark, close the column isolation valve and add liquid through the top of the column to a point slightly above the top scale mark.

Calibration column is filled and ready for the calibration procedure.

9.4 VARIABLE FREQUENCY DRIVE SETTINGS

When powered up, the operator should check the direction of rotational direction of the pump. The following checklist indicates the steps to set the VFD parameters of an AC Tech drive. Other VFD may require different parameters.

1. Set start control source to terminal strip or local keypad.
2. Set acceleration parameter.
3. Set deceleration parameter.
4. Set motor overload in %.
5. Set start method on start on power up.
6. Set input function to 4-20 mA.
7. Set relay output to run (energizes when the drive is running).
8. Set drive mode to vector speed.
9. Set motor rated voltage.
10. Set motor rated current.
11. Set motor rated speed.
12. Run motor auto-calibration.

For more information refer to the VFD manual.

10 OPERATION PROCEDURES

The calibration column is filled to slightly above the top mark of the scale. The pump is then run in the system while being fed from the calibration column. After a start-up period, the liquid level reading on the scale will be a direct readout of the pump flow rate in US Gallons/hr (note that a millilitre scale is also shown on the calibration column).

With the pump running in the system:

1. Open the column isolation valve so that the column feeds into the suction header and immediately close the skid suction valve.
2. Observe the liquid level in the calibration column. When it reaches the top scale mark, begin timing.
3. Allow 30 seconds to pass.
4. Open the skid suction valve and immediately close the column isolation valve.
5. Read pump output flow rate directly on the scale in US Gallons/hr.

Once the calibration is complete, compare the reading to the desired rate for your system. Refer to your pump operation manual and adjust flow rate up or down accordingly (this is usually done by changing the frequency). After pump adjustment is made, repeat calibration procedure. Continue until the desired flow rate is achieved.

11 ROUTINE MAINTENANCE

Before performing any maintenance on your skid system or pump(s), skid components, pump(s) and your process piping may be under pressure!

Prior to working on any portion of the skid system:

- Disconnect pump(s) from power supply.
- De-pressurize the entire system.
- Drain chemicals from the lines.
- Flush and neutralize as necessary.
- Always wear suitable protection (gloves, safety glasses/goggles, etc.).

Routine maintenance will depend upon your service requirements: dosing chemical being handled, environmental conditions, duty cycle(s) of pump(s), etc. When working on any component of your system, i.e., pump(s) and valves, refer to the installation, operation and maintenance manual for that particular item.

Some operational and maintenance checks that need to be performed are:

Piping/Tubing Integrity:	Routinely check piping, tubing, isolation valves and connections for leaks. Replace tubing as necessary. Recommend weekly check.
System Operation:	Perform flow calibration regularly to ensure that dosing chemical is being added at the proper rate. Recommend monthly.
Pressure Relief:	Check to ensure that bolts are tight. Recommend monthly. Diaphragms should be replaced on an annual basis.
Calibration Column:	If handling sticky chemicals, may require cleaning to view liquid level inside. Perform as necessary.
Progressive Cavity Pump:	Weekly check oil level. Oil should be changed on a 3 years basis. Motor bearings shall be repacked with grease every 3 years. Pump bearings shall be repacked every 3000 operating hours.

Note: Special tools are required for dismantling and re-assembly of the pump. Before starting the dismantling, refer to the installation, operation and maintenance manual of the pump.

12 TROUBLESHOOTING GUIDE

PROBLEM	POSSIBLE CAUSE	REMEDY
Pump doesn't deliver product	Air entering suction line	Check fittings for tightness Check integrity of tubing Check level in suction source-must be above foot valve at inlet
	Air trapped in suction line	Re-configure suction line to eliminate air pocket(s)
	Suction line kinked or clogged	Inspect, replace tubing
	Chemical source empty	Refill, re-prime pump
	Pump not primed, air/gas in system	Refer to pump instructions
	Air/gas bubbles forming in chemical	Reduce suction lift or change to flooded suction Consider chemical storage temperature
	Strainer clogged	Check strainer, clean
	Pressure relief valve open	Check pressure relief valve integrity Check pressure relief valve settings
	Pump problem(s) may be: Stator wear, rupture Check valves worn or clogged Low pump flow setting Voltage/electrical difficulty	Refer to pump instructions
	TSE alert is triggered (overheating)	Check overheating causes Acknowledge the alert/release relay: - Press reset button (at TSE control for 1 sec) - Shut-off operating voltage at the TSE control unit (terminal 1-3) - Actuate external contact (reset button close for 1 sec)
Piping Vibration/chatter	Pulsation dampener malfunction (if applicable)	Check pulsation dampener integrity Check dampener air pressure
Injection rate too high, too low	Pump output setting incorrect	Perform flow calibration
	Chemical concentration too high, low	Adjust chemical source strength
	Injector clogged, scaled, restricted	Check injector for solids or corrosion Clean as necessary or replace
Tubing failure	Sunlight/UV exposure	Change to UV resistant tubing
	Corrosive attack	Determine material compatibility, change as necessary
Leaky fittings	Loose fittings	Tighten fittings-plastic fittings should be handtight only
	Corrosive attack	Determine material compatibility, change as necessary

If problem(s) persist, please contact Veolia Water Technologies

13 LUBRICATION SCHEDULE

ITEM	ACTION	FREQUENCY	TYPE OF LUBRICANT
Gear reducer	Check oil level Change Oil	Weekly 3 years	ISO VG 220 (mineral oil) (ambient T°: -5 to 40°C)
Motor Bearing	Repack with grease	3 years	NLGI EP 2 (grease) (refer to motor nameplate)
Pump Bearing	Repack with grease	3000 operating hours	NLGI EP 2 (grease)
Pump Pin Joints	Repack with grease	Rotor replacement or 10000 operating hours whichever is first	Seepex special joint grease only (refer to Seepex manual)

14 SPARE PARTS

It is highly recommended to keep in stock spare parts in sufficient quantity for all critical equipment to the proper functioning of the process.

Only the use of original Veolia spare parts will ensure proper and reliable operation.

When ordering a spare part, please give the following information:

- Veolia project number.
- Project name.
- Part number

15 DRAWINGS

If this dosing system is integrated to a processing plant, refer to the Process and/or Detailed Technical Documentation section of the Operation and Maintenance Manual for the dosing system drawings.

16 COMPONENTS TECHNICAL DATA SHEET

If this dosing system is integrated to a processing plant, refer to the Detailed Technical Documentation section of the Operation and Maintenance Manual for the dosing system data sheets.

17 MANUFACTURERS OPERATION AND MAINTENANCE MANUAL

If this dosing system is integrated to a processing plant, refer to the Manufacturer Operation and Maintenance Manual section of the Operation and Maintenance Manual for the dosing system manufacturer manuals.

LEFT BLANK

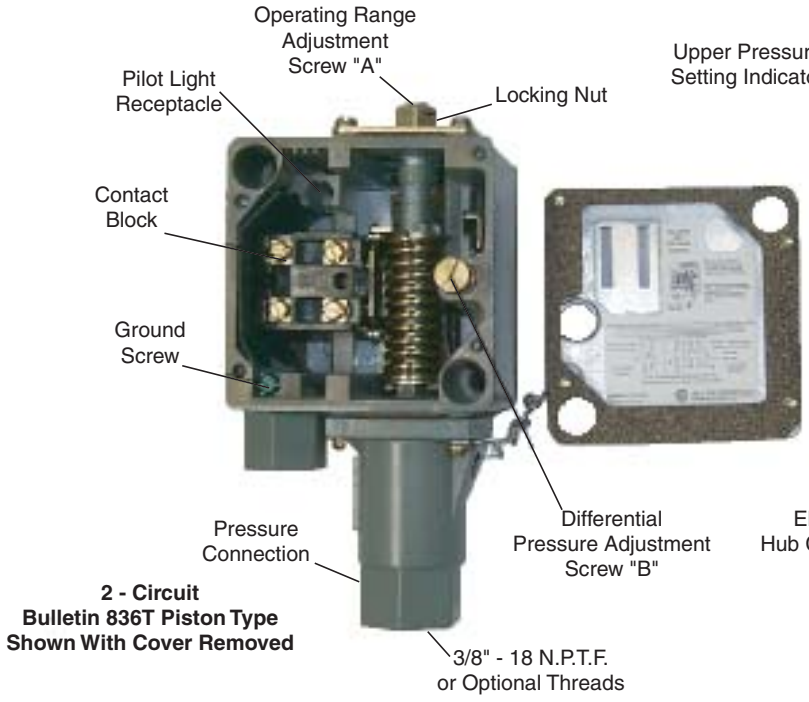
ALLEN BRADLEY

MODEL 386T, PRESSURE SWITCH

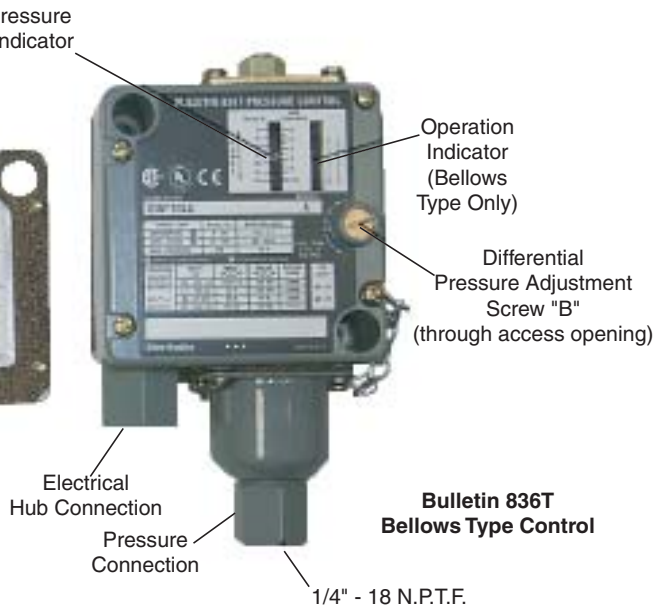
LEFT BLANK

Bulletin 836T Pressure Controls

ATTENTION: To prevent electrical shock, disconnect from power source before installing or servicing.



2 - Circuit Bulletin 836T Piston Type Shown With Cover Removed



Bulletin 836T Bellows Type Control

DESCRIPTION - Bulletin 836T, Type 1, 4, & 13 oiltight pressure controls are designed for use on machine tool applications where a stream of oil or water may flow over the enclosure. Other applications would include areas where it is desirable to resist the entrance of lint, dust, and dirt into the enclosure.

The operating range pressure and differential are adjustable externally.

Bellows type devices are available from vacuum to pressures up to 650 psi.

ATTENTION: Copper alloy bellows may be used on water or air and other liquids or gases not corrosive to this alloy. Type 316 stainless steel bellows are available and are used for the more corrosive liquids and gases.

Piston type devices are available for pressures up to 5000 psi.

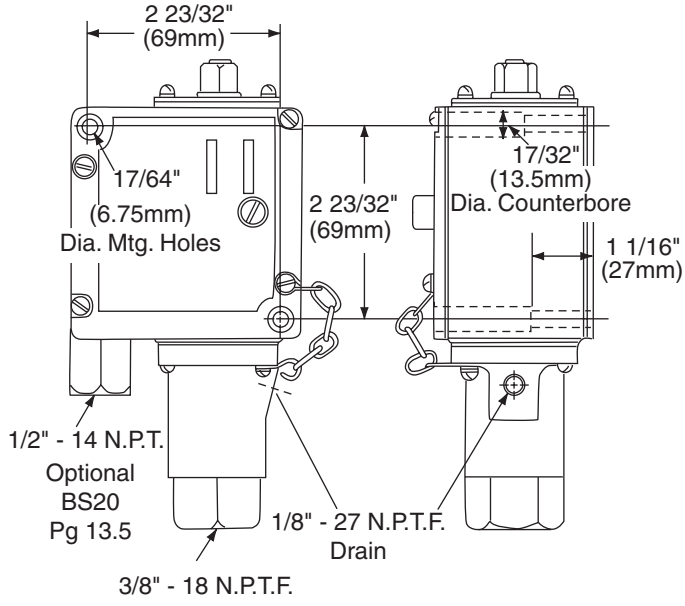
ATTENTION: Stainless steel piston type controls are designed for use on oil, water and waterbased fluids but must not be used on air or gases.

The 2 - Circuit contact block has one set of normally open and one set of normally closed contacts. These contacts may be arranged for single pole double-throw operation or separate circuit operation having the same polarity.

A 4 - Circuit contact block assembly with two normally open and two normally closed contacts is also available. An isolated terminal is furnished to provide a termination point when an optional power source is used. These contacts may be arranged for double pole double-throw operation or two isolated single pole double-throw, electrically isolated circuits. Circuits must be of the same polarity.

MOUNTING - The pressure control should be mounted securely to a firm base using two mounting screws. The recommended fastener for mounting is a 1/4"-20 or M6X1 metric screw. The applied torque should not exceed 70 lb-in (8 Nm).The mounting holes (see sketch) are easily accessible without removing the front cover assembly.

ATTENTION: The control should not be supported by only the electricaland pressure connections. A support wrench should be used when tightening the electrical hub and pressure connections.



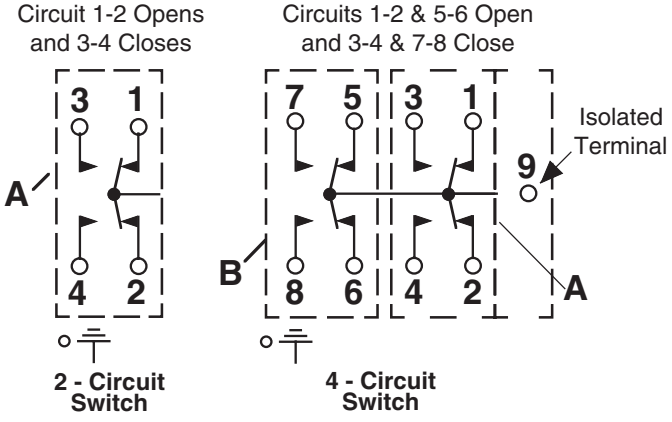
Piston Type Shown

OPERATION - A toggle mechanism operates the snap action switch at a predetermined pressure setting. For the 2 - Circuit snap switch the pressure causes the normally closed circuit 1-2 to open and normally open circuit 3-4 to close. This is known as the trip pressure. When the pressure returns to a lower predetermined setting, the circuit 1-2 will close and circuit 3-4 will open. This is known as the reset pressure. The difference between "trip" and "reset" pressure is the differential.
Similarly, for the 4 - Circuit snap switch, both normally closed circuits, 1-2 & 5-6 would open and both normally open circuits, 3-4 & 7-8 would close on increasing pressure. On decreasing pressure, the contacts would return to their original state at a predetermined setting.

Catalog number 836T-T251J can also be operated in a vacuum. At a higher vacuum setting (lower pressure toward 30" Hg) the 2 - Circuit switch contacts 1-2 will be closed and 3-4 open. At a lower vacuum (higher pressure toward 0 psi) circuit 1-2 will open and circuit 3-4 will close.

EXAMPLE: Control set to close contacts at 15" Hg vacuum, open at 5" Hg vacuum. For the 2 - Circuit switch, circuit 1-2 would be used. For the 4 - Circuit switch, circuits 1-2 or 5-6 would be used.

CONTACT BLOCK WIRING SYMBOL
(Increasing Pressure Operation)



A or B circuits must be the same polarity.

ADJUSTMENT - Generally, unless otherwise specified, controls shipped from the factory are set at the maximum operating range pressure and minimum differential.

The following procedure should be used to set the control to a particular requirement.

OPERATING RANGE ADJUSTMENT: Turn lock nut on adjustment screw "A" counterclockwise to loosen. Turn range adjustment screw "A" clockwise to raise upper and lower pressure settings. To decrease the upper and lower settings, turn screw "A" counterclockwise. The approximate upper pressure setting is shown by an indicator in the left window between the calibration scales on the nameplate. When the proper setting is reached, tighten the lock nut on screw "A" clockwise.

DIFFERENTIAL ADJUSTMENT: When the differential screw "B" is up against the underside of the differential access opening in the cover the control will function at minimum differential. To increase the differential, turn adjustment screw "B" clockwise. This will decrease the lower setting only. The higher setting will not change. Similarly, to decrease the differential turn the differential adjustment screw "B" counterclockwise. This will raise the lower setting only.
Condensed instructions can be found on the inside of the front cover.

NOTE: The use of a pressure gauge is desirable when setting the control.

ATTENTION: The adjustment screw "A" should not be forced beyond the range of the control indicated on the calibrated scale. The adjustment screw "B" should not be adjusted beyond the maximum specified differential of the control.

Operating variables in a system may cause changing pressure requirements. It is recommended that a periodic inspection of the gauge pressure be made and the pressure control adjusted to compensate when necessary for these changes.

PISTON TYPE APPLICATIONS -

ATTENTION: All pistons are provided with a 1/8 inch threaded drainopening which should be connected to an oil return line leading to anoil reservoir which is vented to atmosphere. This reservoir may be at ahigher level of elevation than the control. The controls with seal ringsusually do not require return lines. However, the 1/8 inch threaded drainopening should never be plugged on either type of piston control. Thisalso includes the shipping plug which must be removed upon installa-tion. Filters should be used to reduce contamination of hydraulic fluid.

PILOT LIGHT OPTION - A high intensity neon glow pilot light is available for 120 volt, 60 hertz applications and can be installed at the factory or in the field. To order pilot light kit specify catalog number of existing control and add N9 to this number. Optional pilot lights are available on special orders.

The pilot light is wired to the contact block as follows:

A. **2 - Circuit**
Always connect lamp wires to same set of terminals used for the load. To light on increasing pressure connect across 1-2. To light on decreasing pressure connect across 3-4.

B. **4 - Circuit**
Consists of 2 electrically isolated single pole-double throw circuits. Connect lamp wires to same set of terminals used for load. To light on increasing pressure connect across 1-2 or 5-6. To light on decreasing pressure connect across 3-4 or 7-8.
(or)
An isolated terminal, 9, is provided as a termination point when an optional power source is used. This provides a convenient means for various circuit connections when separation of the load and pilot light is required. Circuits must be the same polarity for pilot light connections and switching of auxiliary equipment.

PAINTING - Standard controls are supplied with a removable paint mask on the nameplate. Remove the mask on final installation.

CONTACT BLOCK REPLACEMENT - To order Bulletin 836T Contact Block 2 - Circuit (SPDT-DB) Replacement Kit specify Catalog Number 836T-N1. For the 4 - Circuit (DPDT-DB) Contact Block Replacement Kit specify Catalog Number 836T-N2.

REPAIRS - Due to the integral construction of the Bulletin 836T Pressure Control, it is recommended it be returned to the factory for repairs (excluding contact block replacement). The control will be adjusted for optimum performance and tested to specifications.

CHAPTER 1

CENTRIFUGE SKID DELIVERY AND INSTALLATION

WARNING:

1.1 GENERAL SAFETY FOR LIFTING AND TRANSPORTATION

Qualifications

Personnel in charge of machine operation/lifting and transportation, must have the necessary qualifications.

Method

Use only recommended tools and methods.

Do not stand under the loaded hoist or place any parts of the body (hands, feet, etc.) under the machine being lifted.

Do not place fingers, hands, feet, or head in areas where there may be risk of pinching. Beware of sharp edges from worn parts.

CAUTION: An unattended or falling load can cause bodily harm or death as well as consequential equipment damage.

1.2 RECEIVING

The centrifuge skid unit arrives preassembled minus the conveyor. The conveyor frame will be offloaded individually. Refer to M818524-4 for lifting points to offload the skid. Use extreme caution when offloading so as not to dislocate the assembled equipment.

1.3 STORAGE INSTRUCTIONS FOR THE CENTRIFUGE SKID

Short term storage is a period of three months or less where the machine is out of service. ANDRITZ recommends indoor storage for the centrifuge skid system, including its motors, ancillary equipment, tools and spares.

1.3.1 Short Term Storage – 3 Months or Less

The centrifuge skid must be stored in a dry, dust-free, ventilated area with sufficient space around the skid so that it will not come into accidental contact with other equipment or environmental or workplace contaminants. The centrifuge and auxiliary equipment on the skid must be covered and completely enclosed with at least two layers of tarp if stored outside and one layer of tarp if stored inside. The centrifuge skid must be stored in an area where the ambient temperature is greater than 50 ºF.

If the centrifuge has been in use before storage, then it must be washed internally thoroughly, and all electrical switch gear must be locked out, before placing it in storage. New equipment may be stored as it arrives from the manufacturer.

Each centrifuge is lubricated before shipping. However, if the centrifuge has been in use, protect the bearing block bearings from moisture by injecting a third to a half an ounce of grease through the lubricators. Turn the rotating assembly by hand so that rolling elements are properly coated. Repeat this procedure every 6 months during storage.

Loosen the belts and coat the pulley with a light lubricant such as WD-40. This procedure is required to keep the belts from becoming deformed and to protect the pulley from corrosion during storage.

Check the manufacturer's manual of each auxiliary equipment for long-term storage recommendations.

CAUTION: A total filling of the bearing housing will result in abnormal heating during startup, which might then require partial disassembly to remove excess grease.

NOTE: The other bearings and the Cyclo reducer are enclosed in a tight housing filled with lubricant, and no maintenance is required.

1.3.2 Tools, Parts and Ancillary Equipment

Tools and spares (if supplied) must be crated and stored on blocks or a wooden pallet. Ancillary equipment should be left as it is shipped (wrapped on a pallet or crated).

1.3.3 Long Term Storage

It is recommended that a centrifuge skid system which is to be stored for a period in excess of three months be stored indoors in a heated building with the temperature maintained at a minimum of 50°F (10°C). This should be a warehouse-type building with no rotating machines that may cause floor vibration; the machine must be isolated from floor vibration.

Prior to storage, the machine should be tagged with a list of instructions followed during storage and special precautions to be taken before start-up.

This procedure does not imply any extension of ANDRITZ Standard Warranty.

Prior to start-up after long-term storage, it is mandatory that an ANDRITZ Service Engineer supervise the startup.

If the centrifuge has been in service before putting into long-term storage, then it must be washed internally thoroughly, and all electrical switch gear must be locked out before placing it in storage. The centrifuge must be covered and completely enclosed by a layer of tarp. The centrifuge must be stored in an area where the ambient temperature is greater than 50ºF (10ºC). It is recommended to store the centrifuge inside.

Tools and spares should be crated and stored on blocks or wooden pallet. Ancillary equipment should be left as it is shipped (wrapped on a pallet or crated).

1.3.4 Preparation of Loose Parts for Storage

All loose parts should be placed in a box lined with rust inhibitor paper. Do not put paper on the base of the box, but apply to sides. All machined, unpainted surfaces should be coated with Mobilarma® 355 or equivalent.

1.3.5 Preparation of Machined Surfaces

All exposed, unpainted steel surfaces on the centrifuge should also be coated with Mobilarma® 355 or equivalent.

1.3.6 Preparing to Crate for Long Term Storage Preparation

The entire centrifuge skid should be covered with a tarp made of rust inhibitor, waterproof paper. The tarp should be 8” (200mm) to 10” (250mm) above the base of the machine.

The following standard notes should then be stenciled on the outside surface of the tarp on both sides of the centrifuge, as follows:

TAG / STENCIL	Rotate the assembly by hand at least 5 revolutions in order to rotate the centrifuge.

1.4 STORAGE INSTRUCTIONS FOR CONTROL PANELS

ANDRITZ control panels are covered with stretch wrapping material and bolted to or braced securely in an enclosed wooden crate for shipment. The control panel crate provides exterior protection against weather precipitation and impact damage that could occur during shipment. Control panels with legs are securely bolted to a shipping skid to provide stability for movement of the control panel with a forklift after it is uncrated at the jobsite. The control panel should always remain secured to the shipping skid until it is ready to be removed and placed in its final destination. Control panels without legs are securely braced in the crate with wooden braces. These braces must be removed prior to lifting the control panel from the crate. Removal of control panels either from the crate or from the shipping skid should be done via the use of the lifting eyes on the control panel and with load-rated lifting straps.

The following statements are guidelines for proper short-term and long-term storage of industrial control panels that are delivered to the jobsite. Failure to adhere to the following storage requirements will render any written or implied ANDRITZ warranty null and void. It needs to also be understood that the shipping crate is not designed to be used as a long-term weather proof shelter for the control panel and that waterproof tarps should be placed over the top of the crate to prevent water seepage and material degradation if the crate is going to be subjected to the outdoors for any period of time; outdoor exposure should be only temporary and kept to a minimum.

1.4.1 Short Term Storage for Control Panels (3 Months or Less)

The industrial control panel should be stored indoors in a clean, dry, vibration-free, non-corrosive environment and be kept at a uniform temperature to prevent condensation. The control panel should be placed on a flat surface and in an upright position. If the control panel is removed from its shipping crate, it should be kept in its stretch wrapped material until it is ready for installation. The industrial control panel should not be tipped or laid flat during storage unless intentionally shipped in that manner by the factory. Proper measures should be taken to protect the control panel from exposure to excess dirt, temperature, and humidity. The control panel should be stored in an area where it will not be subjected to a lot of traffic by personnel, lift trucks, and so forth where potential injury to personnel or damage to the equipment could occur.

1.4.2 Long Term Storage for Control Panels

The industrial control panel should be stored indoors in a dry, vibration-free, non-corrosive environment and be kept at a uniform temperature to prevent condensation. The crate should be set on a flat surface and prepped for long-term storage by completely stretch wrapping it to keep it insulated from any excess dirt and any encroaching insects, vermin, etc.. The crated control panel should be stored in an area where it will not be subjected to a lot of traffic by personnel, lift trucks, and so forth where potential injury to personnel or damage to the equipment could occur.

NOTE: If necessary, temporary electrical heating should be installed to prevent condensation within the control panel, approximately 150 watts per section is usually adequate for the average control panel for most environments. All loose packing of flammable materials should be removed prior to energizing space heaters.

1.5 HANDLING

The skids will arrive as shown in drawing M831476-2. The conveyors and vent piping will be shipped loose. It is the contractor's responsibility to ensure the sling and spreader bar(s) are adequately sized to handle the load. It is also the responsibility of the contractor to ensure the crane is sized to lift and place the load as required. The weight of the skid is approximately 5,883 kgs (12,970 lbs).

1.6 CENTRIFUGE SETUP

The contractor should prepare the foundation as shown in drawing M831476-2 with anchor bolts located, as shown in the detail. The skid should be located such that the sludge inlet and centrate connections can be located. Once in place the skid should be levelled in all directions to within 1/16 inch. High strength grout should be used around the anchor bolts.

The conveyor and vent piping can then be installed. The reminder of the piping connection as well as wiring should be completed. The shipping straps which secure the machine to the stand can be removed.

The rotating assembly is locked on both ends by one radial screw. The bolts can be backed off to allow the rotation assembly to turn freely.

1.6.1 Connections

All connecting piping must be self-supporting. Refer to drawing M831476-3 for all connection locations and sizes.
The following connections need to be made:

- Product flanges
- Wash water connection
- Polymer connection
- Check that the flexible expansion joints can absorb both vertical and horizontal displacement. Axial compression – 38mm, (1 ½"), Axial extension – 16mm ($^{5}/_{8}$"), Lateral offset – 19mm (¾").
- Check feed pump

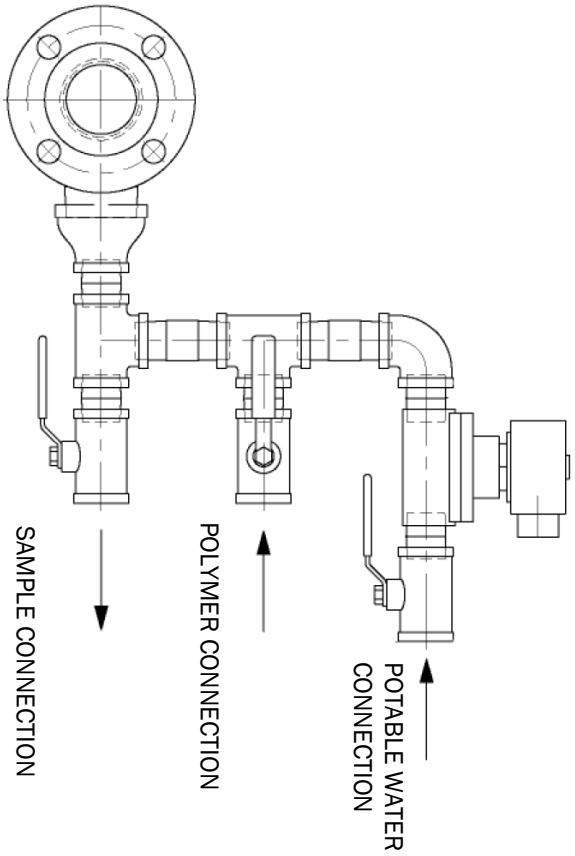

Figure 1-2 Installation of the Feed Head

1.6.2 Installation of the Electricals

Refer to electrical drawings, Chapter 2, §2.2, for all required electrical connections.

1.6.3 Auxiliary Verifications

- Supplied Tools
- Lubrication amounts
- Standard tools
- Test product
- Power and fluids
- Electrician / Automation engineer on site

An Installation Checklist has been included at the end of this chapter.

1.7 INSTALLATION CHECKLIST

This checklist, as well as ensuring equipment is correctly installed will also maximize the efficiency of the Andritz field technician's visit to the site during installation and start-up.

TABLE 1-1. INSTALLATION CHECKLIST FOR ANDRITZ CENTRIFUGES

Check List	Yes	No	Not Applicable
CENTRIFUGE CABLES			
• Inverters			
• Centrifuge Connections			
• Wire Connection			
• Command circuit (relays, I/O/Automate)			
POWER			
• Electricity			
• Raw water or rinse circuit			
• Compressed air			
INSTALLATION			
• Leaks			
• Rotation direction of peripheral motors			
• Sensors			
• Measurement controls (flow meter, flow indicators)			
PRODUCT			
• Quality and quantity			
PRODUCT EVACUATION			
• Trap / Hopper			
• Scroll pump			
MAINTENANCE MEANS FOR MACHINE DISMANTLE			
• Rails, lifting beams			
ELECTRICIAN / AUTOMATION ENGINEER ON SITE			
• Presence required

Installation & Maintenance Instructions

2-WAY INTERNAL PILOT-OPERATED SOLENOID VALVES
NORMALLY CLOSED OPERATION — GENERAL SERVICE
1" , 1¼" OR 1½" NPT

SERIES
8210
8211

NOTICE: See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature, Cause of Improper Operation, Coil or Solenoid Replacement.

DESCRIPTION

Series 8210 valves are 2-way normally closed internal pilot-operated solenoid valves designed for general service. Valves are made of rugged forged brass or die cast stainless steel. Series 8210 valves are provided with a general purpose solenoid enclosure. Series EF8210 and 8211 are the same as Series 8210 except they are provided with an explosionproof or explosionproof/watertight solenoid enclosure.

Notice: Brass valves are not certified as lead-free under the Safe Water Drinking Act SWDA 1417 and are not intended for use on drinking water systems. They are intended for control of water in industrial applications. Consult ASCO for valves rated for use in potable water applications.

OPERATION

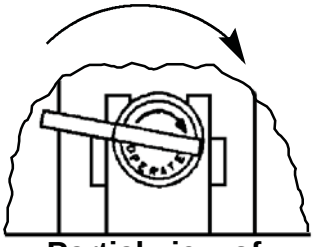
Normally Closed: Valve is closed when solenoid is de-energized; open when energized.

IMPORTANT: Minimum operating pressure differential is 5 psi.

Manual Operator (optional feature)

Manual operator allows manual operation when desired or during an electrical power outage. To engage manual operator(open the valve), turn lever clockwise until it hits a stop. Valve will now be in the same position as when the solenoid is energized. To disengage manual operator (close the valve), turn lever counterclockwise until it hits a stop.

To engage, turn lever clockwise until it hits a stop.



Partial view of Manual Operator

⚠ CAUTION: For valve to operate electrically, manual operator lever must be fully rotated counterclockwise.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

Future Service Considerations

Provision should be made for performing seat leakage, external leakage, and operational tests on the valve with a nonhazardous, noncombustible fluid after disassembly and reassembly.

Temperature Limitations

For maximum valve ambient and fluid temperatures, refer to chart below. Check catalog number prefix and watt rating on nameplate.

Watt Rating AC/DC	Catalog Number Prefix	Solenoid Class	Maximum Ambient Temp.	Maximum Fluid Temp.
6 AC	None or DF	F	122 °F (50 °C)	180 °F (82 °C)
	HT	H	140 °F (60 °C)	180 °F (82 °C)
6.1 AC	None, KF, SF or SC	F	125 °F (54 °C)	180 °F (82 °C)
	HT, KH, ST or SU	H	140 °F (60 °C)	180 °F (82 °C)
11.2 DC	None or HT	F or H	77 °F (25 °C)	150 °F (65 °C)
11.6 DC	None, HT, KF, KH, SC, SF or ST	F or H	104 °F (40 °C)	150 °F (65 °C)

Positioning

This valve is designed to perform properly when mounted in any position. However,for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Piping

Connect piping to valve according to markings on valve body. Apply pipe compound sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

⚠ CAUTION: To protect the solenoid valve, install a strainer or filter suitable for the service involved in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve

Note: It is not necessary to remove the valve from the pipeline for repairs

All Rights Reserved.

©ASCO Valve, Inc.® 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Cleaning

All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general,if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep medium flowing through the valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete rebuild kit.

Causes of Improper Operation

- **Incorrect Pressure:** Check valve pressure. Pressure to valve must be within range specified on nameplate.
- **Excessive Leakage:** Disassemble valve and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Disassembly

1. Disassemble valve in an orderly fashion using exploded views for identification and placement of parts. Refer to Figure 1 for AC construction; Figure 2 for DC construction. For 1" or 1 ¼" NPT valve construction, see Figure 1; for 1 ½" NPT valve construction, see Figure 2.
2. Remove solenoid enclosure. See separate instructions.

- For valves supplied with optional manual operators,see section on ***Disassembly of Manual Operator.***

3. Unscrew solenoid base sub-assembly from valve body. Then remove core assembly with core spring and solenoid base gasket. For AC construction (Figure 1) core spring is a loose piece.
4. For normal maintenance (cleaning) it is not necessary to remove the valve seat. However, for valve seat removal use a 7/16" thin wall socket wrench
5. Remove bonnet screws, valve bonnet, diaphragm spring, diaphragm assembly, body gasket, body passage eyelet(present on current valve constructions only) and body passage gasket.
6. All parts are now accessible for cleaning or replacement. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

- Service Notice -

When installing a new ASCO Rebuild Kit, please be aware that the diaphragm assembly may not be identical to the diaphragm assembly in the valve. See Figure 1 for alternate diaphragm constructions. The two diaphragm constructions are interchangeable and will perform equally well.

⚠ CAUTION: To ensure proper valve operation, install all parts supplied in ASCO Rebuild Kit. Do not mix old and new parts.

Valve Reassembly

1. Lubricate body gasket, body passage gasket, bonnet gasket and solenoid base gasket with DOW CORNING® 200 Fluid lubricant or an equivalent high-grade silicone fluid.
2. Install body passage gasket, body passage eyelet, diaphragm assembly, diaphragm spring, valve bonnet and bonnet screws. Hand thread screws as far as possible. Then torque bonnet screws in a crisscross manner to 144 ± 15 in-lbs [16,3 ± 1,7 Nm].
3. If removed, install valve seat in valve body. Apply a small amount of thread compound compatible with valve media to valve seat threads. Torque valve seat to 75 ± 10 in-lbs [8,5 ± 1,1 Nm].

- For valves supplied with optional manual operator, see section on ***Reassembly of Manual Operator.***

4. For AC construction (Figure 1), install core spring in core assembly. Wide end of core spring in core first, closed end protrudes from top of core.
5. Install solenoid base gasket, core assembly with core spring and solenoid base sub-assembly in valve body. Torque solenoid base sub-assembly to 175 ± 25 in-lbs [19,8 ± 2,8 Nm].
6. Install solenoid. See separate instructions.

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, check valve for proper operation before returning to service. Also perform internal seat and external leakage tests with a nonhazardous, noncombustible fluid.

7. Restore line pressure and electrical power supply to valve.
8. After maintenance is completed, operate the valve a few times to be sure of proper operation. A *metallic click* indicates the solenoid is operating.

Disassembly of Manual Operator

1. Unscrew solenoid base sub-assembly from manual operator body.
2. Unscrew manual operator body from valve body. Then remove stem retainer from base of manual operator body and stem/spacer sub-assembly.
3. Pull stem/spacer sub-assembly with stem gasket from side of manual operator body. Then remove core assembly with core spring, solenoid base gasket and manual operator bonnet gasket.
4. For further disassembly refer to section on *Valve Disassembly* step 4.

Reassembly of Manual Operator

1. Lubricate stem gasket with DOW CORNING® 111 Compound lubricant or an equivalent high-grade silicone grease.
2. For AC construction (Figure 1), install core spring in core assembly. Wide end of core spring in core first, closed end protrudes from top of core.
3. Holding the manual operator body in a horizontal position, install core assembly with core spring from the bottom end.
4. Insert the stem/spacer sub-assembly with the stem gasket into the side hole of the manual operator body. Rotate the lever of the stem/spacer sub-assembly to the 12 o'clock position.
5. Install stem retainer on base of manual operator body and simultaneously engage it into the slot provided on the stem/spacer sub-assembly.

IMPORTANT: The spacer on the stem/spacer sub-assembly must be inside of the stem retainer for AC construction (Figure 1) and outside of the stem retainer for DC construction (Figure 2).

6. Install manual operator bonnet gasket and body with preassembled parts into valve body. Torque manual operator body to 175 ± 25 in-lbs [19,8 ± 2,8 Nm].
7. Replace solenoid base gasket and solenoid base sub-assembly. Torque solenoid base sub-assembly to 175 ± 25 in-lbs [19,8 ± 2,8 Nm].
8. For further reassembly, refer to *Valve Reassembly* step 6.

©ASCO Valve, Inc.® 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Torque Chart

Part Name	Torque Value Inch-Pounds	Torque Value Newton-Meters
Solenoid base sub-assembly	175 ± 25	19,8 ± 2,8
Manual operator body		
Bonnet screw	144 ± 15	16,3 ± 1,7
Valve seat	75 ± 10	8,5 ± 1,1

ORDERING INFORMATION FOR ASCO REBUILD KITS

Parts marked with an asterisk (*) in the exploded view are supplied in Rebuild Kits. When Ordering Rebuild Kits for ASCO valves, order the Rebuild Kit number stamped on the valve nameplate. If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

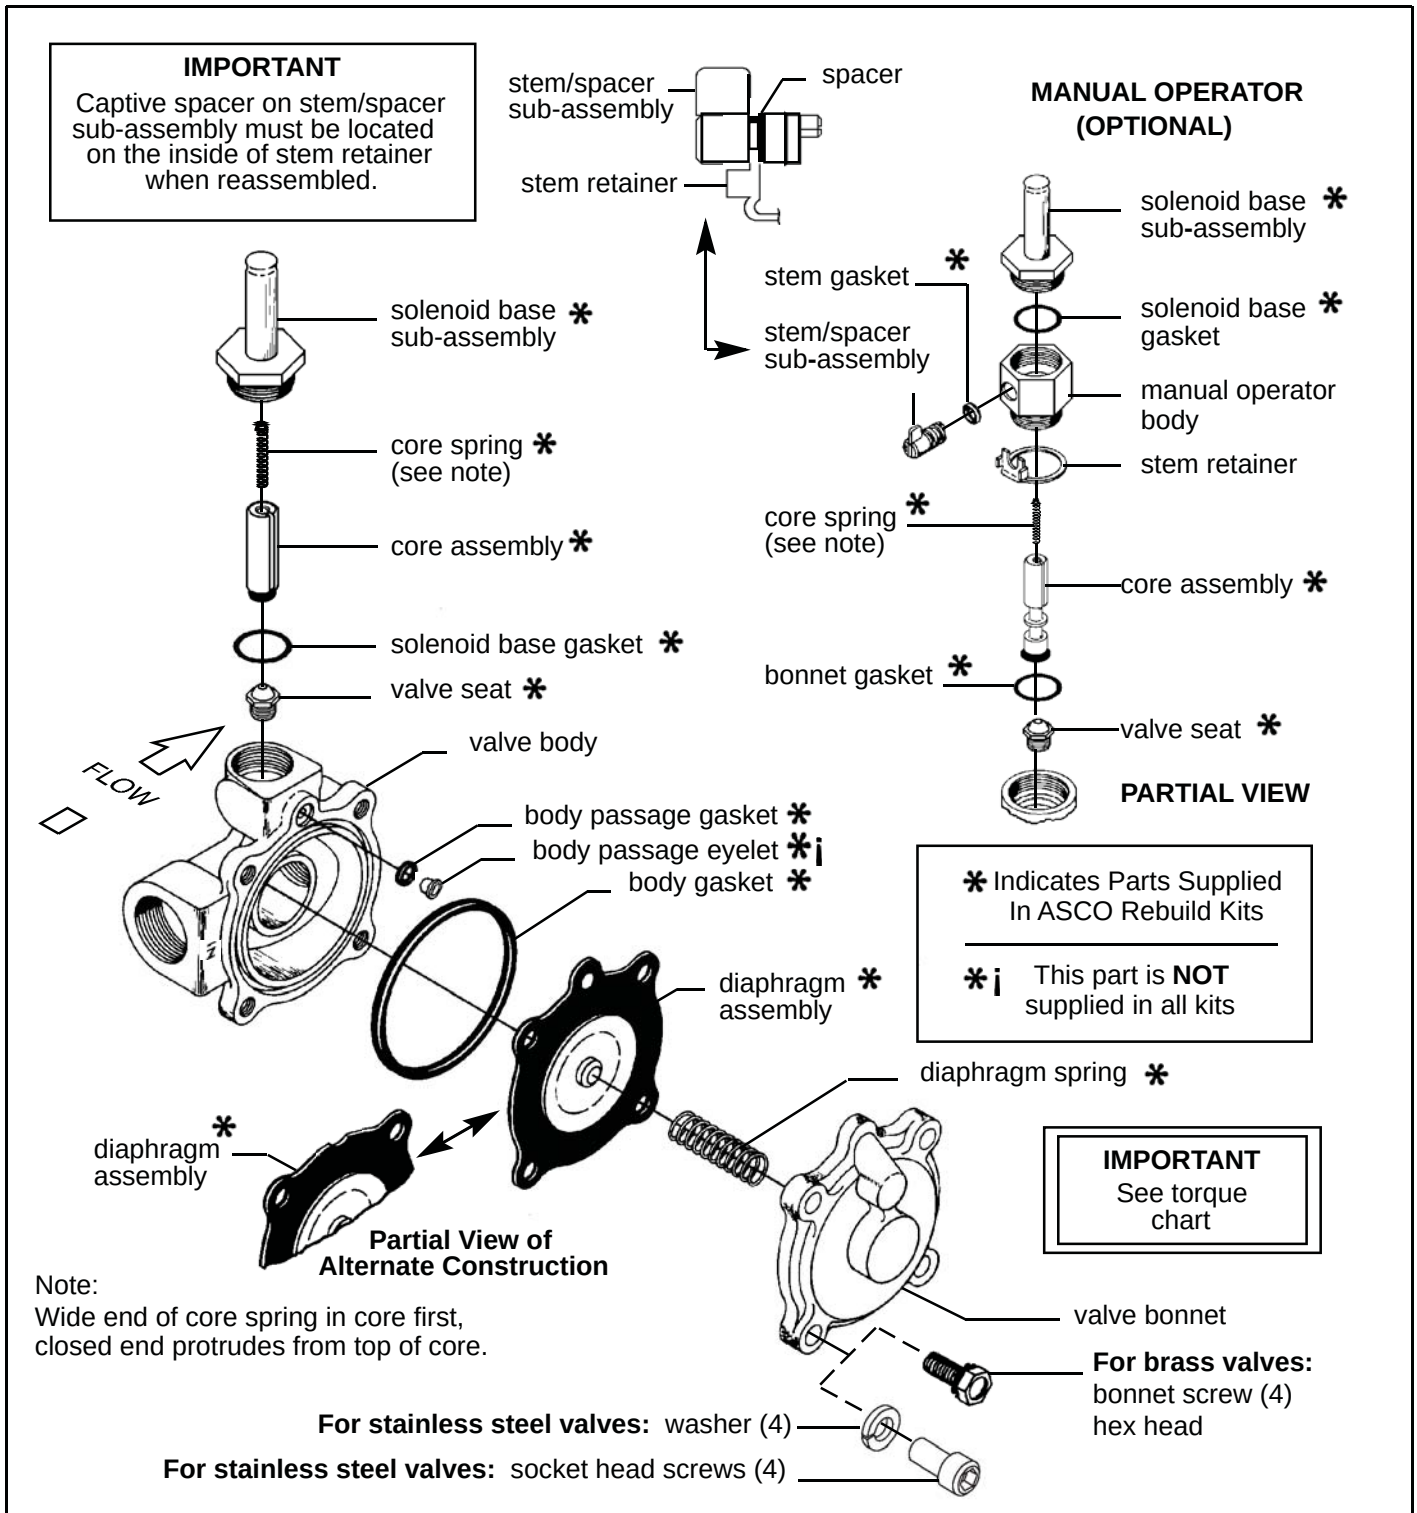


Figure 1. Series 8210 valve without solenoid, AC construction with 1 or 1 ¼" NPT valve body shown.

Installation&Maintenance Instructions

ASCO Red-Hat II™

OPEN-FRAME, GENERAL PURPOSE, WATERTIGHT/EXPLOSIONPROOF SOLENOIDS

SERIES

8016G/H

— SERVICE NOTICE —

ASCO™ solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO Red Hat II® solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

DESCRIPTION

Catalog numbers 8016G/H1 and 8016G/H2 are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/ retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 minimum full thread.

Series 8016G/H are available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer through a panel having a .062 to .093 maximum wall thickness. (Refer to Figure 3 and section on *Installation of Panel Mounted Solenoid*).

Optional Features For Type 1 - General Purpose Construction Only

- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).

OPERATION

When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 0.69lbs (3.1N) and 0.31 lbs (1.38N) for DC.

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165°C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180°C. See nameplate/ retainer for service.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

⚠CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

Temperature Limitations

For maximum valve ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90°C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for maximum fluid temperature.

 All Rights Reserved.

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8016G Solenoids for use on Valves Rated at 6.1, 8.1, 9.1, 10.6 or 11.1 Watts			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
6.1, 8.1, 9.1 & 11.1	None, FB, KF, KP, SC, SD, SF & SP	F	125°F (52°C)
6.1, 8.1, 9.1 & 11.1	HB, HT, KB, KH, SS, ST & SU	H	140°F (60°C)
10.6**	None, KF, SF, SC, HT, KH, ST & SU	F & H	104°F (40°C)
7.1 @ 60Hz (8.1 @ 50Hz)		F & H	175°F (79°C)*
10.6**		F & H	140°F (60°C)

§ Minimum ambient temperature -40°F (-40°C).

* When used with watertight aluminum junction boxers (screw or spade) max. ambient and fluid temperature will be reduced to 157°F (69.4°C)

** 10.6 Watt solenoids rated for 104°F are 8030, 8260, 8316, 8321, 8320, 8360 & 8344 valves while those rated for 140°F are 8040 valves

Temperature Limitations for Series 8003H, 8007H and 8202H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix ①	Coil Class	AC		DC		
		60 Hz	50 Hz		°C	°F
EF	FT	6.1	8.1	-	52	125
EF	FB	9.1	11.1	-		
	FT	6.1	8.1	-	55	131
	FB	9.1	11.1	-		
	HT	-	-	10.6	40 ②	104②
	HB	-	-	18.6		
EF	HT	-	-	10.6		
EF	HB	-	-	18.6		
	HT	6.1	8.1	-	60 ③	140 ③
	HB	9.1	11.1	-		
EF	HT	6.1	8.1	-		
EF	HB	9.1	11.1	-		

①= EF data applies to Explosionproof coils only.

②= Some DC solenoid valves can be operated at maximum ambient temperature of 55°C / 131°F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.

③= Steam Service Valves have a maximum ambient temperature of 55° C/ 131°F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For the watertight and explosionproof solenoid, electrical fittings must be approved for use in the approved hazardous locations.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to10±2 in-lbs [1,0±1,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

- **DIN Plug Connector Kit No. K236034**

1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
4. Thread wire through gland nut, gland gasket, washer and connector cover.

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figure 3)

Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.

3/4" Valve Bonnet Construction

1. Install retainer (convex side to solenoid) in 1.312 diameter mounting hole in customer panel.
2. Position spring washer over plugnut/core tube sub-assembly.
3. Install plugnut/core tube sub-assembly through retainer in customer panel then replace solenoid, nameplate and red cap.

15/16" Valve Bonnet Construction

1. Install solenoid base sub-assembly through 0.69 diameter mounting hole in customer panel.
2. Position spring washer on opposite side of panel over solenoid base sub-assembly then replace.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. On solenoids with lead wires disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**

   Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

   - **Junction Box**

   Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.

   - **DIN Plug Connector**

   Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.

3. Snap off red cap from top of solenoid base sub-assembly.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade in slot provided between solenoid and nameplate/retainer. Pry up slightly and push to remove. Then remove solenoid from solenoid base sub-assembly.
5. Reassemble using exploded views for parts identifcation and placement.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly.
3. Unscrew solenoid base sub-assembly.

NOTE: Some solenoid constructions have a plugnut/core tube sub-assembly, bonnet gasket and bonnet in place of the solenoid base sub-assembly. To remove bonnet use special wrench adapter supplied in ASCO Rebuild Kit. For wrench adapter only, order ASCO Wrench Kit No. K218948.

4. The core is now accessible for cleaning or replacement.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Reassemble using exploded views for identification and placement of parts.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

ORDERING INFORMATION FOR ASCO SOLENOIDS

When Ordering Solenoids for ASCO Solenoid Operators or Valves, order the number stamped on the solenoid. Also specify voltage and frequency.

Torque Chart

Part Name	Torque Value in Inch-Pounds	Torque Value in Newton-Meters
solenoid base sub-assembly	175 ± 25	19,8± 2,8
valve bonnet (3/4" bonnet construction)	90 ± 10	10,2 ± 1,1
bonnet screw (3/8" or 1/2" NPT pipe size)	25	2,8
bonnet screw (3/4" NPT pipe size)	40	4,5

GB

GENERAL INSTALLATION AND MAINTENANCE INSTRUCTIONS

Note: These general Installation and Maintenance Instructions must be read in conjunction with the Instruction Sheet for the specific product.

INSTALLATION

ASCO Numatics components are intended to be used only within the technical characteristics as specified on the nameplate. Changes to the equipment are only allowed after consulting the manufacturer or its representative. Before installation, depressurize the piping system and clean internally.
The equipment may be mounted in any position if not otherwise indicated on the product by means of an arrow.
The flow direction and pipe connection of valves are indicated on the body.

The pipe connections have to be in accordance with the size indicated on the nameplate and fitted accordingly.

Caution:
- Reducing the connections may cause improper operation or malfunctioning.
- For the protection of the equipment install a strainer or filter suitable for the service involved in the inlet side as close to the product as possible.
- If tape, paste, spray or a similar lubricant is used when tightening, avoid particles entering the system.
- Use proper tools and locate wrenches as close as possible to the connection point.
- To avoid damage to the equipment. DO NOT OVERTIGHTEN pipe connections
- Do not use valve or solenoid as lever.
- The pipe connections should not apply any force, torque or strain to the product.

ELECTRICAL CONNECTION

In case of electrical connections, they are only to be made by trained personnel and have to be in accordance with the local regulations and standards.

Caution:
- Turn off electrical power supply and de-energize the electrical circuit and voltage carrying parts before starting work.
- All electrical screw terminals must be properly tightened according to the standards before putting into service.
- Dependent upon the voltage electrical components must be provided with an earth connection and satisfy local regulations and standards.

The equipment can have one of the following electrical terminals:
- Spade plug connections according to ISO-4400 or 3 x DIN-46244 (when correctly installed, this connection provides IP-65 protection).
- Embedded screw terminals in metal enclosure with "Pg" cable gland
- Spade terminals (AMP type).
- Flying leads or cables.

PUTTING INTO SERVICE

Before pressurizing the system, first carry-out an electrical test. In case of solenoid valves, energize the coil a few times and notice a metal click signifying the solenoid operation.

SERVICE

Most of the solenoid valves are equipped with coils for continuous duty service. To prevent the possibility of personal or property damage, do not touch the solenoid which can become hot under normal operating conditions.

SOUND EMISSION

The emission of sound depends on the application, medium and nature of the equipment used. The exact determination of the sound level can only be carried out by the user having the valve installed in his system

MAINTENANCE

Maintenance of ASCO Numatics products is dependent on service conditions. Periodic cleaning is recommended, the timing of which will depend on the media and service conditions. During servicing, components should be examined for excessive wear. A complete set of internal parts is available as spare parts or rebuild kit. If a problem occurs during installation/maintenance or in case of doubt please contact ASCO Numatics or authorized representatives.

*A separate Declaration of Incorporation relating to EU-Directive 2006/42/EC Annex IIB is available on request for applicable products. Please provide product identification number and serial numbers of products concerned.

The product, , when marked CE, complies with the essential requirements of the EMC 2004/108/EC (until April 20th 2016) and EMC 2014/30/EU (from April 20th 2016) and LVD 2006/95/EC (until April 20th 2016) and LVD 2014/35/EU (from April 20th 2016). A separate Declaration of Conformity is available on request. Please provide product identification number and serial numbers of the products concerned.

FR

INSTRUCTIONS GÉNÉRALES D'INSTALLATION ET D'ENTRETIEN

Note: Ces instructions générales d'installation et d'entretien complètent la notice spécifique du produit.

MONTAGE

Les composants ASCO Numatics sont conçus pour les domaines de fonctionnement indiqués sur la plaque signalétique ou la documentation. Aucune modification ne peut être réalisée sur le matériel sans l'accord préalable du fabricant ou de son représentant. Avant de procéder au montage, dépressuriser les canalisations er effectuer un nettoyage inteme.
A moins qu'une fléche ou la notice n'indique un sens de montage spécifique de la tête magnétique, le produit peut être monté dans n'importe quelle position
Le sens de circulation du fluide est indiqué par repères sur le corps er dans la documentation.
La dimension des tuyauteries doit correspondre au raccordement indiqué sur le corps, l'étiquette ou la notice.

Attention:
- Une restriction des tuyauteries peut entraîner des dysfonctionnements.
- Afin de protéger le matériel, installer une crépine ou un filtre adéquat en amont, aussi près que possible du produit.
- En cas d' utilisation de ruban; pàte, aérosol ou autre lubrifiant lors du serrage, veiller à ce qu" aucun corps étranger ne pénètre dans le circuit.
- Utiliser un outillage approprié et placer les clés aussi près que possible du point de raccordement.
- Afin d'éviter toute détérioration, NE PAS TROP SERRER les raccords des tuyauteries.
- Ne pas se servir de la vanne ou de tête magnétique comme d'un levier.
- The pipe connections should not apply any force, torque or strain to the product.

RACCORDEMENT ÉLECTRIQUE

Le raccordement électrique doit être réalisé par un personnel qualifié et selon les normes et règlements locaux.

Attention:
- Avant toute intervention, couper l'alimentation électrique pour mettre hors tension les composants.
- Toutes les bornes à vis doivent être serrées correctement avant la mise en service.
- Selon la tension, les composants électrique doivent être mis à la terre conformément aux normes et règlements locaux.

Selon les cas, le raccordement électrique s'effectué par:
- Connecteur débrochable ISO-4400 ou 3 x DIN-46244 avec degré de protection IP-65 lorsque le raccordement est correctement effectué.
- Bornes à vis solidaires du bobinage, sous boîter métallique avec presse-étoupe "Pg--".
- Cosses (type AMP).
- Fils ou câbles solidaires de la bobine.

MISE EN SERVICE

Avant de mettre le circuit sous pression, effectuer un essai électrique. Dans le cas d'une électrovanne, mettre la bobine sous tension plusieurs fois er écouter le "clic" métallique qui signale le fonctionnement de la tête magnétique.

FONCTIONNEMENT

La plupart des électrovannes comportant des bobinages prévus pour mise sous tension permanente. Pour éviter toute brûlure, ne pas toucher la tête magnétique qui, en fonctionnement normal et en permanence sous tension, peut atteindre une température élevée.

BRUIT DE FONCTIONNEMENT

Le bruit de fonctionnement varie selon l'utilisation, le fluide et le type de matériel employé. L'utilisateur ne pourra déterminer avec précision le niveau sonore émis qu'après avoir monté le composant sur l'installation.

ENTRETIEN

L'entretien nécessaire aux produits ASCO Numatics varie avec leurs conditions d'utilisation. Il est souhaitable de procéder à un nettoyage périodique dont l'intervalle varie suivant la nature du fluide, les conditions de fonctionnement et le milieu ambiant. Lors de l'intervention. Les composants doivent être examinés our détecter toute usure excessive. Un ensemble de pièces internes est proposé en pièces de rechange pour procéder à la réfection. En cas de problème lors du montage/entretien ou en cas de doute, veuillez contacter ASCO Numatics ou ses représentants officiels.

*Une déclaration d'incorporation relative à la directive UE 2006/42/CE Annexe II B est disponible sur demande pour les produits applicables. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

Lorsqu'il est marqué du label CE, le produit est conforme aux exigences essentielles des directives CEM 2004/108/CE (jusqu'au 20 avril 2016) et CEM 2014/30/UE (à partir du 20 avril 2016) et des directives Basse tension 2006/95/CE (jusqu'au 20 avril 2016) et 2014/35/UE (à partir du 20 avril 2016). Une déclaration de conformité peut être fournie sur simple demande. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

DE

ALLGEMEINE BETRIEBSANLEITUNG

Achtung: Diese Allgemeine Betriebsanleitung gilt in Zusammenhang mit der jeweiligen Betriebsanleitung für die speziellen Produkte.

EINBAU

Die ASCO Numatics-Komponenten dürfen nur innerhalb der auf den Typenschildern angenebenen Daten eingesetzt warden, Veränderungen an den Produkten sind nur nach Rücksprache mit ASCO Numatics zulässig.
Vor dem Einbau der Ventile muß das Rohrleitungssystem drucklos geschaltet und innen gereinigt werden.
Die Einbaulage der Produkte ist genereil beliebig. Ausnahme: Die mit einem Pfeil gekennzeichneten Produkte müssen entsprechend der Pfeilrichtung montiert werden.
Die Durchflußrichtung und der Eingang von Ventilen sind gekennzeichnet.

Die Rohranschlüsse sollten entsprechend den Größenangaben auf den Typenschildern mit handelsüblichen Verschraubungen durchgeführt werden. Dabei ist folgendes zu beachten:
- Eine Reduzierung der Anschlüsse kann zu Leistungs-und Funktionsminderungen führen.
- Zum Schutz der Ventile sollten Schmutzfänger oder Filter so dicht wie möglich in den Ventileingang integriert werden.
- Bei Abdichtung am Gewinde ist darauf zu achten, daß kein Dichtungsmaterial in die Rohrleitung oder das Ventil gelangt.
- Zur Montage darf nur geeignetes Werkzeug verwendetwerden.
- Konische Verschraubungen sind sorgfältig anzuziehen. Es ist darauf zu achten, daß beim Anziehen das Gehäuse nicht beschädigt wird.
- Spule und Führungsrohr von Ventilen dürfen nicht als Gegenhalter benutzt werde.
- Die Rohrleitungsanschlüsse sollen fluchten und dürfen keine Spannungen auf das Ventil übertragen.

ELECTRISCHER ANSCHLUß

Der elektrische Anschluß ist von Fachpersonal entsprechend den geltenden VDE-und CEE Richtlinien auszuführen. Es ist besonders auf foigendes zu achten:
- Vor Beginn der Arbeiten ist sicherzustellen, daß alle elektrischen Leitungen und Netzteile spannungslos geschaltet sind.
- Alle Anschlußklemmen sind nach Beendigung der Arbeiten vorschriftsmäßig entsprechend den geltenden Regeln anzuziehen.
- Je nach Spannungsbereich muß das Ventil nach den geltenden Regeln einen Schutzleiteranschluß erhalten.

Der Magnetantrieb kann je nach Bauart folgende Anschlüsse haben:
- Anschluß für Gerätesteckdose nach DIN 43650 Form A/ISO 4400 oder 3 x DIN 46244 (durch ordnungsgemäße Montage der Gerätesteckdose wird Schutzklasse IP 65 erreicht).
- Anschlüsse innerhalb eines Blechgehäuses mittels Schraubklemmen. Kabeleinführung ins Gehäuse mit PG-Verschraubung.
- Offene Spulen mit Flachsteckern (AMP-Fahnen) oder mit eingegossenen Kabelenden.

INBETRIEBNAHME

Vor Druckbeaufschlagung des Produktes sollte eine elektrische Funktionsprüfung erfolgen:

Bei Ventilen Spannung an der Magnetspule mehrmals ein-und ausschalten. Es muß ein Klicken zu hören sein.

BETRIEB

Die meisten Ventile sind mit Spulen für Dauerbetrieb ausgerüstet. Zur Vermeidung von Personen-und Sachschäden sollte jede Berührung mit dem Ventil vermieden werden, da die Magnetspule bei längerem Betrieb sehr heiß werden kann.

GERÄUSCHEMISSION

Diese hängt sehr stark vom Anwendungsfall, den Betriebsdaten und dem Medium, mit denen das Produkt beaufschlagt wird, ab. Eine Aussage über die Geräuschemission des Produktes muß deshalb von demjenigen getroffen werden, der das Produkt innerhalb einer Maschine in Betrieb nimmit.

WARTUNG

Die Wartung hängt von den Einsatzbedigungen ab. In entsprechenden Zeitabständen muß das Produkt geöffnet und gereinigt werden. Für die Überholung der ASCO Numatics-Produkte können Ersatzteilsätze geliefert werden. Treten Schwierigkeiten bel Einbau, Betrieb oder Wartung auf, sowie bei Unklarheiten, ist mit ASCO Numatics Rücksprache zu halten.

ASCO Numatics Produkte sind entsprechend der EG-Richtlinie 89/392/EWG gefertigt.

*Eine separate Herstellererklärung im Sinne der Richtlinie 2006/42/EWG Anhang II B ist auf Anfrage für die entsprechenden Produkte erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

Das Produkt, wenn mit CE gekennzeichnet, erfüllt die Anforderungen von EMV 2004/108/EWG (bis 20. April 2016) und EMV 2014/30/EU (vom 20. April 2016) und LVD 2006/95/EWG (bis 20. April 2016) und LVD 2014/35/EU (vom 20. April 2016). Eine separate Konformitätserklärung ist auf Anfrage erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

ASCO

8320G094, SOLENOID VALVE

LEFT BLANK

Installation & Maintenance Instructions

2-WAY INTERNAL PILOT-OPERATED SOLENOID VALVES
HUNG DIAPHRAGM — 3/8 ", 1/2" AND 3/4" NPT
NORMALLY CLOSED OPERATION

SERIES
8210
8211

NOTICE: See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature, Cause of Improper Operation, Coil or Solenoid Replacement.

DESCRIPTION

Series 8210 valves are 2-way normally closed, internal pilot operated solenoid valves. Valve body and bonnet are of brass construction. Series 8210 valves may be provided with a general purpose/watertight, open-frame or explosionproof/ watertight solenoid.

Series 8210 and 8211 valves with suffix "HW" in the catalog number are specifically designed for hot water service.

Notice: These valves are not certified as lead-free under the Safe Water Drinking Act SWDA 1417 and are not intended for use on drinking water systems. They are intended for control of water in industrial applications. Consult ASCO for valves rated for use in potable water applications.

OPERATION

Normally Closed: Valve is closed when solenoid is de-energized; open when energized.

Manual Operator (Optional)

Valves with suffix "MO" in catalog number are provided with a manual operator which allows manual operation when desired or during an interruption of electrical power. To operate valve manually, push in knurled cap and rotate 180°. Disengage manual operator by rotating knurled cap counterclockwise 180° before operating electrically.

Manual Operator Location (Refer to Figure 3)

Manual operator (when shipped from factory) will be located over the valve outlet. Manual operator may be relocated at 90° increments by rotating valve bonnet. Remove bonnet screws (4) and rotate valve bonnet with solenoid to desired position. Replace bonnet screws (4) and torque in a crisscross manner to 110±10 inch pounds.

If valve is installed in the system and is operational, proceed in the following manner:

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, depressurize valve and vent fluid to a safe area before servicing the valve.

1. Remove the solenoid - see separate solenoid instructions.
2. Remove bonnet screws (4) and rotate valve bonnet to desire position.
3. Replace bonnet screws (4) and torque in a crisscross manner to 110±10 inch pounds.
4. Replace all solenoid parts.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

Temperature Limitations

For maximum valve ambient and fluid temperatures, refer to chart. The temperature limitations listed are for UL applications. For non UL applications, higher ambient and fluid temperature limitations are available. Consult factory. Check catalog number on nameplate to determine maximum temperatures.

Construction	Max. Fluid Temp, °F
AC Construction (Alternating Current)	180
DC Construction (Direct Current)	150
Catalog Numbers Suffixed "HW" AC Construction (Alternating Current)	210

Note: For Maximum Ambient Temperature specifications, see separate solenoid instructions.

Positioning

This valve is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Mounting

For mounting bracket (optional feature) dimensions, refer to Figure 1.

Piping

Connect piping to valve according to markings on valve body. Apply pipe compound or PTFE tape sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

IMPORTANT: Valves with Suffix "HW" in the catalog number have a special diaphragm material which is specifically compounded for hot water service. This material can be attacked by oil and grease. Wipe the pipe threads clean of cutting oils and use PTFE tape to seal pipe joints.

IMPORTANT: To protect the solenoid valve, install a strainer or filter suitable for the service involved in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

All Rights Reserved.

©ASCO Valve, Inc.® 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, depressurize valve and vent fluid to a safe area before servicing the valve.

NOTE: It is not necessary to remove the valve from the pipeline for repairs.

Cleaning

All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Causes of Improper Operation

- **Incorrect Pressure:** Check valve pressure. Pressure to valve must be within range specified on nameplate.
- **Excessive Leakage:** Disassemble valve and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Coil Replacement (See separate solenoid instructions)

Valve Disassembly (Refer to Figures 2 and 3)

1. Remove the solenoid - see separate solenoid instructions.
2. Unscrew solenoid base sub-assembly and remove bonnet gasket.
3. Remove valve bonnet screws (4) and valve bonnet.
4. For normal maintenance, it is not necessary to disassemble the manual operator (optional feature) unless external leakage is evident. To disassemble, remove stem pin, manual operator stem, stem spring and stem gasket.
5. Remove core spring, core/diaphragm sub-assembly and body gasket. CAUTION: Do not damage or distort hanger spring between core/diaphragm sub-assembly.
6. All parts are now accessible for cleaning or replacement. Replace worn or damaged parts with a complete Spare Parts Kit for best results.

Valve Reassembly

1. Reassemble in reverse order of disassembly paying careful attention to exploded views provided for identification and placement of parts.
2. Lubricate body gasket and solenoid base gasket with DOW CORNING® 200 fluid lubricant or an equivalent high-grade silicone fluid. Lubricate manual operator stem gasket with DOW CORNING® 111 Compound lubricant or an equivalent high-grade silicone grease. On oxygen valves Suffix "N" and special cleaning valves where silicone lubricants are not allowed use FLOROLUBE® GR-362, LG-160 or KRYTOX® GPL -226.

Note: Only the gaskets specified above should be lubricated.

3. Replace body gasket and core/diaphragm sub-assembly. Locate the bleed hole in core/diaphragm sub-assembly approximately 45° from the valve outlet.
4. Replace core spring with wide end in core first; closed end protrudes from top of core.
5. If removed, replace manual operator stem, stem spring, stem gasket and stem pin.
6. Replace valve bonnet and bonnet screws (4). Torque bonnet screws (4) in a crisscross manner to 110±10 inch pounds.
7. Replace bonnet gasket and solenoid base sub-assembly. Put solenoid base sub-assembly to 175±25 inch pounds.
8. Replace solenoid enclosure and retaining cap or clip.
9. After maintenance, operate the valve a few times to be sure of proper opening and closing.

ORDERING INFORMATION FOR ASCO REBUILD KITS

Parts marked with an asterisk(*) in the exploded view are supplied in Rebuild Kits. When Ordering Rebuild Kits for ASCO Valves, order the Rebuild Kit number stamped on the valve nameplate. If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

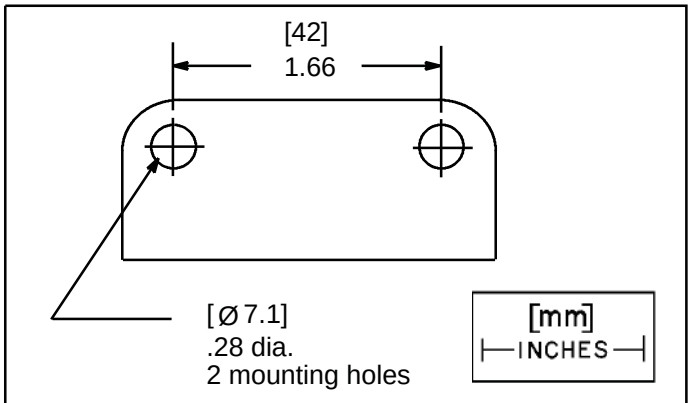

Figure 1. Mounting bracket dimensions

Installation&Maintenance Instructions

ASCO Red-Hat II™

OPEN-FRAME, GENERAL PURPOSE, WATERTIGHT/EXPLOSIONPROOF SOLENOIDS
OPTIONAL FEATURE FOR OPEN FRAME (GENERAL PURPOSE) CONSTRUCTION ONLY

SERIES
8003G/H
8007G/H
8202G/H

— SERVICE NOTICE —

ASCO® solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO™ Red Hat II™ solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

See separate instructions for basic valve.

DESCRIPTION

Catalog numbers 8003G/H, 8007G/H and 8202G/H and are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" or "EV" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type 7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 or 0.63 minimum full thread.

NOTE: Catalog number prefix "EV" denotes stainless steel construction.

Solenoid catalog numbers 8202G/H1, 8202G/H3, 8202G/H5 and 8202G/H7 are epoxy encapsulated push-type, reverse-acting solenoids having the same enclosure types as previously stated for Catalog numbers 8003G/H1 and 8003G/H2. 8007G/H are 3-way solenoid operators with a pipe port or adapter, exhaust protector or vent at the top of the solenoid base sub-assembly.

Series 8003G/H, 8007G/H and 8202G/H solenoids are also available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
  - □ **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer. Refer to Figures specified in this I&M and the section on *Installation of Panel Mounted Solenoid* for details.
- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **Multipin Connectors:** All Multipin connectors (VT, VB, ZT, ZB) do not have any enclosure ratings.

NOTE: For China RoHS Hazardous Substances table, please go to the link below or scan QR code:
www.asco.com/ChinaRoHSDisclosure

OPERATION

Series 8003G/H and 8007G/H - When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring,pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 11 ounces, and 5 ounces for DC construction.

Series 8202G/H - When the solenoid is energized, the disc holder assembly seats against the orifice. When the solenoid is de-energized , the disc holder assembly returns. **IMPORTANT: Initial return force for the disc or disc holder assembly, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force is 1pound, 5 ounces.**

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

⚠ AVERTISSEMENT: Risque d'accès aux parties électriques actives. Afin d'éviter tout risque de mort, blessure ou dommage, installer la bobine dans un boitier.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165°C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180°C. See nameplate/retainer for service.

⚠ ATTENTION : Afin d'éviter le risque de de feu ou d'explosion, ne pas installer la bobine ou l'électrovanne ou la température d'inflammation en atmosphère explosible est inferieure à 165°C. Pour les vannes vapeur ou lorsqu'une bobine de classe H est utilisée, ne pas installer en atmosphère explosible lorsque la température d'inflammation est inférieure à 180°C. Consulter les conditions d'utilisations sures indiquées sur le produit ou dans la notice.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

 All Rights Reserved.
©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932

⚠ CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

⚠ ATTENTION : Afin de protéger l'électrovanne ou l'actionneur, installer une crépine ou un filtre adapté le plus proche possible en amont de l'électrovanne ou de l'actionneur. Nettoyer périodiquement le filtre en fonction des conditions d'utilisation. Se référer aux séries 8600 et 8601 pour les crépines.

Temperature Limitations

For maximum solenoid ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90°C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for maximum ambient and fluid temperatures.

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8003G, 8007G or 8202G			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
10.1 & 17.1	None, FB, KF, KP, SC, SD, SF, SP, VT, VB, ZT & ZB	F	125°F (52°C)
10.1, 17.1 & 24.6	HB, HT, KB, KH, SS, ST, SU, HC	H	140°F (60°C)
11.6 & 22.6	None, FB, KF, KP, SC, SD, SF, SP, VT, VB, ZT & ZB	F	104°F (40°C)
11.6 & 22.6	HP, HT, KB, KH, SS, ST, SU & SV	H	104°F (40°C)
15.6	None, KB, SS, SV	H	104°F (40°C)

§ Minimum ambient temperature -40°F (-40°C).

Temperature Limitations for Series 8003H, 8007H and 8202H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix [1]	Coil Class	AC 60 Hz	AC 50 Hz	DC	°C	°F
EF, EV	FT	10.1	10.1	-	52	125
EF, EV	FB	17.1	17.1	-		
	FT	10.1	10.1	-	55	131
	FB	17.1	17.1	-		
	HT	-	-	11.6	40 [2]	104 [2]
	HF	-	-	15.6		
	HB	-	-	22.6		
EF, EV	HT	-	-	11.6		
EF, EV	HF	-	-	15.6		
EF, EV	HB	-	-	22.6		
	HT	10.1	10.1	-	60 [3]	140 [3]
	HB	17.1	17.1	-		
EF, EV	HT	10.1	10.1	-		
EF, EV	HB	17.1	17.1	-		
EF, EV	HC	-	-	24.6		

[1] = EF, EV data applies to Explosionproof coils only.

[2] = Some DC solenoid valves can be operated at maximum ambient temperature of 55°C / 131°F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.

[3] = Steam Service Valves have a maximum ambient temperature of 55° C/ 131°F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For explosionproof solenoid version, the conduit lead wires are factory sealed for use in hazardous locations.

⚠ CAUTION: Cryogenic Applications - Solenoid lead wire insulation should not be subjected to cryogenic temperatures. Adequate lead wire protection and routing must be provided.

⚠ ATTENTION: Application cryogénique. Les câbles électriques ne doivent pas être soumis à des températures cryogéniques. Une protection adequate des cables électriques doit être fournie.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to 10±2 in-lbs [1,0±1,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

Multipin Connector		
Connector Type	Mating Connector	Application
VT / VB	4-Pin, M12, Female, Single Keyway	DC
	4-Pin, M12, Female, Dual Reverse Keyway	AC
ZT / ZB	3-Pin, Mini, Female, Single Keyway	AC / DC

- **DIN Plug Connector Kit No. K236034**
  1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
  2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
  3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
  4. Thread wire through gland nut, gland gasket, washer and connector cover.

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figures 1 and 2)

1. Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.
2. Install solenoid base sub-assembly through customer panel. 8202H panel mounted solenoids include a retainer to adapt the solenoid base sub-assembly to the customer panel. (See Figure 2)
3. Position finger washer on opposite side of panel over solenoid base sub-assembly.
4. Replace solenoid, nameplate/retainer and red cap.
5. Make electrical hookup, see *Wiring* section.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

⚠ AVERTISSEMENT: Pour éviter tous danger de mort, de blessure grave ou de dommage matériel, avant d'intervenir sur la vanne, couper le courant, purger la vanne dans une zone sécurisée.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. Disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid. For 3-way construction, piping or tubing must be removed from pipe adapter.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**
     Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

   - **Junction Box**
     Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.
   - **DIN Plug Connector**
     Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.
3. Remove red cap or retainer from top of solenoid base sub-assembly. For 3-way construction with pipe adapter (Figure 3), remove pipe adapter, nameplate and solenoid. Omit steps 4 and 5.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade between solenoid and nameplate/retainer. Pry up slightly and push to remove. NOTE: Series 8202G/H solenoids have a spacer between the nameplate/retainer and solenoid.
5. Remove solenoid from solenoid base sub-assembly.
6. Reassemble in reverse order of disassembly. Use exploded views for identification and placement of parts.
7. Torque pipe adapter to 90 inch-pounds maximum [10,2 Nm maximum]. Then make up piping or tubing to pipe adapter on solenoid.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly. For 3-way construction, remove pipe adapter and plugnut gasket.
3. Unscrew solenoid base sub-assembly from valve body.
4. Remove internal solenoid parts for cleaning or replacement. Use exploded views for identification and placement of parts.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Torque solenoid base sub-assembly and adapter to 175±25 in-lbs [19,8±2,8 Nm].

ORDERING INFORMATION FOR ASCO SOLENOIDS

When Ordering Solenoids for ASCO Solenoid Operators or Valves, order the number stamped on the solenoid. Also specify voltage and frequency.

GB

GENERAL INSTALLATION AND MAINTENANCE INSTRUCTIONS

Note: These general Installation and Maintenance Instructions must be read in conjunction with the Instruction Sheet for the specific product.

INSTALLATION

ASCO Numatics components are intended to be used only within the technical characteristics as specified on the nameplate. Changes to the equipment are only allowed after consulting the manufacturer or its representative. Before installation, depressurize the piping system and clean internally.
The equipment may be mounted in any position if not otherwise indicated on the product by means of an arrow.
The flow direction and pipe connection of valves are indicated on the body.

The pipe connections have to be in accordance with the size indicated on the nameplate and fitted accordingly.

Caution:
- Reducing the connections may cause improper operation or malfunctioning.
- For the protection of the equipment install a strainer or filter suitable for the service involved in the inlet side as close to the product as possible.
- If tape, paste, spray or a similar lubricant is used when tightening, avoid particles entering the system.
- Use proper tools and locate wrenches as close as possible to the connection point.
- To avoid damage to the equipment. DO NOT OVERTIGHTEN pipe connections
- Do not use valve or solenoid as lever.
- The pipe connections should not apply any force, torque or strain to the product.

ELECTRICAL CONNECTION

In case of electrical connections, they are only to be made by trained personnel and have to be in accordance with the local regulations and standards.

Caution:
- Turn off electrical power supply and de-energize the electrical circuit and voltage carrying parts before starting work.
- All electrical screw terminals must be properly tightened according to the standards before putting into service.
- Dependent upon the voltage electrical components must be provided with an earth connection and satisfy local regulations and standards.

The equipment can have one of the following electrical terminals:
- Spade plug connections according to ISO-4400 or 3 x DIN-46244 (when correctly installed, this connection provides IP-65 protection).
- Embedded screw terminals in metal enclosure with "Pg" cable gland
- Spade terminals (AMP type).
- Flying leads or cables.

PUTTING INTO SERVICE

Before pressurizing the system, first carry-out an electrical test. In case of solenoid valves, energize the coil a few times and notice a metal click signifying the solenoid operation.

SERVICE

Most of the solenoid valves are equipped with coils for continuous duty service. To prevent the possibility of personal or property damage, do not touch the solenoid which can become hot under normal operating conditions.

SOUND EMISSION

The emission of sound depends on the application, medium and nature of the equipment used. The exact determination of the sound level can only be carried out by the user having the valve installed in his system

MAINTENANCE

Maintenance of ASCO Numatics products is dependent on service conditions. Periodic cleaning is recommended, the timing of which will depend on the media and service conditions. During servicing, components should be examined for excessive wear. A complete set of internal parts is available as spare parts or rebuild kit. If a problem occurs during installation/maintenance or in case of doubt please contact ASCO Numatics or authorized representatives.

*A separate Declaration of Incorporation relating to EU-Directive 2006/42/EC Annex IIB is available on request for applicable products. Please provide product identification number and serial numbers of products concerned.

The product, , when marked CE, complies with the essential requirements of the EMC 2004/108/EC (until April 20th 2016) and EMC 2014/30/EU (from April 20th 2016) and LVD 2006/95/EC (until April 20th 2016) and LVD 2014/35/EU (from April 20th 2016). A separate Declaration of Conformity is available on request. Please provide product identification number and serial numbers of the products concerned.

FR

INSTRUCTIONS GÉNÉRALES D'INSTALLATION ET D'ENTRETIEN

Note: Ces instructions générales d'installation et d'entretien complètent la notice spécifique du produit.

MONTAGE

Les composants ASCO Numatics sont conçus pour les domaines de fonctionnement indiqués sur la plaque signalétique ou la documentation. Aucune modification ne peut être réalisée sur le matériel sans l'accord préalable du fabricant ou de son représentant. Avant de procéder au montage, dépressuriser les canalisations er effectuer un nettoyage inteme.
A moins qu'une fléche ou la notice n'indique un sens de montage spécifique de la tête magnétique, le produit peut être monté dans n'importe quelle position
Le sens de circulation du fluide est indiqué par repères sur le corps er dans la documentation.
La dimension des tuyauteries doit correspondre au raccordement indiqué sur le corps, l'étiquette ou la notice.

Attention:
- Une restriction des tuyauteries peut entraîner des dysfonctionnements.
- Afin de protéger le matériel, installer une crépine ou un filtre adéquat en amont, aussi près que possible du produit.
- En cas d' utilisation de ruban; pàte, aérosol ou autre lubrifiant lors du serrage, veiller à ce qu" aucun corps étranger ne pénètre dans le circuit.
- Utiliser un outillage approprié et placer les clés aussi près que possible du point de raccordement.
- Afin d'éviter toute détérioration, NE PAS TROP SERRER les raccords des tuyauteries.
- Ne pas se servir de la vanne ou de tête magnétique comme d'un levier.
- The pipe connections should not apply any force, torque or strain to the product.

RACCORDEMENT ÉLECTRIQUE

Le raccordement électrique doit être réalisé par un personnel qualifié et selon les normes et règlements locaux.

Attention:
- Avant toute intervention, couper l'alimentation électrique pour mettre hors tension les composants.
- Toutes les bornes à vis doivent être serrées correctement avant la mise en service.
- Selon la tension, les composants électrique doivent être mis à la terre conformément aux normes et règlements locaux.

Selon les cas, le raccordement électrique s'effectué par:
- Connecteur débrochable ISO-4400 ou 3 x DIN-46244 avec degré de protection IP-65 lorsque le raccordement est correctement effectué.
- Bornes à vis solidaires du bobinage, sous boîter métallique avec presse-étoupe "Pg--".
- Cosses (type AMP).
- Fils ou câbles solidaires de la bobine.

MISE EN SERVICE

Avant de mettre le circuit sous pression, effectuer un essai électrique. Dans le cas d'une électrovanne, mettre la bobine sous tension plusieurs fois er écouter le "clic" métallique qui signale le fonctionnement de la tête magnétique.

FONCTIONNEMENT

La plupart des électrovannes comportant des bobinages prévus pour mise sous tension permanente. Pour éviter toute brûlure, ne pas toucher la tête magnétique qui, en fonctionnement normal et en permanence sous tension, peut atteindre une température élevée.

BRUIT DE FONCTIONNEMENT

Le bruit de fonctionnement varie selon l'utilisation, le fluide et le type de matériel employé. L'utilisateur ne pourra déterminer avec précision le niveau sonore émis qu'après avoir monté le composant sur l'installation.

ENTRETIEN

L'entretien nécessaire aux produits ASCO Numatics varie avec leurs conditions d'utilisation. Il est souhaitable de procéder à un nettoyage périodique dont l'intervalle varie suivant la nature du fluide, les conditions de fonctionnement et le milieu ambiant. Lors de l'intervention. Les composants doivent être examinés our détecter toute usure excessive. Un ensemble de pièces internes est proposé en pièces de rechange pour procéder à la réfection. En cas de problème lors du montage/entretien ou en cas de doute, veuillez contacter ASCO Numatics ou ses représentants officiels.

*Une déclaration d'incorporation relative à la directive UE 2006/42/CE Annexe II B est disponible sur demande pour les produits applicables. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

Lorsqu'il est marqué du label CE, le produit est conforme aux exigences essentielles des directives CEM 2004/108/CE (jusqu'au 20 avril 2016) et CEM 2014/30/UE (à partir du 20 avril 2016) et des directives Basse tension 2006/95/CE (jusqu'au 20 avril 2016) et 2014/35/UE (à partir du 20 avril 2016). Une déclaration de conformité peut être fournie sur simple demande. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

DE

ALLGEMEINE BETRIEBSANLEITUNG

Achtung: Diese Allgemeine Betriebsanleitung gilt in Zusammenhang mit der jeweiligen Betriebsanleitung für die speziellen Produkte.

EINBAU

Die ASCO Numatics-Komponenten dürfen nur innerhalb der auf den Typenschildern angenebenen Daten eingesetzt warden, Veränderungen an den Produkten sind nur nach Rücksprache mit ASCO Numatics zulässig.
Vor dem Einbau der Ventile muß das Rohrleitungssystem drucklos geschaltet und innen gereinigt werden.
Die Einbaulage der Produkte ist genereil beliebig. Ausnahme: Die mit einem Pfeil gekennzeichneten Produkte müssen entsprechend der Pfeilrichtung montiert werden.
Die Durchflußrichtung und der Eingang von Ventilen sind gekennzeichnet.

Die Rohranschlüsse sollten entsprechend den Größenangaben auf den Typenschildern mit handelsüblichen Verschraubungen durchgeführt werden. Dabei ist folgendes zu beachten:
- Eine Reduzierung der Anschlüsse kann zu Leistungs-und Funktionsminderungen führen.
- Zum Schutz der Ventile sollten Schmutzfänger oder Filter so dicht wie möglich in den Ventileingang integriert werden.
- Bei Abdichtung am Gewinde ist darauf zu achten, daß kein Dichtungsmaterial in die Rohrleitung oder das Ventil gelangt.
- Zur Montage darf nur geeignetes Werkzeug verwendetwerden.
- Konische Verschraubungen sind sorgfältig anzuziehen. Es ist darauf zu achten, daß beim Anziehen das Gehäuse nicht beschädigt wird.
- Spule und Führungsrohr von Ventilen dürfen nicht als Gegenhalter benutzt werde.
- Die Rohrleitungsanschlüsse sollen fluchten und dürfen keine Spannungen auf das Ventil übertragen.

ELECTRISCHER ANSCHLUß

Der elektrische Anschluß ist von Fachpersonal entsprechend den geltenden VDE-und CEE Richtlinien auszuführen. Es ist besonders auf foigendes zu achten:
- Vor Beginn der Arbeiten ist sicherzustellen, daß alle elektrischen Leitungen und Netzteile spannungslos geschaltet sind.
- Alle Anschlußklemmen sind nach Beendigung der Arbeiten vorschriftsmäßig entsprechend den geltenden Regeln anzuziehen.
- Je nach Spannungsbereich muß das Ventil nach den geltenden Regeln einen Schutzleiteranschluß erhalten.

Der Magnetantrieb kann je nach Bauart folgende Anschlüsse haben:
- Anschluß für Gerätesteckdose nach DIN 43650 Form A/ISO 4400 oder 3 x DIN 46244 (durch ordnungsgemäße Montage der Gerätesteckdose wird Schutzklasse IP 65 erreicht).
- Anschlüsse innerhalb eines Blechgehäuses mittels Schraubklemmen. Kabeleinführung ins Gehäuse mit PG-Verschraubung.
- Offene Spulen mit Flachsteckern (AMP-Fahnen) oder mit eingegossenen Kabelenden.

INBETRIEBNAHME

Vor Druckbeaufschlagung des Produktes sollte eine elektrische Funktionsprüfung erfolgen:

Bei Ventilen Spannung an der Magnetspule mehrmals ein-und ausschalten. Es muß ein Klicken zu hören sein.

BETRIEB

Die meisten Ventile sind mit Spulen für Dauerbetrieb ausgerüstet. Zur Vermeidung von Personen-und Sachschäden sollte jede Berührung mit dem Ventil vermieden werden, da die Magnetspule bei längerem Betrieb sehr heiß werden kann.

GERÄUSCHEMISSION

Diese hängt sehr stark vom Anwendungsfall, den Betriebsdaten und dem Medium, mit denen das Produkt beaufschlagt wird, ab. Eine Aussage über die Geräuschemission des Produktes muß deshalb von demjenigen getroffen werden, der das Produkt innerhalb einer Maschine in Betrieb nimmit.

WARTUNG

Die Wartung hängt von den Einsatzbedigungen ab. In entsprechenden Zeitabständen muß das Produkt geöffnet und gereinigt werden. Für die Überholung der ASCO Numatics-Produkte können Ersatzteilsätze geliefert werden. Treten Schwierigkeiten bel Einbau, Betrieb oder Wartung auf, sowie bei Unklarheiten, ist mit ASCO Numatics Rücksprache zu halten.

ASCO Numatics Produkte sind entsprechend der EG-Richtlinie 89/392/EWG gefertigt.

*Eine separate Herstellererklärung im Sinne der Richtlinie 2006/42/EWG Anhang II B ist auf Anfrage für die entsprechenden Produkte erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

Das Produkt, wenn mit CE gekennzeichnet, erfüllt die Anforderungen von EMV 2004/108/EWG (bis 20. April 2016) und EMV 2014/30/EU (vom 20. April 2016) und LVD 2006/95/EWG (bis 20. April 2016) und LVD 2014/35/EU (vom 20. April 2016). Eine separate Konformitätserklärung ist auf Anfrage erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

(EF) 8345G001, SOLENOID VALVE

LEFT BLANK

Installation & Maintenance Instructions

2-POSITION 4-WAY FUNCTION VALVES

MIDGET SIZE - 1/4 NPT

SERIES 8345G/H

IMPORTANT: See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature,Causes of Improper Operation,and Coil or Solenoid Replacement.

DESCRIPTION

Series 8345 valves are 2-position 4-way midget size solenoid valves with rugged forged brass or stainless steel bodies. These valves are extremely compact to meet the requirements where space and weight are important and are primarily used to control small double acting cylinders not larger than 4 inches in diameter. Series 8345 valves may be provided with a general purpose or explosionproof solenoid enclosure.

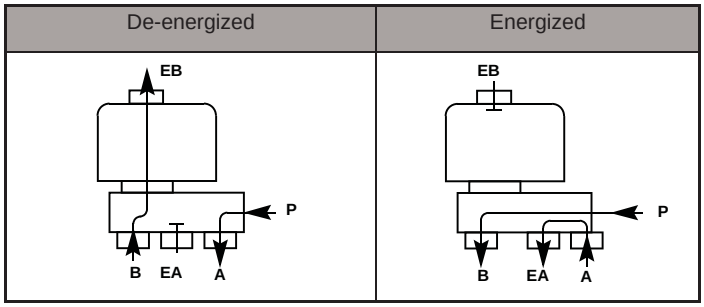
OPERATION

Solenoid De-energized: Flow is from Pressure "P" to Cylinder "A" and from Cylinder "B" to Exhaust "EB". Exhaust "EA" is closed.

Solenoid Energized: Flow is from Pressure "P" to Cylinder "B" and from Cylinder "A" to Exhaust "EA". Exhaust "EB" is closed.

IMPORTANT: Minimum operating pressure differential is 10 psi.

Flow Diagrams



Manual Operator (optional feature)

Manual operator allows manual operation when desired or during an electrical power outage. To operate manual operator, rotate groove pin counter-clockwise 180°. Valve will then remain in the solenoid energized position until stem is rotated clockwise to original position. Manual operator must be in clockwise position for proper electrical operation.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

Temperature Limitations

For maximum valve ambient and fluid temperatures, refer to chart below. Check catalog number on nameplate to determine temperature limitation.

Wattage	Catalog Number Coil Prefix	Coil Class	Max. Ambient Temp.°F	Max. Fluid Temp.°F
10.1	none, KF, SF, SC, EF or EV	F	125	180
10.1	HT, KH, ST, SU, EFHT or EVHT	H	140	180
11.6	none, HT, KF, KH, SC, SF, EF or EV	F or H	104	104

Positioning

This valve is designed to perform properly when mounted in any position. However,for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Mounting

Refer to Figure 1 for Mounting dimensions.

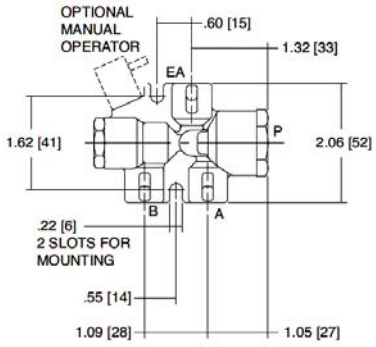


Figure 1. Mounting Dimensions

Piping

Connect piping to valve according to markings on valve body. Apply pipe compound or PTFE tape sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

To ensure proper operation of the valve, the pressure and exhaust lines must be full area without restriction. A minimum differential pressure (10psi), as stamped on the nameplate, must be maintained between pressure and exhaust at the moment of shifting. Air reservoirs must have adequate capacity to maintain this minimum pressure during shifting. To check pressure during shifting, install a pressure gauge in the piping as close to valve as possible.

CAUTION: To protect the solenoid valve, install a strainer or filter suitable for the service involved in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

Wiring

Wiring must comply with Local and National Electrical Codes. For valves equipped with an Explosionproof/Watertight Solenoid Enclosure, the electrical fittings must be approved for use in the approved hazardous Location. Housings for all solenoids are provided with accommodations or connections for a 1/2 inch conduit. To facilitate wiring, the solenoid enclosure may be rotated 360°.

Solenoid Temperature

Standard catalog valves are supplied with coils designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature. Any excess heating will be indicated by smoke and the odor of burning coil insulation

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve

Note: It is not necessary to remove the valve from the pipeline for repairs. However, piping or tubing must be removed from Pressure "P" connection and Exhaust "EB" connection on air and liquid constructions.

Cleaning

All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general,if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean strainer or filter when cleaning the valve.

All Rights Reserved.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932

Preventive Maintenance

- Keep medium flowing through the valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete rebuild kit.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic click signifies that the solenoid is operating. The absence of the click indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded coil, broken lead wires or splice connections.
- **Burned-Out Coil:** Check for open-circuited coil. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate and as marked on the coil.
- **Low Voltage:** Check voltage across the coil leads. Voltage must be at least 85% of nameplate rating.
- **Incorrect Pressure:** Check valve pressure. Pressure to valve must be within range specified on nameplate.
- **Excessive Leakage:** Disassemble valve and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Disassembly

1. Disassemble valve in an orderly fashion using exploded views for identification and placement of parts.
2. Remove solenoid enclosure. See separate instructions.
3. Unscrew solenoid base sub-assembly and remove bonnet gasket.
4. For normal maintenance (cleaning) it is not necessary to disassemble the manual operator (optional feature) unless external leakage is evident. If disassembly is required, remove stem pin, manual operator stem, stem spring and stem gasket from valve body.
5. Remove core spring and core sub-assembly.
6. Unscrew end cap and remove end cap gasket, body gasket and disc.
7. Unscrew end plug and remove end plug gasket, piston and piston U-cup.
8. All parts are now accessible for cleaning or replacement. If parts are worn or damaged, install a complete ASCO Rebuild Kit

Valve Reassembly

1. Lubricate piston U-cup and all gaskets with Parker Super Lube Compound or an equivalent high-grade silicone grease.
2. Position piston U-cup on piston with mouth or open end facing in the direction of the end plug.
3. Install piston into valve body. Position end plug gasket on end plug and install into valve body. Torque end plug to 200±10 in-lbs [22,6±1,1 Nm].
4. Position body gasket and end cap gasket on end cap. Lubricate disc with DOW CORNING® 111 Compound or an equivalent high grade silicone grease. Install disc and end cap into valve body. Torque end cap to 200±10 in-lbs [22,6±1,1 Nm].
5. If removed, assembly and replace manual operator stem, stem spring, stem gasket and stem pin.
6. Position solenoid base gasket in valve body.
7. Install core assembly and core spring into solenoid base sub-assembly. Thread solenoid base sub-assembly into valve body. Torque solenoid base sub-assembly to 175±25 in-lbs [19,8±2,8 Nm].
8. Install solenoid,see separate solenoid instructions. Then make electrical hookup to solenoid.

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, check valve for proper operation before returning to service. Also perform internal seat and external leakage tests with a nonhazardous, noncombustible fluid.

9 Restore line pressure and electrical power supply to valve.

10. After maintenance is completed, operate the valve a few times to be sure of proper operation. A metallic click signifies the solenoid is operating.

ORDERING INFORMATION FOR ASCO REBUILD KITS

Parts marked with an asterisk (*) in the exploded view are supplied in Rebuild Kits. When Ordering Rebuild Kits for ASCO valves, order the Rebuild Kit number stamped on the valve nameplate. If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

Installation&Maintenance Instructions

ASCO Red-Hat II®

OPEN-FRAME, GENERAL PURPOSE, WATERTIGHT/EXPLOSIONPROOF SOLENOIDS

SERIES
8003G/H
8007G/H
8202G/H

— SERVICE NOTICE —

ASCO® solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO® Red Hat II® solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

See separate instructions for basic valve.

DESCRIPTION

Catalog numbers 8003G/H, 8007G/H and 8202G/H and are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" or "EV" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/ retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 or 0.63 minimum full thread.

NOTE: Catalog number prefix "EV" denotes stainless steel construction.

Solenoid catalog numbers 8202G/H1, 8202G/H3, 8202G/H5 and 8202G/H7 are epoxy encapsulated push-type, reverse-acting solenoids having the same enclosure types as previously stated for Catalog numbers 8003G/H1 and 8003G/H2. 8007G/H are 3-way solenoid operators with a pipe port or adapter, exhaust protector or vent at the top of the solenoid base sub-assembly.

Series 8003G/H, 8007G/H and 8202G/H solenoids are available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer. Refer to Figures specified in this I&M and the section on *Installation of Panel Mounted Solenoid* for details.

Optional Features For Type 1 - General Purpose Construction Only

- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).

OPERATION

Series 8003G/H and 8007G/H - When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring,pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 11 ounces, and 5 ounces for DC construction.

Series 8202G/H - When the solenoid is energized, the disc holder assembly seats against the orifice. When the solenoid is de-energized , the disc holder assembly returns. **IMPORTANT: Initial return force for the disc or disc holder assembly, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force is 1pound, 5 ounces.**

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165°C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180°C. See nameplate/ retainer for service.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

⚠CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

 All Rights Reserved.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932

Temperature Limitations

For maximum valve ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90°C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for maximum fluid temperature.

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8003G, 8007G or 8202G Solenoids for use on Valves Rated at 10.1, 11.6, 15.6, 17.1, or 22.6 Watts			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
10.1 & 17.1	None, FB, KF, KP, SC, SD, SF, SP, VT, VB, ZT & ZB	F	125°F (52°C)
10.1 & 17.1	HB, HT, KB, KH, SS, ST, SU	H	140°F (60°C)
11.6 & 22.6	None, FB, KF, KP, SC, SD, SF, SP, VT, VB, ZT & ZB	F	104°F (40°C)
11.6 & 22.6	HP, HT, KB, KH, SS, ST, SU & SV	H	104°F (40°C)
15.6	None, KB, SS, SV	H	104°F (40°C)

§ Minimum ambient temperature -40°F (-40°C).

Temperature Limitations for Series 8003H, 8007H and 8202H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix [1]	Coil Class	AC		DC		
		60 Hz	50 Hz		°C	°F
EF, EV	FT	10.1	10.1	-	52	125
EF, EV	FB	17.1	17.1	-		
	FT	10.1	10.1	-	55	131
	FB	17.1	17.1	-		
	HT	-	-	11.6	40 [2]	104 [2]
	HF	-	-	15.6		
	HB	-	-	22.6		
EF, EV	HT	-	-	11.6		
EF, EV	HF	-	-	15.6		
EF, EV	HB	-	-	22.6		
	HT	10.1	10.1	-	60 [3]	140 [3]
	HB	17.1	17.1	-		
EF, EV	HT	10.1	10.1	-		
EF, EV	HB	17.1	17.1	-		

[1] = EF, EV data applies to Explosionproof coils only.

[2] = Some DC solenoid valves can be operated at maximum ambient temperature of 55°C / 131°F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.

[3] = Steam Service Valves have a maximum ambient temperature of 55° C/ 131°F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For the watertight and explosionproof solenoid, electrical fittings must be approved for use in the approved hazardous locations.

⚠CAUTION: Cryogenic Applications - Solenoid lead wire insulation should not be subjected to cryogenic temperatures. Adequate lead wire protection and routing must be provided.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to 10±2 in-lbs [1,0±1,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

- **DIN Plug Connector Kit No. K236034**

1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
4. Thread wire through gland nut, gland gasket, washer and connector cover.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figures 1 and 2)

1. Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.
2. Install solenoid base sub-assembly through customer panel. 8202H panel mounted solenoids include a retainer to adapt the solenoid base sub-assembly to the customer panel. (See Figure 2)
3. Position finger washer on opposite side of panel over solenoid base sub-assembly.
4. Replace solenoid, nameplate/retainer and red cap.
5. Make electrical hookup, see *Wiring* section.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. Disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid. For 3-way construction, piping or tubing must be removed from pipe adapter.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**

     Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

   - **Junction Box**

     Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.
   - **DIN Plug Connector**

     Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

3. Remove red cap or retainer from top of solenoid base sub-assembly. For 3-way construction with pipe adapter (Figure 3), remove pipe adapter, nameplate and solenoid. Omit steps 4 and 5.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade between solenoid and nameplate/retainer. Pry up slightly and push to remove. NOTE: Series 8202G/H solenoids have a spacer between the nameplate/retainer and solenoid.
5. Remove solenoid from solenoid base sub-assembly.
6. Reassemble in reverse order of disassembly. Use exploded views for identification and placement of parts.
7. Torque pipe adapter to 90 inch-pounds maximum [10,2 Nm maximum]. Then make up piping or tubing to pipe adapter on solenoid.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly. For 3-way construction, remove pipe adapter and plugnut gasket.
3. Unscrew solenoid base sub-assembly from valve body.
4. Remove internal solenoid parts for cleaning or replacement. Use exploded views for identification and placement of parts.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Torque solenoid base sub-assembly and adapter to 175±25 in-lbs [19,8±2,8 Nm].

ORDERING INFORMATION FOR ASCO SOLENOIDS

When Ordering Solenoids for ASCO Solenoid Operators or Valves, order the number stamped on the solenoid. Also specify voltage and frequency.

GENERAL INSTALLATION AND MAINTENANCE INSTRUCTIONS

Note: These general Installation and Maintenance Instructions must be read in conjunction with the Instruction Sheet for the specific product.

INSTALLATION

ASCO Numatics components are intended to be used only within the technical characteristics as specified on the nameplate. Changes to the equipment are only allowed after consulting the manufacturer or its representative. Before installation, depressurize the piping system and clean internally.
The equipment may be mounted in any position if not otherwise indicated on the product by means of an arrow.
The flow direction and pipe connection of valves are indicated on the body.

The pipe connections have to be in accordance with the size indicated on the nameplate and fitted accordingly.

Caution:
- Reducing the connections may cause improper operation or malfunctioning.
- For the protection of the equipment install a strainer or filter suitable for the service involved in the inlet side as close to the product as possible.
- If tape, paste, spray or a similar lubricant is used when tightening, avoid particles entering the system.
- Use proper tools and locate wrenches as close as possible to the connection point.
- To avoid damage to the equipment. DO NOT OVERTIGHTEN pipe connections
- Do not use valve or solenoid as lever.
- The pipe connections should not apply any force, torque or strain to the product.

ELECTRICAL CONNECTION

In case of electrical connections, they are only to be made by trained personnel and have to be in accordance with the local regulations and standards.

Caution:
- Turn off electrical power supply and de-energize the electrical circuit and voltage carrying parts before starting work.
- All electrical screw terminals must be properly tightened according to the standards before putting into service.
- Dependent upon the voltage electrical components must be provided with an earth connection and satisfy local regulations and standards.

The equipment can have one of the following electrical terminals:
- Spade plug connections according to ISO-4400 or 3 x DIN-46244 (when correctly installed, this connection provides IP-65 protection).
- Embedded screw terminals in metal enclosure with "Pg" cable gland
- Spade terminals (AMP type).
- Flying leads or cables.

PUTTING INTO SERVICE

Before pressurizing the system, first carry-out an electrical test. In case of solenoid valves, energize the coil a few times and notice a metal click signifying the solenoid operation.

SERVICE

Most of the solenoid valves are equipped with coils for continuous duty service. To prevent the possibility of personal or property damage, do not touch the solenoid which can become hot under normal operating conditions.

SOUND EMISSION

The emission of sound depends on the application, medium and nature of the equipment used. The exact determination of the sound level can only be carried out by the user having the valve installed in his system

MAINTENANCE

Maintenance of ASCO Numatics products is dependent on service conditions. Periodic cleaning is recommended, the timing of which will depend on the media and service conditions. During servicing, components should be examined for excessive wear. A complete set of internal parts is available as spare parts or rebuild kit. If a problem occurs during installation/maintenance or in case of doubt please contact ASCO Numatics or authorized representatives.

*A separate Declaration of Incorporation relating to EU-Directive 2006/42/EC Annex IIB is available on request for applicable products. Please provide product identification number and serial numbers of products concerned.

The product, , when marked CE, complies with the essential requirements of the EMC 2004/108/EC (until April 20th 2016) and EMC 2014/30/EU (from April 20th 2016) and LVD 2006/95/EC (until April 20th 2016) and LVD 2014/35/EU (from April 20th 2016). A separate Declaration of Conformity is available on request. Please provide product identification number and serial numbers of the products concerned.

FR

INSTRUCTIONS GÉNÉRALES D'INSTALLATION ET D'ENTRETIEN

Note: Ces instructions générales d'installation et d'entretien complètent la notice spécifique du produit.

MONTAGE

Les composants ASCO Numatics sont conçus pour les domaines de fonctionnement indiqués sur la plaque signalétique ou la documentation. Aucune modification ne peut être réalisée sur le matériel sans l'accord préalable du fabricant ou de son représentant. Avant de procéder au montage, dépressuriser les canalisations er effectuer un nettoyage inteme.
A moins qu'une fléche ou la notice n'indique un sens de montage spécifique de la tête magnétique, le produit peut être monté dans n'importe quelle position
Le sens de circulation du fluide est indiqué par repères sur le corps er dans la documentation.
La dimension des tuyauteries doit correspondre au raccordement indiqué sur le corps, l'étiquette ou la notice.

Attention:
- Une restriction des tuyauteries peut entraîner des dysfonctionnements.
- Afin de protéger le matériel, installer une crépine ou un filtre adéquat en amont, aussi près que possible du produit.
- En cas d' utilisation de ruban; pàte, aérosol ou autre lubrifiant lors du serrage, veiller à ce qu" aucun corps étranger ne pénètre dans le circuit.
- Utiliser un outillage approprié et placer les clés aussi près que possible du point de raccordement.
- Afin d'éviter toute détérioration, NE PAS TROP SERRER les raccords des tuyauteries.
- Ne pas se servir de la vanne ou de tête magnétique comme d'un levier.
- The pipe connections should not apply any force, torque or strain to the product.

RACCORDEMENT ÉLECTRIQUE

Le raccordement électrique doit être réalisé par un personnel qualifié et selon les normes et règlements locaux.

Attention:
- Avant toute intervention, couper l'alimentation électrique pour mettre hors tension les composants.
- Toutes les bornes à vis doivent être serrées correctement avant la mise en service.
- Selon la tension, les composants électrique doivent être mis à la terre conformément aux normes et règlements locaux.

Selon les cas, le raccordement électrique s'effectué par:
- Connecteur débrochable ISO-4400 ou 3 x DIN-46244 avec degré de protection IP-65 lorsque le raccordement est correctement effectué.
- Bornes à vis solidaires du bobinage, sous boîter métallique avec presse-étoupe "Pg--".
- Cosses (type AMP).
- Fils ou câbles solidaires de la bobine.

MISE EN SERVICE

Avant de mettre le circuit sous pression, effectuer un essai électrique. Dans le cas d'une électrovanne, mettre la bobine sous tension plusieurs fois er écouter le "clic" métallique qui signale le fonctionnement de la tête magnétique.

FONCTIONNEMENT

La plupart des électrovannes comportant des bobinages prévus pour mise sous tension permanente. Pour éviter toute brûlure, ne pas toucher la tête magnétique qui, en fonctionnement normal et en permanence sous tension, peut atteindre une température élevée.

BRUIT DE FONCTIONNEMENT

Le bruit de fonctionnement varie selon l'utilisation, le fluide et le type de matériel employé. L'utilisateur ne pourra déterminer avec précision le niveau sonore émis qu'après avoir monté le composant sur l'installation.

ENTRETIEN

L'entretien nécessaire aux produits ASCO Numatics varie avec leurs conditions d'utilisation. Il est souhaitable de procéder à un nettoyage périodique dont l'intervalle varie suivant la nature du fluide, les conditions de fonctionnement et le milieu ambiant. Lors de l'intervention. Les composants doivent être examinés our détecter toute usure excessive. Un ensemble de pièces internes est proposé en pièces de rechange pour procéder à la réfection. En cas de problème lors du montage/entretien ou en cas de doute, veuillez contacter ASCO Numatics ou ses représentants officiels.

*Une déclaration d'incorporation relative à la directive UE 2006/42/CE Annexe II B est disponible sur demande pour les produits applicables. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

Lorsqu'il est marqué du label CE, le produit est conforme aux exigences essentielles des directives CEM 2004/108/CE (jusqu'au 20 avril 2016) et CEM 2014/30/UE (à partir du 20 avril 2016) et des directives Basse tension 2006/95/CE (jusqu'au 20 avril 2016) et 2014/35/UE (à partir du 20 avril 2016). Une déclaration de conformité peut être fournie sur simple demande. Veuillez fournir le numéro d'identification du produit et les numéros de série des produits concernés.

DE

ALLGEMEINE BETRIEBSANLEITUNG

Achtung: Diese Allgemeine Betriebsanleitung gilt in Zusammenhang mit der jeweiligen Betriebsanleitung für die speziellen Produkte.

EINBAU

Die ASCO Numatics-Komponenten dürfen nur innerhalb der auf den Typenschildern angenebenen Daten eingesetzt warden, Veränderungen an den Produkten sind nur nach Rücksprache mit ASCO Numatics zulässig.
Vor dem Einbau der Ventile muß das Rohrleitungssystem drucklos geschaltet und innen gereinigt werden.
Die Einbaulage der Produkte ist genereil beliebig. Ausnahme: Die mit einem Pfeil gekennzeichneten Produkte müssen entsprechend der Pfeilrichtung montiert werden.
Die Durchflußrichtung und der Eingang von Ventilen sind gekennzeichnet.

Die Rohranschlüsse sollten entsprechend den Größenangaben auf den Typenschildern mit handelsüblichen Verschraubungen durchgeführt werden. Dabei ist folgendes zu beachten:
- Eine Reduzierung der Anschlüsse kann zu Leistungs-und Funktionsminderungen führen.
- Zum Schutz der Ventile sollten Schmutzfänger oder Filter so dicht wie möglich in den Ventileingang integriert werden.
- Bei Abdichtung am Gewinde ist darauf zu achten, daß kein Dichtungsmaterial in die Rohrleitung oder das Ventil gelangt.
- Zur Montage darf nur geeignetes Werkzeug verwendetwerden.
- Konische Verschraubungen sind sorgfältig anzuziehen. Es ist darauf zu achten, daß beim Anziehen das Gehäuse nicht beschädigt wird.
- Spule und Führungsrohr von Ventilen dürfen nicht als Gegenhalter benutzt werde.
- Die Rohrleitungsanschlüsse sollen fluchten und dürfen keine Spannungen auf das Ventil übertragen.

ELECTRISCHER ANSCHLUß

Der elektrische Anschluß ist von Fachpersonal entsprechend den geltenden VDE-und CEE Richtlinien auszuführen. Es ist besonders auf foigendes zu achten:
- Vor Beginn der Arbeiten ist sicherzustellen, daß alle elektrischen Leitungen und Netzteile spannungslos geschaltet sind.
- Alle Anschlußklemmen sind nach Beendigung der Arbeiten vorschriftsmäßig entsprechend den geltenden Regeln anzuziehen.
- Je nach Spannungsbereich muß das Ventil nach den geltenden Regeln einen Schutzleiteranschluß erhalten.

Der Magnetantrieb kann je nach Bauart folgende Anschlüsse haben:
- Anschluß für Gerätesteckdose nach DIN 43650 Form A/ISO 4400 oder 3 x DIN 46244 (durch ordnungsgemäße Montage der Gerätesteckdose wird Schutzklasse IP 65 erreicht).
- Anschlüsse innerhalb eines Blechgehäuses mittels Schraubklemmen. Kabeleinführung ins Gehäuse mit PG-Verschraubung.
- Offene Spulen mit Flachsteckern (AMP-Fahnen) oder mit eingegossenen Kabelenden.

INBETRIEBNAHME

Vor Druckbeaufschlagung des Produktes sollte eine elektrische Funktionsprüfung erfolgen:

Bei Ventilen Spannung an der Magnetspule mehrmals ein-und ausschalten. Es muß ein Klicken zu hören sein.

BETRIEB

Die meisten Ventile sind mit Spulen für Dauerbetrieb ausgerüstet. Zur Vermeidung von Personen-und Sachschäden sollte jede Berührung mit dem Ventil vermieden werden, da die Magnetspule bei längerem Betrieb sehr heiß werden kann.

GERÄUSCHEMISSION

Diese hängt sehr stark vom Anwendungsfall, den Betriebsdaten und dem Medium, mit denen das Produkt beaufschlagt wird, ab. Eine Aussage über die Geräuschemission des Produktes muß deshalb von demjenigen getroffen werden, der das Produkt innerhalb einer Maschine in Betrieb nimmit.

WARTUNG

Die Wartung hängt von den Einsatzbedigungen ab. In entsprechenden Zeitabständen muß das Produkt geöffnet und gereinigt werden. Für die Überholung der ASCO Numatics-Produkte können Ersatzteilsätze geliefert werden. Treten Schwierigkeiten bel Einbau, Betrieb oder Wartung auf, sowie bei Unklarheiten, ist mit ASCO Numatics Rücksprache zu halten.

ASCO Numatics Produkte sind entsprechend der EG-Richtlinie 89/392/EWG gefertigt.

*Eine separate Herstellererklärung im Sinne der Richtlinie 2006/42/EWG Anhang II B ist auf Anfrage für die entsprechenden Produkte erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

Das Produkt, wenn mit CE gekennzeichnet, erfüllt die Anforderungen von EMV 2004/108/EWG (bis 20. April 2016) und EMV 2014/30/EU (vom 20. April 2016) und LVD 2006/95/EWG (bis 20. April 2016) und LVD 2014/35/EU (vom 20. April 2016). Eine separate Konformitätserklärung ist auf Anfrage erhältlich. Geben Sie bitte die Kennnummer sowie die Seriennummer der betreffenden Produkte an.

1.0 SELECTION & APPLICATION

Users should become familiar with ASME B40.100 (Gauges – Pressure Indicating Dial Type – Elastic Element) before specifying pressure measuring gauges. That document – containing valuable information regarding gauge construction, accuracy, safety, selection and testing – may be ordered from:

ASME International
Three Park Avenue
New York, N.Y. 10016-5990
800-843-2763 (US/Canada)
001-800-843-2763 (Mexico)
973-882-1170 outside North America
email: infocentral@asme.org
www.asme.org

WARNING: To prevent misapplication, pressure gauges should be selected considering media and ambient operating conditions. Improper application can be detrimental to the gauge, causing failure and possible personal injury, property damage or death. The information contained in this manual is offered as a guide in making the proper selection of a pressure gauge. Additional information is available from Ashcroft Inc.

The following is a highlight of some of the more important considerations:

1.1 Range – The range of the instrument should be approximately twice the maximum operating pressure. Too low a range may result in (a) low fatigue life of the elastic element due to high operating stress and (b) susceptibility to overpressure set due to pressure transients that exceed the normal operating pressure. Too high a range may yield insufficient resolution for the application.

1.2 Temperature – Refer to Section 2 of this manual for important information concerning temperature related limitations of pressure gauges, both dry and liquid filled.

1.3 Media – The material of the process sensing element must be compatible with the process media. Use of a diaphragm seal with the gauge is recommended for process media that (a) is corrosive to the process sensing element; (b) contain heavy particulates (slurries) or (c) are very viscous including those that harden at room temperature.

1.4 Oxidizing media – Gauges for direct use on oxidizing media should be specially cleaned. Gauges for oxygen service should be ordered to variation X6B and will carry the ASME required dial marking "USE NO OIL" in red letters. Gauges for direct use on other oxidizing media may be ordered to variation X6W. They will be cleaned but carry no dial marking. *PLUS!*™ Performance gauges or Halocarbon filled gauge or diaphragm fill is required for use with oxidizing media; order variation XCF.

1.5 Pulsation/Vibration – Pressure pulsation can be dampened by several mechanisms; the patented *PLUS! Performance* gauge will handle the vast majority of applications. One exception to this is high frequency pulsation which is difficult to detect. The only indication may be an upscale zero shift due to movement wear. These applications should be addressed with a liquid filled gauge, or in extreme cases, a remotely mounted liquid filled gauge connected with a length of capillary line. The small diameter of the capillary provides excellent dampening, but can be plugged. The Ashcroft 1106 pulsation dampener and 1112 snubber are auxiliary devices which dampen pulsation with less tendency to plug.

1.6 Gauge fills. – Once it has been determined that a liquid filled gauge is in order, the next step is selecting the type of fill. **Glycerin** satisfies most applications. While being the least expensive fill, its usable temperature range is 20/180°F. **Silicone** filled gauges have a broader service range: –40/250°F. Oxidizing media require the use of **Halocarbon,** with a service range of –40/250°F. Pointer motion will be slowed at the low end of the low end of these temperature ranges.

1.7 Mounting – Users should predetermine how the gauge will be mounted in service: stem (pipe), wall (surface) or panel (flush). Ashcroft wall or panel mounting kits should be ordered with the gauge. See Section 3.

2.0 TEMPERATURE

2.1 Ambient Temperature – To ensure long life and accuracy, pressure gauges should preferably be used at an ambient temperature between –20 and +150°F (–30 to +65°C). At very low temperatures, standard gauges may exhibit slow pointer response. Above 150°F, the accuracy will be affected by approximately 1.5% per 100°F. Other than discoloration of the dial and hardening of the gasketing and degradation of accuracy, non-liquid filled Type 1279 (phenolic case) and 1379 (aluminum case) Duragauge® gauge, with standard glass windows, can withstand continuous operating temperatures up to 250°F. Unigauge models 2½″ and 3½″ 1009 and 1008S liquid filled gauges can withstand 200°F but glycerin fill and the acrylic window of Duragauge® gauges will tend to yellow. Silicone fill will have much less tendency to yellow. Low pressure, liquid filled Types 1008 and 1009 gauges may have some downscale errors caused by liquid fill expansion. This can be alleviated by venting the gauge at the top plug (pullout the blue plug insert). To do this the gauge must be installed in the vertical position.

Although the gauge may be destroyed and calibration lost, gauges can withstand short times at the following temperatures: gauges with all welded pressure boundary joints, 750°F (400°C); gauges with silver brazed joints, 450°F (232°C) and gauges with soft soldered joints, 250°F (121°C). For expected long term service below –20°F (–30°C) Duragauge® and 4½″ 1009 gauges should be hermetically sealed and specially lubricated; add "H" to the product code for hermetic sealing. Add variation XVY for special lubricant. Standard Duralife® gauges may be used to –50°F (–45°C) without modification.

2.2 Accuracy – Heat and cold affect accuracy of indication. A general rule of thumb for **dry gauges** is 0.5% of full scale change for every 40°F change from 75°F. Double that allowance for gauges with hermetically sealed or liquid filled cases, except for Duragauge® gauges where no extra allowance is required due to the elastomeric, compensating back. Above 250°F there may exist very significant errors in indication.

2.3 Steam service – In order to prevent live steam from entering the Bourdon tube, a siphon filled with water should be installed between the gauge and the process line. Siphons can be supplied with ratings up to 4,000 psi. If freezing of the condensate in the loop of the siphon is a possibility, a diaphragm seal should be used to isolate the gauge from the process steam. Siphons should also be used whenever condensing, hot vapors (not just steam) are present. Super heated steam should have enough piping or capillary line ahead of the siphon to maintain liquid water in the siphon loop.

2.4 Hot or very cold media – A five foot capillary line assembly will bring most hot or cold process media within the recommended gauge ambient temperature range. For media above

750°F (400°C) the customers should use their own small diameter piping to avoid possible corrosion of the stainless steel. The five foot capillary will protect the gauges used on the common cryogenic (less than –300°F (200°C) gases, liquid argon, nitrogen, and oxygen.) The capillary and gauge must be cleaned for oxygen service. The media must not be corrosive to stainless steel, and must not plug the small bore of the capillary.

2.5 Diaphragm seals – A diaphragm seal should be used to protect gauges from corrosive media, or media that will plug the instrument. Diaphragm seals are offered in a wide variety of designs and corrosion resistant materials to accommodate almost any application and most connections. Visit www.ashcroft.com for details.

2.6 Autoclaving – Sanitary gauges with clamp type connections are frequently steam sterilized in an autoclave. Gauges equipped with polysulfone windows will withstand more autoclave cycles than those equipped with polycarbonate windows. Gauges equipped with plain glass or laminated safety glass **should not be autoclaved.** Gauge cases should be vented to atmosphere (removing the rubber fill/safety plug if necessary) **before** autoclaving to prevent the plastic window from cracking or excessively distorting. If the gauge is liquid filled, the fill should be drained from the case and the front ring loosened before autoclaving.

3.0 INSTALLATION

3.1 Location – Whenever possible, gauges should be located to minimize the effects of vibration, extreme ambient temperatures and moisture. Dry locations away from very high thermal sources (ovens, boilers etc.) are preferred. If the mechanical vibration level is extreme, the gauge should be remotely located (usually on a wall) and connected to the pressure source via flexible tubing.

3.2 Gauge reuse – ASME B40.100 recommends that gauges not be moved indiscriminately from one application to another. The cumulative number of pressure cycles on an in-service or previously used gauge is generally unknown, so it is generally safer to install a new gauge whenever and wherever possible. This will also minimize the possibility of a reaction with previous media.

3.3 Tightening of gauge – Torque should never be applied to the gauge case. Instead, an open end or adjustable wrench should always be used on the wrench flats of the gauge socket to tighten the gauge into the fitting or pipe. NPT threads require the use of a suitable thread sealant, such as pipe dope or teflon tape, and must be tightened very securely to ensure a leak tight seal.

CAUTION: Torque applied to a diaphragm seal or its attached gauge, that tends to loosen one relative to the other, can cause loss of fill and subsequent inaccurate readings. Always apply torque **only** to the wrench flats on the lower seal housing when installing filled, diaphragm seal assemblies or removing same from process lines.

3.4 Process isolation – A shut-off valve should be installed between the gauge and the process in order to be able to isolate the gauge for inspection or replacement without shutting down the process.

3.5 Surface mounting – Also known as wall mounting. Gauges should be kept free of piping strains. The gauge case mounting feet, if applicable, will ensure clearance between the pressure relieving back and the mounting surface.

3.6 Flush mounting – Also known as panel mounting. The applicable panel mounting cutout dimensions can be found at www.ashcroft.com

4.0 OPERATION

4.1 Frequency of inspection – This is quite subjective and depends upon the severity of the service and how critical the accuracy of the indicated pressure is. For example, a monthly inspection frequency may be in order for critical, severe service applications. Annual inspections, or even less frequent schedules, are often employed in non-critical applications.

4.2 In-service inspection – If the accuracy of the gauge cannot be checked in place, the user can at least look for (a) erratic or random pointer motion; (b) readings that are suspect – especially indications of pressure when the user believes the true pressure is 0 psig. Any gauge which is obviously not working or indicating erroneously, should be immediately valved-off or removed from service to avoid a possible pressure boundary failure.

4.3 When to check accuracy – Any suspicious behavior of the gauge pointer warrants that a full accuracy check be performed. Even if the gauge is not showing any symptoms of abnormal performance, the user may want to establish a frequency of bench type inspection.

4.4 When to recalibrate – This depends on the criticality of the application. If the accuracy of a 3-2-3% commercial type gauge is only 0.5% beyond specification, the user must decide whether it's worth the time and expense to bring the gauge back into specification. Conversely if the accuracy of a 0.25% test gauge is found to be 0.1% out of specification then the gauge should be recalibrated.

4.5 Other considerations – These include (a) bent or unattached pointers due to extreme pressure pulsation; (b) broken windows which should be replaced to keep dirt out of the internals; (c) leakage of gauge fill; (d) case damage – dents and/or cracks; (e) any signs of service media leakage through the gauge including its connection; (f) discoloration of gauge fill that impedes readability.

4.6 Spare parts – As a general rule it is recommended that the user maintain in inventory one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service.

5.0 GAUGE REPLACEMENT

It is recommended that the user stock one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service. With regard to gauges having a service history, consideration should be given to discarding rather than repairing them. Gauges in this category include the following:

a. Gauges that exhibit a span shift greater than 10%. It is possible the Bourdon tube has suffered thinning of its walls by corrosion.

b. Gauges that exhibit a zero shift greater than 25%. It is likely the Bourdon tube has seen significant overpressure leaving residual stresses that may be detrimental to the application.

c. Gauges which have accumulated over 1,000,000 pressure cycles with significant pointer excursion.

d. Gauges showing any signs of corrosion and/or leakage of the pressure system.

e. Gauges which have been exposed to high temperature or exhibit signs of having been exposed to high temperature – specifically 250°F or greater for soft soldered systems; 450°F or greater for brazed systems; and 750°F or greater for welded systems.

f. Gauges showing significant friction error and/or wear of the movement and linkage.

g. Gauges having damaged sockets, especially damaged threads.

h. Liquid filled gauges showing loss of case fill.

NOTE: ASME B40.100 does not recommend moving gauges from one application to another. This policy is prudent in that it encourages the user to procure a new gauge, properly tailored by specification, to each application that arises.

6.0 ACCURACY: PROCEDURES/DEFINITIONS

Accuracy inspection – Readings at approximately five points equally spaced over the dial should be taken, both upscale and downscale, before and after lightly rapping the gauge to remove friction. **A pressure standard with accuracy at least four times greater than the accuracy of the gauge being tested is recommended.**

Equipment – A finely regulated pressure supply will be required. It is critical that the piping system associated with the test setup be leaktight. The gauge under test should be positioned as it will be in service to eliminate positional errors due to gravity.

Method – ASME B40.100 recommends that **known** pressure (based on the reading from the pressure standard used) be applied to the gauge under test. Readings including any error from the nominal input pressure, are then taken from the gauge under test. The practice of aligning the pointer of the gauge under test with a dial graduation and then reading the error from the master gauge ("reverse reading") can result in inconsistent and misleading data and should NOT be used.

Calibration chart – After recording all of the readings it is necessary to calculate the errors associated with each test point using the following formula: ERROR in percent = 100 times (TRUE VALUE minus READING) ÷ RANGE. Plotting the individual errors (Figure 1) makes it possible to visualize the total gauge characteristic. The plot should contain all four curves: upscale – before rap; upscale – after rap; downscale – before rap; downscale – after rap. "*Rap*" means lightly tapping the gauge **before** reading to remove friction as described in ASME B40.100.

Referring to Figure 1, several classes of error may be seen:

Zero – An error which is approximately equal over the entire scale. This error can be manifested when either the gauge is

FIG. 1

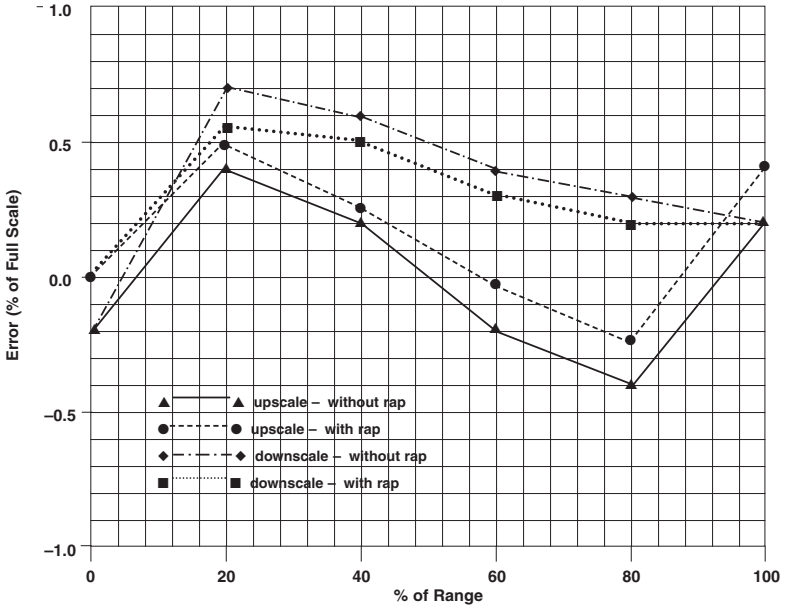
TYPICAL CALIBRATION CHART

INDICATED VALUE (PSI)

True Value – PSI	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.4	0	–.4	0
40	+.8	+1.0	+1.4	+1.1
80	+.4	+.5	+1.2	+1.0
120	–.4	–1.0	+.8	+.6
160	–.8	–.5	+.6	+.4
200	+.4	+.8	+.4	+.4

ERROR (% OF FULL SCALE)

True Value – % of Range	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.20	0	–.20	0
20	+.40	+.50	+.70	+.55
40	+.20	+.25	+.60	+.50
60	–.20	–.05	+.40	+.30
80	–.40	–.25	+.30	+.20
100	+.20	+.40	+.20	+.20



dropped or overpressured and the Bourdon tube takes a permanent set. This error may often be corrected by simply repositioning the pointer. Except for test gauges, it is recommended that the pointer be set at midscale pressure to "split" the errors.

Span – A span error exists when the error at full scale pressure is different from the error at zero pressure. This error is often proportional to the applied pressure. Most Ashcroft gauges are equipped with an internal, adjusting mechanism with which the user can correct any span errors which have developed in service.

Linearity – A gauge that has been properly spanned can still be out of specification at intermediate points if the response of the gauge as seen in Figure 1 (Typical Calibration Chart) is not linear. The Ashcroft Duragauge® pressure gauge is equipped with a rotary movement feature which permits the user to minimize this class of error. Other Ashcroft gauge designs (e.g., 1009 Duralife®) require that the dial be moved left or right prior to tightening the dial screws.

Hysteresis – Some Bourdon tubes have a material property known as hysteresis. This material characteristic results in differences between the upscale and downscale curves. This class of error can **not** be eliminated by adjusting the gauge movement or dial position.

Friction – This error is defined as the difference in readings before and after lightly tapping the gauge case at a check point. Possible causes of friction are burrs or foreign material in the movement gearing, "bound" linkages between the movement and the bourdon tube, or an improperly tensioned hairspring. If correcting these potential causes of friction does not eliminate excessive friction error, the movement should be replaced.

6.1 Calibration – Rotary Movement Gauges and Type 1259 Gauges – Inspect gauge for accuracy. Many times gauges are simply "off zero" and a simple pointer adjustment using the micrometer pointer is adequate. If inspection shows the gauge warrants recalibration to correct span and/or linearity errors, proceed as follows:

a. Remove ring, window and, if solid front case, the rear closure assembly.

b. Pressurize the gauge **once** to full scale and back to zero.

c. Refer to Figure 2 (Ashcroft System Assembly w/Rotary Gear Movement) for a view of a typical Ashcroft rotary system assembly with component parts identified. Refer to Figure 2A for link configuration of Type 1259 gauge.

FIG. 2 ASHCROFT SYSTEM ASSEMBLY W/ROTARY GEAR MOVEMENT

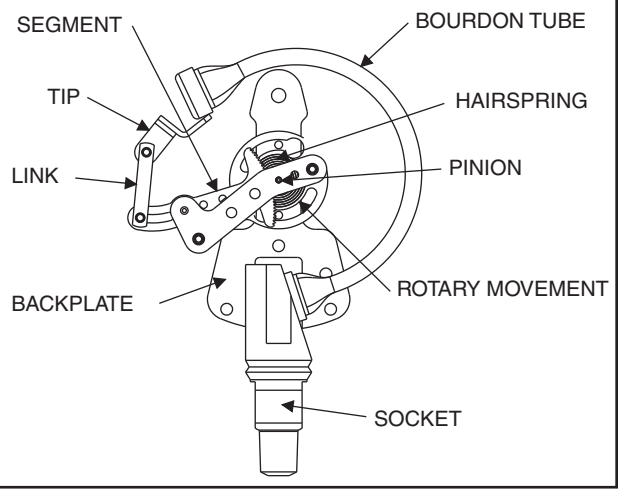


FIG. 2A ASHCROFT TYPE 1259 SYSTEM ASSEMBLY

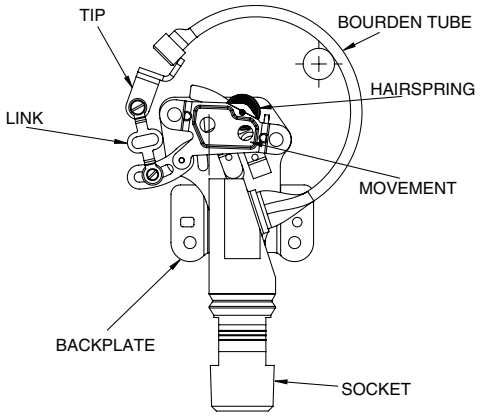


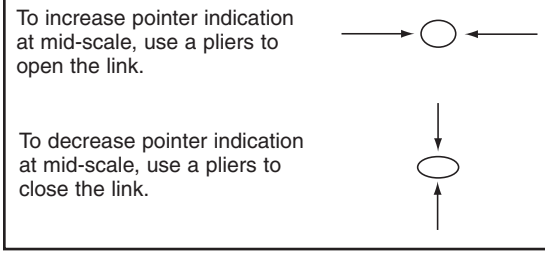
d. Adjust the micrometer pointer so that it rests at the true zero position. For open front gauges the pointer and dial must also be disassembled and the pointer should then be lightly pressed onto the pinion at the 9:00 o'clock position.

e. Apply full scale pressure and note the magnitude of the span error. With open front gauges, ideal span (270 degrees) will exist when at full scale pressure the pointer rests exactly at the 6:00 o'clock position.

f. If the span has shifted significantly (span error greater than 10%), the gauge should be replaced because there may be some partial corrosion inside the Bourdon tube which could lead to ultimate failure. If the span error exceeds 0.25%, loosen the lower link screw and move the lower end of the link toward the movement to increase span or away to decrease span. An adjustment of 0.004 inch will change the span by approximately 1%. This is a repetitive procedure which often requires more than one adjustment of the link position and the subsequent rechecking of the errors at zero and full scale pressure.

g. Apply midscale pressure and note error in reading. Even though the gauge is accurate at zero and full scale, it may be inaccurate at the midpoint. This is called linearity error. For corrections to linearity with the Type 1259 gauges refer to Figure 2B. For rotary movement gauges,

FIG. 2B LINEARITY ADJUSTMENT & LINK CONFIGURATION FOR ASHCROFT TYPE 1259



note the following: if the error is positive, the movement should be rotated counter clockwise. Rotating the movement one degree will change this error by approximately 0.25%. Rotating the movement often affects span and it should be subsequently rechecked and readjusted if necessary according to step 6.1e and 6.1f.

h. While recalibrating the gauge, the friction error – difference in readings taken with and without rap – should be noted. This error should not exceed the basic accuracy

of the gauge. If the friction error is excessive, the movement should be replaced. One possible cause of excessive friction is improper adjustment of the hairspring. The hairspring torque,or tension, must be adequate without being excessive. The hairspring should also be level, unwind evenly (no turns rubbing) and it should never tangle.

NOTES:

1 For operation of test gauge external zero reset, refer to Figure 1 on page 19.

2 For test gauge calibration procedure, refer to Figure 2 on page 20.

7.0 DIAPHRAGM SEALS

7.1 General – A diaphragm seal (isolator) is a device which is attached to the inlet connection of a pressure instrument to isolate its measuring element from the process media. The space between the diaphragm and the instrument's pressure sensing element is solidly filled with a suitable liquid. Displacement of the liquid fill in the pressure element, through movement of the diaphragm, transmits process pressure changes directly to a gauge, switch or any other pressure instrument. When diaphragm seals are used with pressure gauges, an additional 0.5% tolerance must be added to the gauge accuracy because of the diaphragm spring rate.

Used in a variety of process applications where corrosives, slurries or viscous fluids may be encountered, the diaphragm seal affords protection to the instrument where:

- The process fluid being measured would normally clog the pressure element.
- Pressure element materials capable of withstanding corrosive effects of certain fluids are not available.
- The process fluid might freeze due to changes in ambient temperature and damage the element.

7.2 Installation – Refer to bulletin OH-1 for information regarding (a) seal configurations; (b) filling fluids; (c) temperature range of filling fluids; (d) diaphragm material pressure and temperature limits; (e) bottom housing material pressure and temperature limits; (f) pressure rating of seal assembly; (g) accuracy/temperature errors of seal assembly; (h) diaphragm seal displacement. The volumetric displacement of the diaphragm must at least equal the volumetric displacement of the measuring element in the pressure instrument to which the seal is to be attached.

It is imperative that the pressure instrument/diaphragm seal assembly be **properly** filled prior to being placed in service. Ashcroft diaphragm seal assemblies should only be filled by a seal assembler certified by Ashcroft Inc. Refer to section 3.3 for a cautionary note about not applying torque on either the instrument or seal relative to the other.

7.3 Operation – All Ashcroft® diaphragm seals, with the exception of Type 310 mini-seals, are continuous duty. Should the pressure instrument fail, or be removed accidentally or deliberately, the diaphragm will seat against a matching surface preventing damage to the diaphragm or leakage of the process fluid.

7.4 Maintenance – Clamp type diaphragm seals – Types 100, 200 and 300 – allow for replacement of the diaphragm or diaphragm capsule, if that ever becomes necessary. The Type 200 top housing must also be replaced with the diaphragm. With all three types the clamping arrangement allows field disassembly to permit cleaning of the seal interior.

7.5 Failures – Diaphragm failures are generally caused by either corrosion, high temperatures or fill leakage. Process media build-up on the process side of the diaphragm can also require seal cleaning or replacement. Consult Customer Service, Stratford CT for advice on seal failures and/or replacement.

WARNING: All seal components should be selected considering process and ambient operating conditions to prevent misapplication. Improper application could result in failure, possible personal injury, property damage or death.

8.0 DAMPENING DEVICES

8.1 General – Some type of dampening device should be used whenever the pressure gauge may be exposed to repetitive pressure fluctuations that are fairly rapid, high in magnitude and especially when transitory pressure spikes exceeding the gauge range are present (as with starting and stopping action of valves and pumps). A restricted orifice of some kind is employed through which pressure fluctuations must pass before they reach the Bourdon tube. The dampener reduces the magnitude of the pressure pulse thus extending the life of the Bourdon tube and movement. This reduction of the pressure pulsation as "seen" by the pressure gauge is generally evidenced by a reduction in the pointer travel. If the orifice is very small the pointer may indicate the average service pressure, with little or no indication of the time varying component of the process pressure.

Commonly encountered media (e.g. – water and hydraulic oil) often carry impurities which can plug the orifice over time thus rendering the gauge inoperative until the dampener is cleaned or replaced.

Highly viscous media and media that tend to periodically harden (e.g., asphalt) require a diaphragm seal be fitted to the gauge. The seal contains an internal orifice which dampens the pressure fluctuation within the fill fluid.

8.2 Throttle Screws & Plugs – These accessories provide dampening for the least cost. They have the advantage of fitting completely within the gauge socket and come in three types: (a) a screwed-in type which permits easy removal for cleaning or replacement; (b) a pressed in, non-threaded design and (c) a pressed in, threaded design which provides a highly restrictive, helical flow path. Not all styles are available on all gauge types.

8.3 Ashcroft Pulsation Dampener – Type 1106 Ashcroft pulsation dampener is a moving pin type in which the restricted orifice is the clearance between the pin and any one of five preselected hole diameters. Unlike a simple throttle screw/plug, this device has a self-cleaning action in that the pin moves up and down under the influence of pressure fluctuations.

8.4 Ashcroft Pressure Snubber – The heart of the Type 1112 pressure snubber is a thick porous metal filter disc. The disc is available in four standard porosity grades.

8.5 Ashcroft Needle Valves – Type 7001 thru 7004 steel needle valves provide varying degrees of dampening. These devices, in the event of plugging, can easily be opened to allow the pressure fluid to clear away the obstruction.

8.6 Chemiquip® Pressure Limiting Valves – Model PLV-255, PLV-2550, PLV-5460, PLV-5500 and PLV-6430, available with and without built-in snubbers, automatically "shut off" at adjustable preset values of pressure to protect the gauge from damage to overpressure. They are especially useful on hydraulic systems wherein hydraulic transients (spikes) are common.

9.0 TEST EQUIPMENT & TOOL KITS

See our website www.ashcroft.com for more details

9.1 Pressure Instrument Testing Equipment

Type 1305D Deadweight Tester

Type 1327D Pressure Gauge Comparator

Type 1327CM “Precision” Gauge Comparator

9.2 Tools & Tool Kits For Recalibration of 4½˝ and Larger Gauges

Type 2505 universal carrying case for 1082 test gauge

Type 266A132-01 span wrench for 1082 test gauge

Type 1281 socket O-Ring kit for 1279/1379 lower connect

Type 1285 4½˝ ring wrench for 1279/1379 lower & back connect

Type 1286 6˝ ring wrench for 1379 lower & back connect

Type 3220 pointer puller (all gauges except 1009 Duralife®)

Type 3530 pinion back-up tool for 1009 Duralife®

Type 3220 Handjack set

Type 1105 Tool Kit

9.3 Kits to Convert a Dry Gauge to a Liquid Filled or Weather Proof Case Gauge

Type 1280 conversion kit for 4½˝ lower connect 1279/1379

Type 1283 conversion kit for 4½˝ back connect 1279/1379

Type 1284 conversion kit for 6˝ lower & back connect

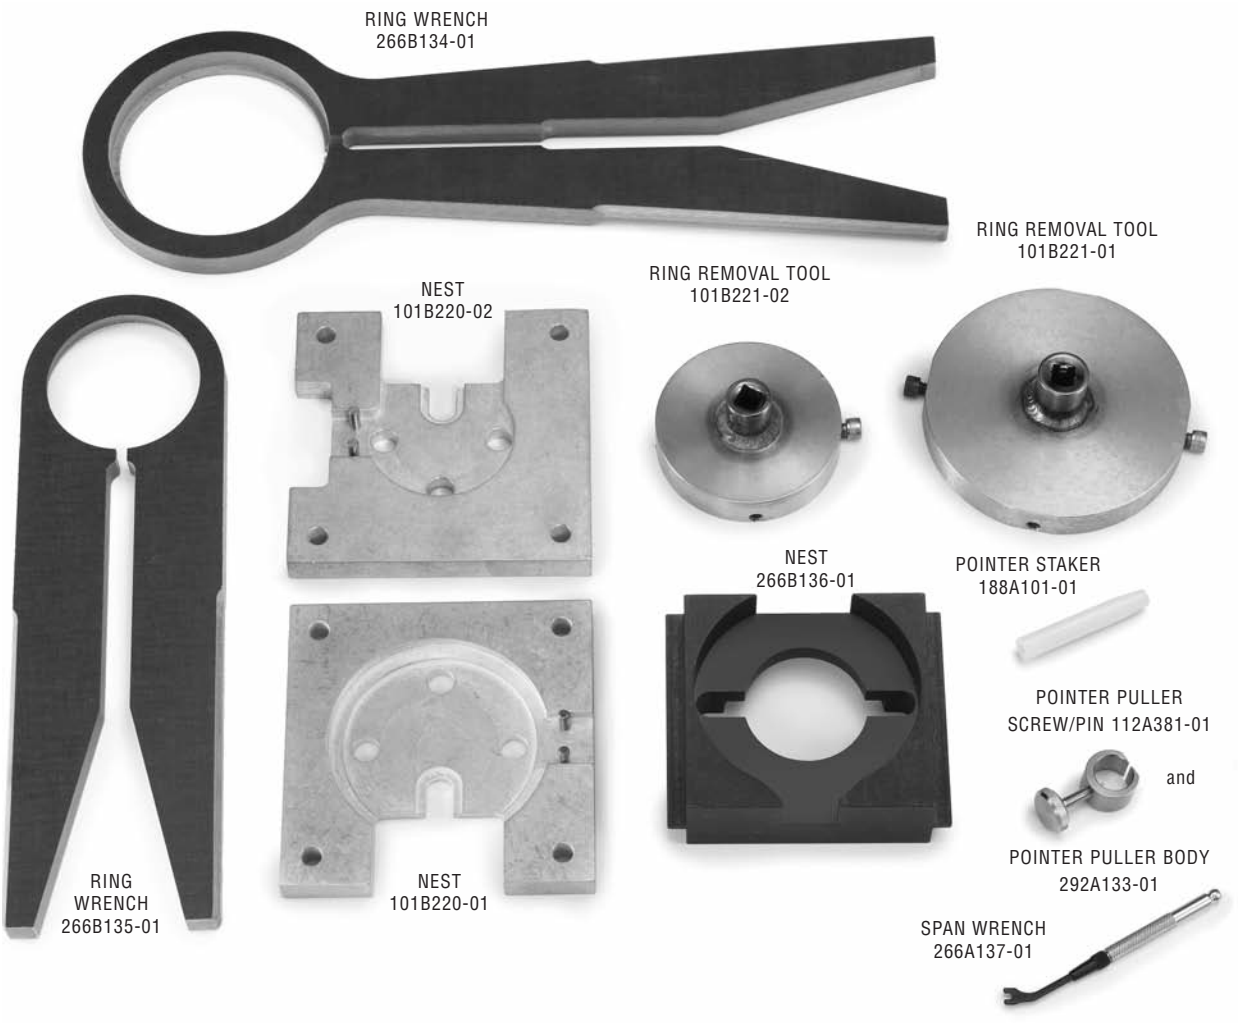
TYPE 1105
TOOL KIT

TYPE 3220
HAND JACK SET

9.4 2½ & 3½ 1009 Duralife® Gauge Tools

Description	Part No.
Pointer Puller Screw/Pin[2][3][4]	112A381-01
Pointer Puller Body[2][3][4]	292A133-01
Pointer Staker[2][4]	188A101-01
Span Wrench[2][5] (to adjust span)	266A137-01
Ring Wrench 3½″[1][5] (for ring removal) (35 1009)	266B134-01
Ring Wrench 2½″[1][5] (for ring removal) (25 1009)	266B135-01
Nest 2½″ & 3½″[1][5] (to hold gauge for ring removal) (25/35 1009)	266B136-01
Ring Removal Tool[6] (25 1009)	101B221-02
Ring Removal Tool[6] (35 1009)	101B221-01
Nest 2½″[6] (to hold gauge for ring removal) (25 1009)	101B220-02
Nest 3½″[6] (to hold gauge for ring removal) (35 1009)	101B220-01
Type 1230 throttle plug insertion (¼ NPT) for 1009 Duralife®)	1230
Type 1231 throttle plug insertion (½ NPT) for 1009 Duralife® (body only)	1231
Tool to open orifice on push-in throttle plug	101A206-01

(1) Formerly 1206T Tool Kit.
(2) Formerly some parts in 1205T Tool Kit.
(3) Both parts must be purchased together.
(4) Previous and current design.
(5) Previous design only.
(6) Current design only.



ASHCROFT® Type 1188 Bellows Gauge Calibration Procedure

CALIBRATION & TROUBLE CORRECTION DIAGRAM

RANGE SPAN ADJUSTMENT

- **RANGE TOO SHORT** — Adjust slide "S" inward
- **RANGE TOO LONG** — Adjust slide "S" outward

POINTER JUMPING

- **STICKY PARTS** — Clean all bearings and gear teeth
- **LOOSE HAIRSPRING** — Remove backlash by disengaging pinion & rotate to tighten
- **COUNTER BALANCE RUBBING** — Bend if necessary to clear socket in travel

NOTE: After adjusting range span, set both movement stops. Set the underload stop so that the pointer will stop at zero. Set the overload stop so that the pointer will pass the maximum range approximately 5˝.

After adjusting span re-zero pointer by removing from pinion and re-assembling at the proper dial mark.

SLUGGISH MOVEMENT

TIGHT HAIRSPRING — Loosen by disengaging pinion & rotate

NON LINEAR

- **NON LINEAR FIRST 3RD.** → **ADJ. ANGLE OF PULL BY INCREASING ANGLE "A"**
- **NON LINEAR LAST 3RD.** → **ADJ. ANGLE OF PULL BY DECREASING ANGLE "A"**

NOTE: To increase or decrease angle "A," bend tip inward or outward as required. Doing this may run the movement segment off the pinion. This can be corrected by cutting off one end off the link "E" decreasing its length, or makin a new length from .032 dia. phos. bronze wire.

Caution: When reproducing link end, follow figure 44 very closely. this will prevent too much play, or, binding in operation.

REF: Replacing System Bellows

After assembling bellows to the gauge socket securely, subject system to 30 psi for five minutes, allowing bellows to travel approximately 1/8˝ against the overload stop. After this, heat treat system for 15 hours at 250°F, this procedure is necssary to prevent gauge drift.

SLIDE AND LINK (angle "A")
Enlarged view of slide and link

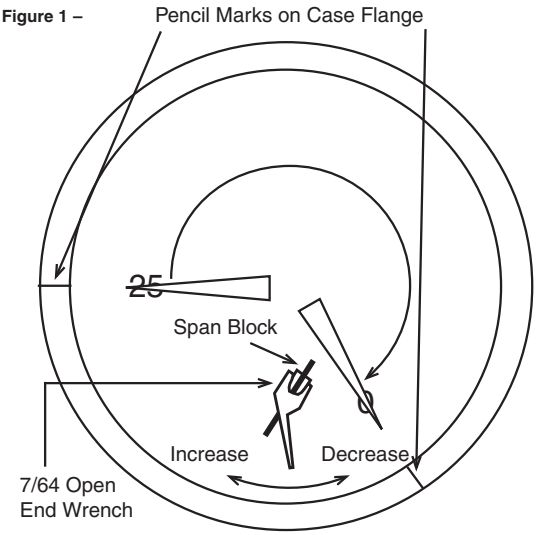
ASHCROFT® Previous Type 1009 Duralife® Calibration Procedure – Vacuum Range

ASHCROFT®

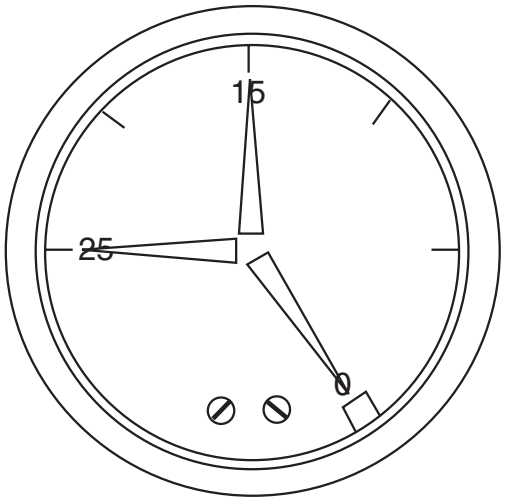
1. Remove ring, window and gasket pointer.
2. Using a pencil, refer to dial and mark the 0 and 25˝ Hg positions on the case flange.
3. Remove dial.
4. Apply 25˝ Hg vac.
5. Lightly press pointer onto pinion carefully aligning it with the 25˝ Hg vac. mark on the flange.
6. Release vacuum fully.
7. Note agreement of pointer to zero mark on flange.
8. If span is high or low, turn span block as shown in Figure 1.

Figure 1 –



9. Repeat steps 4 through 8 until span is correct.
10. Remove pointer.
11. With 25˝ Hg vac applied, reassemble dial, dial screws (finger tight) and point.
12. Apply 15˝ Hg vac. and note accuracy of indication. If required, slide dial left or right to reduce error to 1% maximum.
13. Firmly tighten dial screws.
14. Firmly tap pointer onto pinion.
15. recheck accuracy at 15 and 25˝ Hg vac. (Figure 2).
16. Reassemble window, gasket and ring.

Figure 2 –



Notes: See page 10 for any tools required to calibrate.

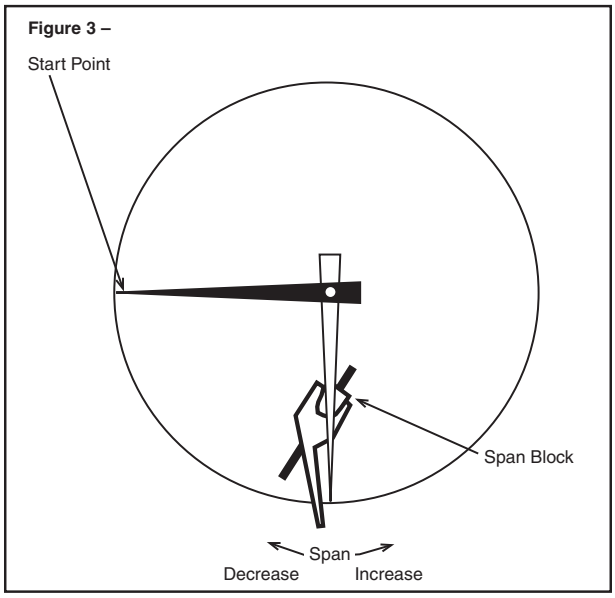
For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

© 2010 Ashcroft Inc., 250 East Main Street, Stratford, CT 06614-5145, USA, Tel: 203-378-8281, Fax: 203-385-0499, www.ashcroft.com
All sales subject to standard terms and conditions of sale. I&M008-10077 9/01 AMR 05/10

ASHCROFT® Previous Type 1009 Duralife® Calibration Procedure – Pressure Range

Step 1. With the dial off, install pointer at 9 o'clock "lightly," Figure 3.

Figure 3 –

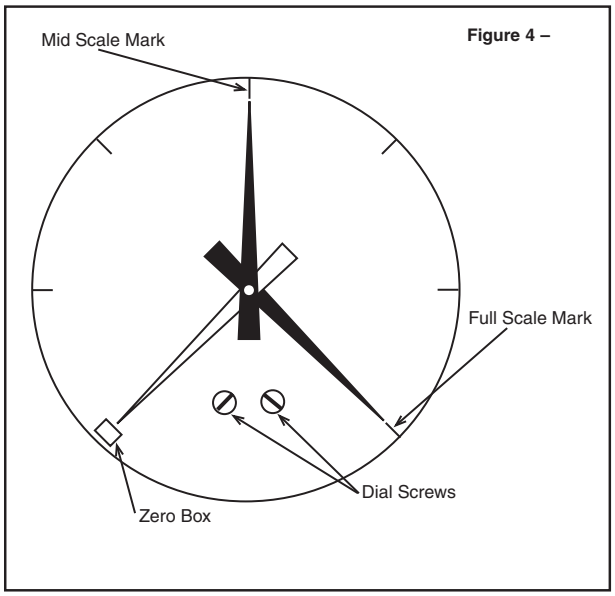


Step 2. Go to full scale pressure…rotate span block with tool until pointer rests at 6 o'clock.

Step 3. Go to zero pressure (9 o'clock)…if pointer has not moved away from start point, go to Step 4. If pointer has moved, repeat Step 1 until span is correct.

Step 4. Install dial with screws snug.

Figure 4 –



Step 5. Install pointer centered in zero box, Figure 4.

Step 6. Go to full scale pressure…check that pointer is within 1% of full scale mark. If not, remove pointer and dial and return to step 1, Figure 4.

Step 7. Go to mid-scale pressure…rotate dial until mid-scale mark is aligned with pointer, Figure 4.

Step 8. Tighten dials screws and stake on pointer.

Step 9. Check zero and full scale. Reassemble window, gasket and ring.

Notes: See page 10 for any tools required to calibrate.

For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

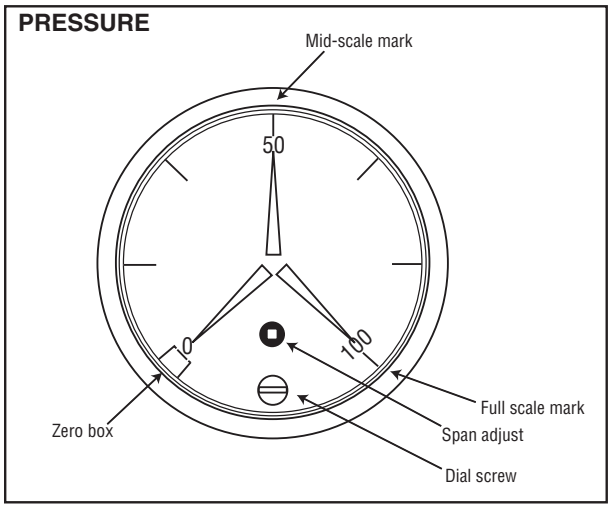
All sales subject to standard terms and conditions of sale. I&M008-10077 9/01 AMR 05/10

ASHCROFT® Current Type 1009 Duralife® Calibration Procedure – Pressure and Vacuum Range

Calibration – 1009 Duralife® Gauge –
Inspect gauge for accuracy. At times gauges are simply "off zero" and opening the ventable plug at the top of the gauge will relieve internal gauge pressure and correct the offset. If this is not adequate and inspection shows that the gauge warrants recalibration to correct zero, span and/or linearity errors, proceed as follows:

Remove ring, window, and gasket using Ashcroft Ring Removal Tools P/N 101B220-02 and 101B221-02 for 2½" gauges and 101B220-01 and 101B221-01 for 3½" gauges.



Positive Pressure Ranges –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply full scale pressure. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise increases span, counterclockwise decrease span.

3. Fully exhaust pressure and check that pointer still is still in the zero box. If not, repeat step 1 and 2

4. Once 0 and full scale are within tolerance, pressurize gauge to mid-scale.

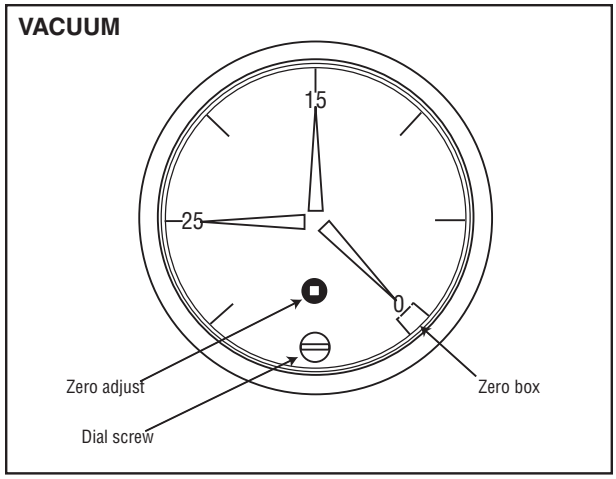
5. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 5, recheck the gauge at zero and full scale, adjust accordingly until zero, mid and full scale points are in tolerance.

Vacuum Range –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply 25 inches Hg vacuum. If the error exceeds 1% adjust pointer with a slotted screwdriver until gauge is within tolerance.



3. Vent to 0 pressure and check pointer position in the zero box. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise rotation moves pointer clockwise, counterclockwise rotation moves the pointer counterclockwise.

4. Repeat step 1 and 2 until 0 and 25 inches of Hg are within gauge tolerance.

5. Apply 15 inches Hg vacuum. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 4, recheck the gauge at zero and 25 inches of Hg vacuum, adjust accordingly until zero, 15 and 25 inches Hg are in tolerance.

7. Continue below.

Re-assemble window and ring to gauge:

a. If plastic window is used, push window back into front of gauge, ensure the o-ring does not roll out of window groove (lubricate if necessary). Align the tabs of the window with the tabs of the case front. Once window is in place, install ring and tighten with tools referenced above and shown on page 10.

b If safety glass is used, reinstall window, gasket, and ring. Ensure that the gasket is seated properly under all four tabs of the ring and does not wrinkle when ring is tightened.

Note: Tighten ring: Apply 120-200inlb of torque. Rotate ring clockwise to tighten. Warning: over tightening of safety glass may induce cracking.

Notes: See page 10 for any tools required to calibrate.

For models produced after September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

Type 1279 & 1379 Solid Front Duragauge® Pressure Gauge Liquid Fill Conversion Instructions

ASHCROFT®

	1279		1379		
	4½˝ LOWER	4½˝ BACK	4½˝ LOWER	4½˝ BACK	6˝ LOWER & BACK
KIT PART NO.	101A202-01	101A203-01	1280	1283	1284
	QUANTITY INCLUDED				
ACRYLIC WINDOW	1	1	1	1	1
FRONT O-RING	1	1	1	1	1
DIAPHRAGM	1	1	1	1	2(1-LC:1-BC)
REAR COVER	1	1	1	1	2(1-LC:1-BC)
COVER SCREWS	4	4	-	-	-
THROTTLE SCREWS	2	2	2	2	2
GARTER SPRING	–	1	1	1	1
FILL IDENTIFICATION	1	1	1	1	1
THREADED RING	–	–	1	1	1

	Ambient Temp. Limits		60 psi and Under Down Scale Zero Shift Required
	°F	°C	
Weatherproof	–50/150	–45/65	N/A
Hermetically Sealed	–10/125	–25/50	N/A
Glycerin Filled	0/150	30/65	.15 psi
Silicone Filled	–50/150	–45/65	.12 psi

1. Unscrew front threaded ring (turn CCW). Remove and discard glass window. For range spans 60 psi and under, shift pointer down scale by the amount shown in the table. With either the glass or plastic window, replace the O-ring with one furnished in the kit.

2. Remove protective paper from acrylic plastic window taking care not to scratch window. Assemble window in gauge.

3. Moisten face of threaded ring with silicone oil or silicone grease where ring bears up against window. Replace front threaded ring and tighten firmly hand tight. See instructions on reverse side for applying proper torque to ring to establish desired squeeze on O-ring seal. **(Fig. 4).**

It is important to hold gauge **rigidly,** otherwise ring lugs may be damaged during removal or assembly process.

4. From rear of gauge, remove and discard these parts: rear cover and cover gaskets from case.

Note: Disregard Step No.s 5a and 5b if converting to hermetically sealed version.

When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.

5. Filling Procedures:

a. Manual Filling Procedure: Place gauge face down on bench and **tip gauge** by blocking up front with a ⅜ inch block at the 12 o'clock dial position. Tipping of the gauge is necessary so fluid will flow into front cavity of the case. Pour in fill liquid to within about 1⁄16 inch of rear seal lip. When bubbles stop rising, front cavity is filled. Remove ⅜ inch block and pour in liquid until level is about 1⁄16 inch below rear sealing lip.

Note: An alternative method of filling is to fill the front dial cavity, adding the front window, etc., as in Step No. 3. Then fill the rear of the gauge. This method eliminates the need to tip the gauge.

b. Vacuum Pump Fill Procedure: (This procedure is recommended when filling a large number of gauges.) Place gauge face down and insert a 1⁄8 inch diameter tube, connected to a vacuum pump, through the 12 o'clock position hole in the rear, solid front portion of the case **(see Fig. 5).** Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1⁄16 inch BELOW the O-ring channel lip.

Pre-measuring fill amount is not necessary with above methods. For reference, amount of fill is approximately 400 ml. or 14 fluid oz. (4½˝ GA.) and 455 ml. or 16 fluid oz. (6˝ GA.).

c. Note: The liquid fill level should be ⅜˝ (±1⁄8) as measured from the inside of the ring at the 12:00 o'clock position.

6. On lower connection gauges, assemble rear seal diaphragm to case.

For back connection gauges see instructions on reverse side. **(Fig. 2/4).**

7. For 1279:

Assemble rear cover and six self tapping screws in a criss-cross pattern and torque to 200 in lbs.

For 1379:

- Thread rear ring and torque to 200 in lbs
- Install stainless steel back cover using two screws

8. Assemble throttle screw to threaded hole in socket.

Note: If system is monel (socket wrenc flat stamped "PHS" or "PH") use monel throttle screw.

9. Check appropriate box on fill identification label, and peel off label back, and attach fill label to gauge case.

10. If gauge is to be repackaged:

a. Include enclosed instruction sheet inside carton.

b. Change type number on carton label to:
(1) Hermetically Sealed – 1279(*)SH.
(2) Liquid Filled – 1279(*)SL.
*Bourdon Tube System Code

Glycerin or silicone should not be used in applications involving Oxygen, Chlorine, Nitric Acid, Hydrogen Peroxide or other strong oxidizing agents, because of danger of spontaneous chemical reaction, ignition or explosion. Halocarbon should be specified. Products with this fill can be ordered from factory.The use of fluids other than those listed in the table above (for example, Hydrocarbon-based oils) may result in leakage caused by a reaction between the fluid and the elastomeric seals. Consult the factory before filling with any other fluid.

Type 1279 & 1379 Solid Front Duragauge® Pressure Gauge Liquid Fill Conversion Instructions

ASHCROFT®

INSTRUCTIONS FOR USING CONE TOOL AND RING WRENCH

Garter Spring & Diaphragm Assembly (Back Connection Gauge Only)

A. Place cone tool over socket shank as shown.

B. Moisten lip of socket and outer O-ring surface with silicone oil or grease.

C. Place diaphragm with rib side facing upward over cone into case grove.
Diaphragm O-ring must be completely in socket-shank grove.

D. Place garter spring over cone as shown and slide onto diaphragm in socket grove

E. Assemble rear cover with screws per step 7.

Front Ring Assembly (All Gauges)

A. Assemble ring to case by hand to start.

B. Place ring on wrench as shown

C. Use ½˝ drive extension and torque ring to 200 in. lb

Alternate Method

A. Tighten ring snugly by hand

B. Mark case and ring.

C. Turn ring another 100 to 120 degrees (slightly less than ½ turn) using the ring wrench and ½˝ drive socket wrench or place the blunt end of a wooden or plastic dowel against a ring lug and tap with a hammer.

INSTRUCTIONS FOR LIQUID FILLING ASHCROFT® TYPE 1279 AND 1379 SOLID FRONT DURAGAUGE® PRESSURE GAUGES USING A VACUUM PUMP

A. Insert a length of ⅛ ˝ diameter tubing through the 12 o'clock position hole in the rear, solid front portion of the case, as shown.

B. Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid.*

C. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1/16 ˝ below the o-ring channel lip, as shown.

D. When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.

*To prevent breakage, reduce vacuum to 15 in. Hg for plain glass and safety glass.

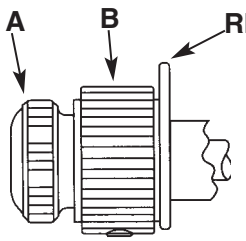
INSTRUCTIONS FOR USE OF EXTERNAL EASY ZERO™ ADJUST FEATURE*

Fig. 1



1. LOOSEN RING-LOCKING SCREW **A**.
2. OBTAIN REQUIRED ADJUSTMENT BY ROTATING KNOB **B** CLOCKWISE OR COUNTER-CLOCKWISE.
3. TIGHTEN SCREW **A** DOWN ON KNOB **B**.

*Applicable only for test gauge with hinged ring design.

ADDITIONAL CALIBRATION INSTRUCTIONS

1) "Standards shall have nominal errors no greater than ¼ of these permitted for the gauge being tested." *(Ref: ASME B40=100-1998)*
2) The instrument used as the calibration standard should have a maximum range no greater than 2x that of the gauge being tested. (i.e. Do not use a 400psi standard to test a 15psi gauge.)
3) "Known pressure shall be applied at each test point on increasing pressure (or vacuum) from one end to the other end of the scale. At each test point the gauge shall be . . .
lightly tapped, and then read . . ."
(*Ref: ASME B40.1 ¶ 6.2.4.1*)
4) To read gauge indication, move eye over red pointer tip at OD of printed dial until red reflection in mirror band is no longer visible, and then read the pointer position in reference to the dial.

ASCHROFT

TYPE 101, DIAPHRAGM SEAL
TYPE 310, DIAPHRAGM SEAL

LEFT BLANK

Type 100 Series Threaded Capsule Diaphragm Seal

TYPE 100 SHOWN

PRODUCT FEATURES

- The top housing and diaphragm capsule are interchangeable with all Ashcroft bottom housings.
- A fill/bleed connection is standard, which permits filling the seal and instrument simultaneously after evacuation and allows the fill to flow into the completed unit.
- A Viton O-ring, compatible with all standard fill fluids, and a Teflon back-up ring provide a seal between the diaphragm capsule and the top housing.
- A thin Teflon PTFE gasket between the diaphragm and bottom housing ensures a leak-tight corrosion resistant seal even at high pressure.
- Top housing and pressure instrument are removable.
- Continuous-duty design will prevent loss of process fluid if pressure instrument is removed or fails.

APPLICATIONS INCLUDE:

- Elevated process temperatures
- Corrosive service
- Isolation of the process for safety
- Suspended solids in the process
- Sanitary connections
- Minimize process dead leg
- Ease of cleaning between batches

When isolation of the process from an instrument is required, Ashcroft® offers a comprehensive line of diaphragm seals. Seal types include threaded, flanged, in-line threaded, in-line flanged, in-line socket weld, in-line butt weld, saddle and sanitary seals. Also available is a complete offering of isolation or iso-rings and isolation or iso-spools.

SPECIFICATIONS

Model Number:	Type 100, 101, 102, 103, 104, 105, 106, 107, 108
Process Connection Size:	See Table A (Pg. 2)
Instrument Connection Size:	¼, ½ NPT
Diaphragm Material:	See Table B (Pg. 2)
Bottom Housing Materials:	See Table C (Pg. 2)
Filling Fluid:	Glycerin, Halocarbon, Silicone, Stylltherm

OPTIONS	**Code**
316 stainless steel top housing	**YT**
Stainless steel clamp rings and flanged ring – includes 300 stainless steel clamping bolts (1500 psi max)	**SE**
300 series stainless steel clamping bolts (max pres is 1500 psi)	**SB**
Pipe plugs for flushing connections – pipe plugs are available in the same materials as bottom housings per Table C (Pg. 2)	**PU**
5000 psi pressure rating – (Type 100 only) threaded inlet only, no flushing connection (metal diaphragm only)	**HP**
Welded instrument to diaphragm seal	**DU**
Dual flushing connections (½ NPT) (Limited to 2″ thru 3″ flanged seals	**DB**
Ring joint (Flanged seal only)	**RJ**
Flat face (Flanged seal only)	**FF**
Clean for gaseous oxygen or strong oxidizing agent applications	**6B**

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Type 100 Series Threaded Capsule Diaphragm Seal

TYPE 100 SERIES THREADED CAPSULE SEAL TYPES

Type 100 –Threaded
¼, ½, ¾, 1 NPT

Type 101 –Threaded
with flushing connection
¼, ½, ¾, 1 NPT

Type 102 – Raised Face Flanged
½″, ¾″, 1″, 1½″, 2″, 3″

Type 103 – Raised Face Flanged
½″, ¾″, 1″, 1½″, 2″, 3
with flushing conection

Type 104 – In-line Threaded
¼, ½, ¾, 1 NPT

Type 105 – Saddle
3,″ 4″ pipe only

Type 106 – In-line Flanged
½″, ¾″, 1″, 1½″, 2″, 3″, 4″, 6″, 8″

Type 107 – In-line Socket Weld
½″, ¾″, 1″, 1½″, 2″

Type 108 – In-line Butt Weld
¼″, ½″, ¾″, 1″, 1½″, 2″

Table A – Process Connection/Type Number

	Process Connection Size/Code—Inches											Type Number
	Size	¼	½	¾	1	1½	2	3	4	6	8

Titanium	TI	Nickel

Table D – Instrument Connection

Size – NPT	Code
¼	02T
½	04T

Notes:

(1) 150, 300, 600, 900, 1500 & 2500 class flanges.
(2) 1″ 150 thru 8″ 300 class flanges only.
(3) Use on applications where NACE standard MR-01-75/ISO 1516 w/Sept. 2005 corrigendums.
(4) Maximum Press./Temp.
Threaded: 200 psi/74°F, 125 psi/125°F, 80 psi/150°F.
Flanged: 75 psi/100°F.
(5) Type 102 only.
(6) Type 102 only – Temp. Limits: –40/300°F.
(7) Only available in 1″, 1½″, & 2″ 150 class, Types 102. Max. Press./Temp. – 270 psi and 150°F. Consult factory for conditions beyond these limits.
(8) Maximum Pressure/Temp.: 200 psi and 180°F.
(9) Type 100: ¼ or ½ NPT only. Larger sizes offered with solvent weld joint. N/A in 101 or 103 design.

Table E – Filling Fluid

Filling	Service	Connection to Instrument	Temperature Range °F	Code
Glycerin	Pressure	Direct Only	0/400	CG
Silicone	Pressure/Vacuum	Direct or Flexible Line	–40/600	CK
Halocarbon	Pressure/Vacuum in presence of strong oxidizing agent	Direct or Flexible Line	–70/300	CF
Sylltherm	Pressure/Vacuum	Direct or Flexible Line	–40/750	HA

Monel is a registered trademark of Huntington Alloys, Inc.
Hastelloy is a registered trademark of Cabot Corp.
Halocarbon is a registered trademark of Halocarbon Products
GYLON 3510 is a registered trademark of Garlock Inc.

HOW TO ORDER:

1. **From Table A...**select TYPE NUMBER based on process connection, process connection size and diaphragm type/construction. (e.g., Threaded/1″/capsule–code-10-100)
2. **From Table B...**select DIAPHRAGM MATERIAL. (e.g., 316L stainless steel–code S)
3. **From Table C...**select BOTTOM HOUSING MATERIAL. (e.g., 316 stainless steel–code S)
4. **From Table D...**select INSTRUMENT CONNECTION size. (e.g., 1/4 NPT–code 02T)
5. **From Table E...**select FILLING FLUID, if diaphragm seal will be attached to instrument. (e.g., Glycerin–code CG)

Typical code: 10–100SS–02T–CG

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

ASHCROFT®
Trust the shield.™

Type 310, 315 All-Welded "Mini" Diaphragm Seal

PRODUCT FEATURES

- Compact size to fit space-restricted areas
- Designed to protect transducers, mini-switches and 3½″ or smaller pressure gauges from corrosion, plugging or freeze-up
- All-welded metal construction prevents leakage of process media
- Rated for 2500 psi at 100°F
- Fill/bleed connection is standard
- Available with male process connection (Type 310)

The compact size of the Ashcroft® 310 mini-seal allows it to fit into space-restricted areas and is designed to protect transducers, mini-switches, and 3½" or smaller dial size pressure gauges from corrosion, plugging or freeze- up. All welded metal construction prevents leakage of process media. It is rated for 2500 psi at 100°F and has a 316L stainless steel top housing standard. Lower housing materials include 316L stainless steel or Hastelloy C. Diaphragm materials include 316L stainless, Hastelloy C or Tantalum. ¼ NPT or ½ NPT process connection sizes are available.

PRODUCT SPECIFICATIONS

Model Number:	Type 310, 315
Process Connection Size:	¼″, ½″ (⅛″, ¾″, 1″- 310 only) (see table A)
Instrument Connection Size:	⅛, ¼ NPT
Diaphragm Material:	316L SS, Hastelloy C276, Tantalum, Monel
Bottom Housing Materials:	316L SS, Hastelloy C276, Monel, Hastelloy B
Filling Fluid:	Glycerin, Silicone, Halocarbon, Syltherm

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Type 310, 315 All-Welded "Mini" Diaphragm Seal

Table A – Process Connection

Process Connection	Size	Code
Threaded – male NPT*	⅛	01
Threaded – male NPT*	¼	02
Threaded – male NPT*	½	04
Threaded – male NPT*	¾	06
Threaded – male NPT*	1	08
Threaded – female NPT†	¼	25
Threaded – female NPT†	½	50

*Available in Type 310 only.
†Available in Types 310 & 315.

Pressure Ratings – All 2500 psi except flanged seals are per ASME B 16.5, temperature limit determined by diaphragm, bottom housing and/or filling fluid.

Table B – Type

Description	Code
All-welded mini-seal	310
All-welded midi-seal w/flushing connection	315

Table C – Diaphragm Materials

Materials	Code
316L stainless steel	S
Hastelloy C-276	H
Tantalum	U
Monel	P

Table D – Housing Materials

Bottom(1)	Code	Top(2)
316L SS	S	316L SS
Hastelloy C-276	H	316L SS
Monel	M	Monel

(1) Other bottom housing materials on application.
(2) Top housing material is 316L SS (standard). Monel mini-seal standard with monel top housing.

Table E – Instrument Connection

Instrument Connection	Size	Code
Threaded – female NPT	¼	02T
Threaded – female NPT	⅛	01T

NOTES:
(1) For use with most 3½″ and smaller gauges. Movementless gauge 4½″ (exception).
(2) Other bottom housing materials on application.
(3) Top housing material is 316L SS (standard). Monel mini-seal standard with monel top housing.
(4) Not available with monel bottom housing.

Table F – Filling Fluid

Fill	Service	Connection to Instrument	Temperature Range °F	Code
Glycerin	Pressure	Direct Only	0/400	CG
Silicone	Pressure/Vacuum	Direct or Flexible Line	–40/600	CK
Halocarbon	Pressure/Vacuum in presence of strong oxidizing agent	Direct or Flexible Line	–70/300	CF
Syltherm	Pressure	Direct or Flexible Line	–40/750	HA

HOW TO ORDER:

1. **From Table A...** select PROCESS CONNECTION (e.g., 1/4″ process code 25)
2. **From Table B...** select TYPE (310)
3. **From Table B...** select DIAPHRAGM MATERIAL. (e.g., 316L stainless steel–code S)
4. **From Table C...** select BOTTOM HOUSING MATERIAL. (e.g., 316 stainless steel–code S)
5. **From Table D...** select INSTRUMENT CONNECTION size. (e.g., 1/4 NPT–code 02T)
6. **From Table E...** select FILLING FLUID, if diaphragm seal will be attached to instrument. (e.g., Glycerin–code CG)

Coded order: **25-310SS-02T-CG**

Section 1
General Information

Overview This manual contains general procedures that apply to Baldor Motor products. Be sure to read and understand the Safety Notice statements in this manual. For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements.
A Warning statement indicates a possible unsafe condition that can cause harm to personnel.
A Caution statement indicates a condition that can cause damage to equipment.

Important: **This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. This manual describes general guidelines that apply to most of the motor products shipped by Baldor. If you have a question about a procedure or are uncertain about any detail, Do Not Proceed. Please contact your Baldor distributor for more information or clarification.**

Before you install, operate or perform maintenance, become familiar with the following:

- NEMA Publication MG-2, Safety Standard for Construction and guide for Selection, Installation and Use of Electric Motors and Generators.
- The National Electrical Code
- Local codes and Practices

Limited Warranty

www.baldor.com/support/warranty_standard.asp

Safety Notice: This equipment contains high voltage! Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation and maintenance of electrical equipment.

Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and generators, the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

WARNING: **Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

WARNING: **Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.**

WARNING: **Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.**

WARNING: **Avoid extended exposure to machinery with high noise levels. Be sure to wear ear protective devices to reduce harmful effects to your hearing.**

WARNING: **Surface temperatures of motor enclosures may reach temperatures which can cause discomfort or injury to personnel accidentally coming into contact with hot surfaces. When installing, protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this precaution could result in bodily injury.**

WARNING: **This equipment may be connected to other machinery that has rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt to install operate or maintain this equipment.**

WARNING: **Do not by-pass or disable protective devices or safety guards. Safety features are designed to prevent damage to personnel or equipment. These devices can only provide protection if they remain operative.**

WARNING: **Avoid the use of automatic reset devices if the automatic restarting of equipment can be hazardous to personnel or equipment.**

WARNING: **Be sure the load is properly coupled to the motor shaft before applying power. The shaft key must be fully captive by the load device. Improper coupling can cause harm to personnel or equipment if the load decouples from the shaft during operation.**

WARNING: **Use proper care and procedures that are safe during handling, lifting, installing, operating and maintaining operations. Improper methods may cause muscle strain or other harm.**

WARNING: **Thermostat contacts automatically reset when the motor has slightly cooled down. To prevent injury or damage, the control circuit should be designed so that automatic starting of the motor is not possible when the thermostat resets.**

Safety Notice Continued

WARNING: **UL Listed motors must only be serviced by UL Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.**

WARNING: **Pacemaker danger – Magnetic and electromagnetic fields in the vicinity of current carrying carrying conductors and permanent magnet motors can result result in a serious health hazard to persons with cardiac pacemakers, metal implants, and hearing aids. To avoid risk, stay way from the area surrounding a permanent magnet motor.**

WARNING: **Before performing any motor maintenance procedure, be sure that the equipment connected to the motor shaft cannot cause shaft rotation. If the load can cause shaft rotation, disconnect the load from the motor shaft before maintenance is performed. Unexpected mechanical rotation of the motor parts can cause injury or motor damage.**

WARNING: **Use only UL/CSA listed explosion proof motors in the presence of flammable or combustible vapors or dust.**

WARNING: **Motors that are to be used in flammable and/or explosive atmospheres must display the UL label on the nameplate along with CSA listed logo. Specific service conditions for these motors are defined in NFPA 70 (NEC) Article 500.**

WARNING: **Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.**

Caution: **To prevent premature equipment failure or damage, only qualified maintenance personnel should perform maintenance.**

Caution: **Do not over–lubricate motor as this may cause premature bearing failure.**

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

Caution: **If eye bolts are used for lifting a motor, be sure they are securely tightened. The lifting direction should not exceed a 20° angle from the shank of the eye bolt or lifting lug. Excessive lifting angles can cause damage.**

Caution: **To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.**

Caution: **If a HI POT test (High Potential Insulation test) must be performed, follow the precautions and procedure in NEMA MG1 and MG2 standards to avoid equipment damage.**

If you have any questions or are uncertain about any statement or procedure, or if you require additional information please contact your Baldor distributor or an Authorized Baldor Service Center.

Receiving

Each Baldor Electric Motor is thoroughly tested at the factory and carefully packaged for shipment. When you receive your motor, there are several things you should do immediately.

1. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your motor.
2. Verify that the part number of the motor you received is the same as the part number listed on your purchase order.

Handling

The motor should be lifted using the lifting lugs or eye bolts provided.

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

1. Use the lugs or eye bolts provided to lift the motor. Never attempt to lift the motor and additional equipment connected to the motor by this method. The lugs or eye bolts provided are designed to lift only the motor. Never lift the motor by the motor shaft or the hood of a WPII motor.
2. To avoid condensation inside the motor, do not unpack until the motor has reached room temperature. (Room temperature is the temperature of the room in which it will be installed). The packing provides insulation from temperature changes during transportation.
3. When lifting a WPII (Weather Proof Type 2) motor, do not lift the motor by inserting lifting lugs into holes on top of the cooling hood. These lugs are to be used for hood removal only. A spreader bar should be used to lift the motor by the cast lifting lugs located on the motor frame.

4. If the motor must be mounted to a plate with the driven equipment such as pump, compressor etc., it may not be possible to lift the motor alone. For this case, the assembly should be lifted by a sling around the mounting base. The entire assembly can be lifted as an assembly for installation.

   Do not lift the assembly using the motor lugs or eye bolts provided. Lugs or eye bolts are designed to lift motor only. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting.

Storage

Storage requirements for motors and generators that will not be placed in service for at least six months from date of shipment.

Improper motor storage will result in seriously reduced reliability and failure. An electric motor that does not experience regular usage while being exposed to normally humid atmospheric conditions is likely to develop rust in the bearings or rust particles from surrounding surfaces may contaminate the bearings. The electrical insulation may absorb an excessive amount of moisture leading to the motor winding failure.

A wooden crate “shell” should be constructed to secure the motor during storage. This is similar to an export box but the sides & top must be secured to the wooden base with lag bolts (not nailed as export boxes are) to allow opening and reclosing many times without damage to the “shell”.

Minimum resistance of motor winding insulation is 5 Meg ohms or the calculated minimum, which ever is greater. Minimum resistance is calculated as follows: **Rm = kV + 1**

where: (Rm is minimum resistance to ground in Meg−Ohms and
kV is rated nameplate voltage defined as Kilo−Volts.)

Example: For a 480VAC rated motor Rm =1.48 meg−ohms (use 5 MΩ).
For a 4160VAC rated motor Rm = 5.16 meg−ohms.

Preparation for Storage

1. Some motors have a shipping brace attached to the shaft to prevent damage during transportation. The shipping brace, if provided, must be removed and stored for future use. The brace must be reinstalled to hold the shaft firmly in place against the bearing before the motor is moved.
2. Store in a clean, dry, protected warehouse where control is maintained as follows:
   a. Shock or vibration must not exceed 2 mils maximum at 60 hertz, to prevent the bearings from brinelling. If shock or vibration exceeds this limit vibration isolation pads must be used.
   b. Storage temperatures of 10°C (50°F) to 49°C (120°F) must be maintained.
   c. Relative humidity must not exceed 60%.
   d. Motor space heaters (when present) are to be connected and energized whenever there is a possibility that the storage ambient conditions will reach the dew point. Space heaters are optional.

   Note: Remove motor from containers when heaters are energized, reprotect if necessary.
3. Measure and record the resistance of the winding insulation (dielectric withstand) every 30 days of storage.
   a. If motor insulation resistance decreases below the minimum resistance, contact your Baldor District office.
   b. Place new desiccant inside the vapor bag and re−seal by taping it closed.
   c. If a zipper−closing type bag is used instead of the heat−sealed type bag, zip the bag closed instead of taping it. Be sure to place new desiccant inside bag after each monthly inspection.
   d. Place the shell over the motor and secure with lag bolts.
4. Where motors are mounted to machinery, the mounting must be such that the drains and breathers are fully operable and are at the lowest point of the motor. Vertical motors must be stored in the vertical position. Storage environment must be maintained as stated in step 2.

5. Motors with anti−friction bearings are to be greased at the time of going into extended storage with periodic service as follows:
   a. Motors marked “Do Not Lubricate” on the nameplate do not need to be greased before or during storage.
   b. Ball and roller bearing (anti−friction) motor shafts are to be rotated manually every 3 months and greased every 6 months in accordance with the Maintenance section of this manual.
   c. Sleeve bearing (oil lube) motors are drained of oil prior to shipment. The oil reservoirs must be refilled to the indicated level with the specified lubricant, (see Maintenance). The shaft should be rotated monthly by hand at least 10 to 15 revolutions to distribute oil to bearing surfaces.
   d. “Provisions for oil mist lubrication” − These motors are packed with grease. Storage procedures are the same as paragraph 5b.
   e. “Oil Mist Lubricated” − These bearings are protected for temporary storage by a corrosion inhibitor. If stored for greater than 3 months or outdoor storage is anticipated, connected to the oil mist system while in storage. If this is not possible, add the amount of grease indicated under “Standard Condition” in Section 3, then rotate the shaft 15 times by hand.
6. All breather drains are to be fully operable while in storage (drain plugs removed). The motors must be stored so that the drain is at the lowest point. All breathers and automatic “T” drains must be operable to allow breathing and draining at points other than through the bearings around the shaft. Vertical motors should be stored in a safe stable vertical position.
7. Coat all external machined surfaces with a rust preventing material. An acceptable product for this purpose is Exxon Rust Ban # 392.

Non−Regreaseable Motors

Non−regreasable motors with “Do Not Lubricate” on the nameplate should have the motor shaft rotated 15 times to redistribute the grease within the bearing every 3 months or more often.

All Other Motor Types

Before storage, the following procedure must be performed.

1. Remove the grease drain plug, if supplied, (opposite the grease fitting) on the bottom of each bracket prior to lubricating the motor.
2. The motor with regreasable bearing must be greased as instructed in Section 3 of this manual.
3. Replace the grease drain plug after greasing.
4. The motor shaft must be rotated a minimum of 15 times after greasing.
5. Motor Shafts are to be rotated at least 15 revolutions manually every 3 months and additional grease added every nine months (see Section 3) to each bearing.
6. Bearings are to be greased at the time of removal from storage.

Removal From Storage

1. Remove all packing material.
2. Measure and record the electrical resistance of the winding insulation resistance meter at the time of removal from storage. The insulation resistance must not be less than 50% from the initial reading recorded when the motor was placed into storage. A decrease in resistance indicates moisture in the windings and necessitates electrical or mechanical drying before the motor can be placed into service. If resistance is low, contact your Baldor District office.
3. Regrease the bearings as instructed in Section 3 of this manual.
4. Reinstall the original shipping brace if motor is to be moved. This will hold the shaft firmly against the bearing and prevent damage during movement.

Section 2
Installation & Operation

Overview Installation should conform to the National Electrical Code as well as local codes and practices. When other devices are coupled to the motor shaft, be sure to install protective devices to prevent future accidents. Some protective devices include, coupling, belt guard, chain guard, shaft covers etc. These protect against accidental contact with moving parts. Machinery that is accessible to personnel should provide further protection in the form of guard rails, screening, warning signs etc.

Location It is important that motors be installed in locations that are compatible with motor enclosure and ambient conditions. Improper selection of the motor enclosure and ambient conditions can lead to reduced operating life of the motor.

Proper ventilation for the motor must be provided. Obstructed airflow can lead to reduction of motor life.

1. **Open Drip−Proof/WPI** motors are intended for use indoors where atmosphere is relatively clean, dry, well ventilated and non−corrosive.
2. **Totally Enclosed and WPII** motors may be installed where dirt, moisture or dust are present and in outdoor locations.

Severe Duty, IEEE 841 and Washdown Duty enclosed motors are designed for installations with high corrosion or excessive moisture conditions. These motors should not be placed into an environment where there is the presence of flammable or combustible vapors, dust or any combustible material, unless specifically designed for this type of service.

Hazardous Locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers, or flyings. Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code.

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

Mounting The motor must be securely installed to a rigid foundation or mounting surface to minimize vibration and maintain alignment between the motor and shaft load. Failure to provide a proper mounting surface may cause vibration, misalignment and bearing damage.

Foundation caps and sole plates are designed to act as spacers for the equipment they support. If these devices are used, be sure that they are evenly supported by the foundation or mounting surface.

After installation is complete and accurate alignment of the motor and load is accomplished, the base should be grouted to the foundation to maintain this alignment.

The standard motor base is designed for horizontal or vertical mounting. Adjustable or sliding rails are designed for horizontal mounting only. Consult your Baldor distributor or authorized Baldor Service Center for further information.

Alignment Accurate alignment of the motor with the driven equipment is extremely important. The pulley, sprocket, or gear used in the drive should be located on the shaft as close to the shaft shoulder as possible. It is recommended to heat the pulley, sprocket, or gear before installing on the motor shaft. Forcibly driving a unit on the motor shaft will damage the bearings.

1. **Direct Coupling**
   For direct drive, use flexible couplings if possible. Consult the drive or equipment manufacturer for more information. Mechanical vibration and roughness during operation may indicate poor alignment. Use dial indicators to check alignment. The space between coupling hubs should be maintained as recommended by the coupling manufacturer.
2. **End-Play Adjustment**
   The axial position of the motor frame with respect to its load is also extremely important. The motor bearings are not designed for excessive external axial thrust loads. Improper adjustment will cause failure.
3. **Pulley Ratio**
   The pulley ratio should not exceed 8:1.

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

4. **Belt Drive**
   Align sheaves carefully to minimize belt wear and axial bearing loads (see End-Play Adjustment). Belt tension should be sufficient to prevent belt slippage at rated speed and load. However, belt slippage may occur during starting.
5. Sleeve bearing motors are only suitable for coupled loads.

Doweling & Bolting After proper alignment is verified, dowel pins should be inserted through the motor feet into the foundation. This will maintain the correct motor position should motor removal be required. (Baldor motors are designed for doweling.)

1. Drill dowel holes in diagonally opposite motor feet in the locations provided.
2. Drill corresponding holes in the foundation.
3. Ream all holes.
4. Install proper fitting dowels.
5. Mounting bolts must be carefully tightened to prevent changes in alignment. Use a flat washer and lock washer under each nut or bolt head to hold the motor feet secure. Flanged nuts or bolts may be used as an alternative to washers.

WARNING: Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.

Guarding Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions. This is particularly important where the parts have surface irregularities such as keys, key ways or set screws. Some satisfactory methods of guarding are:

1. Covering the machine and associated rotating parts with structural or decorative parts of the driven equipment.
2. Providing covers for the rotating parts. Covers should be sufficiently rigid to maintain adequate guarding during normal service.

Power Connection Motor and control wiring, overload protection, disconnects, accessories and grounding should conform to the National Electrical Code and local codes and practices. Flying leads must be insulated with two full wraps of electrical grade insulating tape or heat shrink tubing.

Conduit Box For ease of making connections, an oversize conduit box is provided.
The box can be rotated 360° in 90° increments.
Auxiliary conduit boxes are provided on some motors for accessories such as space heaters, RTD's etc.

AC Power Connect the motor leads as shown on the connection diagram located on the name plate or inside the cover on the conduit box. Be sure the following guidelines are met:

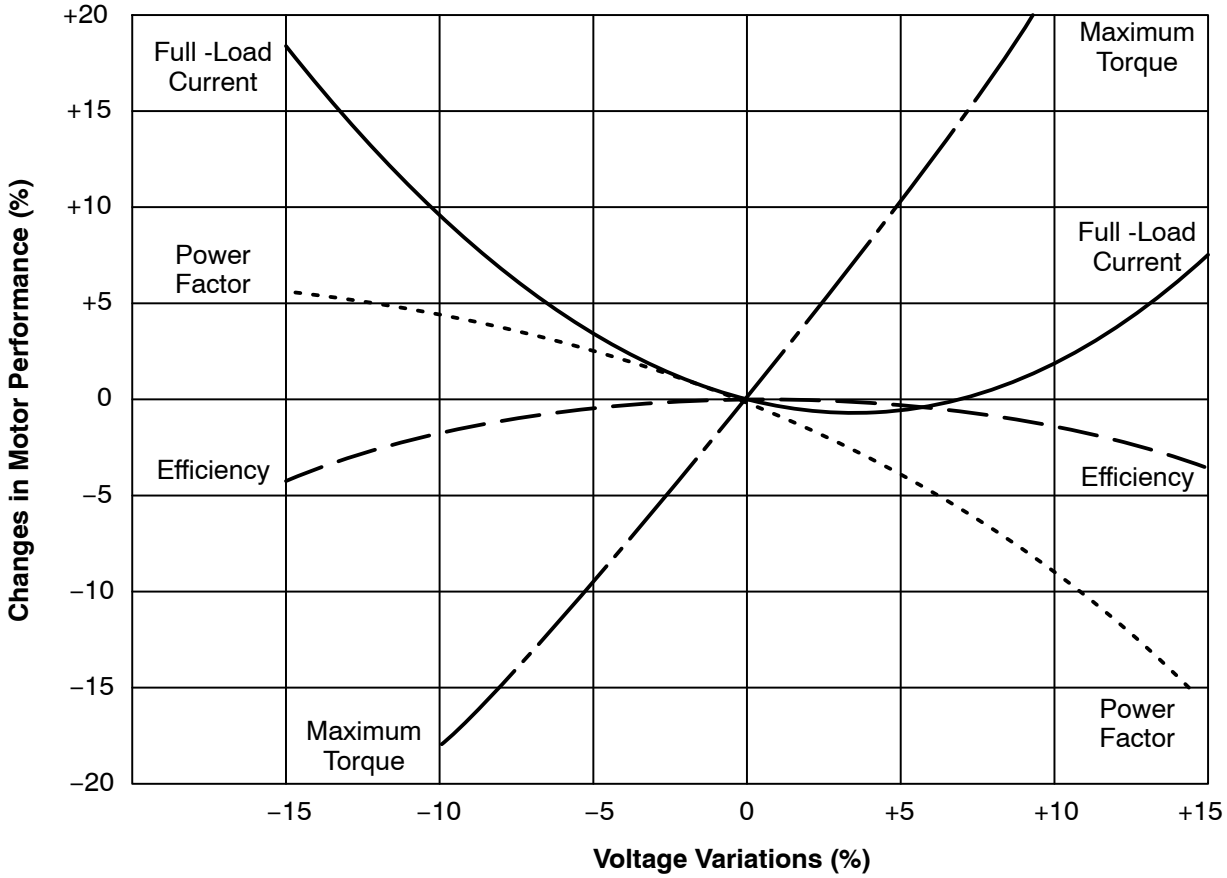
1. AC power is within ±10% of rated voltage with rated frequency. (See motor name plate for ratings).
   OR
2. AC power is within ±5% of rated frequency with rated voltage.
   OR
3. A combined variation in voltage and frequency of ±10% (sum of absolute values) of rated values, provided the frequency variation does not exceed ±5% of rated frequency.

Performance within these voltage and frequency variations are shown in Figure 2-2.

Figure 2-1 Accessory Connections

HEATERS 	One heater is installed in each end of motor. Leads for each heater are labeled H1 & H2. (Like numbers should be tied together).
THERMISTORS 	Three thermistors are installed in windings and tied in series. Leads are labeled T1 & T2.
WINDING RTDS 	Winding RTDs are installed in windings (2) per phase. Each set of leads is labeled W1, W2, W3, W4, W5, & W6.
BEARING RTD 	* One bearing RTD is installed in Drive endplate (PUEP), leads are labeled RTDDE. * One bearing RTD is installed in Opposite Drive endplate (FREP), leads are labeled RTDODE. * Note RTD may have 2–Red/1–White leads; or 2–White/1–Red Lead.

Figure 2-2 Typical Motor Performance VS Voltage Variations



Rotation All three phase motors are reversible. To reverse the direction of rotation, disconnect and lock out power and interchange any two of the three line leads for three phase motors. For single phase motors, check the connection diagram to determine if the motor is reversible and follow the connection instructions for lead numbers to be interchanged. Not all single phase motors are reversible.

Adjustable Frequency Power Inverters used to supply adjustable frequency power to induction motors produce wave forms with lower order harmonics with voltage spikes superimposed. Turn−to−turn, phase−to−phase, and ground insulation of stator windings are subject to the resulting dielectric stresses. Suitable precautions should be taken in the design of these drive systems to minimize the magnitude of these voltage spikes. Consult the drive instructions for maximum acceptable motor lead lengths, and proper grounding.

First Time Start Up Be sure that all power to motor and accessories is off. Be sure the motor shaft is disconnected from the load and will not cause mechanical rotation of the motor shaft.

1. Make sure that the mechanical installation is secure. All bolts and nuts are tightened etc.
2. If motor has been in storage or idle for some time, check winding insulation integrity.
3. Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity.
4. Be sure all shipping materials and braces (if used) are removed from motor shaft.
5. Manually rotate the motor shaft to ensure that it rotates freely.
6. Replace all panels and covers that were removed during installation.
7. Momentarily apply power and check the direction of rotation of the motor shaft.
8. If motor rotation is wrong, be sure power is off and change the motor lead connections. Verify rotation direction before you continue.
9. Start the motor and ensure operation is smooth without excessive vibration or noise. If so, run the motor for 1 hour with no load connected.
10. After 1 hour of operation, disconnect power and connect the load to the motor shaft. Verify all coupling guards and protective devices are installed. Ensure motor is properly ventilated.

Coupled Start Up This procedure assumes a coupled start up. Also, that the first time start up procedure was successful.

1. Check the coupling and ensure that all guards and protective devices are installed.
2. Check that the coupling is properly aligned and not binding.
3. The first coupled start up should be with no load. Apply power and verify that the load is not transmitting excessive vibration back to the motor though the coupling or the foundation. Vibration should be at an acceptable level.
4. Run for approximately 1 hour with the driven equipment in an unloaded condition.

The equipment can now be loaded and operated within specified limits. Do not exceed the name plate ratings for amperes for steady continuous loads.

Jogging and Repeated Starts Repeated starts and/or jogs of induction motors generally reduce the life of the motor winding insulation. A much greater amount of heat is produced by each acceleration or jog than by the same motor under full load. If it is necessary to repeatedly start or jog the motor, it is advisable to check the application with your local Baldor distributor or Baldor Service Center.

Heating - Duty rating and maximum ambient temperature are stated on the motor name plate. Do not exceed these values. If there is any question regarding safe operation, contact your local Baldor District Office or Baldor Service Center.

Section 3
Maintenance & Troubleshooting

WARNING: UL Listed motors must only be serviced by UL Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.

General Inspection Inspect the motor at regular intervals, approximately every 500 hours of operation or every 3 months, whichever occurs first. Keep the motor clean and the ventilation openings clear. The following steps should be performed at each inspection:

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

1. Check that the motor is clean. Check that the interior and exterior of the motor is free of dirt, oil, grease, water, etc. Oily vapor, paper pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.
2. Use a “Megger” periodically to ensure that the integrity of the winding insulation has been maintained. Record the Megger readings. Immediately investigate any significant drop in insulation resistance.
3. Check all electrical connectors to be sure that they are tight.

Relubrication & Bearings Bearing grease will lose its lubricating ability over time, not suddenly. The lubricating ability of a grease (over time) depends primarily on the type of grease, the size of the bearing, the speed at which the bearing operates and the severity of the operating conditions. Good results can be obtained if the following recommendations are used in your maintenance program.

Type of Grease A high grade ball or roller bearing grease should be used. Recommended grease for standard service conditions is **Polyrex EM (Mobil)**. Do not mix greases unless compatibility has been checked and verified.

Equivalent and compatible greases include:
Texaco Polystar, Rykon Premium #2, Pennzoil Pen 2 Lube and Chevron SRI.

Relubrication Intervals Recommended relubrication intervals are shown in Table 3-1. It is important to realize that the recommended intervals of Table 3-1 are based on average use.

Refer to additional information contained in Tables 3-2, 3-3 and 3-4.

Table 3-1 Relubrication Intervals *

NEMA / (IEC) Frame Size	Rated Speed - RPM					
	10000	6000	3600	1800	1200	900
Up to 210 incl. (132)	**	2700 Hrs.	5500 Hrs.	12000 Hrs.	18000 Hrs.	22000 Hrs.
Over 210 to 280 incl. (180)		**	3600 Hrs.	9500 Hrs.	15000 Hrs.	18000 Hrs.
Over 280 to 360 incl. (225)		**	* 2200 Hrs.	7400 Hrs.	12000 Hrs.	15000 Hrs.
Over 360 to 5800 incl. (300)		**	*2200 Hrs.	3500 Hrs.	7400 Hrs.	10500 Hrs.

* Relubrication intervals are for ball bearings.
For vertically mounted motors and roller bearings, divide the relubrication interval by 2.

** For motors operating at speeds greater than 3600 RPM, contact Baldor for relubrication recommendations.

Table 3-2 Service Conditions

Severity of Service	Hours per day of Operation	Ambient Temperature Maximum	Atmospheric Contamination
Standard	8	40° C	Clean, Little Corrosion
Severe	16 Plus	50° C	Moderate dirt, Corrosion
Extreme	16 Plus	>50° C* or Class H Insulation	Severe dirt, Abrasive dust, Corrosion, Heavy Shock or Vibration
Low Temperature		<–29° C **	

* Special high temperature grease is recommended (Dow Corning DC44). Note that Dow Corning DC44 grease does not mix with other grease types. Thoroughly clean bearing & cavity before adding grease.

** Special low temperature grease is recommended (Aeroshell 7).

Table 3-3 Relubrication Interval Multiplier

Severity of Service	Multiplier
Standard	1.0
Severe	0.5
Extreme	0.1
Low Temperature	1.0

Some motor designs use different bearings on each motor end. This is normally indicated on the motor nameplate. In this case, the larger bearing is installed on the motor Drive endplate. For best relubrication results, only use the appropriate amount of grease for each bearing size (not the same for both).

Table 3-4 Bearings Sizes and Types

Frame Size NEMA (IEC)	Bearing Description (These are the "Large" bearings (Shaft End) in each frame size)			
	Bearing	Weight of Grease to add * oz (Grams)	Volume of grease to be added	
			in^3	teaspoon
56 to 140 (90)	6203	0.08 (2.4)	0.15	0.5
140 (90)	6205	0.15 (3.9)	0.2	0.8
180 (100–112)	6206	0.19 (5.0)	0.3	1.0
210 (132)	6307	0.30 (8.4)	0.6	2.0
250 (160)	6309	0.47 (12.5)	0.7	2.5
280 (180)	6311	0.61 (17)	1.2	3.9
320 (200)	6312	0.76 (20.1)	1.2	4.0
360 (225)	6313	0.81 (23)	1.5	5.2
400 (250)	6316	1.25 (33)	2.0	6.6
440 (280)	6319	2.12 (60)	4.1	13.4
5000 to 5800 (315–450)	6328	4.70 (130)	9.2	30.0
5000 to 5800 (315–450)	NU328	4.70 (130)	9.2	30.0
360 to 449 (225–280)	NU319	2.12 (60)	4.1	13.4
AC Induction Servo				
76 Frame 180 (112)	6207	0.22 (6.1)	0.44	1.4
77 Frame 210 (132)	6210	0.32 (9.0)	0.64	2.1
80 Frame 250(160)	6213	0.49 (14.0)	0.99	3.3

* Weight in grams = .005 DB of grease to be added

Note: Not all bearing sizes are listed. For intermediate bearing sizes, use the grease volume for the next larger size bearing.

Caution: To avoid damage to motor bearings, grease must be kept free of dirt. For an extremely dirty environment, contact your Baldor distributor or an authorized Baldor Service Center for additional information.

Relubrication Procedure Be sure that the grease you are adding to the motor is compatible with the grease already in the motor. Consult your Baldor distributor or an authorized service center if a grease other than the recommended type is to be used.

Caution: Do not over−lubricate motor as this may cause premature bearing failure.

With Grease Outlet Plug

1. With the motor stopped, clean all grease fittings with a clean cloth.
2. Remove grease outlet plug.

Caution: Over−lubricating can cause excessive bearing temperatures, premature lubrication breakdown and bearing failure.

3. Add the recommended amount of grease.
4. Operate the motor for 15 minutes with grease plug removed. This allows excess grease to purge.
5. Re-install grease outlet plug.

Without Grease Provisions

Note: Only a Baldor authorized and UL or CSA certified service center can disassemble a UL/CSA listed explosion proof motor to maintain it's UL/CSA listing.

1. Disassemble the motor.
2. Add recommended amount of grease to bearing and bearing cavity. (Bearing should be about 1/3 full of grease and outboard bearing cavity should be about 1/2 full of grease.)
3. Assemble the motor.

Sample Relubrication Determination

Assume - NEMA 286T (IEC 180), 1750 RPM motor driving an exhaust fan in an ambient temperature of 43° C and the atmosphere is moderately corrosive.

1. Table 3-1 list 9500 hours for standard conditions.
2. Table 3-2 classifies severity of service as "Severe".
3. Table 3-4 shows that 1.2 in^3 or 3.9 teaspoon of grease is to be added.

Note: Smaller bearings in size category may require reduced amounts of grease.

Table 3-5 Troubleshooting Chart

Symptom	Possible Causes	Possible Solutions
Motor will not start	Usually caused by line trouble, such as, single phasing at the starter.	Check source of power. Check overloads, fuses, controls, etc.
Excessive humming	High Voltage.	Check input line connections.
	Eccentric air gap.	Have motor serviced at local Baldor service center.
Motor Over Heating	Overload. Compare actual amps (measured) with nameplate rating.	Locate and remove source of excessive friction in motor or load. Reduce load or replace with motor of greater capacity.
	Single Phasing.	Check current at all phases (should be approximately equal) to isolate and correct the problem.
	Improper ventilation.	Check external cooling fan to be sure air is moving properly across cooling fins. Excessive dirt build-up on motor. Clean motor.
	Unbalanced voltage.	Check voltage at all phases (should be approximately equal) to isolate and correct the problem.
	Rotor rubbing on stator.	Check air gap clearance and bearings.
		Tighten “Thru Bolts”.
	Over voltage or under voltage.	Check input voltage at each phase to motor.
	Open stator winding.	Check stator resistance at all three phases for balance.
	Grounded winding.	Perform dielectric test and repair as required.
	Improper connections.	Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity. Refer to motor lead connection diagram.
Bearing Over Heating	Misalignment.	Check and align motor and driven equipment.
	Excessive belt tension.	Reduce belt tension to proper point for load.
	Excessive end thrust.	Reduce the end thrust from driven machine.
	Excessive grease in bearing.	Remove grease until cavity is approximately $^3/_4$ filled.
	Insufficient grease in bearing.	Add grease until cavity is approximately $^3/_4$ filled.
	Dirt in bearing.	Clean bearing cavity and bearing. Repack with correct grease until cavity is approximately $^3/_4$ filled.
Vibration	Misalignment.	Check and align motor and driven equipment.
	Rubbing between rotating parts and stationary parts.	Isolate and eliminate cause of rubbing.
	Rotor out of balance.	Have rotor balance checked are repaired at your Baldor Service Center.
	Resonance.	Tune system or contact your Baldor Service Center for assistance.
Noise	Foreign material in air gap or ventilation openings.	Remove rotor and foreign material. Reinstall rotor. Check insulation integrity. Clean ventilation openings.
Growling or whining	Bad bearing.	Replace bearing. Clean all grease from cavity and new bearing. Repack with correct grease until cavity is approximately $^3/_4$ filled.

Suggested bearing and winding RTD setting guidelines

Most large frame AC Baldor motors with a 1.15 service factor are designed to operate below a Class B (80°C) temperature rise at rated load and are built with a Class H winding insulation system. Based on this low temperature rise, RTD (Resistance Temperature Detectors) settings for Class B rise should be used as a starting point. Some motors with 1.0 service factor have Class F temperature rise.

The following tables show the suggested alarm and trip settings for RTDs. Proper bearing and winding RTD alarm and trip settings should be selected based on these tables unless otherwise specified for specific applications.

If the driven load is found to operate well below the initial temperature settings under normal conditions, the alarm and trip settings may be reduced so that an abnormal machine load will be identified.

The temperature limits are based on the installation of the winding RTDs imbedded in the winding as specified by NEMA. Bearing RTDs should be installed so they are in contact with the outer race on ball or roller bearings or in direct contact with the sleeve bearing shell.

Winding RTDs – Temperature Limit In °C (40°C Maximum Ambient)

Motor Load	Class B Temp Rise ≤ 80°C (Typical Design)		Class F Temp Rise ≤ 105°C		Class H Temp Rise ≤ 125°C	
	Alarm	Trip	Alarm	Trip	Alarm	Trip
≤ Rated Load	130	140	155	165	175	185
Rated Load to 1.15 S.F.	140	150	160	165	180	185

Note: • Winding RTDs are factory production installed, not from Mod–Express.
• When Class H temperatures are used, consider bearing temperatures and relubrication requirements.

Bearing RTDs – Temperature Limit In °C (40°C Maximum Ambient)

Bearing Type Oil or Grease	Anti–Friction		Sleeve	
	Alarm	Trip	Alarm	Trip
Standard*	95	100	85	95
High Temperature**	110	115	105	110

Note: * Bearing temperature limits are for standard design motors operating at Class B temperature rise.
** High temperature lubricants include some special synthetic oils and greases.

Greases that may be substituted that are compatible with Polyrex EM (but considered as “standard” lubricants) include the following:

- Texaco Polystar
- Rykon Premium #2
- Chevron SRI #2
- Mobilith SHC–100
- Pennzoil Pennzlube EM–2
- Chevron Black Pearl
- Darmex 707
- Darmex 711
- Petro–Canada Peerless LLG

See the motor nameplate for replacement grease or oil recommendation.
Contact Baldor application engineering for special lubricants or further clarifications.

Fax: 905-889-8553

MAINTENANCE & INSTALLATION INSTRUCTIONS
For Chemline Type 21 True Union Ball Valve Size 1/2"- 4"

Installation:

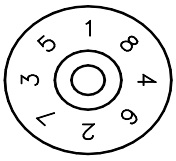
1. Make sure all surfaces are clear and free of debris prior to installing valve in pipeline. Pipeline should be empty at connection site.

2. Valve should be set to the closed position.

3. When installing valves with socket connections, ensure that only PVC solvent cement is used. Excessive use of cement can cause sticking in the valve interior, therefore use caution when applying cement, especially on vertical piping.

4. For threaded connections we recommend the use of sealing tape and, with the use of a strap wrench, to tighten no more than 2 full turns past finger-tight. Use of a pipe wrench can deform the pipe or union nut and cause damage to the valve and/or connection(s).

5. Flanged connections should be torqued evenly and in a symmetrical pattern with a torque wrench and as per the figure and chart below:



RECOMMENDED FLANGE BOLT TORQUES

VALVE SIZE	FLANGE	BOLT TORQUE	IN FT-LB	AXIAL MISALIGNMENT	PARALLELISM (INCH)
	PSI - 50	PSI - 100	PSI – 150		
1½	11	13	14	0.04	0.03
2	13	14	16	0.04	0.03

24	72	-	-		

Maintenance Instructions Type 21 Ball Valve cont.

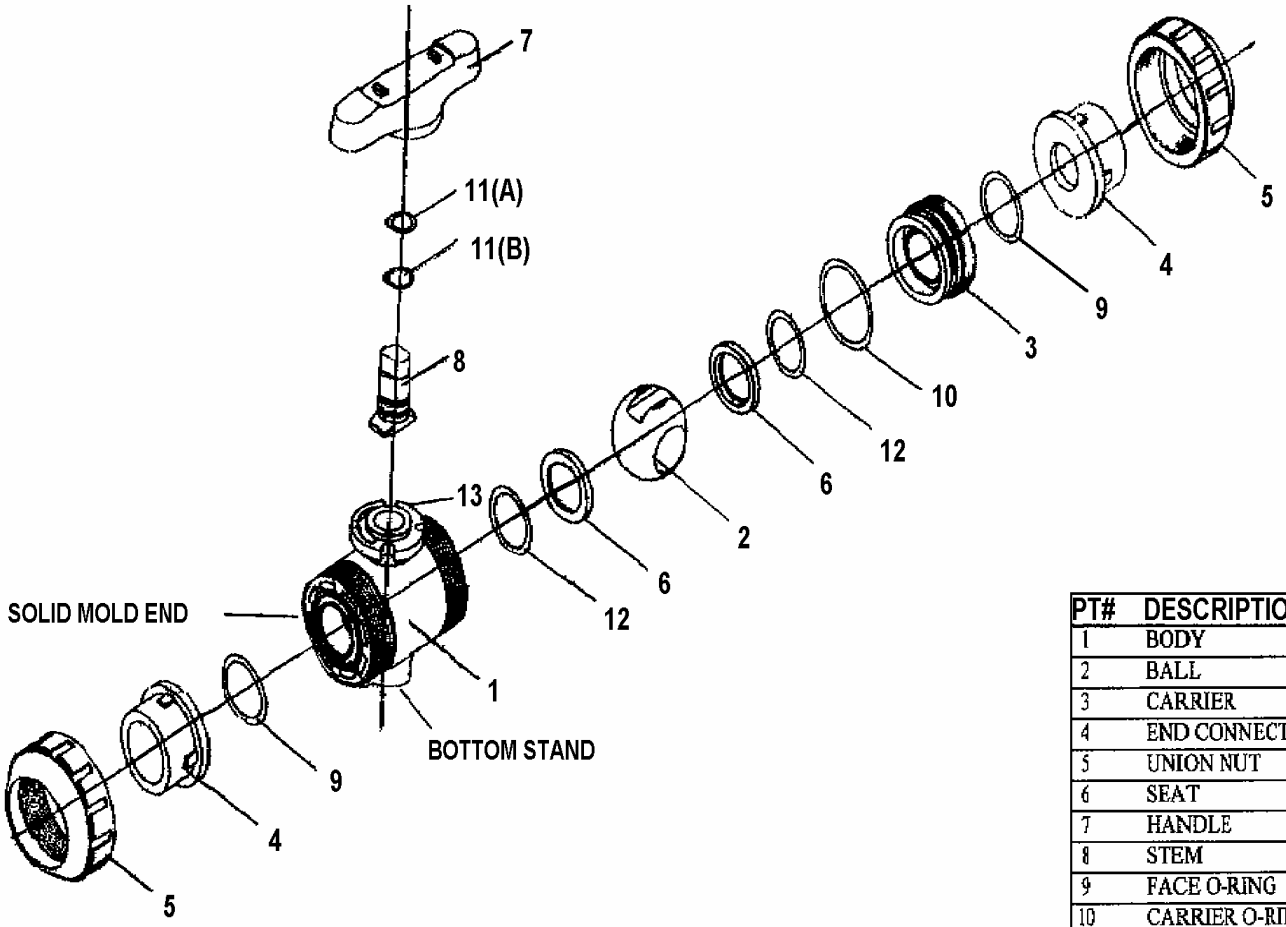
Maintenance:

Refer to **ASSEMBLY DRAWING T21V Rev. 0.** And proceed as follows:

1. Turn valve to the closed position.
2. Unscrew union nut (5) from both ends of valve.
3. Remove end connectors (4).
4. On solid mold end, remove face o-ring (9). This completely disassembles this end of valve.
5. Pull upward on handle (7) to remove.
6. On opposite end of valve, remove face o-ring (9) and use handle (7) as a spanner wrench to remove carrier (3).
7. Remove carrier o-ring (10).
8. Remove seat (6) and seat cushion (12) to expose ball (2).
9. Remove ball (2) by pushing from solid molded end of body.
10. Remove stem (6) by pushing it down into body (1).
11. Remove stem o-rings 11(A) and 11(B) from groves in stem.
12. Remove other seat (6) and seat cushion (12).
13. Inspect all parts for wear and replace as necessary.
14. Before re-assembling valve, lubricate all o-rings with Dow Corning III silicone compound or equivalent.
15. To re-assemble valve follow steps 1 through 10 in reverse order.

NOTE: If mounting actuator on mounting flange (13), make sure handle (7) is removed and stem (6) and actuator are aligned.

After replacing carrier (3), the face of the carrier should remain slightly projected from the end of the body. Make sure the ball rotates smoothly with only a touch of resistance.



PT#	DESCRIPTION	QTY	MATERIALS
1	BODY	1	PVC/PP/PVDF/CPVC
2	BALL	1	PVC/PP/PVDF/CPVC
3	CARRIER	1	CPE/EPDM/VITON/HYP.

ChemFlare™ End Connectors

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC CPVC PP PVDF

SERIES: ChemFlare™

VALVE SIZES: 3/8", 1/2", 3/4", 1" & 1-1/4"

TUBING SIZES: 1/4", 3/8", 1/2", 3/4", 1" & 1-1/4"

All Chemline valves with True Union ends are available with ChemFlare™ end connections. ChemFlare™ is a long term leak-free connection design for difficult applications such as sodium hypochlorite[1]. These flared end connections are easy to install and allow for compact plumbing and a small footprint.

They are available on all Chemline valves which have True Union ends, flow meters and controls up to 1-1/4". They connect PFA tubing down to 1/4" size.

Tubing must be flared using a mechanical flare tool or by heating and using a forming flare tool (preferred method). Consult Chemline for flare tools.

features

Full Valve Working Pressure

Weldless Design

- Eliminates all fusion welds and glued joints
- Threaded connection between flared end and tube nut is not wetted

Easy Installation

- Flaring the tube ends is easy
- Assembly is by hand[2]

Low Down Time

- No welding or curing waiting time. The system may be pressure tested immediately.

Minimum Dead Volume

- The flared tubing connection has minimum dead volume desirable on sodium hypochlorite and ultrapure applications

[1] For sodium hypochlorite applications Chemline recommends venting ball valves by drilling a hole on the upstream side of the ball in the closed position.
[2] ChemFlare™ fitting nuts should be hand tightened only. Use of a wrench can result in excessive tightening and stripped threads.

Temperature Ranges: PVC 0 to 60°C (32 to 140°F), **PP** –20 to 90°C (–4 to 194°F), **PVDF** –40 to 100°C (–40 to 212°F).

[1] ChemFlare™ ends are available for reduced tube sizes down to 1/4″. Tube nuts are always supplied with end connectors.

SAMPLE SPECIFICATION

1. All True Union Ball Valves in PVC, CPVC, PP or PVDF shall be Chemline Type 21 or equal sizes 1/2″ to 2″ in PVC, CPVC, and PVDF rated at 230 psi and in PP 150 psi maximum working pressure. Sizes 2-1/2″, 3″ and 4″ rated at 150 psi maximum working pressure with EPDM , FKM (Viton®) or CPE seals. Cushioned PTFE ball seats shall be provided for positive closure with minimum stem torques.
2. All valves will have Safety Shear stem design, blowout-proof with double o-rings for safety. The top o-ring groove shall be deeper so that if the stem breaks under excessive torque the lower o-ring will remain intact and the valve will hold pressure.
3. All valves shall be full port and two-way blocking.
4. All PVC/EPDM and PVC/FKM (Viton®) valves shall be certified under NSF/ANSI Standard 61 for contact with drinking water.
5. All valves will be CRN (Canadian Registration Number) registered with TSSA.
6. All valves for sodium hypochlorite service shall have the ball vented on the upstream side to prevent the accumulation of chlorine gas due to off-gassing.
7. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.
8. PVC compound shall have an ASTM cell classification 12454, as per ASTM D-1784 (CSA Report LO 4000-1172) and a chemical resistance equal to S20-1-3-R as per ASTM D5260.
9. End connections shall be ChemFlare™ design for connection to flared PFA tubing.

[1] ChemFlare™ ends are available for reduced tube sizes down to 1/4″. Tube nuts are always supplied with end connectors.

SAMPLE SPECIFICATION

1. All Back Pressure/Relief Valves in PVC, PP or PVDF shall be Chemline SB10 or SB11 Series or equal in sizes 1/2″ to 2″. SB10 shall have inlet set pressure range of 3 to 60 psi and SB11 shall have an inlet set pressure range of 7 to 150 psi. SB12 valves shall have an inlet set pressure range of 5 to 150 psi. All valves shall have a maximum inlet pressure rating of 150 psi. Valves shall be suitable for aggressive, clean, non-scaling chemicals.
2. All valves shall have a large PTFE coated control diaphragm to fully open at 10-15% over pressure, provide low hysteresis (“backlash”) and no flutter.
3. Static seals shall be EPDM or FPM (Viton®).
4. End connections shall be ChemFlare™ design for connection to flared PFA tubing.
5. PVC compound shall have an ASTM cell classification 13463-A, with minimum suffix “A” designation for chemical resistance as per ASTM D-1784.
6. All polypropylene material shall conform to ASTM D-4101 PP 0211B67272 material requirements.
7. All PVDF material shall be unpigmented conforming to ASTM D-3222 Type 2 suspension resin material requirements and also with USDA Title 21, Chapter I, Part 177.2510 requirements for contact with food.
8. All valves shall have chemical resistant labels permanently marked with manufacturing number to provide production level traceability.

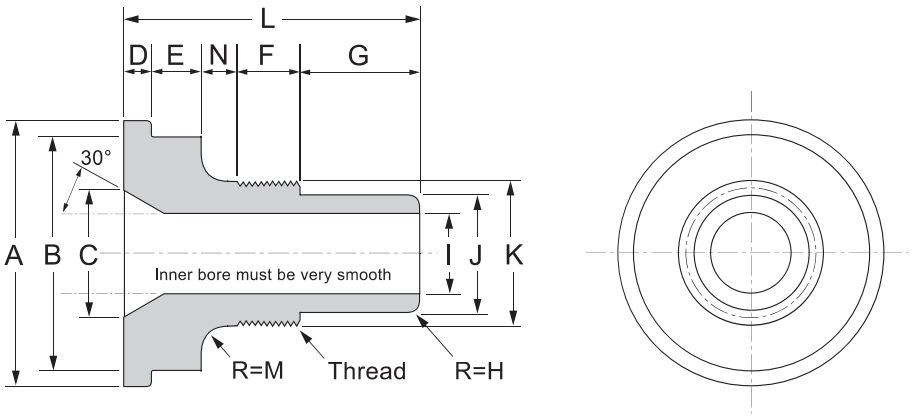
[1] All fittings with 1/4" tube connections to have threads up to the flange face. See dimensions M and N.



ORDERING EXAMPLE

ChemFlare™ End Connections for SB Series Back Pressure/Relief Valves	SB	005	–17	A	8N	–1
Valve Size	**003** – 3/8" **005** – 1/2" **007** – 3/4" **010** – 1" **012** – 1-1/4"					
End Connector	**–17** – for all sizes					
Material	**A** – PVC **C** – CPVC **B** – PP **K** – PVDF					
Tube Size[2]	**4N** – 1/4" **6N** – 3/8" **8N** – 1/2" **12N** – 3/4" **16N** – 1" **20N** – 1-1/4"					
Tube Nut	**–1** – includes nut **Blank** – without nut					

Example: Chemline ChemFlare™ End Connectors for SB10, SB11 and SB12 Back Pressure Relief Valves, 1/2" valve size, PVC, with 1/2" tube size, including nuts.

[2] Tube size must be equal or smaller than the valve size.

Metering Ball Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

Chemline SM Series Metering Ball Valve is designed for fine linear flow control of chemicals or clean fluids. The ball is solid with graduated V-groove cut on the outside surface. Precise linear flow control is accomplished through 180° rotation of the handle. With a positioning electric actuator, this becomes an inexpensive control valve. If higher C_V values are required, refer to SP Series Proportional ball valves.

PVC PP

SERIES: SM2
SIZES: 1/2" – 1"
ENDS: Threaded, Socket, Butt[1] or ChemFlare™ [2]
SEATS: PTFE
O-RINGS: EPDM, FPM (Viton®)

Integral 180° Scale with 5° Increments
- Linear flow control and settable flow rates

features

Precise Linear Flow Control
- Provided by a special V-groove ball and wide handle travel (0° to 180°)

Full Size Range
- 6 valves sizes 1/2" to 2" offers a large selection of C_V values

High End Ball Valve Features
- Full Blocking design
- Double Stem O-Rings for safety
- PTFE seats with elastomer cushion
  - Automatically compensates for seat wear or expansion
- 230 psi pressure rated (PVC)

Low Stem Torques
- Due to floating ball design and cushioned PTFE seats

Bidirectional
- Works with flow in either direction
