ELECTRICALLY OR PNEUMATICALLY ACTUATED

The metering ball valve becomes a proportional control valve with the addition of a Q or E Series electric or P Series pneumatic actuator with 4-20 mA positioner

- Thermoplastic housing and mounting bracket
- Manual override
- Position indication
- Mechanical travel stops
- Different voltages are available

Q Series Electric

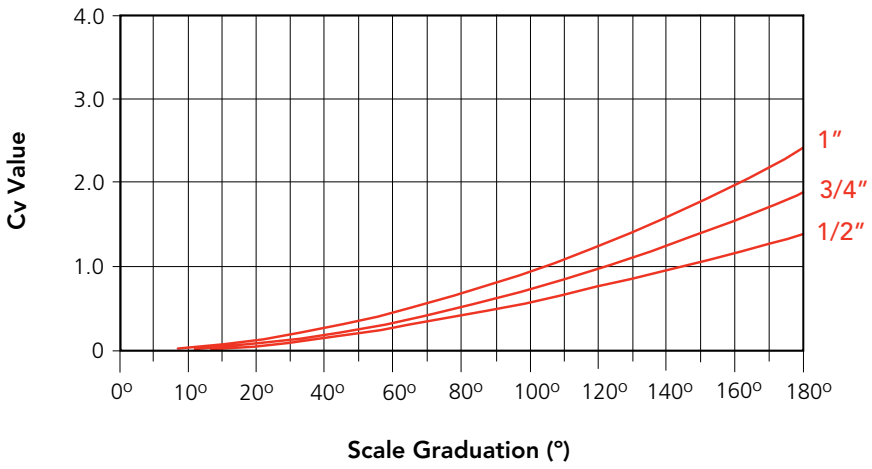
Cv VALUE vs. VALVE OPENING



SAMPLE SPECIFICATION

1. All low flow control valves, 1/2″ to 1″, will be Chemline SM Series metering ball valves.
2. Body material will be PVC or PP, and o-rings will be EPDM or FPM (Viton®).
3. Body will be full blocking design with double stem o-rings for safety, rated at 230 psi maximum working pressure for PVC and 150 psi for PP material.
4. Ball will be floating design, molded solid with a V-groove for linear flow control over a 180° range of handle rotation.
5. Seats will be PTFE with elastomer cushions for positive closure with minimum stem torques and automatic compensation for seat wear and expansion.
6. Position indicating scale will be 0° to 180° with 5° increments for fine flow control and settable flow rates.
7. End connections will be 1/2″ to 1″ ANSI socket or FNPT threaded or 150 lb flanged or butt fusion for Chemline metric PP pipe or ChemFlare™ for PFA tubing.

ORDERING EXAMPLE

Chemline Metering Ball Valves	SM2	A	010	E	S
Valve Material	**A** – PVC	**B** – PP			
Size	**005** – 1/2″	**007** – 3/4″	**010** – 1″		
Seals	**E** – EPDM	**V** – FPM (Viton®)			
Ends	**S** – Socket	**T** – Threaded	**B** – Butt[1]	**CF** – ChemFlare™	

Example: SM2 Series Ball Valve, PVC, 1″, EPDM seals, socket ends.

[1] PP metric butt fusion ends (1/2″ to 2″) connect to Chemline PP piping systems.

VACUUM RATING

- 29.9 inches mercury

OPTIONS & ACCESSORIES

- **Reduced Ends**
- **Electric or Pneumatic Actuator with Positioner**
  – Operates as a linear control valve

MAINTENANCE INSTRUCTIONS
For Chemline Ball Check Valves and Ball Foot Valves Sizes 1/2" to 4"

Maintenance

Refer to dwg. **APR-050** or **ASSEMBLY DRAWING BC-003 rev.0** and proceed as follows:

1. Loosen union nut (5) and remove valve from line.
   (Note: make sure there is no pressure in line prior to removing valve.)

2. **Important** Hold seat/seal (3) in place while removing valve, as the seat, stop ring (6) and ball (2) may fall out.

3. Remove seat (3), stop ring (6) and ball (2). Inspect for excessive wear. The ball should not show signs of wear or deformation.

4. When re-installing ball (2), stop ring (6) and seat (3), check inside body for any foreign debris that may have become lodged in the valve.

5. Replace union nut (5) and tighten.

6. For Foot Valves with strainer baskets, remove basket (7) and clean thoroughly.

ASAHI AV VALVES

(1) General Operating Instructions

Operate the valve within the pressure vs. temperature range.

The valve can be damaged by operating beyond the allowable range.

Select a valve material that is compatible with the media, refer to "CHEMLINE CHEMICAL RESISTANCE GUIDE".

Some chemicals may damage incompatible valve materials.

Do not use the valve on condition that fluid has crystallized.

(The valve will not operate properly.)

Do not step on the valve or apply excessive weight on valve. (It can be damaged.)

Do not exert excessive force in closing the valve.

Make sure to consult a waste treatment dealer to dispose of the valves.

(Poisonous gas is generated when the valve is burned improperly.)

Allow sufficient space for maintenance and inspection.

Keep the valve away from excessive heat or fire. (It can be deformed, or destroyed.)

Do not change or replace valve parts under line pressure.

The valve is not designed to bear any kind of external load. Never stand on or place anything heavy on the valve at anytime.

Using a positive-pressure gas with our plastic piping may pose dangerous condition due to the repellent force peculiar to compressed fluids, even when the gas is under the same pressure as water. Therefore, be sure to take the necessary safety precautions such as covering the piping protective material. For inquiries, please contact us.

(2) General Instructions for Transportation, Unpacking and Storage

Keep the valve in its original packaging until needed for installation.

Avoid contact with any coal tar creosote, insecticides, vermicides or paint.

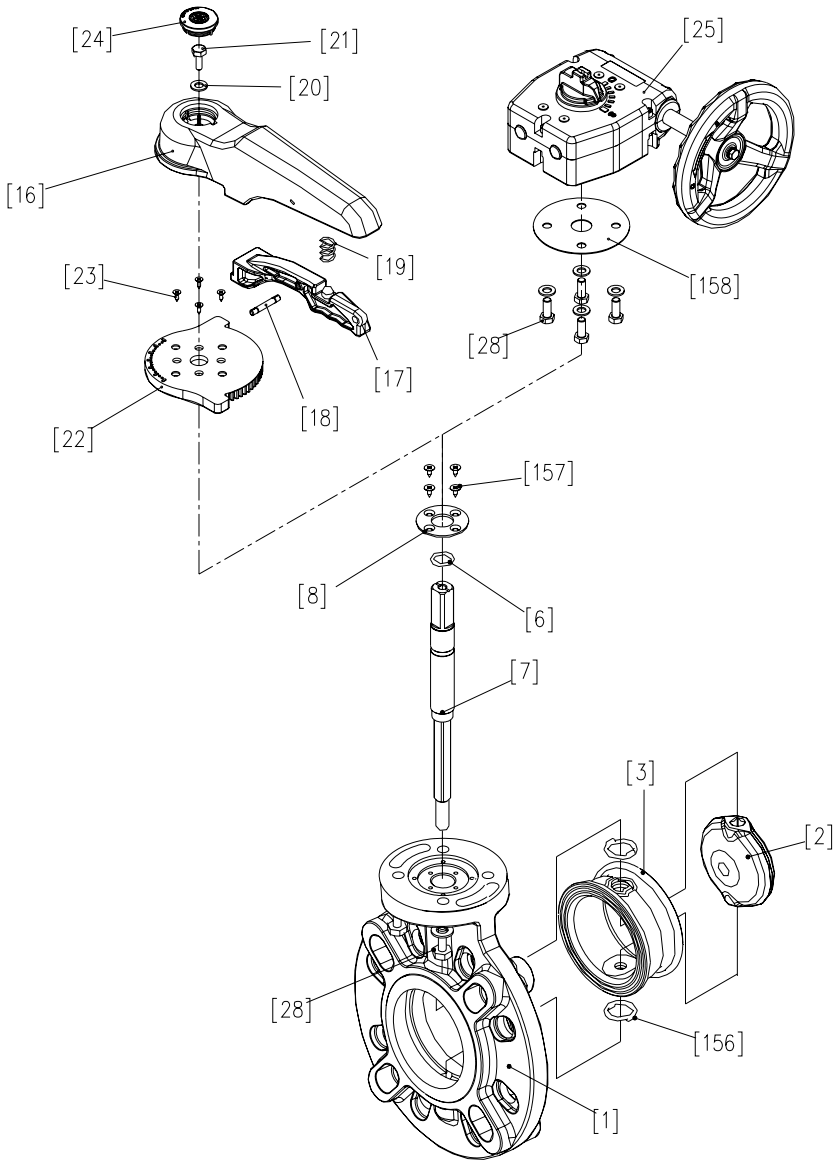
The force of swelling may damage the valve.

The valve is not designed to handle any kind of impact. Avoid throwing or dropping the valve.

Avoid scratching the valve with any sharp object.

(3) Parts description

Type57: 40mm (1-1/2") – 350mm (14")



No.	Description	No.	Description	No.	Description
[1]	Body	[17]	Handle Lever	[24]	Cap (A)

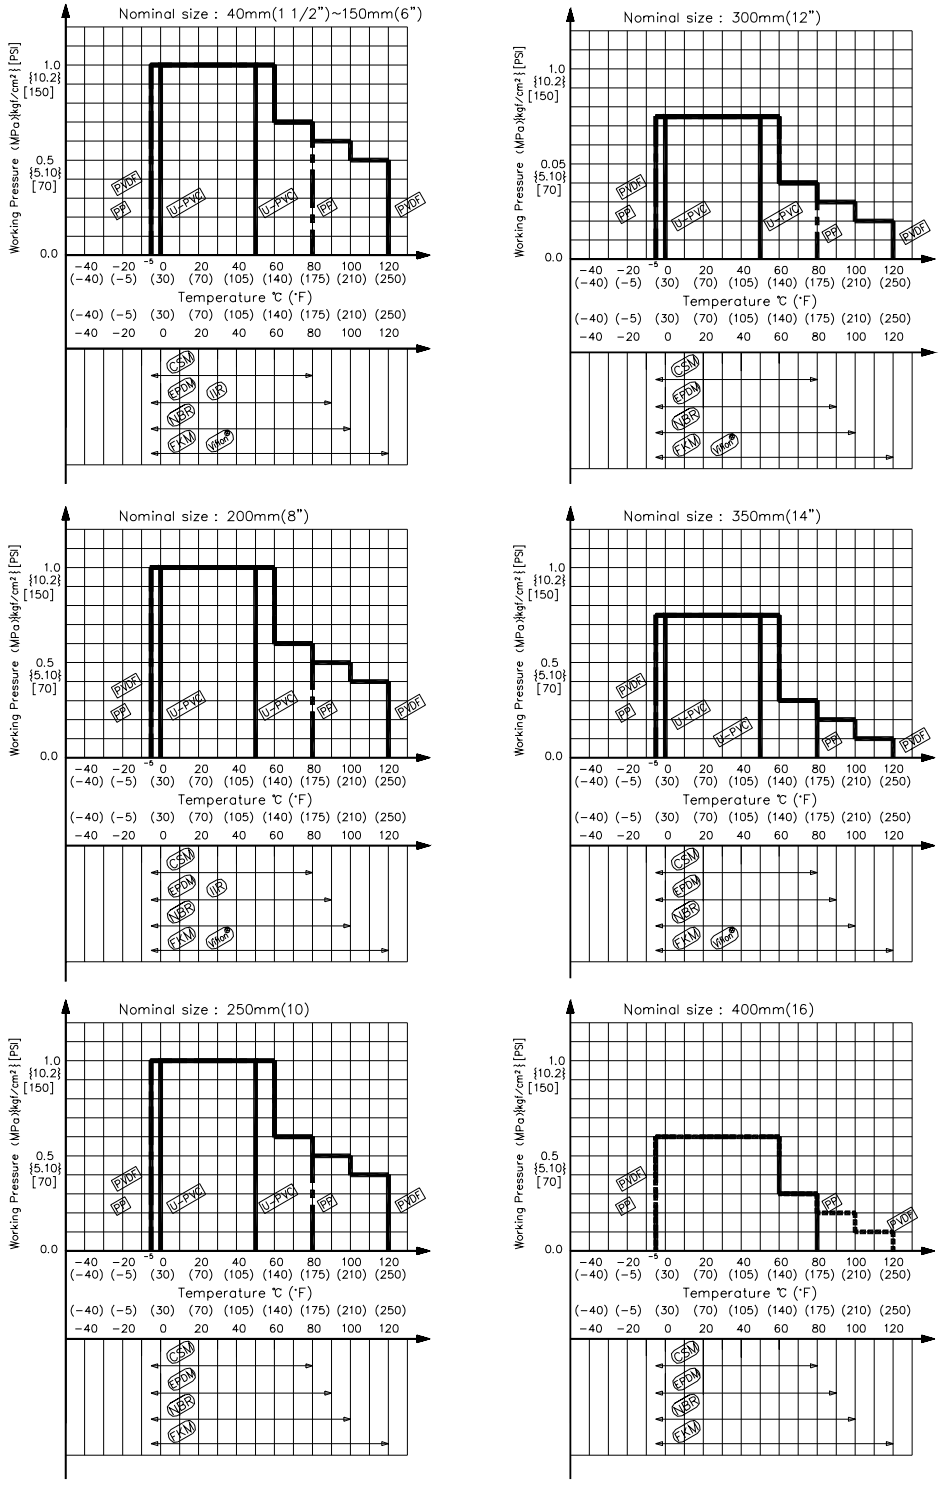
(4) Working Temperature vs. Pressure



Caution

Do not operate the valve beyond the range of working temperature and pressure.
(The valve can be damaged.)

(5) Installation Procedure

⚠ Caution

1) The valve disc is sent in the position indicated by. solid lines in Fig. 5-1 prior to shipment from the factory. If the valve is opened or closed after unpacking, it must be reset in this position before installation. Failure to do so will result in damage to the surface of the valve seat during handling and installation.
2) The valve most not be dropped or thrown against other objects, since the sealing surface of the disc and the sealing surface of the valve seat may easily be damaged.
3) Care must be used during piping installation to ensure that the pipes or flanges are properly aligned so that the valve disc does not contact them in any setting. Misalignment as in Fig.5-2 will result in damage to the valve.
4) The installed valve must never be opened or closed when foreign matter such as sand is present in the pipeline.

Fig. 5-1

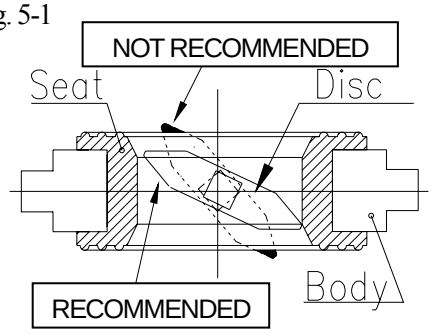


Fig. 5-2

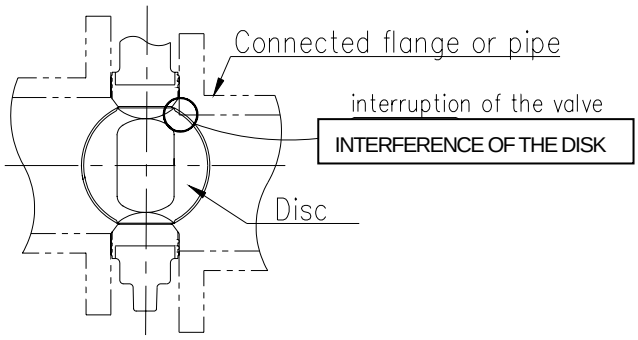
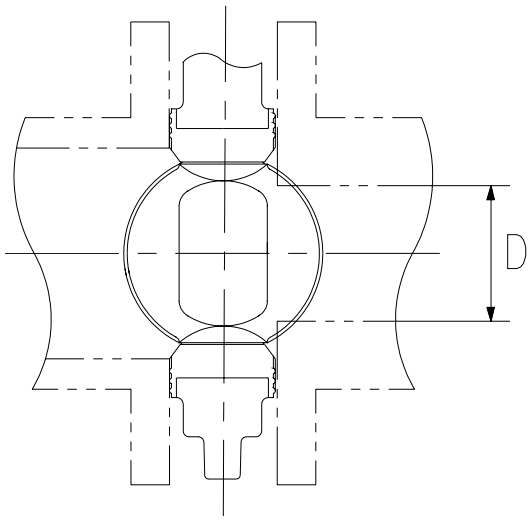


In case of the thick wall of the connection part (flange and pipe) is too thick, shave the flange or the pipe inside in order to avoid the contact of pipe and disc. If inside diameter of the connection part is larger than size D, shaving is not necessity.



Nominal Size	Diameter D
40mm (1 1/2”)	30mm (1.18”)
50mm (2”)	44mm (1.73”)
65mm (2 1/2”)	67mm (2.64”)
80mm (3”)	71mm (2.80”)
100mm (4”)	90mm (3.54”)
125mm (5”)	115mm (4.53”)
150mm (6”)	136mm (5.35”)
200mm (8”)	179mm (7.05”)
250mm (10”)	237mm (9.33”)
300mm (12”)	289mm (11.38”)
350mm (14”)	340mm (13.39”)
400mm (16”)	370mm (14.57”)

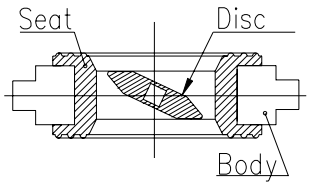
Necessary items

- Torque Wrench
- Spanner Wrench

Procedure

Caution

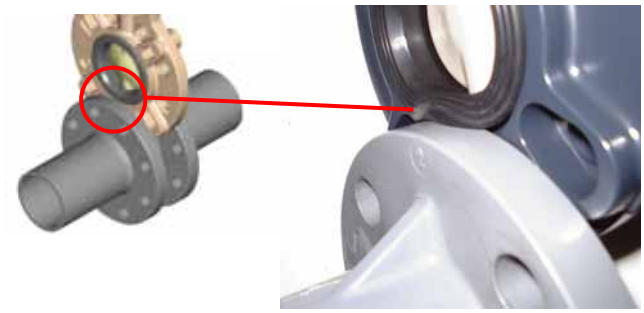
The disk [2] is prevented from overflowing. (The disk [2] is damaged.)



1) Install the valve between flanges and open the valve slightly.
2) Insert bolts, set nuts and washer and tighten the bolts and nuts temporarily by hand.

Caution

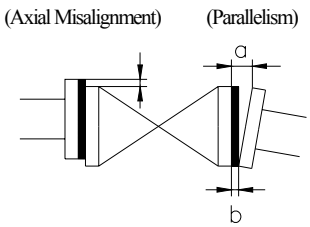
When you insert a valve between flanges, please insert after extending the fields of flanges fully.
(If you insert a valve by force without fully extending fields of flanges, a liner may be turned over and suffer a crack..)



The parallelism and axial misalignment of the flange surface should be under the values shown in the following table to prevent damage the valve. (A failure to observe them can cause destruction due to stress application to the pipe)

Unit : mm (inch)

Nom. Size	Axial Misalignment	Parallelism (a – b)
40 - 80mm (1 1/2”-3”)	1.0 (0.04)	0.8 (0.03)
100-150mm (4”-6”)	1.0 (0.04)	1.0 (0.04)
200-400mm (8”-16”)	1.5 (0.06)	1.0 (0.04)

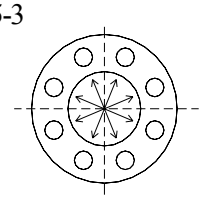


3) Tighten the bolts and nuts gradually with torque wrench to the specified torque in a diagonal manner. (Refer to Fig. 5-3)

Recommended torque value Unit N-m kgf-cm [lb-inch]

Nom. Size	40mm (1 1/2”)	50, 65mm (2”,2 1/2”)	80, 100 mm (3”,4”)
Torque value	20.0 {204} [177]	22.5 {230} [200]	30.0 {306} [266]

Fig. 5-3



Nom. Size	125, 150 mm (5”,6”)	200, 250 mm (8”,10”)	300, 350 mm (12”,14”)	400 mm (16”)
Torque value	40.0 {408} [355]	55.0 {561} [488]	60.0 {612} [532]	80.0 {816} [710]

Caution : Avoid excessive tightening. (The valve can be damaged.)

Caution

The gasket is unnecessary. (The seat [3] carries out the role of the gasket.)

(6) Operating Procedure

Caution

The lever operation and the steering wheel operation are done by the hand.

1) Open and close the valve by turning handle smoothly.
   Turn clockwise to close and counterclockwise to open.
2) In case of lever type (40-200 mm{1 1/2"-8"}), the direction of handle is same as the disc as shown in Fig. 6-1.
   For the full-shut (Close) position, the handle is perpendicular to the piping axis direction.
   For the full-opened position, the handle is parallel to the piping axis direction.

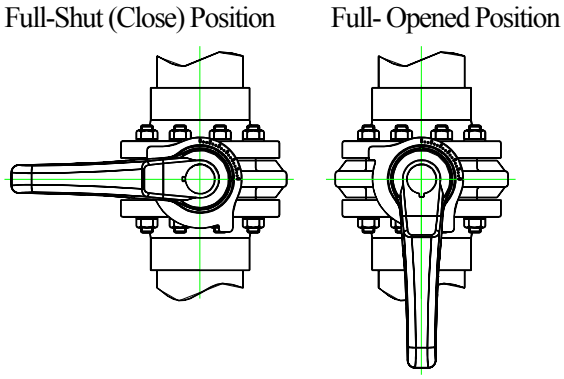

Fig. 6 – 1

3) In case of gear type (40-400 mm {1 1/2"-16"}), the indicator shows the position of the disc on the top of gear box. (Fig.6-2)
   For the full-shut (close) position, the indication shows Shut (S).
   For the full-opened position, the indication shows Open (O).

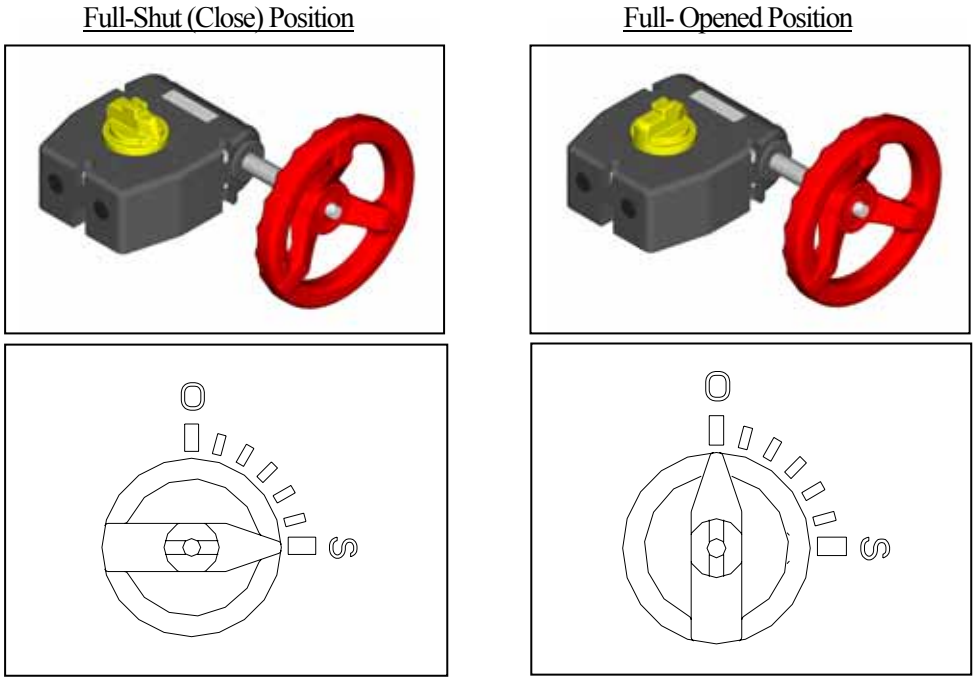

Fig. 6 – 2

Technical Data for Operation

Nom. Size	Stem Torque (N m)		Required Hand-Wheel Torque (N m)		Length of Lever and Diameter of Handle (mm)		Required Operating Force (N)	
	Peak	Seal	Peak	Seal	Lever	Gear	Lever	Gear
40mm (1 1/2")	5	5	0.4	0.4	220	80	23	5.0

400mm (16")	930	780	63	53	-	150	-	353

Note : Data mentioned in the table above is reference only.

These data are measured in standard condition and it slightly differs depending on conditions.

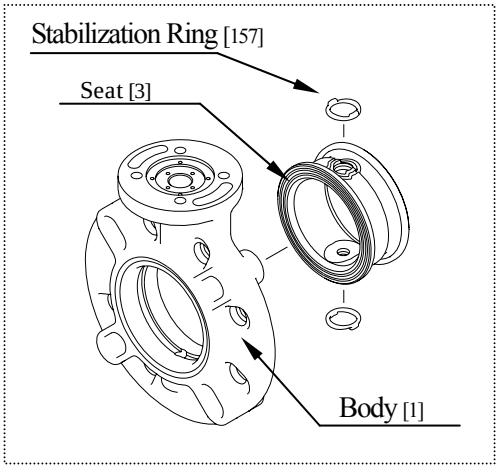
(7) Disassembly and Assembly Procedure for Parts Replacement

Necessary items

- Protective Gloves
- Goggles
- Spanner Wrench
- Vise
- Grease (Silicone)
- Square Lumber
- Circular Stick (Plastic or Wood)
- Pressing Machine
- Hammer
- Screw Driver (+)
- Screw Driver (–)

Caution

Wear protective gloves and goggles in case some dangerous fluid remains in the valve body.
(You might be injured by working without them.)
The handle part can be removed with line pressure present. The locking plate [22] can't be removed with line pressure present. If locking plate [22] needs to be removed, there can not be line pressure present.



<< Disassembly >>

Procedure

1) Drain fluid completely from the pipeline.
2) Leave the valve slightly opened.
3) Loosen the connecting bolts and nuts.
4) Remove the valve from the pipeline.

Lever Type <Nominal size 40mm-200mm (1 1/2"-8")

5) To remove handle[16], first take off the cap [24] by using screw driver (–) and release bolt [21] by using socket wrench, then pull up the handle [16] while holding handle lever[17].
6) To take off locking plate [22], release 4 self-tapping screws [23] by using screw driver(+) and take off stem holder[8].

Gear Type <Nominal size 40mm-400mm (1 1/2"-16")

5) Loosen set bolt [28] for gear box [25] and pull off the gear box upward with gasket [158].
6) <Nominal size 40mm-350mm (1 1/2"-14") *It advances 400mm (16") as follows.>
To take off stem holder [8]. Release 4 tapping screws [157] by using screw driver (+).

Lever & Gear Type

7) Hold flat surface of Stem [7] with vise and pull off valve body[1].
8) (A) Set the valve body [1] on square lumbers at edges of valve body on the press and put a lumber on the disc[2]. Operate the press slowly and push disc [2] and seat [3] out if the valve body[1].
(B) Set the valve body [1] on square lumbers at edges of valve body and put a circular stick on the disc[2]. Strike the circular stick with a hammer and remove disc [2] and seat [3] out of the valve body[1].
9) Set the disc [2] parallel to the working desk to half opened position. Push the seat[3], and remove the disc[2].
10) <Nominal size 40mm-350mm (1 1/2"-14") *It advances 400mm (16") as follows.>
Remove the stabilization ring [156] and the O-ring(C) [6]from the stem[7].

<< Assembly >>

Procedure

1) Put the O-ring(C) [6]onto the stem[7].
2) Before starting assembly, grease (Silicone) should be spread on the top and bottom disc[2], the stem hole of the seat [3] and the stem O-ring(C)[6].
3) <Nominal size: 40mm-350mm(1 1/2"-14") *It advances 400mm (16") as follows.>
   Insert the stabilization ring [156] into the upper side slot of the seat [3]. The upper side slot of seat [3] has larger stem hole than lower side.

⚠ Caution

Make certain tabs are properly aligned. Both upper and lower stabilization ring [156] are identical.

4) Insert the stem [7] about 1/3 into the body [1]. Install the seat [3] into the body [1] by aligning upper seat stem hole with the stem [7].
5) Collapse the left or right side of seat [3] in towards opposing side exposing lower stem hole by screw driver (–).
   <Nominal size: 40mm-350mm (1 1/2"-14") *It advances 400mm (16") as follows.>
   Install the stabilization ring [156] into the body [1] aligning tabs of ring with center groove of the body [1]. Seat [3] tabs should line up when bottom of seat is reset into body of valve.
6) Remove the stem [7].
7) Reset the seat [3] into the body [1].

⚠ Caution

<Nominal size: 40mm-350mm(1 1/2"-14") *It advances 400mm (16") as follows.>
Make certain stabilization rings [156] sit flush inside of seat [3] with tabs properly aligned. If stabilization rings [156] are not installed correctly, the seat [3] will not sit in the body [1] properly. This is indicated by a visible gap between seat [1] and body [1], and disc [2] will not fit properly.

8) To install disc [2], make certain valve size on disc [2] is in upright direction. Install top of disc [2] into seat [3] aligning with upper stem hole.
9) Rotate disc [2] to 75% (Approx.) closed position and install stem [7] about 50% into the body [1].
10) Press in bottom of disc [2] to lower stem hole.

⚠ Caution

Look into valve body [1] to be certain full square in disc [2] is centered with upper valve [1] stem hole. If not, repeat step 8), 9), and 10).
Make certain line scribed on top of stem [7] indicates disc [2] position while installing stem [7].

11) Install the stem [7] into valve body [1] and disc [2]. If disc [2] is properly aligned, stem [7] should slide in smoothly. If stem [7] does not slide in smoothly, report from step 8) to properly align the disc [2] in the valve body [1].
12) <Nominal size: 40mm-350mm(1 1/2"-14") *It advances 400mm (16") as follows.>
    Install stem holder [8] onto valve body [1] with countersunk holes facing up using 4 screws [157].
13) To install lever or gear operator reverse disassembly procedure #5).
14) After assembly, make sure that the valve can be fully opened and closed smoothly.

(8) Installation procedure for handle

Necessary items

- ●Plastic Hammer
- ●Socket Wrench
- ●Screw Driver
- ●Goggles
- ●Protective Gloves

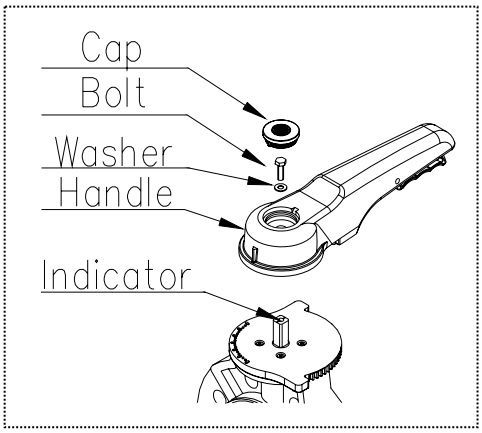
⚠ Caution

Do not give any unjust force to cap, in installing or removing the cap.
It can be damaged

Installation

Procedure

1) Install the handle on the stem. Set the direction of handle in the indication line at the top of stem.
2) Fix the handle at the top of stem with the attached bolts and washer by using socket wrench.
3) Set the convex part at the side of the cap and the concave of the handle, and set in the cap by striking lightly by using a plastic hammer.

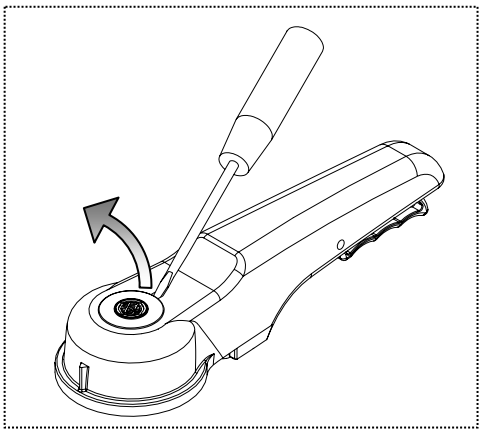


Nominal Size	40-100mm (1 1/2"-4")	125-200mm (5"-8")
Bolt Size	M6×15L	M8×15L
Socket Size	10	13

Remove

Procedure

1) To remove the cap, push up the side of the cap by using a screw driver
2) Loose the bolts and washer by using a socket wrench, then remove the handle.

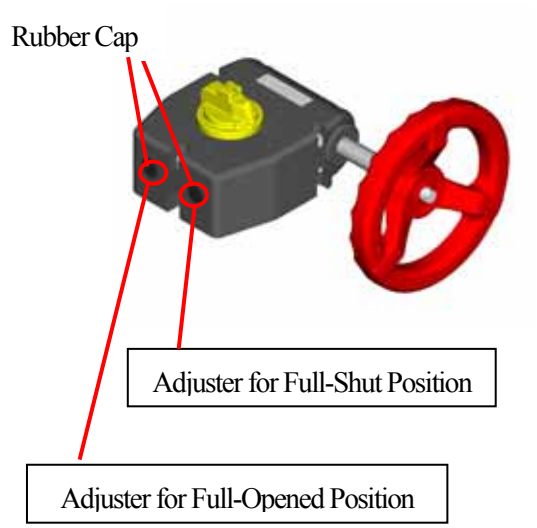


(9) Adjustment Procedure for Stopper Gear Type

Necessary Items

- Hexagon Wrench

The adjustments for full-opened and full-shut position are step-less, and it can be done with the stopper adjuster.



Adjustment for Full-shut (Full-opened) position

1) Remove the rubber cap of Full-closing (Full-opening) adjuster.
2) Loosen the first stopper hex-bolt completely by Hex. Wrench.
3) Adjust the disc of valve to required position.
4) Tighten the stopper hex-bolts.
5) Put the rubber cap of Full-closing (Full-opening) adjuster back on gearbox.

(10) Inspection Items

Inspect the following items.

(1)	Check for flaw, crack, or deformation on the valve.
(2)	Check for leaks to the outside.
(3)	Check for the deformation of seat due to improper installation of valve.
(4)	Check for the smoothness of handle operation..

(11) Troubleshooting

Phenomenon	Cause	Treatment
Fluid is not stopped in the full closed position at the seat.	1) The stopper is not set correctly. 2) The seat is damaged or worn. 3) Foreign materials are caught. 4) The disc is damaged or worn. 5) The connecting bolts are over tightened or tightened unevenly.	Adjust the stopper. Replace the seat. Clean it up. Replace the disc. Adjust and retighten.
Fluid leaks to the outside.	1) The seat is damaged or worn. 2) The connecting bolts are not tightened in proper torque or evenly.	Replace the seat. Adjust and retighten.
The handle does not work smoothly.	1) Foreign materials have adhered. 2) The gear box is damaged. 3) The connecting bolt is over tightened.	Clean it up. Repair or replace. Adjust and retighten.
Valve does not operate	1) The gear box is damaged 2) The stem is damaged.	Repair or replace. Replace the stem.

(12) Handling of Residual and Waste Materials

⚠ Caution

Make sure to consult waste treatment dealer to dispose valves.
(Poisonous gas is generated when the valve is burned improperly.)

DESCRIPTION

Ces actionneurs électriques ont été conçus pour permettre le pilotage d'une vanne 1/4 tour. Pour tout autre application, nous consulter préalablement. Nous ne pouvons être tenus responsables en cas d'autre utilisation.

TRANSPORT ET STOCKAGE

- Les transporteurs étant responsables des avaries et des retards de livraison, les destinataires doivent émettre des réserves, le cas échéant, avant de prendre livraison des marchandises. Les envois directs d'usine sont soumis aux mêmes conditions.
- Le transport sur site est effectué dans un emballage rigide.
- Les produits doivent être stockés dans des endroits propres, secs et aérés, de préférence sur des palettes de manutention ou sur des étagères.

MAINTENANCE

- La maintenance est assurée par notre usine. Si le matériel ne fonctionne pas, vérifier le câblage suivant le schéma électrique et l'alimentation de l'actionneur électrique concerné.
- Pour toute question, prendre contact avec le service après-vente.
- Pour nettoyer l'extérieur de l'appareil, utiliser un chiffon (et de l'eau savonneuse).
  NEPAS UTILISER D'AGENT A BASE DE SOLVANT OU D'ALCOOL

GARANTIE

- 100% des actionneurs ont été testés et réglés en usine.
- Ces produits sont garantis 2 ans ou 50000 manœuvres contre tous vices de fabrication et de matière, à partir de la date de livraison (facteur de service et classe du modèle suivant la norme CEI34).
- Cette garantie n'est valable que dans le cas où le matériel aura été, entre temps, ni démonté, ni réparé. Cette garantie ne s'étend pas à l'usure provoquée par suite de chocs ou maladresse, ainsi que par l'utilisation du matériel dans les conditions qui ne seraient pas conforme à ses caractéristiques. Cette garantie est strictement limitée au remplacement de la ou des pièces d'origines reconnues défectueuses, par nos services, après expertise. Les frais de port aller et retour, ainsi que la main d'œuvre, restent à la charge du client. Aucune responsabilité ne serait nous incomber au sujet des accidents ou risques directs ou indirects découlant d'une défectuosité de nos matériels. La garantie ne couvre pas les conséquences d'immobilisation et exclut tout versement d'indemnité. Les accessoires et adaptations ne sont pas couverts par cette garantie. Au cas où le client n'aurait pas réalisé ponctuellement les paiements stipulés aux échéances convenues, notre garantie sera suspendue jusqu'au paiement des échéances en retard et sans que cette suspension puisse augmenter la durée de la garantie à la mise à disposition.

RETOUR DE MARCHANDISE

- L'acheteur est tenu de vérifier au moment de la livraison la conformité de la marchandise par rapport à sa définition.
- L'acceptation par l'acheteur de la marchandise dégage le fournisseur de toute responsabilité, si l'acheteur découvre une non-conformité postérieurement à la date d'acceptation. Dans un tel cas, les frais de mise en conformité seront à la charge de l'acheteur qui supportera également seul, les conséquences financières du dommage. Les retours des marchandises sont acceptés que si nous les avons préalablement autorisés : ils doivent nous parvenir franco de tous frais à domicile et ne comporter que des produits dans leur emballage d'origine. Les marchandises rendues sont portées au crédit de l'acheteur, déduction faite des 20% de reprise du matériel calculé sur la base du montant initial des marchandises retournées.

CONSIGNES DE SECURITE

A lire avant toute installation du produit

- L'alimentation électrique doit être coupée avant toute intervention sur l'actionneur électrique (avant de démonter le capot ou de manipuler la commande manuelle de secours).
- Toute intervention doit être effectuée par un électricien qualifié ou une personne formée aux règles d'ingénierie électrique, de sécurité et tout autre directive applicable.
- Respecter impérativement l'ordre des consignes de raccordement et de mise en service décrites dans le manuel sans quoi le bon fonctionnement n'est plus garanti. Vérifier les indications portées sur la plaque d'identification de l'actionneur : elles doivent correspondre à votre réseau électrique d'alimentation.

- Ne pas monter l'actionneur « tête en bas ».
Risques encourus :
Disfonctionnement du mécanisme de débrayage
Possible écoulement de graisse sur la partie électronique

- Ne pas monter l'actionneur à moins de 30 cm d'une source de perturbations électromagnétiques

INSTRUCTIONS AND SECURITY

DESCRIPTION

These electric actuators have been designed to perform the control of a valve with 90° rotation. Please consult us for any different application. We cannot be held responsible if the mentioned actuators are used in contradiction to this advice.

TRANSPORT AND STORAGE

- The forwarding agents being held as responsible for damages and delays of the delivered goods, the consignees are obliged to express if applicable their reserves, prior to accept the goods. The goods delivered directly ex works are subject to the same conditions.
- The transport to the place of destination is carried out by using rigid packing material.
- The products must be stored in clean, dry, and ventilated places preferably on appropriate palettes or shelves.

MAINTENANCE

- Maintenance is ensured by our factory. If the supplied unit does not work, please check the wiring according to the electric diagram as well as the power supply of the concerned electric actuator.
- For any question, please contact our after-sales service.
- To clean the outside of the actuator, use a lint and soapy water.
  DO NOT USE CLEANING PRODUCT WITH SOLVENT OR ALCOHOL

GUARANTEE

- 100% of the actuators are fully tested and set in the factory.
- These products are guaranteed two years from the delivery date or 50,000 operating cycles against all types of manufacturing and material faults (operating time and model class according to standard CEI34).
- This guarantee will only be valid if the unit has not been disassembled or self-repaired during its service life. It does not cover any wear and damage caused by shocks or faulty operation neither by the use of the unit under conditions not in accordance with its nominal characteristics. The guarantee is strictly limited to the replacement of original parts found defective on checking by our service personnel. The cost of shipping to our premises, the return of devices to the customer as well as the repair cost will be chargeable. We will not assume the responsibility for any direct or indirect accidents/risks originated by a failure of our products. The guarantee does not cover the consequences of breakdown and excludes any payments for indemnities. The accessories and adaptations are excluded from the guarantee. In the case where a customer has not proceeded to payments within the agreed period, our guarantee will be suspended until the delayed payments have been received and with the consequence that this suspension will not prolong the guarantee period in any case.

RETURN OF GOODS

- The customer is obliged to check the conformity of the goods with regard to their definition at the time of delivery.
- The acceptance of the goods by the purchaser disclaims the supplier of all responsibility if the purchaser discovers any non-conformity after the date of acceptance. In such case, the repair cost will be borne by the purchaser who will also exclusively bear all financial consequences of any resulting damage. Returned goods will only be accepted if our prior agreement has been given to this procedure : the goods must be sent free of all cost and being shipped solely and in their original packing. The returned goods will be credited to the purchaser with a reduction of 20% on the unit's price charged in accordance with the original invoice of the returned goods.

SAFETY INSTRUCTIONS To be read prior to the installation of the product

- The electric power supply must be switched-off before any intervention on the electric actuator (i.e. prior demounting its cover or manipulating the manual override knob).
- Any intervention must only be carried out by a qualified electrician or other person instructed in accordance with the regulations of electric engineering, safety, and all other applicable directives.
- Strictly observe the wiring and set-up instructions as described in the manual: otherwise, the proper working of the actuator can not be guaranteed anymore. Verify that the indications given on the identification label of the actuator fully correspond to the characteristics of the electric supply.

- Do not mount the actuator « upside down ».
Risks:
Declutching mechanism failure
Possible flow of the grease on the electronic board

- Do not mount the actuator less than 30 cm of a electromagnetic disturbances source.

BESCHREIBUNG

Die elektrischen Stellantriebe wurden entwickelt, um Ventile mit Vierteldrehung zu steuern. Bitte ziehen Sie uns vor jeder anderen Verwendung zur Rate. Für jeglichen weitergehenden Einsatz können wir keine Verantwortung übernehmen.

TRANSPORT UND LAGERUNG

- Da die Spediteure für Schäden und Lieferverspätungen verantwortlich sind, müssen die Empfänger gegebenenfalls vor Annahme der Waren Vorbehalte äußern. Lieferungen direkt ab Werk unterliegen den gleichen Bedingungen.
- Der Transport vor Ort erfolgt in einer festen Verpackung.
- Die Lagerung muss an einem sauberen, gelüfteten und trockenen Ort erfolgen, bevorzugt auf Transportpaletten oder in Regalen.

WARTUNG

- Die Wartung wird in unserem Werk vorgenommen. Falls das Material nicht funktioniert, überprüfen Sie bitte die Kabelanschlüsse nach dem Schaltplan und die Stromzufuhr des betreffenden elektrischen Stellantriebes.
- Bei Fragen wenden Sie sich bitte an den Kundendienst.
- Verwenden Sie zur Außenreinigung des Antriebs ein Tuch und Seifenlösung.
  BITTE NIE LÖSUNGSMITTEL ODER ALKOHOLHALTIGE MITTEL ZUR REINIGUNG BENUTZEN.

GARANTIE

- 100% der Stellantriebe werden im Werk geprüft und eingestellt.
- Die Produkte unterliegen einer Garantie von zwei Jahren oder 50000 Bedienvorgängen bezüglich allen Herstellungs- und Materialfehlern, vom Datum der Auslieferung an (Einschaltdauer und Modellklasse nach Norm CEI34).
- Diese Garantie tritt nur in Kraft, wenn die Ware zwischenzeitlich weder repariert noch zerlegt worden ist. Sie bezieht sich weder auf Verschleiß durch Stöße oder Fehlbedienung noch auf den Einsatz des Materials unter nicht geeigneten Bedingungen. Diese Garantie ist eingeschränkt auf den Ersatz des oder der Originalteile, die von uns nach Begutachtung als defekt anerkannt wurden. Die Frachtkosten für Hin- und Rückweg sowie der Arbeitslohn obliegen dem Kunden. Wir übernehmen keinerlei Verantwortung bezüglich Unfällen oder direkten oder indirekten Risiken, die sich aus einem Defekt unserer Waren ergeben. Die Garantie deckt die Folgen eines Stillstandes nicht ab und schließt jede Entschädigungs-zahlung aus. Zubehör und Umbauten fallen nicht unter die Garantie. Für den Fall, daß der Kunde zeitweise nicht den Zahlungen zu den vereinbarten Fälligkeiten nachgekommen ist, wird die Garantie bis zur Zahlung der verspäteten Fälligkeiten ausgesetzt, ohne daß diese Unterbrechung die Dauer der gewährleisteten Garantie verlängert.

RÜCKSENDUNG VON WAREN

- Der Käufer ist gehalten, bei Erhalt der Ware die Übereinstimmung mit den Vorgaben zu überprüfen.
- Die Annahme der Ware durch den Käufer befreit den Lieferanten von jeglicher Verantwortung, falls der Käufer eine Reklamation nach dem Zeitpunkt der Annahme feststellt. In einem solchen Fall obliegen dem Käufer allein die Kosten für die Beseitigung sowie die Folgekosten des Schadens. Warenrücksendungen werden nur angenommen, wenn wir sie zuvor genehmigt haben: sie müssen frei Haus, ohne jegliche Gebühren, an unseren Firmensitz geliefert werden und dürfen ausschliesslich originalverpackte Ware enthalten. Die zurückgesendeten Waren werden dem Käufer gutgeschrieben, abzüglich 20% Warenrücksendungspauschale, veranschlagt auf Grundlage des ursprünglichen Rechnungsbetrags der zurückgesandten Waren.

ANLEITUNG UND SICHERHEITSHINWEISE

Vor jeglicher Installation des Produktes zu lesen

- Die Stromzufuhr muss vor jeglichem Eingriff am elektrischen Stellantrieb unterbrochen werden (bevor die Haube abgenommen oder die Handnotbetätigung bedient wird).
- Jeglicher Eingriff darf nur von qualifizierten Elektrikern oder von nach den Regeln der Elektrotechnik, der Sicherheit und allen anderen anwendbaren Normen geschultem Personal vorgenommen werden.
- Beachten Sie unbedingt die Reihenfolge der Anweisungen zum Anschliessen und zur Inbetriebnahme, welche im Handbuch beschrieben werden, ansonsten wird die einwandfreie Funktion nicht gewährleistet. Überprüfen Sie die Angaben auf dem Typenschild des Stellantriebes : sie müssen Ihrer Stromversorgung entsprechen.

- Antrieb nie uber Kopf einbauen
Risiken:
Störung der Kupplung des Antriebes
Mögliche Fettleckage auf die elektronische Karte

- Immer einen Mindestabstand von 30cm zu einer elektromagnetischens Störquelle einhalten .

INSTRUCCIONES Y SEGURIDAD

DESCRIPCIÓN

Estos actuadores eléctricos han sido concebidos para permitir el pilotaje de válvulas 1/4 de vuelta. Para otra aplicación, consultarnos. No podemos valorar responsabilidad en caso de otra utilización.

TRANSPORTE Y ALMACENAMIENTO

Al ser responsables los transportistas de averías y retrasos de entrega, los destinatarios deben emitir reservas, si llega el caso, antes de tomar entrega de las mercancías. Los envíos directos de fábrica están sometidos en las mismas condiciones.

- El transporte sobre sitio es efectuado en un embalaje rígido.
- Los productos deben ser almacenados en lugares limpios, secos y airados, preferentemente sobre paletas de manutención o sobre estanterías.

MANTENIMIENTO

- El mantenimiento es asegurado por nuestra fábrica. Si el material no funciona, verificar que el cableado, sigue el esquema eléctrico y la alimentación del actuador eléctrico concernido.
- Para toda pregunta, entrar en contacto con servicio posventa.
- Para limpiar el exterior del actuador, utilizar un trapo, y del agua jabonosa.
  NO UTILIZAR PRODUCTO DE LIMPIEZA CON DISOLVENTE O ALCOHOL

GARANTÍA

- El 100% de los actuadores están sometidos a un testigo y vienen ajustados de fábrica.
- Este producto es garantizado 2 años o 50000 maniobras contra todo vicio de fabricación y de materia, a partir de la fecha de entrega (factor de servicio y clase del modelo, sigue la norma CEI34).
- Esta garantía es valida tan solo en caso de que el material habrá sido, entre tanto, ni desmontado, ni reparado. Esta garantía no se extiende al desgaste provocado por choques o torpeza, así como por la utilización del material en las condiciones que serian conformes a sus características. Esta garantía es estrictamente limitada a la sustitución de una o varias piezas de orígenes reconocidas defectuosas por nuestros servicios, después de sometirlos a un control de expertos. Los gastos de transportes ida y vuelta así como la mano de obra, se quedan al cargo del cliente. Ninguna responsabilidad debe incumbirnos respeto a los accidentes o los riesgos directos o indirectos que emanarían de una defectuosidad de nuestros materiales. La garantía no cubre las consecuencias de inmovilización y excluye todo pago de indemnidad. Los accesorios y las adaptaciones no son cubiertos por esta garantía. En caso de que el cliente no habría realizado puntualmente los pagos estipulados a los vencimientos convencionales, nuestra garantía será suspendida hasta el pago de los vencimientos tardes y sin que esta suspensión pueda aumentar la duración de la garantía a la disposición.

DEVOLUCIÓN DE LA MERCANCÍA

- El comprador debe verificar al momento de la entrega la conformidad de la mercancía en relación a su definición.
- La aceptación por el comprador de la mercancía suelta al proveedor de toda responsabilidad; igual que si el comprador descubre una non conformidad posteriormente a la fecha de aceptación. En tal caso, los gastos de devolución para conformidad están a cargo del comprador que soportara también las consecuencias financieras del daño. Las devoluciones de las mercancías son aceptadas que si previamente las autorizamos: deben llegar sin cargo a nuestro domicilio y comportar solamente productos dentro sus embalajes de origen. Las mercancías devueltas son abonadas a cuenta del comprador, deducción hecha de 20% por devolución del material, calculado sobre el importe inicial de las mercancías devueltas.

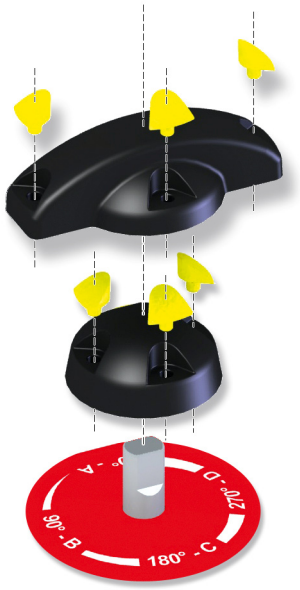
CONSEJOS DE SEGURIDAD ⚠ A leer antes de toda instalación del producto.

- La alimentación eléctrica debe ser cortada antes de toda intervención sobre el actuador eléctrico (antes de desmontar la tapa o de manipular el mando de socorro).
- Toda intervención debe ser efectuada por un electricista cualificado o una otra persona formada a las reglas de seguridad y otras directivas aplicables.
- Respetar obligatoriamente el orden de las consignas de conexión y de las puestas en marcha descritas en el manual al fin de garantizar el buen funcionamiento. Verificar las indicaciones puestas sobre la placa de identificación del actuador : deben corresponder a su red eléctrico de alimentación.

- No montar el actuador "cabeza de bajo"
Riesgos incurridos :
Avería del mecanismo de desembrague
derrame Posible de grasa sobre la tarjeta electrónica

- No montar el actuador por menos de 30 cm de una fuente de perturbaciones electromagnéticas

INDICATEUR DE POSITION



Indicateur modulable, livré avec 5 repères de signalisation (3 jaunes + 2 noirs), à positionner en fonction du type de vanne à piloter.

Modular position indicator with three removable position markers **(3 yellow + 2 black)**, *adjustable according the type of valve to be actuated.*

Stellungsanzeige mit 5 einstellbaren Markierungsknöpfen (3 gelbe + 2 schwarze), die je nach Armaturtyp zu positionnieren sind

Indicador modulable, entregado con 5 marcas de señalización (3 amarillos y 2 negros), a colocar con arreglo al tipo de válvula a maniobrar

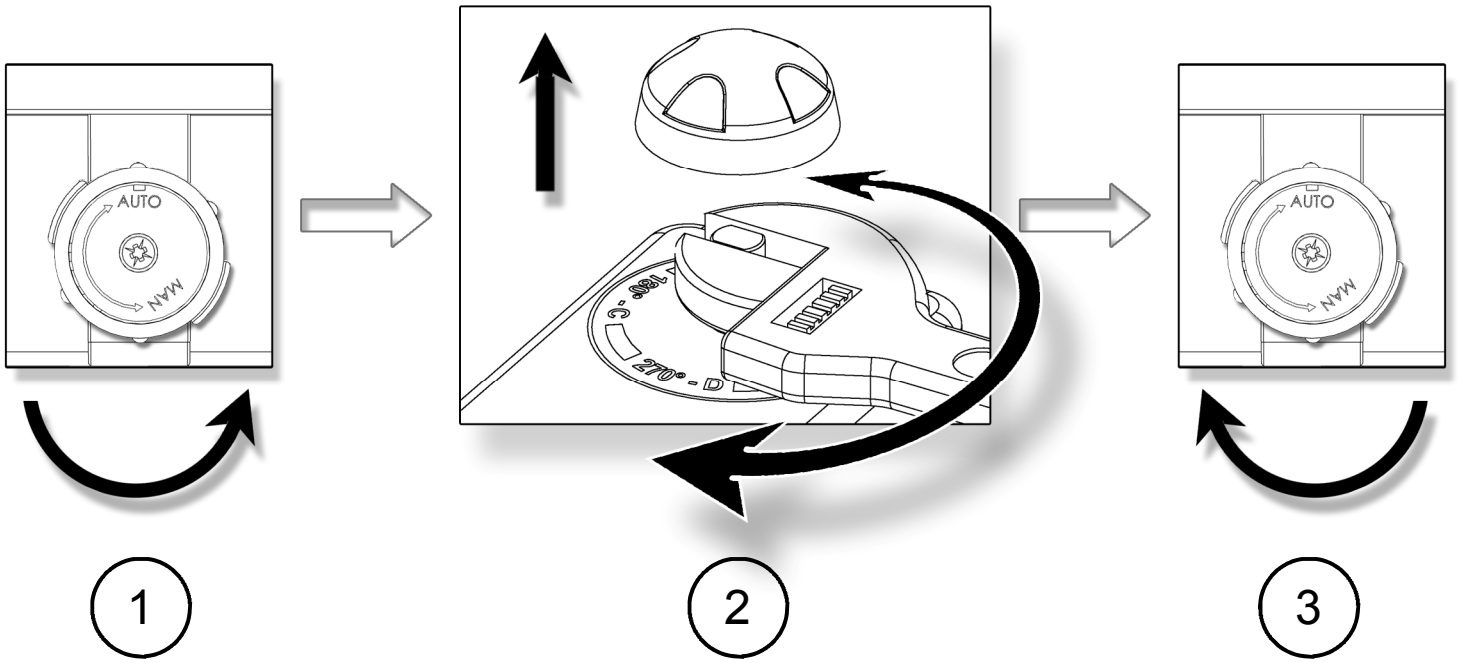
COMMANDE MANUELLE DE SECOURS



FR

L'actionneur fonctionne en priorité électrique. S'assurer que l'alimentation est coupée avant de le manœuvrer manuellement.

1. Tourner le bouton de débrayage vers la position MAN (sens antihoraire) et le maintenir dans cette position.
2. Tourner l'axe sortant de l'actionneur à l'aide d'une clé à molette.
3. Pour revenir en position automatique, relâcher le bouton de débrayage (rappel par ressort).

GB

The priority functionning mode of this actuator is electric. Be sure than the power supply is switched off before using the manual override.

1. Turn the knob to position MAN (counter-clockwise) and hold it in position.
2. Turn the outgoing drive shaft of the actuator with the help of an adjusting spanner.
3. In order to re-engage the reduction, release the knob (spring return).

D

Die Priorität der Funktion des Antriebs ist Automatikbetrieb. Bitte prüfen, dass die Stromversorgung abgeschaltet ist bevor der Antrieb von Hand betätigt wird .

1. Stellen Sie den Schalter auf MAN (gegen den Uhrzeigersinn) um und halten Sie ihn in dieser Position.
2. Drehen Sie die Achse des Stellantriebes mit Hilfe eines Rollgabelschlüssels.
3. Um den Kraftschluss wiederherzustellen, lassen Sie den Kupplungsschalter los (federrückstellend).

ES

El actuador funciona en prioridad eléctrico. Asegurarse que la alimentación es cortada antes de maniobrarlo manualmente.

1. Girar el interruptor de desembrague hacia la posición MAN y mantenerlo en esta posición.
2. Girar el eje saliente del actuador con la ayuda de una llave inglesa.
3. Para reenganchar la reducción, relajar el interruptor de desembrague (retorno por mueles)

Symboles utilisés :

Danger : risque de choc électrique

Terre de protection

Tension continue

Tension alternative

- Le branchement à une prise de Terre est obligatoire au-delà de 42V suivant la norme en vigueur.
- L'actionneur étant branché en permanence, il doit être raccordé à un dispositif de sectionnement (interrupteur, disjoncteur), assurant la coupure d'alimentation de l'appareil.
- La température du bornier peut atteindre 90°C
- Pour une utilisation avec de grandes longueurs de câbles, le courant induit généré par les câbles ne doit pas dépasser 1mA
- Afin d'optimiser la sécurité des installations, le câblage du report défaut (D1 et D2) est fortement conseillé.

Used symbols :

Danger : risk of electric shock

Earth protection

Direct voltage

Alternating voltage

- As stipulated in the applicable regulation, the connection to earth contact is compulsory for devices with working voltages exceeding 42 V.
- The actuator is always powered, so it must be connected to a disconnection system (switch, circuit breaker) to ensure the actuator power cut.
- The terminal temperature can reach 90°C
- For a use with a long power supply wiring, the induction current generated by the wires musn't be higher than 1mA
- To optimize the installation security, please connect the failure feedback signal (D1 and D2).

Verwendete Symbole :

Gefahr : Gefahr eines elektrischen Schlages

Schutzerdung

Gleichspannung

Wechselspannung

- Die Erdung ist nach der geltenden Norm bei über 42V vorgeschrieben.
- Der Antrieb ist dauerhaft unter Spannung, daher muß beim Anschluß ein Abschaltsystem (Leistungsschalter) vorgesehen werden um die Unterbrechung der Stromzufuhr zu gewährleisten.
- Die Terminal-Temperatur kann bis zu 90°C erreichen.
- Bei Verwendung einer langen Zuleitung für die Spannungsversorgung darf die Induktionsspannung der Leitung nicht größer als 1mA sein.
- Um die Sicherheit der Anlagen zu optimieren empfehlen wir die Verkablung der Fehlermeldung (D1/D2 Stecker)

Símbolos utilizados:

Peligro: riesgo de choque eléctrico

Tierra de protección

Tensión continua

Tensión alternativa

- El enchufe a una toma de tierra es obligatorio más allá de 42V según la norma corriente.
- El actuador esta siempre conectado, debe ser empalmado a un dispositivo de seccionamiento (interruptor, disyuntor), asegurando la cortadura de alimentación del aparato.
- La temperatura del Terminal de conexión puede alcanzar 90°C
- Para una utilización con los grandes largo de cables, la corriente induce engendrado por los cables no debe adelantar 1mA
- Para optimizar la seguridad de las instalaciones, el cableado del señal de retorno de la información de defecto (D1 y D2) es aconsejado

RESPECTER LES CONSIGNES DE SECURITE

Nos presse-étoupe acceptent un câble de diamètre compris entre 7mm et 12mm.

- Retirer l'indicateur visuel, dévisser les 4 vis et retirer le capot.

CABLAGE DE L'ALIMENTATION ET DE LA COMMANDE

- Vérifier sur l'actionneur que la tension indiquée sur l'étiquette correspond à la tension du réseau.
- Connecter les fils sur le connecteur suivant le mode de pilotage souhaité. (Voir schémas p.13 ou p.22 pour les modèles POSI)
- Pour garantir le bon fonctionnement de la résistance anti-condensation, l'actionneur doit être alimenté en permanence

CABLAGE DE LA RECOPIE (Sauf POSI : p.21)

Nos actionneurs sont par défaut équipés de 2 contacts fins de course auxiliaires secs, soit normalement ouverts, soit normalement fermés (voir schéma électrique DSBL0436). Par défaut, la came blanche est utilisée pour détecter l'ouverture (FC1) et la came noire pour détecter la fermeture (FC2).
Les fins de courses auxiliaires doivent être connectés avec des câbles rigides. Si la tension appliquée est supérieure à 42V, l'utilisateur doit prévoir un fusible dans la ligne d'alimentation.

- Dévisser le presse-étoupe droit et passer le câble.
- Enlever 25mm de gaine et dénuder chaque fil de 8mm.
- Connecter les fils sur le bornier suivant le schéma p.13 (ou p.22 pour les modèles POSI) .
- Revisser le presse-étoupe (s'assurer du bon remontage de celui-ci afin de garantir une bonne étanchéité).

REGLAGE DES CONTACTS FINS DE COURSE

L'actionneur est préréglé en usine. Ne pas toucher les 2 cames inférieures sous peine de perturber le fonctionnement de l'actionneur voire d'endommager ce dernier.

- Pour ajuster la position des contacts auxiliaires, faire pivoter les 2 cames supérieures en utilisant la clé appropriée.
- Remonter le capot, visser les 4 vis et monter l'indicateur visuel.

RESPECT SAFETY INSTRUCTIONS

Our cable glands are designed for cables with a diameter between 7mm and 12mm.

- Remove the position indicator, unscrew the four screws and take off the cover.

SUPPLY AND CONTROL WIRING

- Ensure that the voltage indicated on the actuator ID label corresponds to the voltage supply.
- Connect the wires to the connector in accordance with the required control mode. (see diagram p.13 or p.22 for POSI models)
- To ensure the correct functioning of the anti condensation heater, the actuator must be always supplied

WIRING OF THE FEEDBACK SIGNAL (Except POSI: p.21)

Our actuators are equipped with two simple limit switch contacts normally set either in open position, either in closed position (see wiring diagram DSBA0436). As per factory setting, the white cam is used to detect the open position (FC1) and the black cam is used to detect the closed position (FC2).
The auxiliary limit switches must be connect with rigid wires. If the applied voltage is higher than 42V, the user must foresee a fuse in the power supply line.

- Unscrew the right cable gland and insert the cable.
- Remove 25mm of the cable sheath and strip each wire by 8mm.
- Connect the wires to the terminal strip in accordance with the diagram 13 (or p.22 for POSI models).
- Tighten the cable gland (Ensure that it's well mounted to guaranty the proofness).

SETTING OF END LIMIT SWITCHES

The actuator is pre-set in our factory. Do not touch the two lower cams in order to avoid any malfunctioning or even damage to the actuator.

- To adjust the position of the auxiliary contacts, make rotate the two superior cams by using the appropriate wrench.
- Re-mount the cover, fasten the four screws and attach the position indicator.

BEACHTEN SIE UNBEDINGT DIE SICHERHEIT ANWEISUNGEN

Unsere Kabelverschraubungen sind zulässig für Kabel mit einem Durchmesser zwischen 7mm und 12mm.

- Den Stellanzeiger abziehen, die vier Schrauben lösen und die Haube abnehmen.

VERKABELUNG DER STROMZUFUHR UND DER STEUERUNG

- Überprüfen Sie am Stellantrieb, daß die angegebene Spannung auf dem Typenschild der Spannung des Netzes entspricht.
- Schließen Sie die Drähte an der Verbindung an, je nach gewünschter Steuerungsart. (bitte siehe Schaltplan S.13 oder 23 für POSI)
- Die richtige Funktion der Heizwiderstände zu gewährleisten, muss der Antrieb immer mit Strom versorgt sein

VERKABELUNG DER RÜCKMELDUNG (außer den Modellen POSI: S.21)

Unsere Stellantriebe sind serienmäßig mit 2 einfachen Endschalterkontakten versehen, welche normalerweise geöffnet sind (NO). Gemäß Voreinstellung dient die weiße Nocke dazu, die Öffnung zu erfassen (FC1) und die schwarze Nocke, um das Schliessen zu erfassen (FC2).

- Die Klemmen "Kunde" müssen mit biegesteif Anschlusskabel verkabelt werden. Sollte die Spannung 42v überschritten, so muss vom Anwender eine Sicherung in der Stromzufuhr vorgesehen werden.

- Lösen Sie die Kabelverschraubung und führen Sie das Kabel durch.
- Entfernen Sie 25mm der Ummantelung und legen Sie jeden Draht auf 8mm frei.
- Schließen Sie die Drähte gemäß dem nebenstehenden Schaltplan an der Klemmleiste an. (siehe Schaltplan S.13 oder S.23 für POSI)
- Die Kabelverschraubung wieder festziehen.

EINSTELLUNG DER ENDSCHALTERKONTAKTE

Der Stellantrieb wird im Werk voreingestellt. Berühren Sie die beiden unteren Nocken nicht, da sonst die Funktion des Stellantriebes gestört oder letzterer sogar beschädigt werden kann.

- Um die Position der Hilfskontakte einzustellen, drehen Sie die beiden oberen Nocken unter Zuhilfenahme eines geeigneten Schlüssels.
- Die Haube wieder anbringen, die vier Schrauben anziehen und den Stellanzeiger aufstecken.

RESPETAR LAS CONSIGNAS DE SEGURIDAD

Nuestros prensas a estopa aceptan un cable de diámetro entre 7mm y 12mm.

- Quitar el indicador visual, destornillar los 4 tornillos y quitar la tapa.

CABLEADO DE LA ALIMENTACIÓN

- Verificar sobre el actuador que el voltaje indicado sobre la etiqueta corresponde al voltaje de la red.
- Conectar los cables sobre el conector siguiente el modo de pilotaje deseado. (ver esquema p.13 o p.23 para los actuadores POSI)
- Para un buen funcionamiento de la resistencia anti-condensación, el actuador debe ser alimentado en permanencia

CABLEADO DE LA RECOPIA (salvo los modelos POSI : P.21)

Nuestros actuadores son equipados por defecto de 2 contactos de finales de carrera auxiliares secos normalmente abiertos o normalmente cerrados (Ver el esquema eléctrico DSBL0436). Por defecto, la leva blanca es utilizada para detectar la apertura (FC1) y la leva negra para detectar el cierre (FC2).

Los finales de carrera deben ser conectados con cables rígidos. Si la tensión aplicada es superiora a 42V, el usuario debe prever un fusible en la alimentación.

- Destornillar la prensa a estopa de derecho y pasar el cable .
- Quitar 25mm de tubo y desnudar cada cable de 8mm .
- Conectar los cables sobre el terminal según el esquema p.13 (o p.23 para los actuadotes POSI)..
- Reatornillar la prensa-estopa correctamente para garantizar una buena hermeticidad

REGLAJE DE LOS CONTACTOS DE FINALES DE CARRERA

El actuador es preajustado en fábrica. No tocar las 2 levas inferiores so pena de perturbar el funcionamiento del actuador incluso de dañarlo .

- Para ajustar la posición de los contactos auxiliares, hacer girar las 2 levas superioras utilizando la llave apropiada.
- Volver a montar la tapa, atornillar los 4 tornillos y montar el indicador visual .

Actionneurs avec système de sécurité intégré (mode Tout ou Rien obligatoire)
Actuator with failsafe integrated security system (ON/OFF mode compulsory)
Stellantriebe mit Sicherheitsblock (AUF/ZU Modus notwendig)
Actuadores con systéma de seguridad (Modo ON/OFF obligatorío)

Le modèle failsafe intègre un bloc batterie de secours piloté par une carte électronique. Sa fonction est de prendre le relais en cas de coupure d'alimentation aux bornes 1, 2 et 3 de l'actionneur. Le modèle failsafe peut être configuré en normalement ouvert (NO) ou normalement Fermé (NF) selon l'application client.
La carte pilotant la batterie gère le cycle de charge et vérifie l'état de la batterie. Si un défaut est détecté au niveau de la batterie, un contact sec entre les bornes 65 et 66 s'ouvre. Si ce contact est relayé par le client il a ainsi la possibilité de détecter un défaut sans ouvrir l'actionneur et de prévoir le remplacement de la batterie.
Le modèle failsafe fonctionne en câblage ON/OFF.
Un autre schéma de câblage est possible en utilisant les bornes 1,2, 3 et 65, 66 , l'avantage de ce câblage est que le pilotage moteur n'est autorisé que lorsque le contact entre 65 et 66 est fermé et donc le bloc batterie en état de marche.

Failsafe option integrate battery pack monitored by electronic board in the actuator. Its function is to relay in case of power supply failure on terminal PIN 1,2 and 3 of the actuator. The fail safe option could be set on different position like normally open (NO) or normally close (NC) depends on customer application.
The electronic board monitors the battery pack and check the status of battery (cycle load and failure)
If a battery failure is detected , a contact on PIN 66 and 66 switch off .If customer use this contact he could be aware that there is a failure on battery in the actuator without remove cover and plan the replacement.
Fail safe option requiered ON/OFF mode.
An another wiring diagram is also available using terminal PIN 1, 2, 3 and 65, 66. The advantage of it is actuator could not ne derive if failure battery pack is detected

---

FAILSAFE-Modelle beinhalten einen Batteriesatz, der von der elektronischen Karte im Antrieb gesteuert wird. Seine Aufgabe ist, einen Spannungsausfall an Klemme 1,2 und 3 zu überbrücken. Die FAILSAFE-Position kann zwischen ÖFFNER (NC) oder SCHLIESSER (NO) abhängig vom Verwendungszweck frei gewählt werden.
Die elektronische Karte prüft stets den Batteriesatz (Ladezustand bzw. Ausfall). Wenn ein Batterieausfall erkannt wird, kann dieser über einen an Klemme 65 und 66 angelegten Schaltkreis signalisiert werden. Somit kann der Anwender den Zustand der Batterie überwachen, ohne den Antriebsdeckel entfernen zu müssen.
Die FAILSAFE-Option ist sowohl im AUF/ZU-Modus als auch im 3-Punkt-Modulier-Modus verwendbar.
Durch Spannungsversorgung an Klemme 1, 2, 3 über Klemme 65 und 66 kann sichergestellt werden, daß der Antrieb bei schlechtem Batteriezustand nicht mehr die Sicherheitsposition verlässt.

El modelo failsafe integra un bloque de baterías de seguridad, pilotado por una tarjeta electrónica. Su función es de tomar el relevo en caso de apagón a los conectadores 1, 2 y 3 del actuador. El modelo failsafe puede ser configurado en normalmente abierto (NO) o normalmente cerrado (NF), según la utilización del cliente.
La tarjeta comprueba el ciclo de carga y el estado de la batería. Si un defecto es detectado al nivel de la batería, un contacto seco entre los conectadores 65 y 66 se abre. Si este contacto es utilizado, el cliente tiene la posibilidad de detectar un defecto sin abrir el actuador y así prever el reemplazo de la batería.
El modelo failsafe funciona con el modo ON/OFF.
Un otro tipo de cableado es posible utilizando los conectadores 1, 2, 3 y 65, 66, la ventaja de este cableado es que el pilotaje del motor es autorizado solamente cuando el contacto entre 65 y 66 es cerrado, luego, que el bloque de baterías en estado de funcionamiento.

Fermé par défaut / *Pre-set to closed* / Voreinstellung geschlossen / Cerado por defecto

Configuration A ou B :

A- Mode standard : en cas de pilotage de l'actionneur avec un automate, le report d'état de la charge peut être connecté à celui-ci pour plus de sécurité.

B- Mode de sécurité totale (en utilisant le relais de report d'état, bornes 65 et 66) : l'actionneur n'ouvrira la vanne que si le bloc de sécurité est opérationnel (charge suffisante, carte initialisée).

Configuration A or B :

A- Standard mode : *when piloting the actuator with an automat (PLC), the load state feedback can be connected to it for more safety.*

B- Total security mode *(using the feedback relay, terminals 65 and 66) : the actuator will open only if the security block is operational (sufficient loading, initialized card).*

Konfiguration A oder B :

A- Standard Modus : Im Fälle der Steuerung des Antrieb mit einer Automat kann der Rückmeldung des Batteriesladung an diesen hier für Sicherheit angeschlossen sein.

B- Total Sicherheit Modus (mit benutzung des Rückmeldungsrelais, Klemmen 65 und 66) : der Antrieb wird den Hahn nur öffnen wenn das Sicherheitsblock geladen ist (gemïgenede Ladung, initializierte Karte).

Configuración A o B :

A - Modo estándar : en caso de un pilotaje del actuador con un autómata, el retorno de la información de carga puede ser conectado a éste para más de seguridad.

B - Moda de seguridad total (utilizando el relé de retorno de estado, conectadores 65 y 66): el actuador abrirá la válvula solazmente si el bloque de seguridad es operativo (carga suficiente, tarjeta inicializada).

Différents types de consigne (pilotage carte Bornier N°15 et N°16)
Nos cartes sont paramétrables en usine sur demande. Le signal de commande (consigne) et signal de recopie peuvent être de nature différente (courant ou tension). **Sans aucune information du client les cartes sont paramétrées en courant 4-20mA (consigne+recopie client)**

Pilotage en 0-10V et 0-20mA :
Lors d'un événement extérieur, absence de consigne (coupure accidentelle câble par ex) mais en présence de l'alimentation carte.
La convention veut que l'actionneur se retrouve en une position définie (vanne ouverte ou fermée). En standard nos actionneurs se fermeront en absence de consigne, mais d'autres états sont possibles sur demande

Pilotage en 4-20mA.
La convention veut que l'actionneur reste dans sa position lors de la coupure de la consigne (coupure accidentelle câble par ex) mais en présence de l'alimentation carte.
Lors du rétablissement de la consigne l'actionneur se repositionne automatiquement selon la valeur de la consigne

---

Various control types (control signal on terminals N°15 and N°16)
On request, our cards can be set in factory. The consign and the feedback signal can have different forms (current or voltage).
Without any information from the customer, the cards are set for current 4-20mA (control + feedback signal)

Control in modes 0-10V and 0-20mA
In case of outside event, absence of control signal (accidental wires cut for example) but in presence of power, the actuator will travel to defined position (open or closed valve).
In standard our actuators will close themselves in absence of control signal but there are other possibilities on request.

Control in mode 4-20mA
In case of outside event, absence of control signal (accidental wires cut for example) but in presence of power, the actuator will stay in its position.
In the both cases, when the control signal is restored, the actuator reach automatically the position corresponding to control signal value.

Verschiedene Steuersignale (über Anschlüsse 15 und 16)

Unsere Karten können nach Bedarf parametriert werden. Ein– und Ausgangssignal können dabei unabhängig voreinander gewählt werden (Strom– oder Spannungssignal). **Standardmäßige Voreinstellung ist 4-20mA für Ein– und Ausgangssignal.**

Ansteuerung mit 0-10V oder 0-20mA:
Bei Ausfall des Steuersignals (z.B. Kabelbruch) aber Aufrechterhaltung der Spannungsversorgung fährt der Antrieb in die voreingestellte Sicherheitsposition (Auf oder Zu). **Standardmäßige Voreinstellung ist « Schliesser ».**

Ansteuerung mit 4-20mA:
Bei Ausfall des Steuersignals (z.B. Kabelbruch) aber Aufrechterhaltung der Spannungsversorgung verharrt der Antrieb in seiner letzten Position.
In beiden Fällen fährt der Antrieb automatisch in die dem Steuersignal entsprechende Position, sobald es wieder anliegt.

Diferentes tipos de mando – Bornes N°15 y N°16)
Nuestras tarjetas, a petición, pueden ser parametrizadas en fábrica. El señal de mando y el señal de recopia pueden ser de tipos diferentes, corriente o tensión. **Sin ninguna información del cliente las tarjetas son parametrizadas en el modo corriente 4-20mA (mando + recopia cliente)**

Pilotaje en 0-10V y 0-20mA :
En el caso de un acontecimiento exterior, ausencia de mando (corte accidental del cableado por ejemplo) pero en presencia de la alimentación de la tarjeta, el actuador coloca la válvula en una posición definida (válvula abierta o cerrada).
Por defecto, nuestros actuador se cerrarán en ausencia de mando pero otras posibilidades son posibles a petición.

Pilotaje en 4-20mA.
En el caso de un acontecimiento exterior, ausencia de mando (corte accidental del cableado por ejemplo) pero en presencia de la alimentación de la tarjeta, el actuador se queda en la misma posición.
Cuando se restablece el mando, el actuador se reposiciona automáticamente según el valor del mando

ACTIONNEUR DEJA PRE-REGLE EN USINE

CABLAGE CONSIGNE ET RECOPIE DE LA CARTE P6

Afin de limiter les perturbations électromagnétiques, l'utilisation de câbles blindés est obligatoire (câbles supérieurs à 3m).

- Dévisser le presse-étoupe droit et passer le câble.
- Connecter la consigne entre les bornes 15 et 16 (annexe p.20 rep.B).
  La borne 15 est la polarité négative (-) et la borne 16 la polarité positive (+).
- Connecter la recopie entre les bornes 13 et 14 (annexe p.20 rep.C).
  La borne 13 est la polarité positive (+) et la borne 14 la polarité négative (-).
- Revisser le presse-étoupe (s'assurer du bon remontage de celui-ci afin de garantir une bonne étanchéité).

Montage départ usine : par défaut, consigne et recopie en 4-20mA, sens normal.
Pour reparamétrer la carte : voir page 24, « Séquence de paramétrage ».
Pour vérifier le bon fonctionnement de la carte : voir page 24, « Mode de fonctionnement normal ».

ACTUATOR PRE-SET IN FACTORY

POSITIONING CARD WIRING (OUTPUT AND INPUT SIGNAL)

In order to avoid electromagnetic perturbations, it is compulsory to use shielded cables (cables longer than 3m).

- Unscrew the right gland and pass the cable.
- Connect the input signal between terminals 15 and 16 (attached p.20 mark.B)..
  Terminal 15 is the negative polarity (-) and terminal 16 is the positive polarity (+).
- Connect the output signal between terminals 13 and 14.(attached p.20 mark.B)..
  Terminal 13 is the positive polarity (+) and terminal 14 is the negative polarity (-).
- Tighten the cable gland (Ensure that it's well mounted to guaranty the proofness).

The feedback must be connect with rigid wires. If the applied voltage is higher than 42V, the user must foresee a fuse in the power supply line.
Factory setting : by default, 4-20mA input and output signals with normal rotation sense.
To proceed to a new setting of the card : please see page 25, "Parameter selection sequence".
To check the proper operation of the card : please see page 25, "Normal operating mode".

STELLANTRIEB IST SCHON IM WERK VOREINGESTELLT

REGELUNGKARTE VERKABELUNG (SIGNALMELDUNG UND RUCKMELDUNG)

Um elektromagnetische Störungen zu vermeiden, müssen abgeschirmte Kabel benutzt werden (Kabel länger als 3m).

- Lösen Sie die Kabelverschraubung und führen Sie das Kabel durch.
- Verkabeln Sie den Signalgeber zwischen den Klemmen 15 und 16.
  Die Klemme 15 ist negativ gepolt (-) und die Klemme 16 positiv (+).
- Verkabeln Sie den Positionrückmelder zwischen den Klemmen 13 und 14.
  Die Klemme 13 ist positiv gepolt (+) und die Klemme 14 negativ (-).
- Die Kabelverschraubung wieder befestigen.

Aufbau ab Werk : Voreingestellt, Signalgeber und Rückmeldung 4-20mA, im normal Drehrichtung.
Um die Karte wieder zu programmieren : siehe Seite 26, « Parametrisierungsschritte ».
Um die richtige Arbeitsweise zu prüfen : siehe Seite 26, « Normalbetrieb ».

ACTUADOR YA PREREGLADO EN FÁBRICA

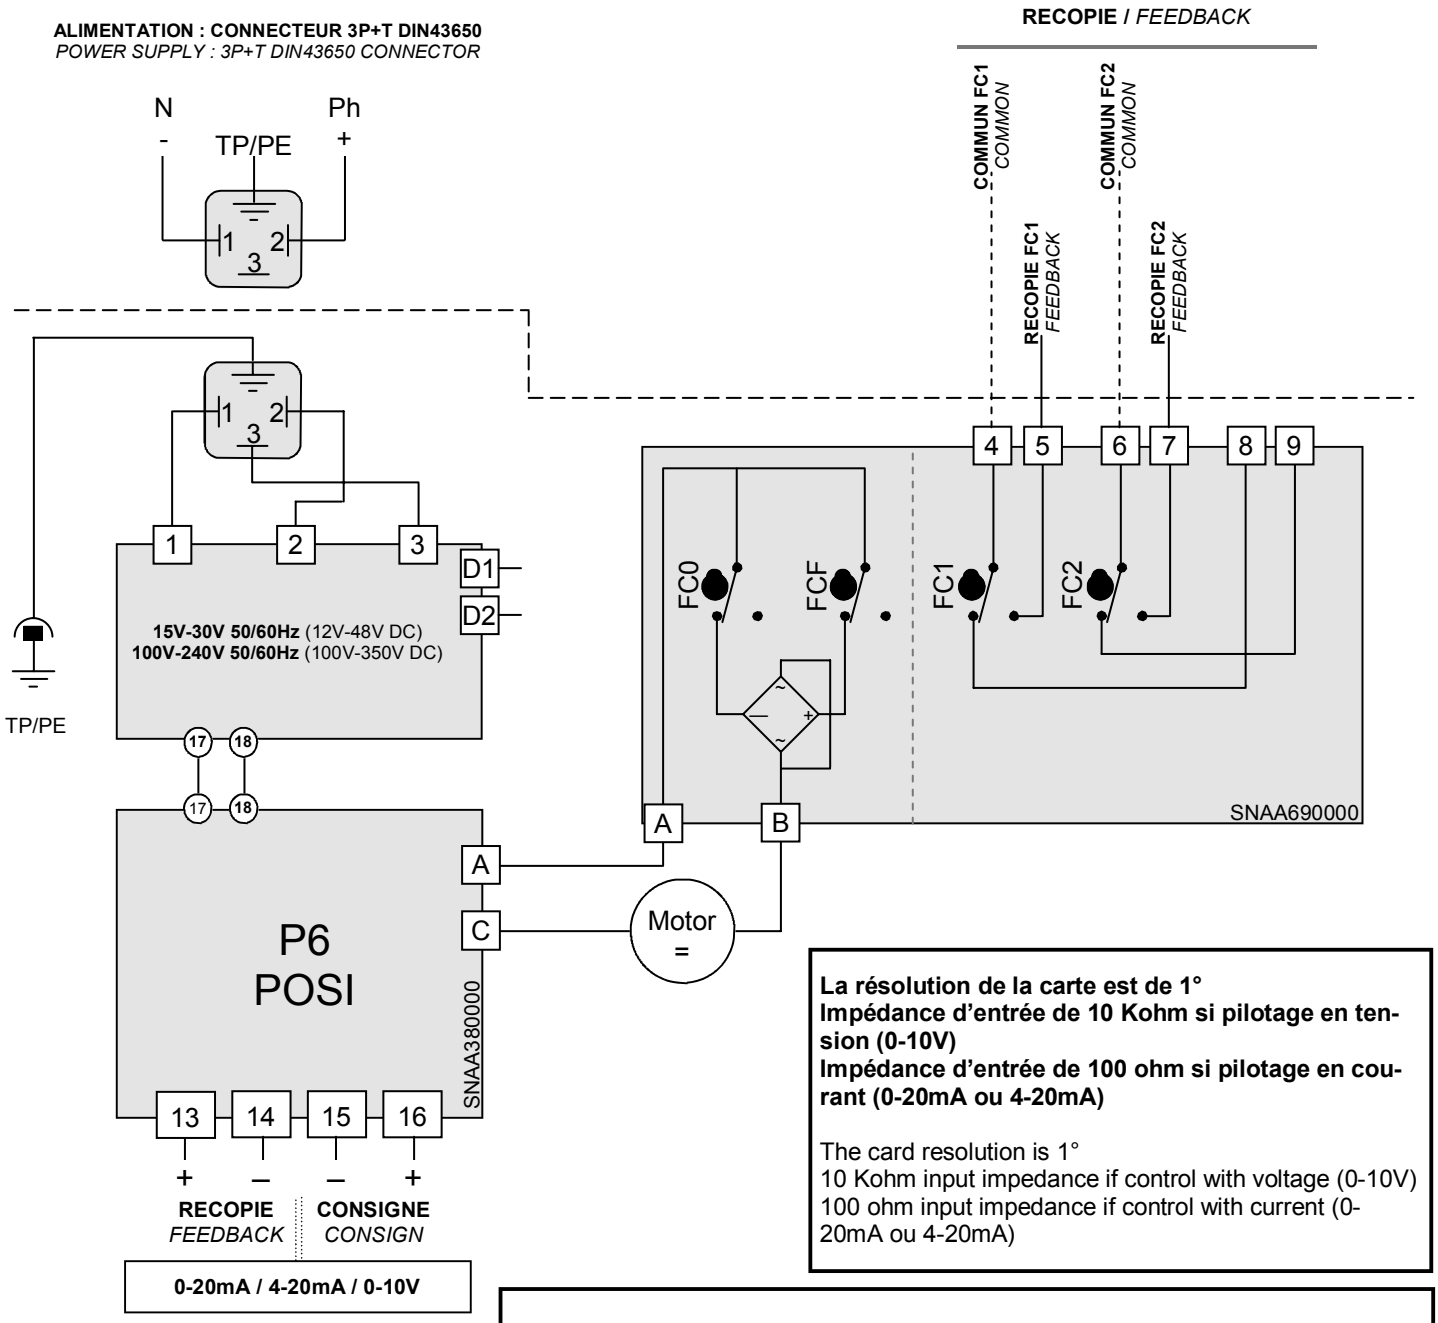
CABLEADO, MANDO Y RECOPIA DE LA TARJETA P6

Al fin de limitar las perturbación electromagnéticas, la utilización de cables blindados es obligatoria (cables de longitud más que 3m).

- Destornillar la prensa a estopa de derecho y pasar el cable .
- Conectar el mando entre los bornes 15 y 16. (anexo p.20 Ref. B)
  El borne 15 es la polaridad negativa (-) y el borne 16 la polaridad positiva (+).
- Conectar la recopia entre los bornes 13 y 14. (anexo p.20 Ref. C).
  El borne 13 es la polaridad positiva (+) y el borne 14 la polaridad negativa (-).
- Reatornillar la prensa-estopa correctamente para garantizar una buena hermeticidad

Montaje a la salida de fábrica : Por defecto, mando y recopia en 4-20mA, dirección normal.
Para ajustar de nuevo la tarjeta : ver página 27, « Secuencia de reglaje ».
Para verificar el buen funcionamiento de la tarjeta : ver página 27, « Modo de funcionamiento normal ».

POSI - SHÉMA ÉLECTRIQUE



La résolution de la carte est de 1°
Impédance d'entrée de 10 Kohm si pilotage en tension (0-10V)
Impédance d'entrée de 100 ohm si pilotage en courant (0-20mA ou 4-20mA)

The card resolution is 1°
10 Kohm input impedance if control with voltage (0-10V)
100 ohm input impedance if control with current (0-20mA ou 4-20mA)

REP	DESIGNATION
FC0	**Fin de course ouverture** *Open limit switch*
FCF	**Fin de course fermeture** *Close limit switch*
FC1	**Fin de course auxiliaire 1** *Auxiliary limit switch 1*
FC2	**Fin de course auxiliaire 2** *Auxiliary limit switch 2*
D1/D2	**Bornier report défaut (24V DC / 3A max)** *Failure report Terminal strip (24V DC / 3A max)*

La tension de pilotage doit être de type T.B.T.S. (Très Basse Tension de Sécurité)
The control voltage must be .S.E.L.V. (Safety Extra Low Voltage)

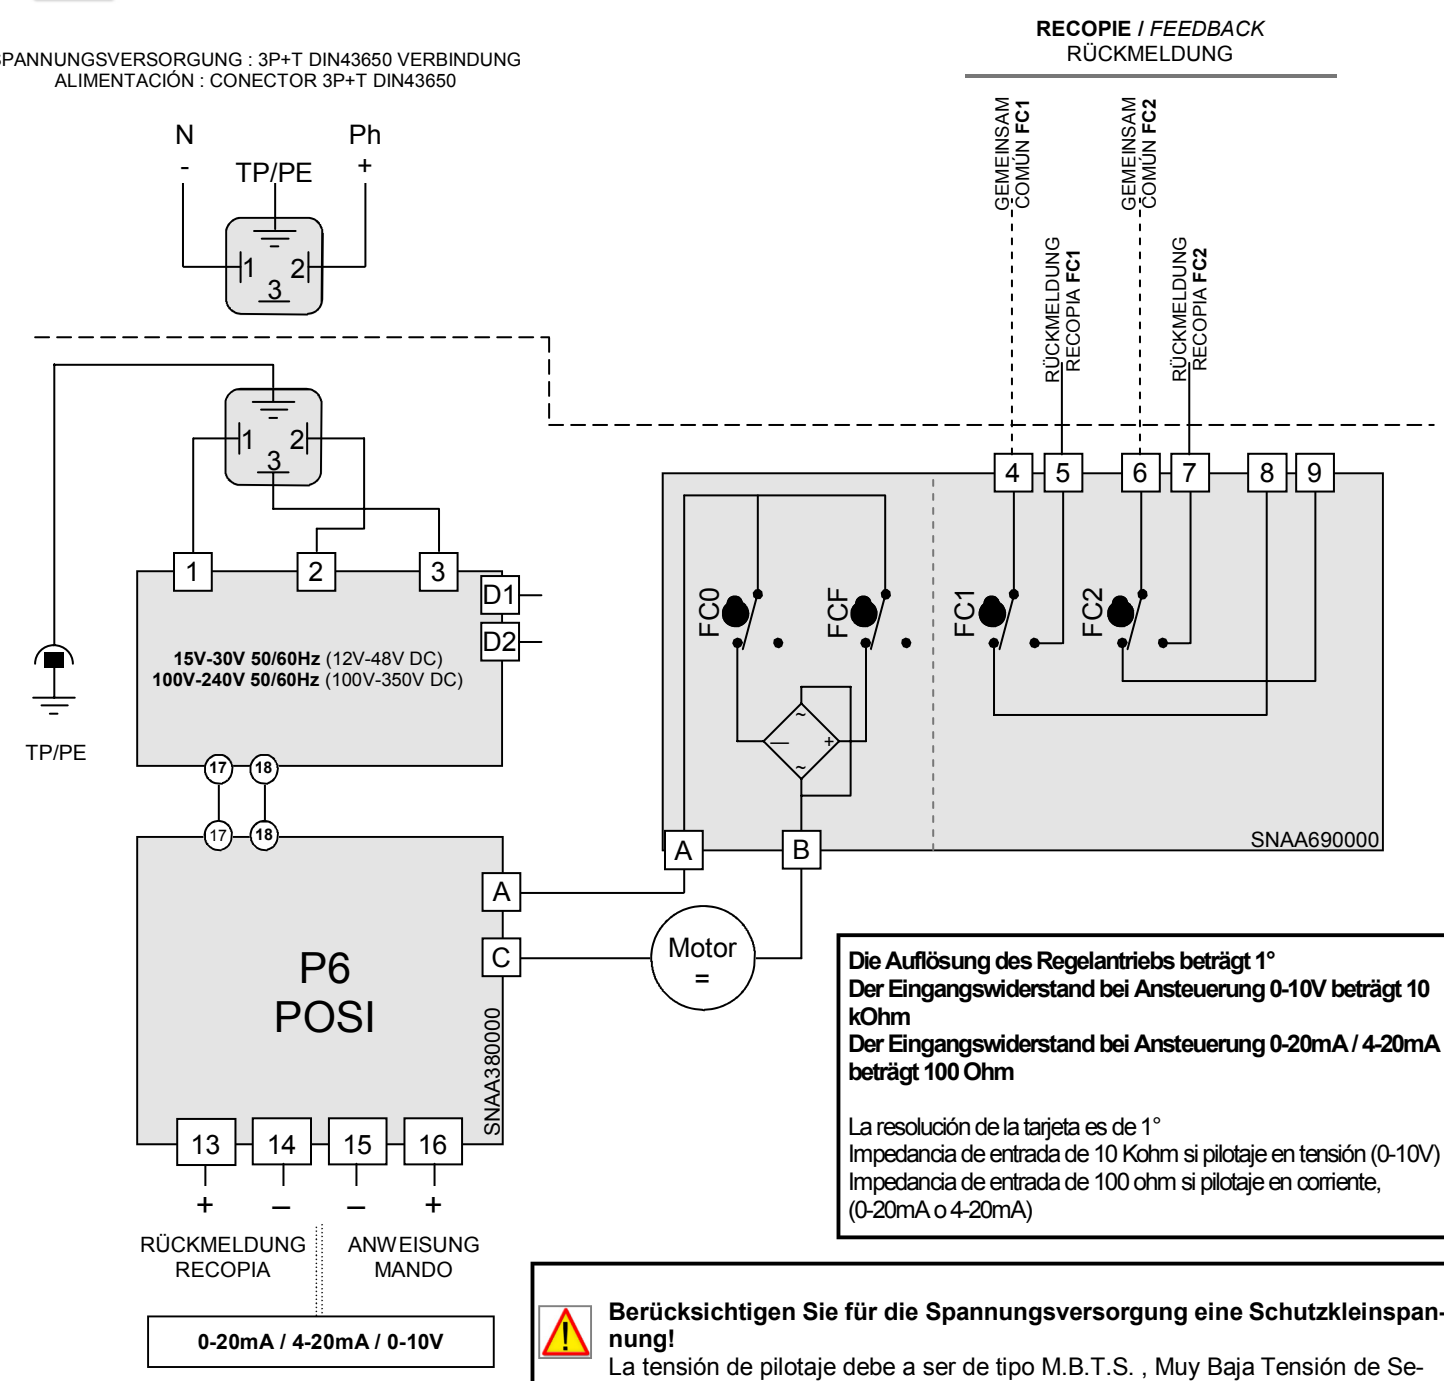
La température du bornier peut atteindre 90°C
The terminal temperature can reach 90°C

La recopie doit être connecté avec des câbles rigides. Si la tension appliquée est supérieure à 42V, l'utilisateur doit prévoir un fusible dans la ligne d'alimentation.
The feedback must be connect with rigid wires. If the applied voltage is higher than 42V, the user must foresee a fuse in the power supply line.

Pour une utilisation avec de grandes longueurs de câbles, le courant induit généré par les câbles ne doit pas dépasser 1mA
For a use with a long power supply wiring, the induction current generated by the wires musn't be higher than 1mA

Les câbles utilisés doivent être rigides (tensions pour la recopie : 4 à 250V AC/DC)
The used wires must be rigid (feedback voltages : 4 to 250V AC

SPANNUNGSVERSORGUNG : 3P+T DIN43650 VERBINDUNG
ALIMENTACIÓN : CONECTOR 3P+T DIN43650



Die Auflösung des Regelantriebs beträgt 1°
Der Eingangswiderstand bei Ansteuerung 0-10V beträgt 10 kOhm
Der Eingangswiderstand bei Ansteuerung 0-20mA / 4-20mA beträgt 100 Ohm

La resolución de la tarjeta es de 1°
Impedancia de entrada de 10 Kohm si pilotaje en tensión (0-10V)
Impedancia de entrada de 100 ohm si pilotaje en corriente, (0-20mA o 4-20mA)

REP	BESCHREIBUNG DESIGNACIÓN
FC0	Endschalter AUF Final de carrera apertura
FCF	Endschalter ZU Final de carrera cierre
FC1	Zusätzlicher Endschalter 1 Final de carrera auxiliar 1
FC2	Zusätzlicher Endschalter 2 Final de carrera auxiliar 2
D1/D2	Fehlermeldung Klemmleiste (24V DC / 3A max) Terminal retorno de defecto (24V DC / 3A max)

Berücksichtigen Sie für die Spannungsversorgung eine Schutzkleinspannung!
La tensión de pilotaje debe a ser de tipo M.B.T.S. , Muy Baja Tensión de Seguridad,

Die Terminal-Temperatur kann bis zu 90°C erreichen
La temperatura del Terminal de conexión puede alcanzar 90°C

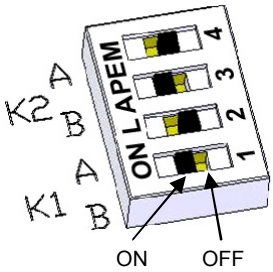
Die Klemmen "Kunde" müssen mit biegesteif Anschlusskabel verkabelt werden. Sollte die Spannung 42v überschritten, so muss vom Anwender eine Sicherung in der Stromzufuhr vorgesehen werden.
La recopia debe ser conectada con cables rígidos. Si la tensión aplicada es superiora a 42V, el usuario debe prever un fusible en la alimentación.

Bei Verwendung einer langen Zuleitung für die Spannungsversorgung darf die Induktionsspannung der Leitung nicht größer als 1mA sein.
Para una utilización con los grandes largo de cables, la corriente induce engendrado por los cables no debe adelantar 1mA

Die Anschlusskabel müssen biegesteif sein (Rückmeldespannungen 4 bis 250V AC/DC)
Los cables eléctricos utilizados deben ser rígidos (tención para el señal de retorno : 4 hasta 250V AC/DC)

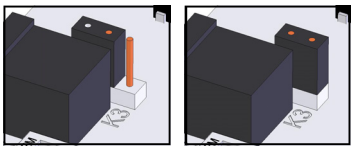
SEQUENCES DE PARAMETRAGE

1 Positionnement des cavaliers K1, K2 et K3

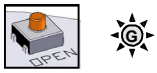


- Positionner les cavaliers d'après le tableau suivant (avant chaque modification, mettre la carte hors tension) :

Consigne	Recopie	Cavalier K1		Cavalier K2		Cavalier K3
		A	B	A	B	
0-10V	**0-10V**	ON	OFF	ON	OFF	OFF
0-10V	**0-20mA**	ON	OFF	OFF	ON	OFF
0-10V	**4-20mA**	ON	OFF	OFF	ON	ON
0-20mA	**0-10V**	OFF	ON	ON	OFF	OFF
0-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
0-20mA	**4-20mA**	OFF	ON	OFF	ON	ON
4-20mA	**0-10v**	OFF	ON	ON	OFF	OFF
4-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
4-20mA	**4-20mA**	OFF	ON	OFF	ON	ON



2 Choix du sens de la vanne

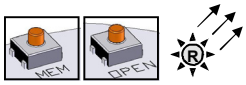


2.1 Sens normal (par défaut)
- Appuyer sur **OPEN** et mettre la carte sous tension en maintenant le bouton enfoncé.
- La **LED verte s'allume**. Relâcher le bouton **OPEN.**
- Débrancher la carte.

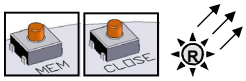
2.2 Sens inverse
- Appuyer sur **CLOSE** et mettre la carte sous tension en maintenant le bouton enfoncé.
- La **LED rouge s'allume**. Relâcher le bouton **CLOSE.**
- Débrancher la carte.

3 Choix du type de consigne

3.1 Consigne en tension 0-10V
- Appuyer sur **MEM** et mettre la carte sous tension en maintenant le bouton enfoncé.
- La **LED rouge clignote 3 fois**. Relâcher le bouton.
- Débrancher la carte.

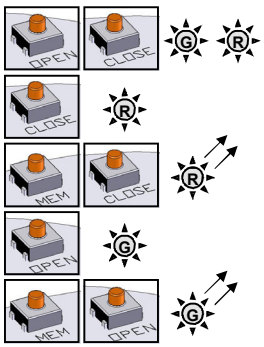


3.2 Consigne en courant 0-20mA
- Appuyer sur **MEM** et **OPEN** et mettre la carte sous tension en maintenant les boutons enfoncés.
- La **LED rouge clignote 3 fois**. Relâcher les boutons.
- Débrancher la carte.



3.3 Consigne en courant 4-20mA (par défaut)
- Appuyer sur **MEM** et **CLOSE** et mettre la carte sous tension en maintenant les boutons enfoncés.
- La **LED rouge clignote 3 fois**. Relâcher les boutons.
- Débrancher la carte.

4 Mode apprentissage



- Appuyer sur **OPEN** et **CLOSE** et mettre la carte sous tension en maintenant les boutons enfoncés.
- Les **2 LEDs s'allument**. Relâcher les boutons, les 2 LEDs s'éteignent. Le mode apprentissage est sélectionné.

- Appuyer sur **CLOSE** pour faire venir la vanne en position fermée. La **LED rouge s'allume**.
- Mémoriser la position fermée par **MEM + CLOSE,** la **LED rouge clignote 2 fois** pour acquitter.

- Appuyer sur **OPEN** pour faire venir la vanne en position ouverte. La **LED verte s'allume**.
- Mémoriser la position ouverte par **MEM + OPEN,** la **LED verte clignote 2 fois** pour acquitter.

- Les positions sont mémorisées, débrancher la carte.

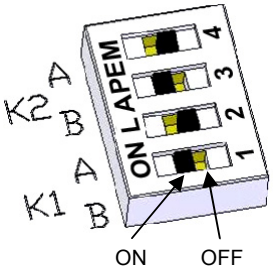
MODE DE FONCTIONNEMENT NORMAL

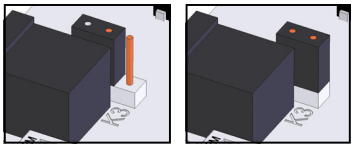
- Mettre la carte sous tension. La **LED verte clignote 3 fois**.
- Lors du fonctionnement normal, la LED verte s'allume lorsque le moteur ouvre la vanne, et la LED rouge lorsque le moteur ferme la vanne.
- Lorsque les 2 LEDs sont éteintes, le moteur n'est pas sollicité.

- En cas de couple trop important, les **2 LEDs s'allument** pour indiquer la limitation et l'actionneur s'arrête. Pour le redémarrer, il faut soit inverser le sens de marche, soit éteindre et remettre sous tension la carte.

PARAMETER SELECTION SEQUENCE

1 Shunts positioning K1, K2 and K3

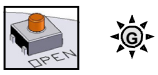




- Position the shunts as follows (before modification, switch off the card) :

Input signal	Output signal	Schunt K1		Schunt K2		Schunt K3
		A	B	A	B	
0-10V	**0-10V**	ON	OFF	ON	OFF	OFF
0-10V	**0-20mA**	ON	OFF	OFF	ON	OFF
0-10V	**4-20mA**	ON	OFF	OFF	ON	ON
0-20mA	**0-10V**	OFF	ON	ON	OFF	OFF
0-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
0-20mA	**4-20mA**	OFF	ON	OFF	ON	ON
4-20mA	**0-10v**	OFF	ON	ON	OFF	OFF
4-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
4-20mA	**4-20mA**	OFF	ON	OFF	ON	ON

2 Selection of the flow direction of the valve

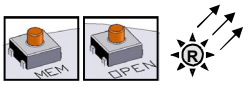


2.1 Normal flow direction (by default)
- Press the **OPEN** button and apply the operating voltage to the card while keeping this button depressed.
- The **green LED lights up**. Release the **OPEN** button.
- Disconnect the card.

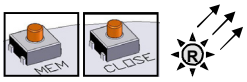
2.2 Inverse flow direction
- Press the **CLOSE** button and apply the operating voltage to the card while keeping this button depressed.
- The **red LED lights up**. Release the **CLOSE** button.
- Disconnect the card.

3 Selection of the type of set value

3.1 Voltage set value 0-10V
- Press the **MEM** button and apply the operating voltage to the card while keeping this button depressed.
- The **red LED will light up 3 times**. Release this button.
- Disconnect the card.

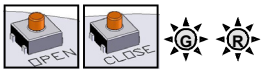


3.2 Current set value 0-20mA
- Press the **MEM** and **OPEN** buttons and apply the operating voltage to the card while keeping these buttons depressed.
- The **red LED will light up 3 times**. Release these buttons.
- Disconnect the card.

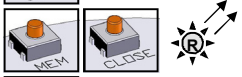


3.3 Current set value 4-20mA (by default)
- Press the **MEM** and **CLOSE** buttons and apply the operating voltage to the card while keeping these buttons depressed.
- The **red LED will light up 3 times**. Release these buttons.
- Disconnect the card.

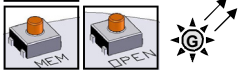
4 Learning mode



- Press the **OPEN** and **CLOSE** buttons and apply the operating voltage to the card while keeping these buttons depressed.
- The **2 LEDs will light up**. Release these buttons and the 2 LEDs will extinguish. The card is now in the learning mode.



- Press the **CLOSE** button to put the valve in its closed position. The **red LED will light up**.
- Store this selected closed position by pushing **MEM + CLOSE,** the **red LED will light up 2 times** as a confirmation of acknowledgement.



- Press the **OPEN** button to put the valve in its open position. The **green LED will light up**.
- Store this selected open position by pushing **MEM + OPEN,** the **green LED will light up 2 times** as a confirmation of acknowledgement.

- Now, the positions selected have been stored. Disconnect the card.

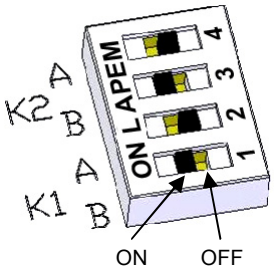
NORMAL OPERATING MODE

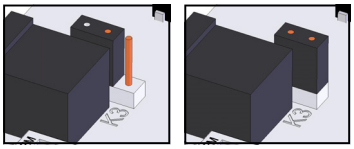
- Apply the operating voltage to the card. The **green LED will light up 3 times**.
- Under normal operating conditions, the green LED will light up when the drive motor opens the valve, and the red LED will light up when the drive motor closes it.
- If both LEDs remain extinguished, it means that the drive motor has not been triggered.

- In the case of an over torque, the motor stops and the **2 LEDS lights** then together to indicate the action of the torque limiter. To re-start it, you must either reverse the sense of rotation, either switch the power off and on.

PARAMETRISIERUNGSSCHRITTE

1 Position der Steckbrücke K1, K2 und K3

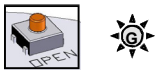




- Steckbrücken Positionierung (Vor jeder Änderung, die Karte spannungsfrei machen) :

Signalgeber	Rückmeldung	Steckbrücke K1		Steckbrücke K2		Steckbrücke K3
		A	B	A	B	
0-10V	**0-10V**	ON	OFF	ON	OFF	OFF
0-10V	**0-20mA**	ON	OFF	OFF	ON	OFF
0-10V	**4-20mA**	ON	OFF	OFF	ON	ON
0-20mA	**0-10V**	OFF	ON	ON	OFF	OFF
0-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
0-20mA	**4-20mA**	OFF	ON	OFF	ON	ON
4-20mA	**0-10v**	OFF	ON	ON	OFF	OFF
4-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
4-20mA	**4-20mA**	OFF	ON	OFF	ON	ON

2 Festlegung der Drehrichtung des Absperrventils

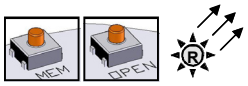


2.1 Normale Drehrichtung (Voreingestellt)
- Auf **OPEN** drücken und die Karte einschalten, dabei den Knopf gedrückt halten.
- Die **GRÜNE LED leuchtet auf**. Den Knopf **OPEN** loslassen.
- Die Karte spannungsfrei machen.

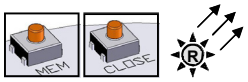
2.2 Umgekehrte Drehrichtung
- Auf **CLOSE** drücken und die Karte einschalten, dabei den Knopf gedrückt halten.
- Die **ROTE LED leuchtet auf**. Den Knopf **CLOSE** loslassen.
- Die Karte spannungsfrei machen.

3 Einstellung des Eingang Signal

3.1 Eingang Signal bei Spannung 0-10V
- auf **MEM** drücken und die Karte einschalten, dabei den Knopf gedrückt halten.
- die **rote LED leuchtet dreimal auf**. Den Knopf loslassen.
- Die Karte spannungsfrei schalten.

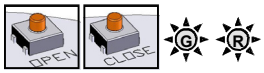


3.2 Eingang Signal bei Strom 0-20mA
- auf **MEM** und **OPEN** drücken und die Karte einschalten, dabei die Knöpfe gedrückt halten.
- die **rote LED leuchtet dreimal auf**. Die Knöpfe loslassen.
- Die spannungsfrei schalten.

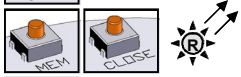


3.3 Eingang Signal bei Strom 4-20mA (Ab Werk voreingestellt)
- auf **MEM** und **CLOSE** drücken und die Karte einschalten, dabei die Knöpfe gedrückt halten.
- die **rote LED leuchtet dreimal auf**. Die Knöpfe loslassen.
- Die spannungsfrei schalten.

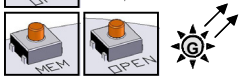
4 Lernmodus



- auf **OPEN** und **CLOSE** drücken und die Karte einschalten, dabei die Knöpfe gedrückt halten.
- Die **beiden LEDs leuchten auf**. Die Knöpfe loslassen, die **beiden LEDs erlöschen**. Der Lernmodus ist gewählt.



- auf **CLOSE** drücken, um das Absperrventil in die geschlossene Position zu bringen. **Die rote LED leuchtet auf**.
- Die geschlossene Position durch **MEM + CLOSE** speichern, die **rote LED leuchtet 2 zur Bestätigung auf**.



- auf **OPEN** drücken, um das Absperrventil in die geöffnete Position zu bringen. **Die grüne LED leuchtet auf**.
- Die geöffnete Position durch **MEM + OPEN** speichern, die **grüne LED leuchtet 2 zur Bestätigung auf**.
- Die Positionen sind gespeichert, die Karte spannungsfrei machen.

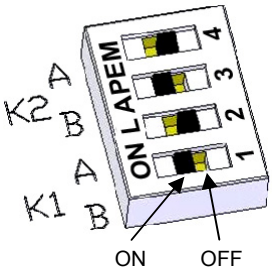
NORMALBETRIEB

- Die Karte einschalten. Die **grüne LED leuchtet dreimal auf**, um anzuzeigen, dass der Startvorgang korrekt ausgeführt wird.
- Im Normalbetrieb leuchtet die grüne LED auf, wenn der Antrieb das Absperrventil öffnet, und die rote LED, wenn der Antrieb das Absperrventil schliesst.
- Wenn keine der beiden LEDs aufleuchtet, wird der Antrieb nicht angesteuert.

- Im zu hoch Drehmoment Fall, **leuchten die beiden LEDs an** und stoppt der Antrieb. Um der Antrieb wieder zu starten, muss man den Drehrichtung auswechseln oder die Spannung Auf/Zu Umschalten.

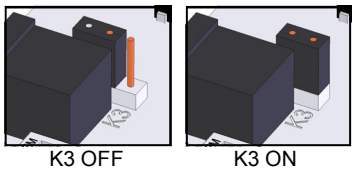
SECUENCIA DE REGLAJE

1 Posicionamiento de las grapas K1, K2 y K3



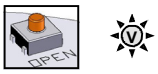
- Colocar las grapas según la tabla siguiente (antes de cada modificación, Desconectar la tarjeta) :

Mando	Recopia	Grapa K1		Grapa K2		grapa K3
		A	B	A	B	
0-10V	**0-10V**	ON	OFF	ON	OFF	OFF
0-10V	**0-20mA**	ON	OFF	OFF	ON	OFF
0-10V	**4-20mA**	ON	OFF	OFF	ON	ON
0-20mA	**0-10V**	OFF	ON	ON	OFF	OFF
0-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
0-20mA	**4-20mA**	OFF	ON	OFF	ON	ON
4-20mA	**0-10v**	OFF	ON	ON	OFF	OFF
4-20mA	**0-20mA**	OFF	ON	OFF	ON	OFF
4-20mA	**4-20mA**	OFF	ON	OFF	ON	ON



K3 OFF K3 ON

2 Elección de la dirección de la válvula

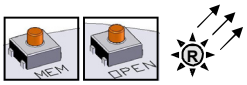


2.1 Dirección normal (por defecto)
- apoyar sobre **OPEN** y poner la tarjeta bajo tensión manteniendo el pulsador hundido.
- **El LED verde se enciende**. Relajar el pulsador **OPEN**.
- Desconectar la tarjeta.

2.2 Dirección inversa
- apoyar sobre **CLOSE** y poner la tarjeta bajo tensión manteniendo el pulsador hundido.
- **El LED rojo se enciende**. Relajar el pulsador **CLOSE**.
- Desconectar la tarjeta.

3 Elección del tipo de mando

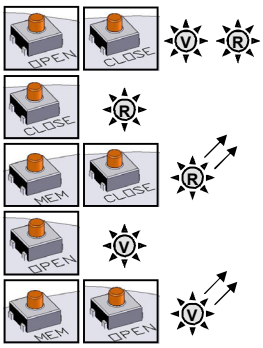
3.1 Mando bajo tensión 0-10V
- apoyar sobre **MEM** y poner la tarjeta bajo tensión manteniendo el pulsador hundido.
- **El LED rojo parpadea 3 veces**. Relajar el pulsador.
- Desconectar la tarjeta.



3.2 Mando bajo tensión 0-20mA
- apoyar sobre **MEM** y **OPEN** y poner la tarjeta bajo tensión manteniendo los pulsadores hundidos.
- **El LED rojo parpadea 3 veces**. Relajar el pulsador.
- Desconectar la tarjeta.

3.3 Mando bajo tensión 4-20mA (por defecto)
- apoyar sobre **MEM** y **CLOSE** y poner la tarjeta bajo tensión manteniendo los pulsadores hundidos.
- **El LED rojo parpadea 3 veces**. Relajar el pulsador.
- Desconectar la tarjeta.

4 Modo aprendizaje



- apoyar sobre **OPEN** y **CLOSE** y poner la tarjeta bajo tensión manteniendo los pulsadores hundidos.
- **Los 2 LED se encienden**. Relajar los pulsadores , Los 2 LED se apagan. El Modo aprendizaje es seleccionado.

- apoyar sobre **CLOSE** , Para hacer venir la válvula en posición cerrada. **El LED rojo se enciende**.
- Memorizar la posición cerrada apoyando sobre **MEM + CLOSE**, El **LED rojo parpadea 2 veces** para confirmar.

- apoyar sobre **OPEN** , Para hacer venir la válvula en posición abierta. **El LED verde se enciende**.
- Memorizar la posición abierta apoyando sobre **MEM + OPEN**, El **LED verde parpadea 2 veces** para confirmar.

- Las posiciones memorizadas, Desconectar la tarjeta.

MODO FUNCIONAMIENTO NORMAL

- Poner la tarjeta bajo tensión, El **LED verde parpadea 3 veces**.
- Durante el funcionamiento normal, el LED verde se enciende cuando el motor abre la válvula y el LED rojo cuando el motor cierre la válvula.
- Cuando los 2 LED son apagados, el motor no es solicitado.

- En caso de par demasiado importante, los **2 LED se encienden** para indicar la limitación y el actuador cesa de funcionar. Para arrancarlo de nuevo, hay que o invertir la dirección de funcionamiento, o desconectar y poner de nuevo la tarjeta bajo tensión.

Actionneurs avec possibilité d'une troisième position
Actuator with a third position
Stellantrieb mit einer dritten Position
Actuadores con una tercera posición

L'option GF3 permet à l'actionneur d'être piloté en 3 positions. Les trois positions peuvent être comprises entre 0° et 180°. En standard les actionneurs sont réglés en usine à 0° 90° 180°, ce qui correspond à une vanne 3 voies standard. D'autres configurations sont possibles mais cela doit être précisé par le client lors de la commande.
Les 3 positions sont pilotées par 4 contacts (FCO,FCF,FCIO,FCIF) et 3 contacts de recopie (FC1,FC2,FC3)
Les contacts FC1,FC2 sont des contacts NO (fermeture du circuit en position extrême) et FC3 est un contact NF. (ouverture du circuit en position intermédiaire).

GF3 option allow actuator to be drive and stop in 3 positions.
These 3 positions could be between 0° to 180°.In standard actuators are setting in our workshop at 0° 90° 180° that's fit with standard 3 ways ball valve .
Others positions still available but customer have to price on the order witch position is request.
These 3 positions are controlled by 4 switches (FCO,FCF,FCIO and FCIF) and 3 switches for feed back signal
Switches FC1,FC2 are NO contact (close the circuit in extreme position) and FC3 is a NC contact (open the circuit in intermediate position)

Die GF3-Ausführung erlaubt dem Anwender, den Antrieb in 3 vordefinierte Stellungen zu verfahren.
Diese 3 Positionen können in einem Schwenkbereich zwischen 0° bis 180° liegen. In der Standardausführung werden sie passend zu 3-Wege-Standardventilen auf 0°, 90° und 180° voreingestellt.
Andere Voreinstellungen sind möglich und müssen im Bedarfsfall durch den Kunden im Auftrag vermerkt sein.
Das Anfahren der 3 Positionen wird durch 4 Mikroschalter (FCO,FCF,FCIO and FCIF) und die Positionsrückmeldung durch 3 weitere Mikroschalter realisiert. Die Schalter FC1 und FC2 haben "Öffner"-Funktion (schliessen den Stromkreis am jeweiligen Ende des Schwenkbereichs) und der Schalter FC3 hat "Schliesser"-Funktion (öffnet den Stromkreis in der Zwischenstellung).

La opción GF3 permite que el actuador es pilotado en 3 posiciones. Las tres posiciones pueden ser comprendidas entre 0° y 180°. En estándar, los actuadores son reglados en fábrica a 0° 90° 180°, lo que corresponde a una válvula 3 vías estándares. Otras configuraciones son posibles pero el cliente debe precisarlo cuando hace el pedido.
Las 3 posiciones son pilotadas por 4 contactos, FCO,FCF,FCIO,FCIF, y 3 contactos de recopía, (FC1,FC2,FC3)
Los contactos FC1,FC2 son contactos normalmente abiertos (circuito cerrado en posición extrema) y FC3 es un contacto cerrado abierto (circuito abierto en posición intermediaria).

INSTALLATION AND MAINTENANCE INSTRUCTIONS
For Chemline P-Series Pneumatic Actuators

General:

The P series actuator is a double-opposed piston, double rack and pinion, quarter-turn operator.

The body and end caps are Polyamide plastic in the PP-Series, Rilsan-coated Aluminum in the PA and PG-Series, 316 stainless steel in the P3-Series and Xylan-coated Aluminum in the PH-Series.

This style of actuator has two opposed pistons with racks engaging with a single pinion on actuator shaft. Racks and pinion engage with massive teeth over the full length of the pinion, resulting in balanced forces with minimal backlash. The lower air port opens the actuator in a counter-clockwise direction and the upper port closes the actuator in a clockwise direction, looking from the top of the actuator.

Operating medium requirement:

1. The condition and quality of the compressed air supply to an actuator will affect the efficiency and the life of the seals, bearings and actuator in general. Actuators are to be used with clean, dry air, gas or non-aggressive fluids for satisfactory operation, although lubricated air is acceptable and fluids must be compatible with actuator internals and contain no suspended particles. Natural gas can also be used with the Rilsan-coated aluminum models.

2. We recommend installing a shutoff valve ahead of the actuator to allow the removal of the specific valve and actuator.

3. If air lubricators are used, the lubricant selected must be compatible with Nylon 66 (also known as Polyamide) and Nitrile (also known as Buna –N).

4. Factory assembled units are sized for operating air pressures of 60 psi minimum to 120 psi maximum If lower air supply pressures are available, actuator/valve combination has to be resized.

5. Actuator operating environment temperature limits are –32°C to 90°C (–32°C to265°C for the PH-Series).

Maintenance & Installation Instructions P Series Actuators cont.

Installation:

1. Unpowered actuators are in their "normal" state and are mounted onto valves placed in their fail-safe state, resulting in "Normally-Closed" or "Normally-Open" assemblies. The flats and the ISO slot on the top output shaft, as well as the indicator knob, should be aligned or modified to indicate the valve position.

2. Remove the valve handle according to that valve's maintenance manual.

3. On old-style multi-port valves, install the interference-fit saddle on/around the neck of the valve, tighten the set-screws, drop/tap the coupling into the hole in the saddle and onto the valve shaft, then mount the actuator with appropriate nuts/bolts/washers.

4. On Type-21/23 ball valves and Type-56/57 butterfly valves, center the mounting bracket on the ISO mounting pad, secure with nuts/bolts/washers, drop/tap the coupling onto the valve shaft and mount the actuator as above.

5. Test the actuator for alignment by cycling to the fully open and fully closed positions. Loosen mounting nuts and adjust if necessary, then retighten the nuts and retest for positioning. All nuts/bolts should be snug (hand-tight) but not excessively over-tightened.

6. If the mounted valve is installed other than straight up (actuator on top), the actuator should be supported separately in order to prevent side-loading, loosening of fasteners and increased pressure on the valve stem.

Maintenance:

'P' Series double rack and pinion actuators do not need any preventive maintenance. However, we recommend that you stock the spare parts listed below. Specify actuator model# and drawing part# or description when ordering. Refer to **ASSEMBLY DRAWING PPNA rev 0**. and proceed as follows:

(1) One set of piston O-rings (7)
(2) One set of end cap O-rings (6)
(3) One set of output shaft O-rings (8 & 9)
(4) Retaining ring shaft (10)
(5) Flat Washer (11)

Maintenance & Installation Instructions P Series Actuators cont.

IMPORTANT - Extreme care should be taken when disassembling end caps on spring return models as they are under tension.

1. Isolate actuator from electrical power supply and compressed air supply. Remove from line.

2. Sandwich actuator lengthwise through end caps (2) in a hydraulic press or large vise. Remove end cap retaining ring (13) and gradually release hydraulic pressure, or open vise until springs are fully released.

3. To replace piston O-rings (7) and end cap O-rings (6), remove end cap (2), spring(s) (12) and O-rings (6 & 7).

4. To replace output shaft O-rings (8 & 9), retaining ring shaft (10) and flat washers (11), remove position indicator (14), lift up and replace retaining ring (10) and flat washer (11).

5. Pull down shaft (4) and/or pinion (5), remove and replace shaft top O-rings (8) and shaft bottom O-rings (9).

6. To reassemble, reinstall the shaft (4) and/or pinion (5), washer (11) and retaining ring (10). Sit the actuator on a benchtop with the air port/solenoid mounting pad side of the actuator body (1) facing you while the slotted top part of the shaft (4) is pointing up. Slide the pistons (3) into the body from either end so that the teeth on the left-hand piston face you while the teeth on the right-hand piston face away from you. Ensure that both sets of piston teeth face and engage the pinion/shaft, then turn the shaft clockwise, as seen from the top, to pull the pistons into the body. Confirm that both pistons bottom out against the shaft properly by checking that the slot on top of the actuator shaft is pointing end-to-end when the shaft can turn no further and by comparing the distance from both piston faces to the ends of the body. If pistons are not engaged identically, turn shaft counterclockwise to push out pistons and hold one or both pistons to skip pinion teeth, if applicable, and repeat until both pistons bottom out at the same time. This bottoming out simulates the 90-degree rotation that occurs when air is applied to the actuator. Proceed with spring installation, if applicable, then reverse steps 2, 3 and 4.

Periodic checks should be performed to ensure tightness of all fittings.

NOTE 1: FOR SPRING-RETURN MODELS ONLY, DOUBLE-ACTING HAVE NO SPRINGS AND A FLAT END CAP.

NOTE 2: ON SOME SIZES, SHAFT AND PINION ARE ONE PIECE.

MAINTENANCE INSTRUCTIONS
For Chemline Globe Valves Sizes 1/2" - 2"

Maintenance (Sizes 1/2" to 2")

Refer to **ASSEMBLY DRAWING GV-01(A).** And proceed as follows:

1. Remove bonnet and stem assembly (2 through 5) by unscrewing gland nut (6). The complete stem assembly should lift out of the valve body.
   (Note: make sure there is no pressure in line prior to removing valve.)

2. The stem (4) is removed from the bonnet assembly by first removing the handwheel (3) by unscrewing nut (9). Loosen the stem packing (8) and inspect for excessive wear and cracking.

3. Lubricate the seal (7) before replacing the shaft (4). Dow Corning III silicone compound recommended.

4. Inspect the body seat (1) and disc seat (5) for excessive wear and pitting. Pitting is caused by foreign objects being jammed between the sealing surfaces when closing the valve. If the disc seat (5) is damaged, replace the part.
   Important: If the body seat is damaged replace the complete valve.

5. To reassemble valve, reverse steps 1 to 4 above.

   (NOTE) When replacing the stem assembly back into the valve body, be sure that the stem NOT in the closed position. If it is, the stem may be over extended and could damage the body seat when the bonnet is re-tightened.

MAINTENANCE INSTRUCTIONS
For Chemline Globe Valves Sizes 2-1/2"- 4"

Maintenance (2-1/2" - 4")

Refer to **ASSEMBLY DRAWING GV-01(B).** And proceed as follows:

1. Remove bonnet and stem assembly (2 through 5) by unscrewing gland nut (2), or by loosening and removing bolts (17). The complete stem assembly should lift out of the valve body. (Note: make sure there is no pressure in line prior to removing valve.)

2. The stem (4) is removed from the bonnet assembly by first removing the handwheel (3) by unscrewing nut (9). Loosen the stem and inspect for excessive wear and cracking.

3. Lubricate the seal (7) before replacing the shaft (4). Dow Corning III silicone compound recommended.

4. Inspect the body seat (1) and disc seat (5) for excessive wear and pitting. Pitting is caused by foreign objects being jammed between the sealing surfaces when closing the valve. If the disc seat (5) is damaged, replace the part.
   Important: If the body seat is damaged replace the complete valve.

5. To reassemble valve, reverse steps 1 to 4 above.

   (NOTE) When replacing the stem assembly back into the valve body, be sure that the stem is NOT in the closed position. If it is, the stem may be over extended and could damage the body seat when the body is re-tightened.

CHEMLINE

SERIES SB12, BACK PRESSURE/RELIEF VALVE

LEFT BLANK

CHEMLINE Plastics Limited

Your Pipeline To Quality Valves, Strainers, Flowmeters and Controls

55 Guardsman Road
Thornhill, Ontario
L3T 6L2
Canada
Tel: 905-889-7890
Fax: 905-889-8553

MAINTENANCE INSTRUCTIONS
For Chemline 3/8" - 1-1/2" SB Series Pressure Relief Valves

Installation:

1. Always mount a filter or strainer in the line immediately before the valve to avoid damage to the valve from dirt or particles. Valve is spring operated, therefore can be installed in any orientation.

2. **To adjust pressure use the adjustment screw (8) and a pressure gauge**.
   - the valve will be closed at the set pressure and will start to open when the operating pressure rises above the set pressure.
   - connect the compressed air supply to the inlet of the valve. Adjust the flow of the air to the desired set pressure by turning clockwise to increase the set pressure, counterclockwise to decrease it.
   - with the valve being closed, adjust the screw (8) until the valve starts to open. Fix the adjusting screw in place with the locking nut (9).

3. For installation in an application where the temperature is 0^{o} C or less. Check with Chemline Engineering
   Technical staff prior to installation.

Maintenance

Refer to **ASSEMBLY DRAWING SB10/11 rev 0.** And proceed as follows.

1. Loosen and remove cap (10).

2. Loosen counter nut (9) and remove adjustment screw (8).

3. Remove body cap (12a), body bolt (12b), body nut (12c) and washer (12d).

4. Lift up and remove bonnet (2).

5. Remove pressure plate (7a) and ball bearing (7b) to reach relief spring (3).

6. Loosen piston screw (11), remove spring plate (6) and draw piston assembly (5) downward and out of body (1).
   Note: Piston assembly (5) is all parts (5a) outer piston assembly
   (5b) inner piston assembly
   (5c) seat
   (5d) piston o-ring

Piston assembly is removed from body as a unit. It can then be further disassembled into the component parts listed above.

7 Remove diaphragm (4).

8. Remove seal (14) at intermediate flange (13).

9. Inspect all parts for wear and abrasion, replace seals, diaphragm etc. if necessary.

10. To re-assemble valve follow steps 1 through 9 in reverse order.

MAINTENANCE & INSTALLATION INSTRUCTIONS
For Chemline 2" – 4" SB Series Pressure Relief Valves

Installation:

1. Always mount a filter or strainer in the line immediately before the valve to avoid damage to the valve from dirt or particles. Valve is spring operated, therefore can be installed in any orientation.

2. **To adjust pressure use the adjustment screw (8) and a pressure gauge**.
   - the valve will be closed at the set pressure and will start to open when the operating pressure rises above the set pressure.
   - connect the compressed air supply to the inlet of the valve. Adjust the flow of the air to the desired set pressure by turning clockwise to increase the set pressure, counterclockwise to decrease it.
   - with the valve being closed, adjust the screw (8) until the valve starts to open. Fix the adjusting screw in place with the locking nut (9).

3. For installation in an application where the temperature is 0^{o} C or less. Check with Chemline Engineering
   Technical staff prior to installation.

Maintenance:

Refer to **ASEMBLY DRAWING SB1201 rev 0.** And proceed as follows:

1. Loosen and remove cap (10).

2. Loosen counter nut (9) and remove adjustment screw (8).

3. Remove body cap (12c), body nut and bolt (12a) and washer (12b).

4. Lift up and remove bonnet (2).

5. Remove pressure plate (7a) and ball bearing (7b) to reach relief spring (3).

6. Draw piston assembly (5) downward and out of body (1).
   Note: Piston assembly (5) is all parts (5a) outer piston assembly
   (5b) plug
   (5c) seat
   Piston assembly is removed from the body as a unit. It can then be further disassembled into the component parts listed above.

7. Remove diaphragm (4).

8. Remove seal (14) at intermediate flange (13).

9. Inspect all parts for wear and abrasion, replace seals, diaphragms etc. if necessary.

10. To re-assemble valve follow steps 1 through 10 in reverse order.

MAINTENANCE INSTRUCTIONS
For Chemline SG Series Gauge Isolator 1/4"and 1/2"

Maintenance:

Refer to drawing on page 2 of the **SG Gauge Isolator Data Page**

1. Gauge isolators can be mounted and filled with glycerine at Chemline prior to delivery, or isolators can be mounted and filled on site.
2. Remove isolator from valve.
3. To disassemble isolator remove gauge (6) from upper chamber/bonnet (3).
4. Separate bonnet (3) from body (1).
5. Drain glycerin (or other fluid) from both chambers (1 & 3), prior to removing diaphragm (2).
6. Check teflon diaphragm (2) for wear and replace if necessary.
7. Refill upper chamber (3) and replace diaphragm (2).
8. To reassemble diaphragm follow steps 1 through 4 in reverse, to hand-tight plus ¼ turn (approx. 30 in-lb).

Gauge Isolators

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered Consult Chemline

NSF[4] Certified to NSF/ANSI 61

SERIES: SG

INLET CONNECTION: 1/4" or 1/2" Threaded[1]

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

DIAPHRAGM: PTFE

Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine[2]. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

features

Easy to Mount Gauges

- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port

- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance

- Choice of body materials for a wide range of applications
- PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety

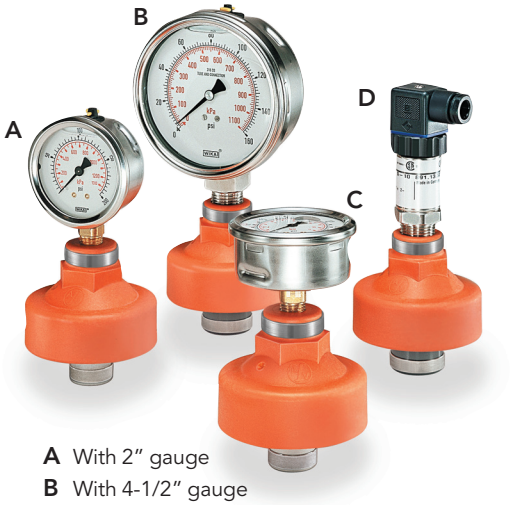
- PPG[3] top chamber
- Heavy wall connection ports

CRN Registration number by province

- Ontario: OH16085.5

Optional Gauges

- Isolators are available alone or with gauge mounted and prefilled with glycol[2]

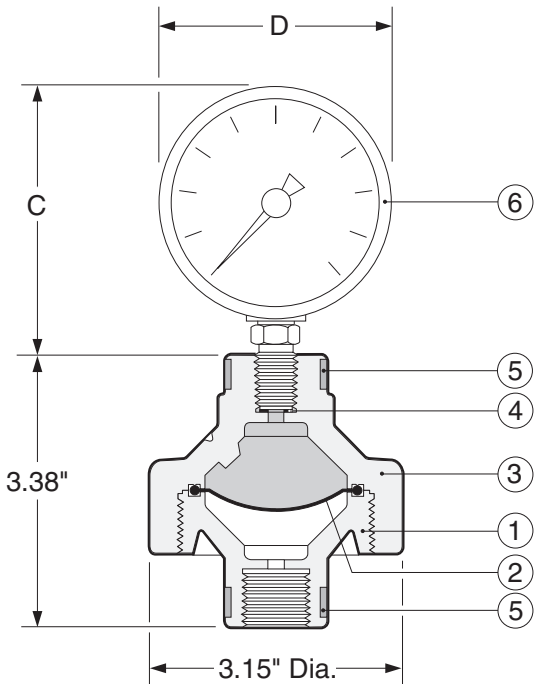


A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

[1] Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
[2] Other fluids are available for special applications such as chlorine service.
[3] Glass reinforced polypropylene.
[4] PVC isolators are certified under NSF/ANSI Standard 61 for contact with drinking water.

06/14 ©Chemline Plastics Limited 2014
Chemline is a registered trade mark of Chemline Plastics Limited

Gauge Isolators



PARTS

No.	Part	Pcs.	Materials
1	Body	1	PVC, PP, PVDF
2	Diaphragm	1	PTFE
3	Bonnet	1	PPG[1]
4	Gasket	1	EPDM
5	Stainless Steel Bands	2	304 SS
6	Optional Gauge	1	See below

[1]PPG = Glass reinforced polypropylene

OPTIONAL GAUGES

- Chemline offers the gauges listed below mounted to isolator and prefilled with glycol, glycerine or special fluid for chlorine applications. These gauges have dials and cases filled with either glycol (standard), glycerine or silicon for corrosion resistance and dampening.
- Chemline SG gauge isolators are not recommended for vacuum applications. They will not affect the gauge accuracy as low as approximately 3 psi. The accuracy depends on the process conditions and the gauge installed on it.

OTHER OPTIONS

- **Flanged** inlet connections
- **Threaded Fill Port** – drilled, tapped and plugged
- Chemline will mount any pressure instrument supplied free issue by customer

DIMENSIONS (Gauge Isolator with optional gauge installed) INCHES

Optional Gauge Ordering No.	Gauge Diameter	Gauge Connection	Housing	Bourdon Tube	Window	Accuracy	Dimensions C	Dimensions D(max.)

INSTALLATION & MAINTENANCE INSTRUCTIONS
For Chemline FC/FS Series Variable Area Flowmeter Sizes 5" and 7"

Installation & Maintenance:

Refer to **ASSEMBLY DRAWING SFM1 REV 0**. And proceed as follows:

1. Install in line (where flow readings are required).
2. Unscrew union nuts (5).
3. Remove end connectors (6).
4. Tube (1) will slide out when end connectors (6) are removed.
5. Upper and lower float stops will come out with the end connectors (6).
6. Remove and clean or replace o-rings (7).
7. Remove float (2) from tube (1) and clean.
8. Remove range indicator (8) from tube and clean or replace.
9. It is recommended that spare o-rings (7) and range indicators (8) be kept.

Maximum Working Pressures and Temperature Ranges

Construction				
Tube	**Union Nuts**	**Ends**	**Pressure**	**Temperature**
PVC	PVC	PVC	150 psi	0 to 60° C
Polyamide (PA)	PVC	PVC	150 psi	0 to 60° C
Polyamide (PA	PPG	PP or CPVC	150 psi	0 to 80° C
Polysulfone (PSU)	PPG	PP or CPVC	150 psi	0 to 90° C
Polysulfone (PSU)	PVDF	PVDF	150 psi	0 to 120° C
PVDF	PVDF	PVDF	150 psi	-40 to 120° C

Ranges, Conversion Charts, Sizing, Scale Correction Factors etc. are available on the Chemline Data Page and also available from the Chemline Technical Department.

1 Safety instructions

1.1 Designated use

The measuring device described in this Operating Manual is to be used only for measuring the flow rate of conductive fluids in closed pipes.

A minimum conductivity of 20 µS/cm is required for measuring demineralized water. Most liquids can be measured as of a minimum conductivity of 5 µS/cm.

Examples:
- Acids, alkalis
- Drinking water, wastewater, sewage sludge
- Milk, beer, wine, mineral water, etc.

Resulting from incorrect use or from use other than that designated the operational safety of the measuring devices can be suspended. The manufacturer accepts no liability for damages being produced from this.

1.2 Installation, commissioning and operation

Please note the following:
- Installation, connection to the electricity supply, commissioning and maintenance of the device must be carried out by trained, qualified specialists authorized to perform such work by the facility's owner-operator. The specialist must have read and understood this Operating Manual and must follow the instructions it contains.
- The device must be operated by persons authorized and trained by the facility's owner-operator. Strict compliance with the instructions in the Operating Manual is mandatory.
- With regard to special fluids, including fluids used for cleaning, Endress+Hauser will be happy to assist in clarifying the corrosion-resistant properties of wetted materials. However, minor changes in temperature, concentration or in the degree of contamination in the process may result in variations in corrosion resistance. For this reason, Endress+Hauser does not accept any responsibility with regard to the corrosion resistance of wetted materials in a specific application.
  The user is responsible for the choice of suitable wetted materials in the process.
- If welding work is performed on the piping system, do not ground the welding appliance through the Promag flowmeter.
- The installer must ensure that the measuring system is correctly wired in accordance with the wiring diagrams. The transmitter must be grounded apart from when special protective measures are taken (e.g. galvanically isolated SELV or PELV power supply)
- Invariably, local regulations governing the opening and repair of electrical devices apply.

1.3 Operational safety

Please note the following:
- Measuring systems for use in hazardous environments are accompanied by separate Ex documentation, which is an integral part of this Operating Manual. Strict compliance with the installation instructions and ratings as stated in this supplementary documentation is mandatory. The symbol on the front of this Ex documentation indicates the approval and the certification body (e.g. Ⓔx Europe, FM USA, CSA Canada).
- The measuring device complies with the general safety requirements in accordance with EN 61010-1, the EMC requirements of IEC/EN 61326 and NAMUR Recommendations NE 21 and NE 43.
- Depending on the application, the seals of the process connections of the Promag H sensor require periodic replacement.

- When hot fluid passes through the measuring tube, the surface temperature of the housing increases. In the case of the sensor, in particular, users should expect temperatures that can be close to the fluid temperature. If the temperature of the fluid is high, implement sufficient measures to prevent burning or scalding.
- The manufacturer reserves the right to modify technical data without prior notice. Your Endress+Hauser distributor will supply you with current information and updates to these Operating Instructions.

1.4 Return

The measuring device must be returned if repairs or a factory calibration are required, or if the wrong measuring device has been ordered or delivered. According to legal regulations, Endress+Hauser, as an ISO-certified company, is required to follow certain procedures when handling returned products that are in contact with medium.

To ensure swift, safe and professional device returns, please read the return procedures and conditions on the Endress+Hauser website at www.services.endress.com/return-material

1.5 Notes on safety conventions and icons

The devices are designed to meet state-of-the-art safety requirements, have been tested, and left the factory in a condition in which they are safe to operate. The devices comply with the applicable standards and regulations in accordance with EN 61010-1 "Safety requirements for electrical equipment for measurement, control and laboratory use".
The devices can, however, be a source of danger if used incorrectly or for anything other than the designated use. Consequently, always pay particular attention to the safety instructions indicated in this Operating Manual by the following icons:

Warning!
"Warning" indicates an action or procedure which, if not performed correctly, can result in injury or a safety hazard. Comply strictly with the instructions and proceed with care.

Caution!
"Caution" indicates an action or procedure which, if not performed correctly, can result in incorrect operation or destruction of the device. Comply strictly with the instructions.

Note!
"Note" indicates an action or procedure which, if not performed correctly, can have an indirect effect on operation or trigger an unexpected response on the part of the device.

2 Identification

2.1 Device designation

The flow measuring system consists of the following components:

- Promag 50 transmitter
- Promag D/E/H/L/P/W sensor

In the *compact version*, the transmitter and sensor form a single mechanical unit; in the *remote version* they are installed separately.

2.1.1 Nameplate of the transmitter

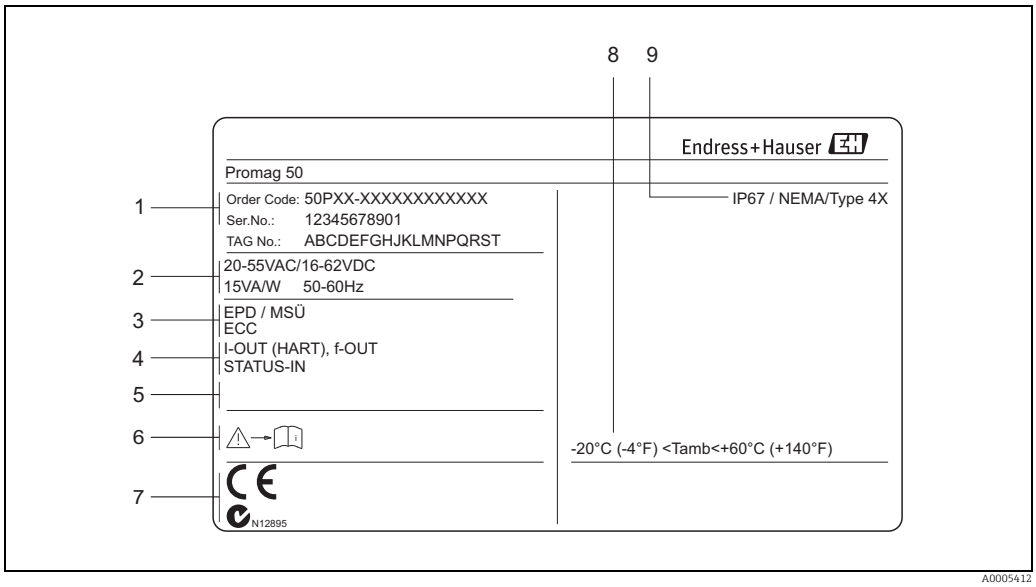

Fig. 1: Nameplate specifications for the "Promag 50" transmitter (example)

1 *Ordering code/serial number: See the specifications on the order confirmation for the meanings of the individual letters and digits.*
2 *Power supply, frequency, power consumption*
3 *Additional information:*
EPD/MSÜ: with Empty Pipe Detection
ECC: with electrode cleaning
4 *Outputs available:*
I-OUT (HART): with current output (HART)
f-OUT (HART): with frequency output
STATUS-IN: with status input (power supply)
5 *Reserved for information on special products*
6 *Observe device documentation*
7 *Reserved for additional information on device version (approvals, certificates)*
8 *Permitted ambient temperature range*
9 *Degree of protection*

2.1.2 Nameplate of the sensor

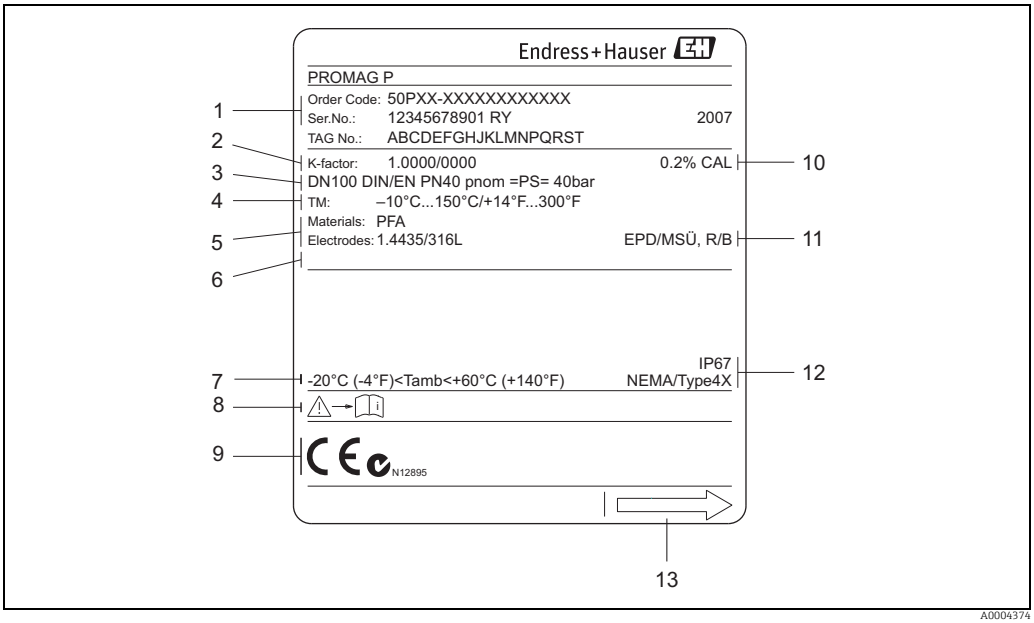

Fig. 2: Nameplate specifications for the "Promag" sensor (example)

1 *Ordering code/serial number: See the specifications on the order confirmation for the meanings of the individual letters and digits.*
2 *Calibration factor with zero point*
3 *Nominal diameter / Pressure rating*
4 *Fluid temperature range*
5 *Materials: lining/measuring electrodes*
6 *Reserved for information on special products*
7 *Permitted ambient temperature range*
8 *Observe device documentation*
9 *Reserved for additional information on device version (approvals, certificates)*
10 *Calibration tolerance*
11 *Additional information (examples):*
- *EPD/MSÜ: with Empty Pipe Detection electrode*
- *R/B: with reference electrode*

12 *Degree of protection*
13 *Flow direction*

2.1.3 Nameplate, connections

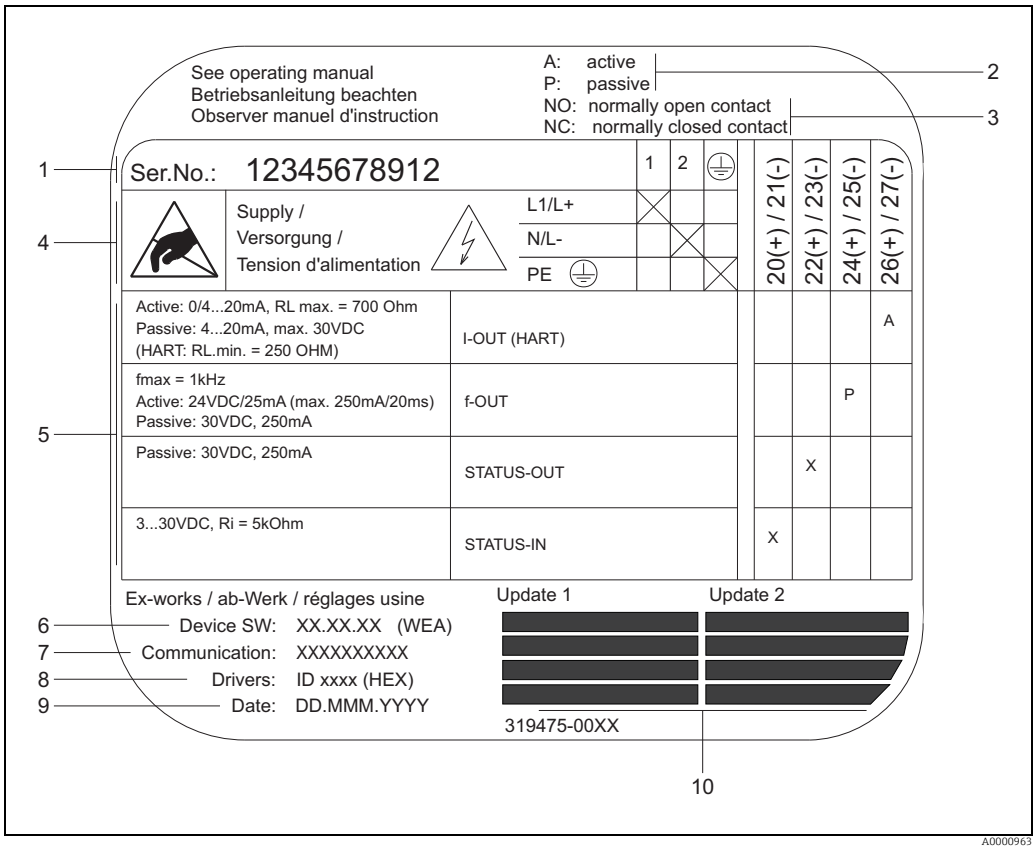

Fig. 3: Nameplate specifications for transmitter (example)

1 *Serial number*
2 *Possible configuration of current output*
3 *Possible configuration of relay contacts*
4 *Terminal assignment, cable for power supply: 85 to 260 V AC, 20 to 55 V AC, 16 to 62 V DC*
*Terminal **No. 1**: L1 for AC, L+ for DC*
*Terminal **No. 2**: N for AC, L– for DC*
5 *Signals present at inputs and outputs, possible configuration and terminal assignment (20 to 27), see also "Electrical values of inputs/outputs"*
6 *Version of device software currently installed*
7 *Installed communication type, e.g.: HART, PROFIBUS PA, etc.*
8 *Information on current communication software (Device Revision and Device Description), e.g.: Dev. 01 / DD 01 for HART*
9 *Date of installation*
10 *Current updates to data specified in points 6 to 9*

2.2 Certificates and approvals

The devices are designed to meet state-of-the-art safety requirements in accordance with sound engineering practice. They have been tested and left the factory in a condition in which they are safe to operate.

The devices comply with the applicable standards and regulations in accordance with EN 61010-1 "Safety requirements for electrical equipment for measurement, control and laboratory use" and with the EMC requirements of IEC/EN 61326/A1.

The measuring system described in this Operating Manual is therefore in conformity with the statutory requirements of the EC Directives. Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

3 Installation

3.1 Incoming acceptance, transport and storage

3.1.1 Incoming acceptance

On receipt of the goods, check the following:
- Check the packaging and the contents for damage.
- Check the shipment, make sure nothing is missing and that the scope of supply matches your order.

3.1.2 Transport

The following instructions apply to unpacking and to transporting the device to its final location:
- Transport the devices in the containers in which they are delivered.
- Do not remove the protective plates or caps on the process connections until you are ready to install the device. This is particularly important in the case of sensors with PTFE linings.

Special notes on flanged devices

Caution!
- The wooden covers mounted on the flanges from the factory protect the linings on the flanges during storage and transportation. In case of Promag L they are additionally used to hold the lap joint flanges in place. Do not remove these covers until **immediately before** the device in the pipe.
- Do not lift flanged devices by the transmitter housing, or the connection housing in the case of the remote version.

Transporting flanged devices DN ≤ 300 (12")

Use webbing slings slung round the two process connections. Do not use chains, as they could damage the housing.

Warning!
Risk of injury if the measuring device slips. The center of gravity of the assembled measuring device might be higher than the points around which the slings are slung.
At all times, therefore, make sure that the device does not unexpectedly turn around its axis or slip.

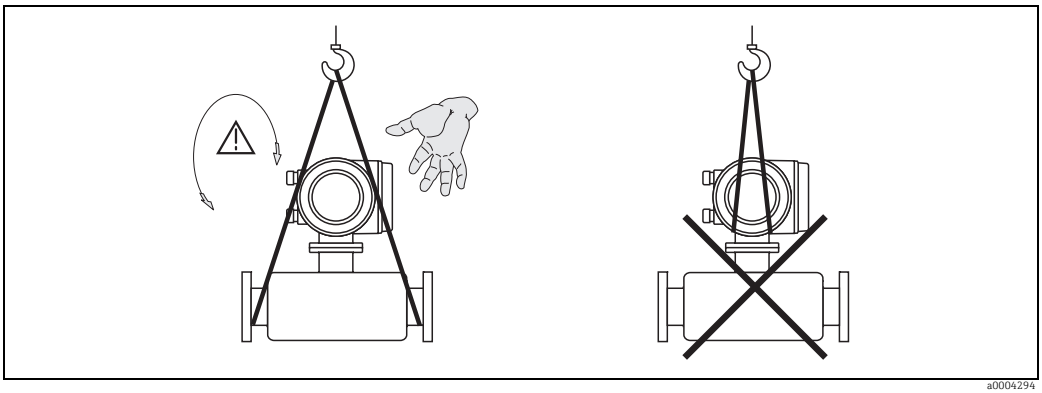

Fig. 4: Transporting sensors with DN ≤ 300 (12")

Transporting flangeddevices DN ≥ 350 (14")

Use only the metal eyes on the flanges for transporting the device, lifting it and positioning the sensor in the piping.

Caution!
Do not attempt to lift the sensor with the tines of a fork-lift truck beneath the metal casing. This would buckle the casing and damage the internal magnetic coils.

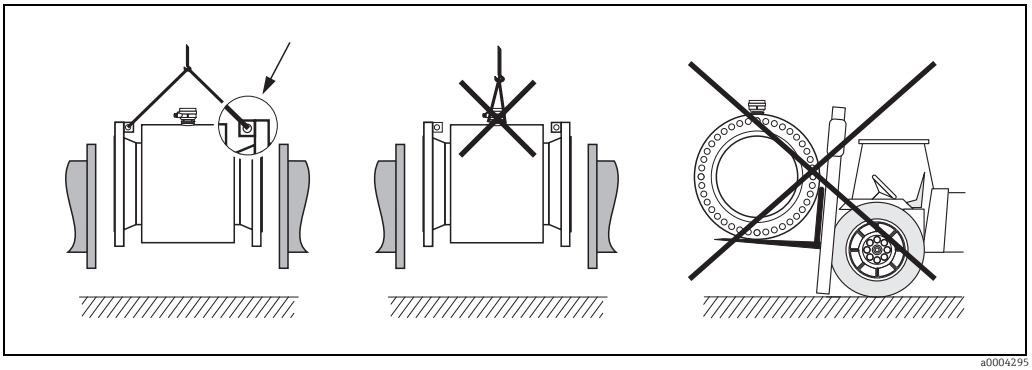

Fig. 5: Transporting sensors with DN ≥ 350 (14")

3.1.3 Storage

Please note the following:
- Pack the measuring device in such a way as to protect it reliably against impact for storage (and transportation). The original packaging provides optimum protection.
- The storage temperature corresponds to the operating temperature range of the measuring transmitter and the appropriate measuring sensors → 🖹 102.
- Do not remove the protective plates or caps on the process connections until you are ready to install the device. This is particularly important in the case of sensors with PTFE linings.
- The measuring device must be protected against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- Choose a storage location where moisture does not collect in the measuring device. This will help prevent fungus and bacteria infestation which can damage the liner.

3.2 Installation conditions

3.2.1 Dimensions

The dimensions and installation lengths of the sensor and transmitter can be found in the "Technical Information" for the device in question. This document can be downloaded as a PDF file from www.endress.com. A list of the "Technical Information" documents available is provided in the "Documentation" section on → 127.

3.2.2 Mounting location

Entrained air or gas bubble formation in the measuring tube can result in an increase in measuring errors.
Avoid the following locations:
- Highest point of a pipeline. Risk of air accumulating!
- Directly upstream from a free pipe outlet in a vertical pipeline.

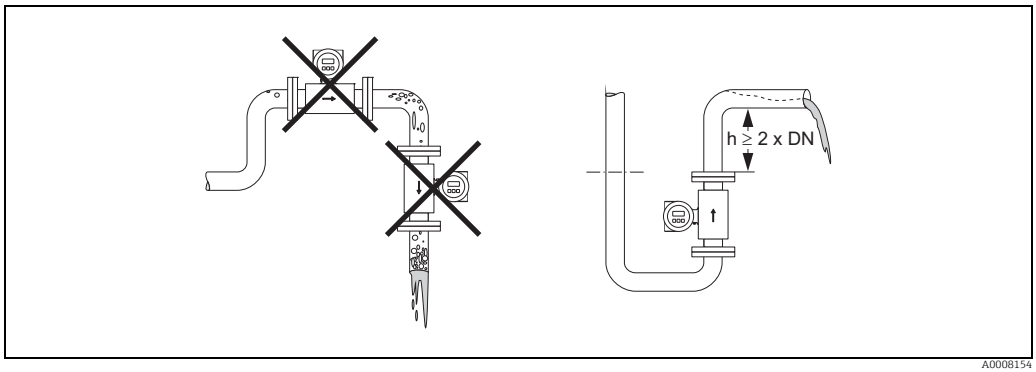

Fig. 6: Mounting location

Installation of pumps

Do **not** install the sensor on the intake side of a pump. This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. Information on the lining's resistance to partial vacuum can be found on → 107.

It might be necessary to install pulse dampers in systems incorporating reciprocating, diaphragm or peristaltic pumps. Information on the measuring system's resistance to vibration and shock can be found on → 103.

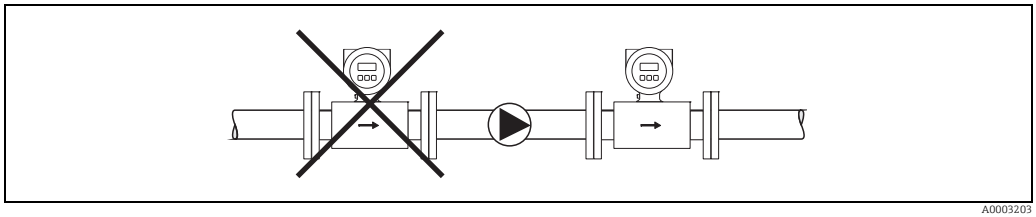

Fig. 7: Installation of pumps

Partially filled pipes

Partially filled pipes with gradients necessitate a drain-type configuration.
The Empty Pipe Detection function (EPD → 🖹 76) offers additional protection by detecting empty or partially filled pipes.

Caution!
Risk of solids accumulating. Do not install the sensor at the lowest point in the drain. It is advisable to install a cleaning valve.

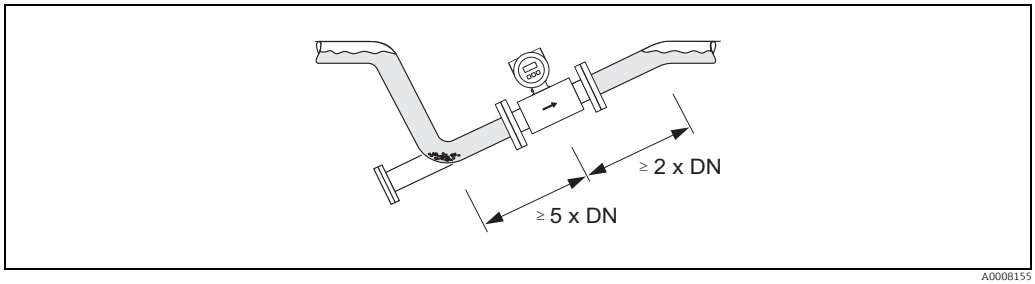

Fig. 8: Installation in a partially filled pipe

Down pipes

Install a siphon or a vent valve downstream of the sensor in down pipes whose length h ≥ 5 m (16.4 ft). This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube.
This measure also prevents the system losing prime, which could cause air pockets.
Information on the lining's resistance to partial vacuum can be found on → 🖹 107.

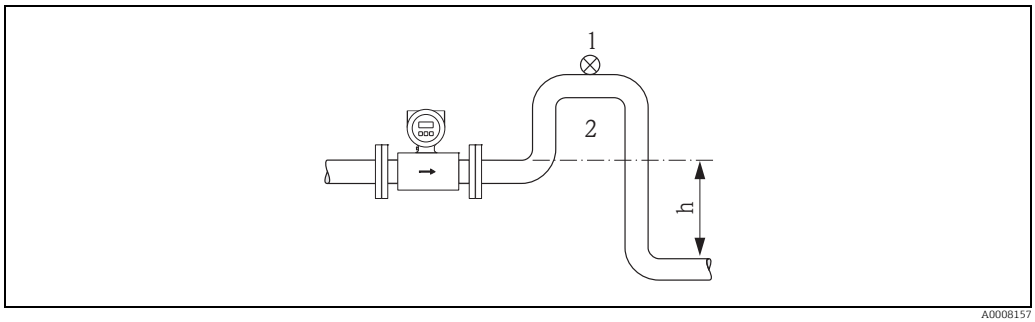

Fig. 9: Measures for installation in a down pipe

1 Vent valve
2 Pipe siphon
h Length of down pipe

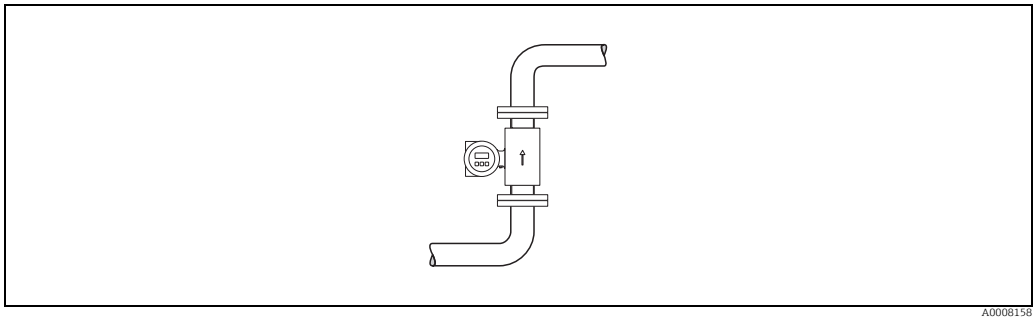
3.2.3 Orientation

An optimum orientation position helps avoid gas and air accumulations and deposits in the measuring tube. However, Promag offers the additional Empty Pipe Detection (EPD) function to ensure the detection of partially filled measuring tubes, e.g. in the case of degassing fluids or varying process pressure:

- Electrode Cleaning Circuit (ECC) for applications with accretive fluids, e.g. electrically conductive deposits (→ "Description of Device Functions" manual).
- Empty Pipe Detection (EPD) ensures the detection of partially filled measuring tubes, e.g. in the case of degassing fluids (→ 🖹 76)
- Exchangeable Measuring Electrodes for abrasive fluids (→ 🖹 95)

Vertical orientation

This is the ideal orientation for self-emptying piping systems and for use in conjunction with Empty Pipe Detection.



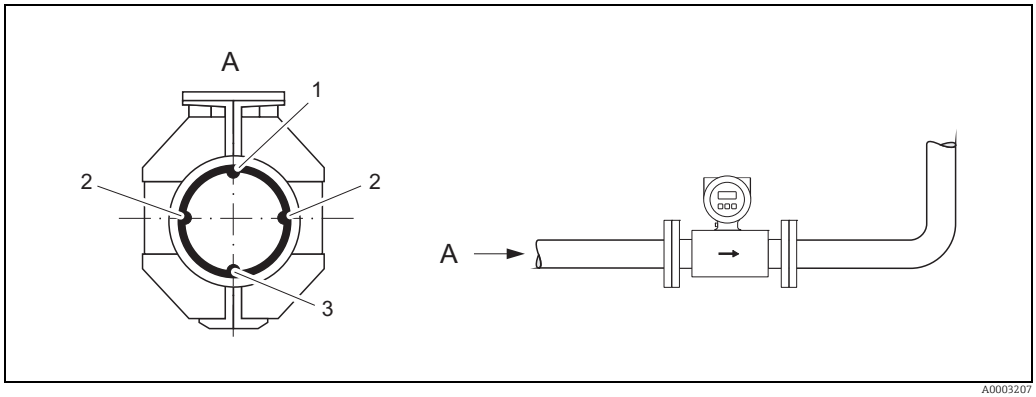
A0008158

Fig. 10: Vertical orientation

Horizontal orientation

The measuring electrode plane should be horizontal. This prevents brief insulation of the two measuring electrodes by entrained air bubbles.

Caution!
Empty Pipe Detection functions correctly only when the measuring device is installed horizontally and the transmitter housing is facing upward (→ 🖹 10). Otherwise there is no guarantee that Empty Pipe Detection will respond if the measuring tube is only partially filled or empty.



A0003207

Fig. 11: Horizontal orientation

1 EPD electrode for the detection of empty pipes (not with Promag D and Promag H (DN 2 to 15 / 1/12 to ½"))
2 Measuring electrodes for signal detection
3 Reference electrode for the potential equalization (not with Promag D and H)

Inlet and outlet run

If possible, install the sensor upstream from fittings such as valves, T-pieces, elbows, etc. The following inlet and outlet runs must be observed in order to meet accuracy specifications:
- Inlet run: ≥ 5 × DN
- Outlet run: ≥ 2 × DN

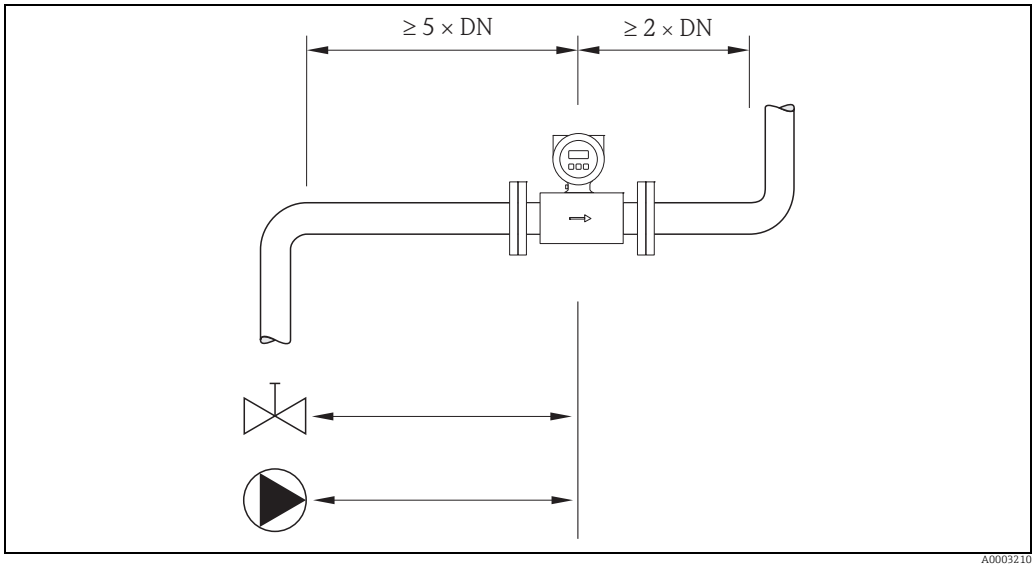


Fig. 12: Inlet and outlet runs

3.2.4 Vibrations

Secure the piping and the sensor if vibration is severe.

Caution!
If vibrations are too severe, we recommend the sensor and transmitter be mounted separately. Information on resistance to vibration and shock can be found on → 🖹 103.

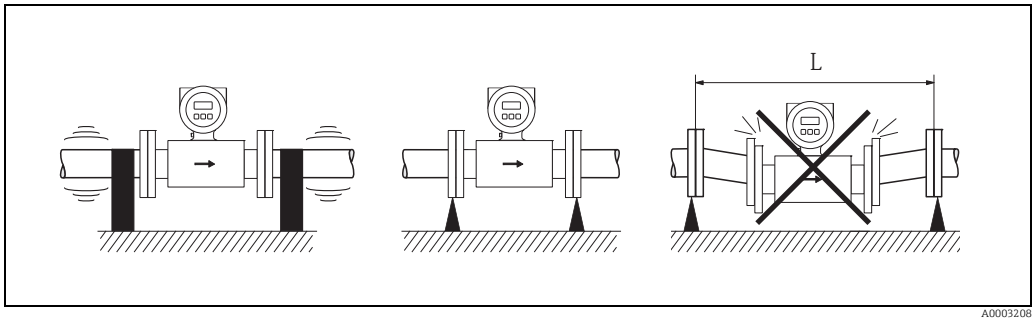

Fig. 13: Measures to prevent vibration of the device (L > 10 m (32.8 ft))

3.2.5 Foundations, supports

If the nominal diameter is DN ≥ 350 (14"), mount the sensor on a foundation of adequate load-bearing strength.

Caution!
Risk of damage.
Do not support the weight of the sensor on the metal casing: the casing would buckle and damage the internal magnetic coils.

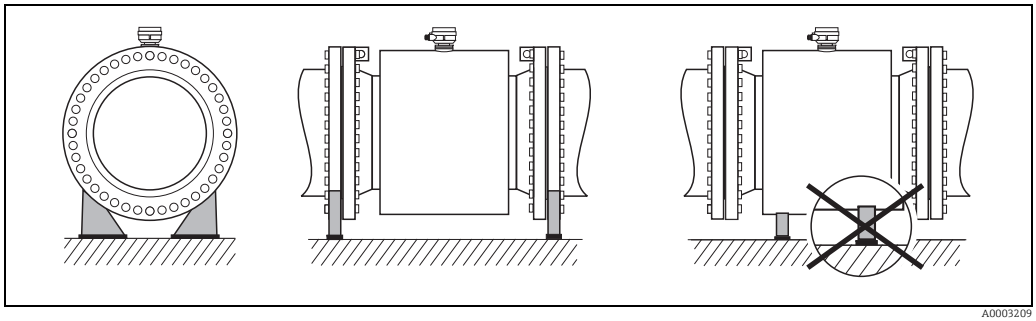

Fig. 14: Correct support for large nominal diameters (DN ≥ 350 / 14")

3.2.6 Adapters

Suitable adapters to DIN EN 545 (double-flange reducers) can be used to install the sensor in larger-diameter pipes.
The resultant increase in the rate of flow improves measuring accuracy with very slow-moving fluids. The nomogram shown here can be used to calculate the pressure loss caused by reducers and expanders.

Note!
The nomogram only applies to liquids of viscosity similar to water.

1. Calculate the ratio of the diameters d/D.
2. From the nomogram read off the pressure loss as a function of flow velocity (*downstream* from the reduction) and the d/D ratio.

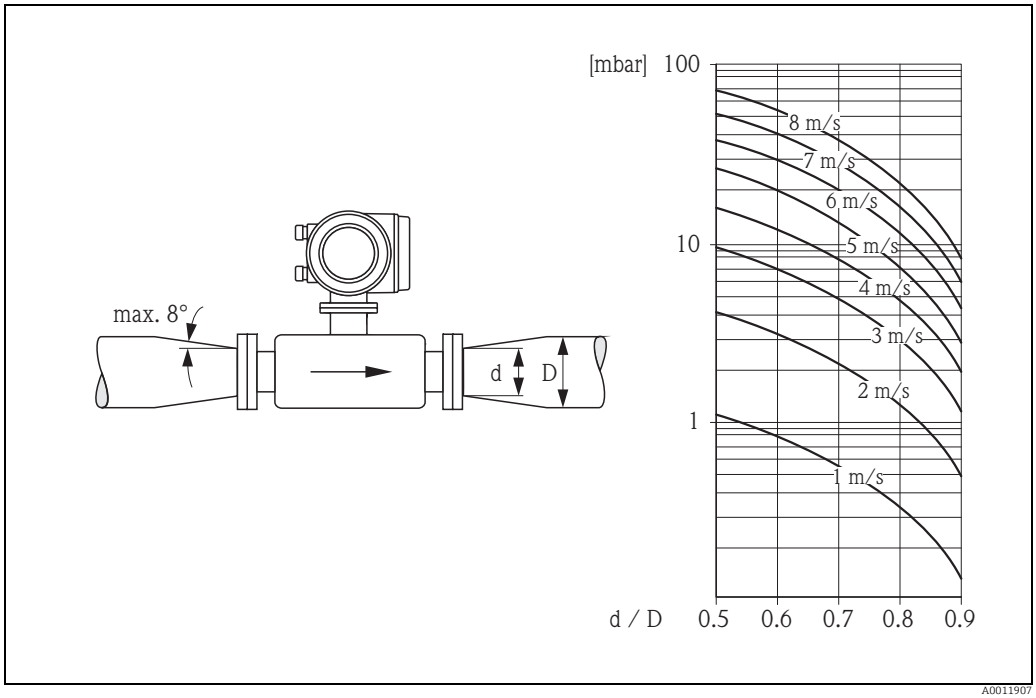

Fig. 15: Pressure loss due to adapters

3.2.7 Nominal diameter and flow rate

The diameter of the pipe and the flow rate determine the nominal diameter of the sensor. The optimum velocity of flow is between 2 and 3 m/s (6.5 to 9.8 ft/s).

The velocity of flow (v), moreover, has to be matched to the physical properties of the fluid:
- v < 2 m/s (v < 6.5 ft/s): for abrasive fluids
- v > 2 m/s (v > 6.5 ft/s): for fluids producing buildup

Note!
Flow velocity can be increased, if necessary, by reducing the nominal diameter of the sensor (→ 16).

Recommended flow (SI units)

Nominal diameter	Promag D	Promag E/P	Promag H	Promag L	Promag W

3.2.8 Length of connecting cable

In order to ensure measuring accuracy, comply with the following instructions when installing the remote version:

- Fix cable run or lay in armored conduit. Cable movements can falsify the measuring signal especially in the case of low fluid conductivities.
- Route the cable well clear of electrical machines and switching elements.
- Ensure potential equalization between sensor and transmitter, if necessary.
- The permitted connecting cable length L_{max} is determined by the fluid conductivity (→ 16). A minimum conductivity of 20 µS/cm is required for measuring demineralized water. Most liquids can be measured as of a minimum conductivity of 5 µS/cm.
- The maximum connecting cable length is 10 m (32.8 ft) when empty pipe detection (EPD → 76) is switched on.

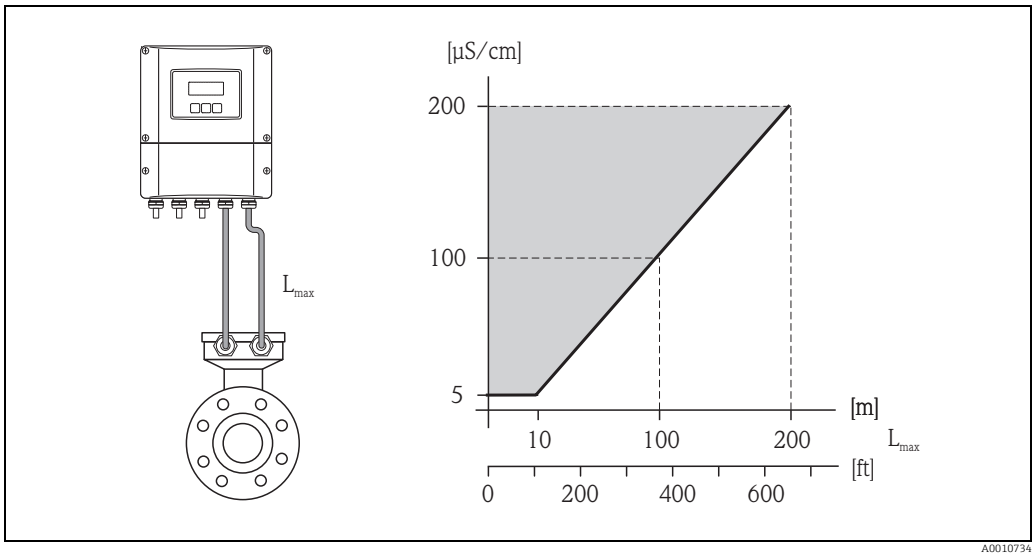

Fig. 16: Permissible cable length for the remote version

Area shaded gray = permitted range
Lmax = connecting cable length in [m]
Fluid conductivity in [µS/cm]

3.3 Installation instructions

3.3.1 Installing the Promag D sensor

The sensor is installed between the pipe flanges with a mounting kit. The device is centered using recesses on the sensor (→ 🖹 21).

Note!
A mounting kit consisting of mounting bolts, seals, nuts and washers can be ordered separately (→ 🖹 79). Centering sleeves are provided with the device if they are required for the installation.

Caution!
When installing the transmitter in the pipe, observe the necessary torques (→ 🖹 22).

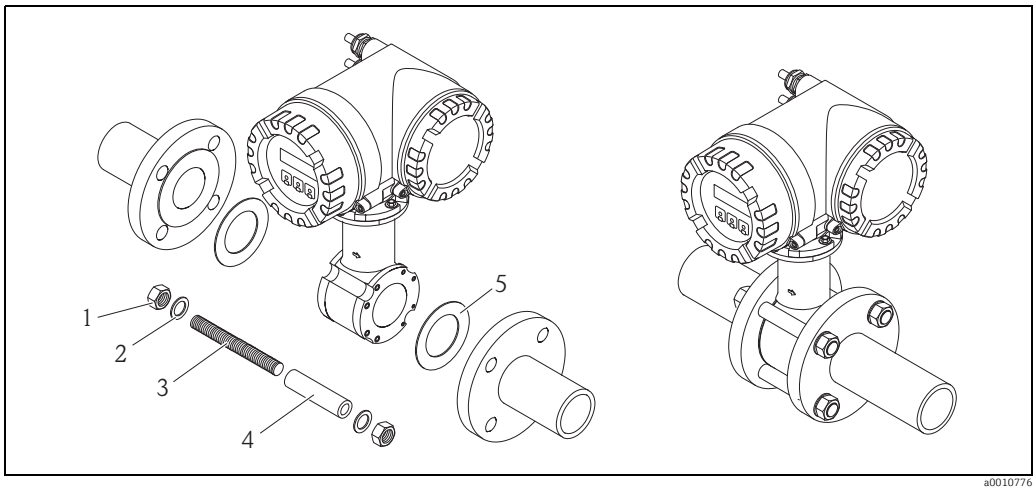

Fig. 17: Mounting the sensor

1 Nut
2 Washer
3 Mounting bolt
4 Centering sleeve
5 Seal

Seals

When installing the sensor, make sure that the seals used do not project into the pipe cross-section.

Caution!
Risk of short circuit! Do not use electrically conductive sealing compounds such as graphite! An electrically conductive layer could form on the inside of the measuring tube and short-circuit the measuring signal.

Note!
Use seals with a hardness rating of 70° Shore A.

Arrangement of the mounting bolts and centering sleeves

The device is centered using recesses on the sensor. The arrangement of the mounting bolts and the use of the centering sleeves supplied depend on the nominal diameter, the flange standard und the pitch circle diameter.

	Process connection		
	EN (DIN)	ASME	JIS

2 = EN (DIN) flanges: 4-hole → with centering sleeves
3 = EN (DIN) flanges: 8-hole → without centering sleeves

Screw tightening torques (Promag D)

Please note the following:
- The tightening torques listed below are for lubricated threads only.
- Always tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.
- The tightening torques listed below apply only to pipes not subjected to tensile stress.

The tightening torques apply to situations where an EPDM soft material flat seal (e.g. 70° Shore A) is used.

Tightening torques, mounting bolts and centering sleeves for EN (DIN) PN 16

Nominal diameter [mm]	Mounting bolts [mm]	Centering sleeve length [mm]	Tightening torque [Nm] with a process flange with a	
			smooth seal face	raised face

2"	4 × UNC 5/8" × 7.50"	– *	30	27
3"	4 × UNC 5/8" × 9.25"	– *	31	31
4"	8 × UNC 5/8" × 10,4"	5,79	28	28

* A centering sleeve is not required. The device is centered directly via the sensor housing.

3.3.2 Installing the Promag E sensor

Caution!
- The protective covers mounted on the two sensor flanges guard the PTFE, which is turned over the flanges. Consequently, do not remove these covers until **immediately before** the sensor is installed in the pipe.
- The covers must remain in place while the device is in storage.
- Make sure that the lining is not damaged or removed from the flanges.

Note!
Bolts, nuts, seals, etc. are not included in the scope of supply and must be supplied by the customer.

The sensor is designed for installation between the two piping flanges.
- Observe in any case the necessary screw tightening torques on → 📄 24
- If grounding disks are used, follow the mounting instructions which will be enclosed with the shipment

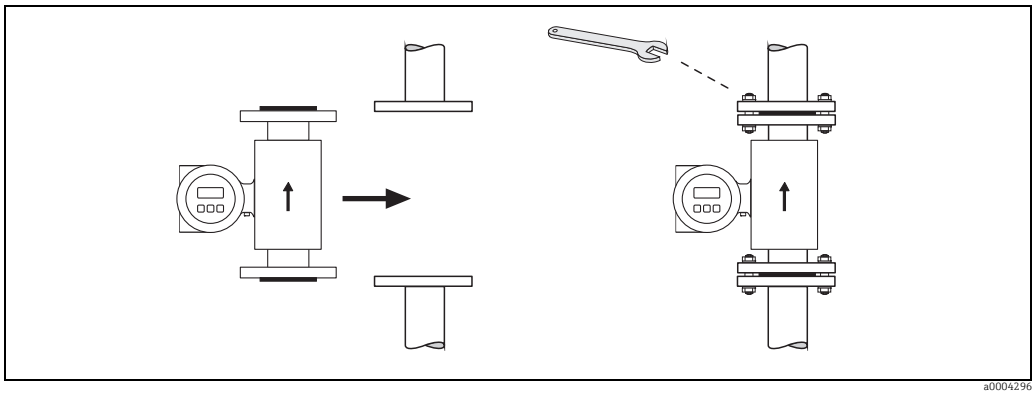

Fig. 18: Installing the Promag E sensor

Seals

Comply with the following instructions when installing seals:
- PFA or PTFE lining → **No** seals are required!
- For DIN flanges, use only seals according to EN 1514-1.
- Make sure that the seals do not protrude into the piping cross-section.

Caution!
Risk of short circuit! Do not use electrically conductive sealing compounds such as graphite! An electrically conductive layer could form on the inside of the measuring tube and short-circuit the measuring signal.

Ground cable

- If necessary, special ground cables for potential equalization can be ordered as an accessory (→ 📄 79).
- Information on potential equalization and detailed mounting instructions for the use of ground cables can be found on → 📄 56

Tightening torques for threaded fasteners (Promag E)

Please note the following:
- The tightening torques listed below are for lubricated threads only.
- Always tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.
- The tightening torques listed below apply only to pipes not subjected to tensile stress.

Tightening torques for:
- EN (DIN) → 🖹 24
- ASME → 🖹 25
- JIS → 🖹 25

300	10K	16 × M 22	99

3.3.3 Installing the Promag H sensor

The sensor is supplied to order, with or without pre-installed process connections. Pre-installed process connections are secured to the sensor with 4 or 6 hex-head threaded fasteners.

Caution!
The sensor might require support or additional attachments, depending on the application and the length of the piping run. When plastic process connections are used, the sensor must be additionally supported mechanically. A wall-mounting kit can be ordered separately from Endress+Hauser as an accessory (→ 79).

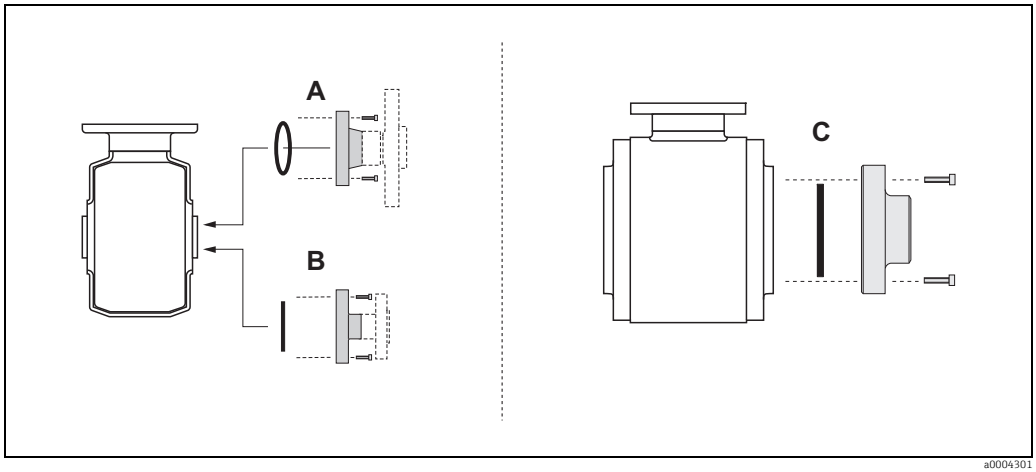

Abb. 19: Promag H process connections (DN 2 to 25 / 1/12 to 1", DN 40 to 100 / 1½ to 4")

A = DN 2 to 25 / 1/12 to 1": process connections with O-ring
- *welding flanges (DIN EN ISO 1127, ODT / SMS),*
- *flange (EN (DIN), ASME, JIS), flange PVDF (EN (DIN), ASME, JIS)*
- *external and internal thread, hose connection, PVC adhesive fitting*

B = DN 2 to 25 / 1/12 to 1": process connections with aseptic gasket vseal
- *weld nipples (DIN 11850, ODT/SMS)*
- *Clamp (ISO 2852, DIN 32676, L14 AM7)*
- *coupling (DIN 11851, DIN 11864-1, SMS 1145)*
- *flange DIN 11864-2*

C = DN 40 to 100 / 1½ to 4": process connections with aseptic gasket seal
- *weld nipples (DIN 11850, ODT/SMS)*
- *Clamp (ISO 2852, DIN 32676, L14 AM7)*
- *coupling (DIN 11851, DIN 11864-1, ISO 2853, SMS 1145)*
- *flange DIN 11864-2*

Seals

When installing the process connections, make sure that the seals are clean and correctly centered.

Caution!
- With metal process connections, you must fully tighten the screws. The process connection forms a metallic connection with the sensor, which ensures a defined compression of the seal.
- With plastic process connections, note the max. torques for lubricated threads (7 Nm / 5.2 lbf ft). With plastic flanges, always use seals between connection and counter flange.
- The seals must be replaced periodically, depending on the application, particularly in the case of gasket seals (aseptic version)!
  The period between changes depends on the frequency of cleaning cycles, the cleaning temperature and the fluid temperature. Replacement seals can be ordered as accessories → 79.

Usage and assembly of ground rings (DN 2 to 25 / 1/12 to 1")

In case the process connections are made of plastic (e.g. flanges or adhesive fittings), the potential between the sensor and the fluid must be equalized using additional ground rings. If the ground rings are not installed this can affect the accuracy of the measurements or cause the destruction of the sensor through the electrochemical erosion of the electrodes.

Caution!

- Depending on the option ordered, plastic disks may be installed at the process connections instead of ground rings. These plastic disks serve only as spacers and have no potential equalization function. In addition, they provide a sealing function at the interface between the sensor and process connection. For this reason, with process connections without ground rings, these plastic disks/seals must not be removed, or must always be installed.
- Ground rings can be ordered separately from Endress+Hauser as accessories (→ 🖹 79). When placing the order, make certain that the ground ring is compatible with the material used for the electrodes. Otherwise, there is a risk that the electrodes may be destroyed by electrochemical corrosion! Information about the materials can be found on → 🖹 120.
- Ground rings, including the seals, are mounted within the process connections. Therefore, the fitting length is not affected.

1. Loosen the four or six hexagonal headed bolts (1) and remove the process connection from the sensor (4).
2. Remove the plastic disk (3), including the two O-ring seals (2).
3. Place one seal (2) in the groove of the process connection.
4. Place the metal ground ring (3) on the process connection.
5. Now place the second seal (2) in the groove of the ground ring.
6. Finally, mount the process connection on the sensor again.
   With plastic process connections, note the max. torques for lubricated threads (7 Nm / 5.2 lbf ft).

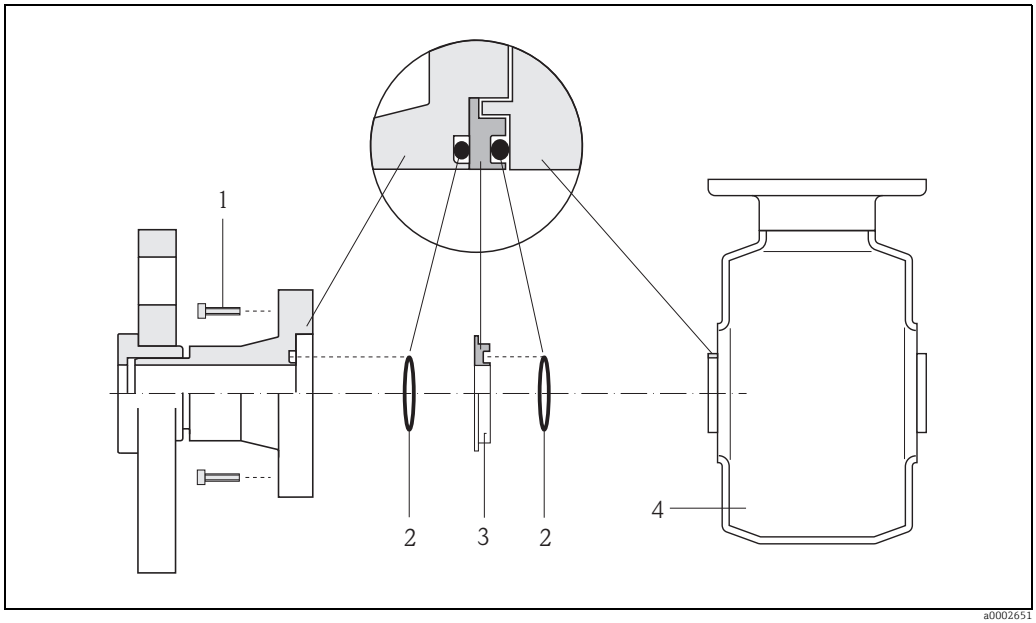

Fig. 20: Installing ground rings with Promag H (DN 2 to 25 / 1/12 to 1")

1 = Hexagonal-headed bolt (process connection)
2 = O-ring seals
3 = Ground ring or plastic disk (spacer)
4 = Sensor

Welding the transmitter into the piping (weld nipples)

Caution!
Risk of destroying the measuring electronics. Make sure that the welding machine is *not* grounded via the sensor or the transmitter.

1. Tack-weld the sensor into the pipe. A suitable welding jig can be ordered separately as an accessory (→ 79).
2. Loosen the screws on the process connection flange and remove the sensor, complete with the seal, from the pipe.
3. Weld the process connection to the pipe.
4. Reinstall the sensor in the pipe. Make sure that everything is clean and that the seal is correctly seated.

Note!
- If thin-walled foodstuffs pipes are not welded correctly, the heat could damage the installed seal. It is therefore advisable to remove the sensor and the seal prior to welding.
- The pipe has to be spread approximately 8 mm to permit disassembly.

Cleaning with pigs

If pigs are used for cleaning, it is essential to take the inside diameters of the measuring tube and process connection into account. All the dimensions and lengths of the sensor and transmitter are provided in the separate documentation "Technical Documentation" → 127.

3.3.4 Installing the Promag L sensor

Caution!
- The protective covers mounted on the two sensor flanges (DN 25 to 300 / 1 to 12") are used to hold the lap joint flanges in place and to protect the PTFE liner during transportation. Consequently, do not remove these covers until immediately before the sensor is installed in the pipe.
- The covers must remain in place while the device is in storage.
- Make sure that the lining is not damaged or removed from the flanges.

Note!
Bolts, nuts, seals, etc. are not included in the scope of supply and must be supplied by the customer.

The sensor is designed for installation between the two piping flanges.
- Observe in any case the necessary screw tightening torques on → 30
- If grounding disks are used, follow the mounting instructions which will be enclosed with the shipment
- To comply with the device specification, a concentrical installation in the measuring section is required

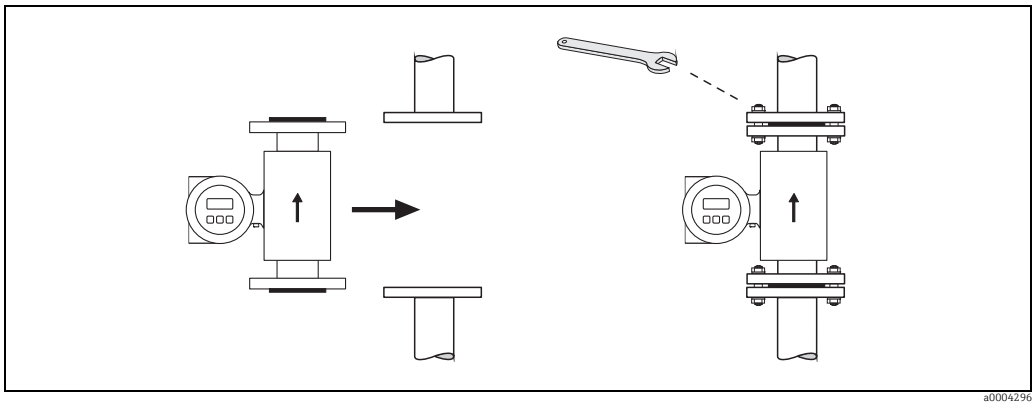

Fig. 21: Installing the Promag L sensor

Seals

Comply with the following instructions when installing seals:
- Hard rubber lining → additional seals are **always** necessary.
- Polyurethane lining → **no** seals are required.
- PTFE lining → **no** seals are required.
- For DIN flanges, use only seals according to EN 1514-1.
- Make sure that the seals do not protrude into the piping cross-section.

Caution!
Risk of short circuit!
Do not use electrically conductive sealing compounds such as graphite! An electrically conductive layer could form on the inside of the measuring tube and short-circuit the measuring signal.

Ground cable

- If necessary, special ground cables for potential equalization can be ordered as an accessory (→ 79).
- Information on potential equalization and detailed mounting instructions for the use of ground cables can be found on → 58.

Screw tightening torques (Promag L)

Please note the following:
- The tightening torques listed below are for lubricated threads only.
- Always tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.
- The tightening torques listed below apply only to pipes not subjected to tensile stress.

3.3.5 Installing the Promag P sensor

Caution!
- The protective covers mounted on the two sensor flanges guard the PTFE, which is turned over the flanges. Consequently, do not remove these covers until **immediately before** the sensor is installed in the pipe.
- The covers must remain in place while the device is in storage.
- Make sure that the lining is not damaged or removed from the flanges.

Note!
Bolts, nuts, seals, etc. are not included in the scope of supply and must be supplied by the customer.

The sensor is designed for installation between the two piping flanges.
- Observe in any case the necessary screw tightening torques on → 📄 34
- If grounding disks are used, follow the mounting instructions which will be enclosed with the shipment

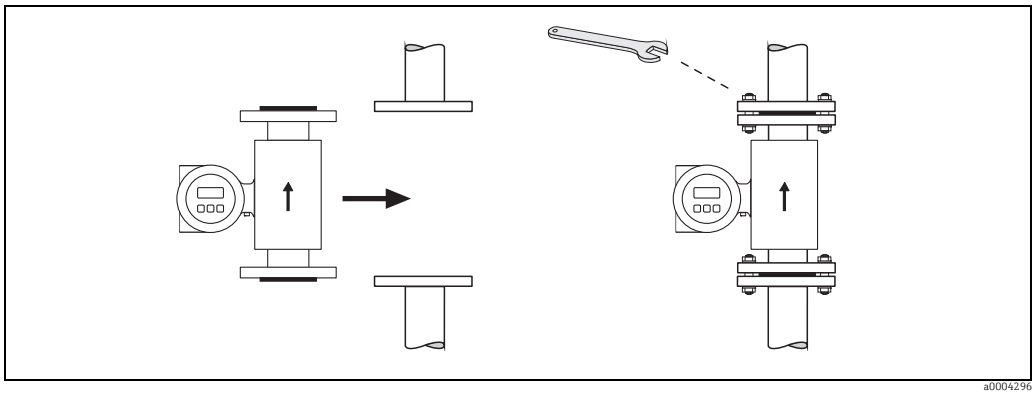

Fig. 22: Installing the Promag P sensor

Seals

Comply with the following instructions when installing seals:
- PFA or PTFE lining → **No** seals are required!
- For DIN flanges, use only seals according to EN 1514-1.
- Make sure that the seals do not protrude into the piping cross-section.

Caution!
Risk of short circuit! Do not use electrically conductive sealing compounds such as graphite! An electrically conductive layer could form on the inside of the measuring tube and short-circuit the measuring signal.

Ground cable

- If necessary, special ground cables for potential equalization can be ordered as an accessory (→ 📄 79).
- Information on potential equalization and detailed mounting instructions for the use of ground cables can be found on → 📄 56

Installing the high-temperature version (with PFA lining)

The high-temperature version has a housing support for the thermal separation of sensor and transmitter. The high-temperature version is always used for applications in which high ambient temperatures are encountered **in conjunction with** high fluid temperatures. The high-temperature version is obligatory if the fluid temperature exceeds +150 °C.

Note!
You will find information on permissible temperature ranges on → 104

Insulation

Pipes generally have to be insulated if they carry very hot fluids, in order to avoid energy losses and to prevent accidental contact with pipes at temperatures that could cause injury. Guidelines regulating the insulation of pipes have to be taken into account.

Caution!
Risk of measuring electronics overheating. The housing support dissipates heat and its entire surface area must remain uncovered. Make sure that the sensor insulation does not extend past the top of the two sensor shells.

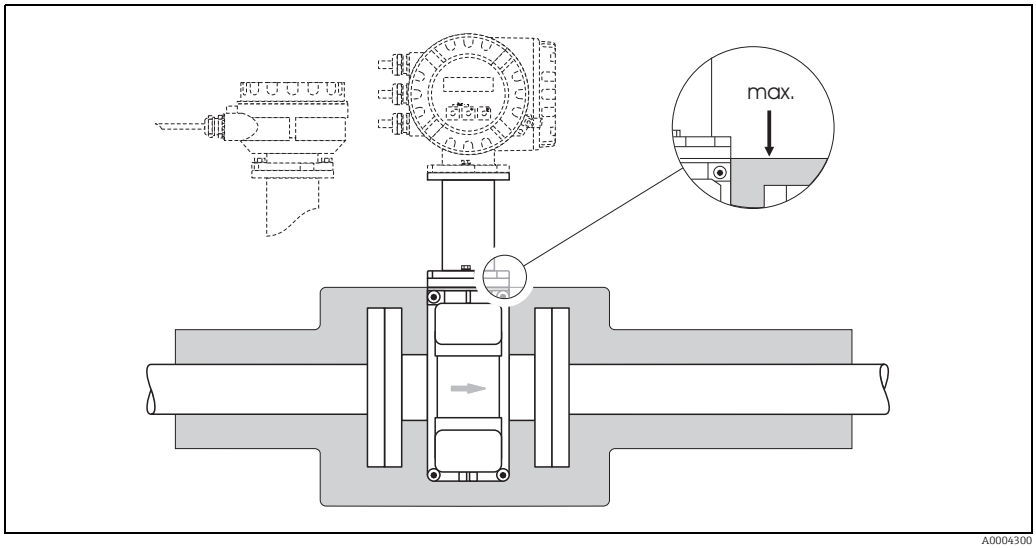

Fig. 23: Promag P (high-temperature version): Insulating the pipe

Tightening torques for threaded fasteners (Promag P)

Please note the following:
- The tightening torques listed below are for lubricated threads only.
- Always tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.
- The tightening torques listed below apply only to pipes not subjected to tensile stress.

Tightening torques for:
- EN (DIN) → 35
- ASME → 35
- JIS → 36
- AS 2129 → 36
- AS 4087 → 36

3.3.6 Installing the Promag W sensor

Note!
Bolts, nuts, seals, etc. are not included in the scope of supply and must be supplied by the customer.

The sensor is designed for installation between the two piping flanges.
- Observe in any case the necessary screw tightening torques on → 37
- If grounding disks are used, follow the mounting instructions which will be enclosed with the shipment

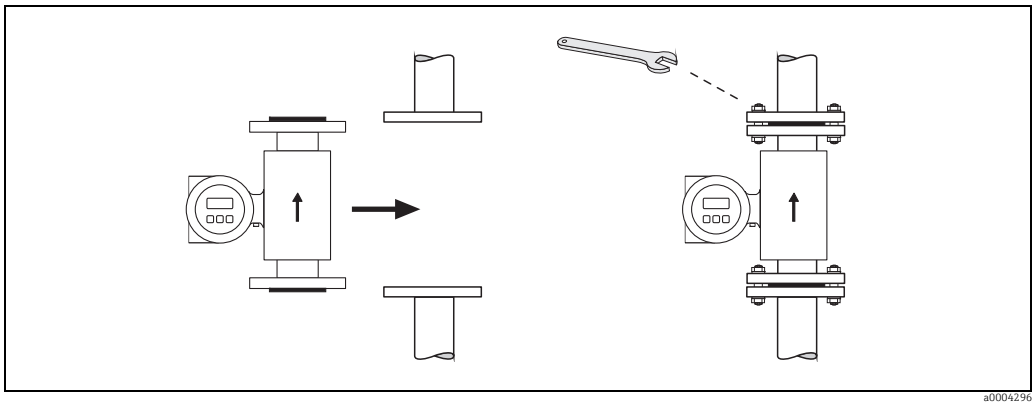

Fig. 24: Installing the Promag W sensor

Seals

Comply with the following instructions when installing seals:
- Hard rubber lining → additional seals are **always** necessary.
- Polyurethane lining → **no** seals are required.
- For DIN flanges, use only seals according to EN 1514-1.
- Make sure that the seals do not protrude into the piping cross-section.

Caution!
Risk of short circuit!
Do not use electrically conductive sealing compounds such as graphite! An electrically conductive layer could form on the inside of the measuring tube and short-circuit the measuring signal.

Ground cable

- If necessary, special ground cables for potential equalization can be ordered as an accessory (→ 79).
- Information on potential equalization and detailed mounting instructions for the use of ground cables can be found on → 58

Screw tightening torques (Promag W)

Please note the following:
- The tightening torques listed below are for lubricated threads only.
- Always tighten the screws uniformly and in diagonally opposite sequence.
- Overtightening the screws will deform the sealing faces or damage the seals.
- The tightening torques listed below apply only to pipes not subjected to tensile stress.

3.3.7 Turning the transmitter housing

Turning the aluminum field housing

Warning!
The turning mechanism in devices with Ex d/de or FM/CSA Cl. I Div. 1 classification is not the same as that described here. The procedure for turning these housings is described in the Ex-specific documentation.

1. Loosen the two securing screws.
2. Turn the bayonet catch as far as it will go.
3. Carefully lift the transmitter housing:
   – Promag D: approx. 10 mm (0.39 in) above the securing screws
   – Promag E/H/L/P/W: to the stop
4. Turn the transmitter housing to the desired position:
   – Promag D: max. 180° clockwise or max. 180° counterclockwise
   – Promag E/H/L/P/W: max. 280° clockwise or max. 20° counterclockwise
5. Lower the housing into position and re-engage the bayonet catch.
6. Retighten the two securing screws.

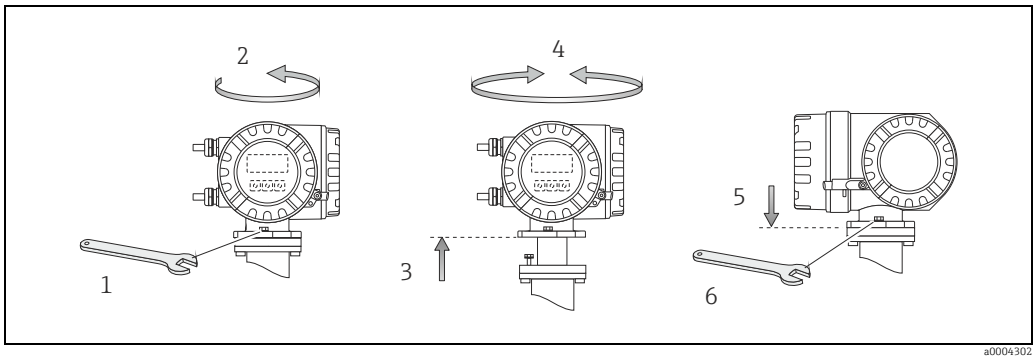

Fig. 25: Turning the transmitter housing (aluminum field housing)

Turning the stainless-steel field housing

1. Loosen the two securing screws.
2. Carefully lift the transmitter housing as far as it will go.
3. Turn the transmitter housing to the desired position (max. 2 × 90° in either direction).
4. Lower the housing into position.
5. Retighten the two securing screws.

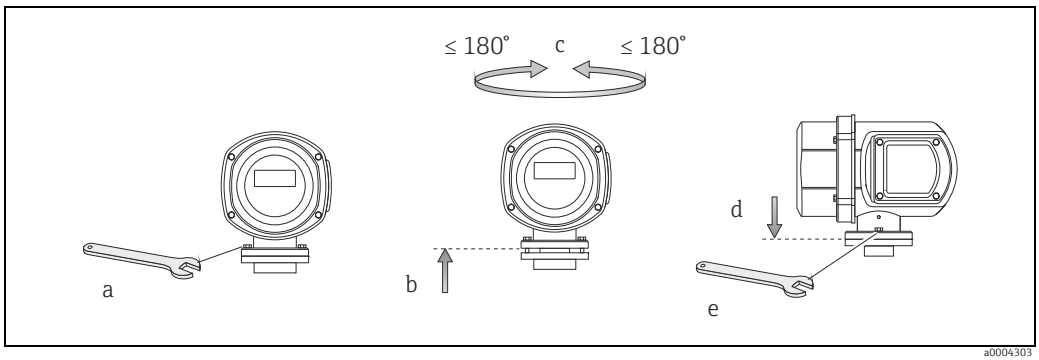

Fig. 26: Turning the transmitter housing (stainless-steel field housing)

3.3.8 Turning the onsite display

1. Unscrew the cover of the electronics compartment from the transmitter housing.
2. Press the side latches on the display module and remove it from the electronics compartment cover plate.
3. Turn the display to the desired position (max. 4 × 45° in both directions) and reset it onto the cover plate of the electronics compartment.
4. Screw the cover of the electronics compartment firmly back onto the transmitter housing.

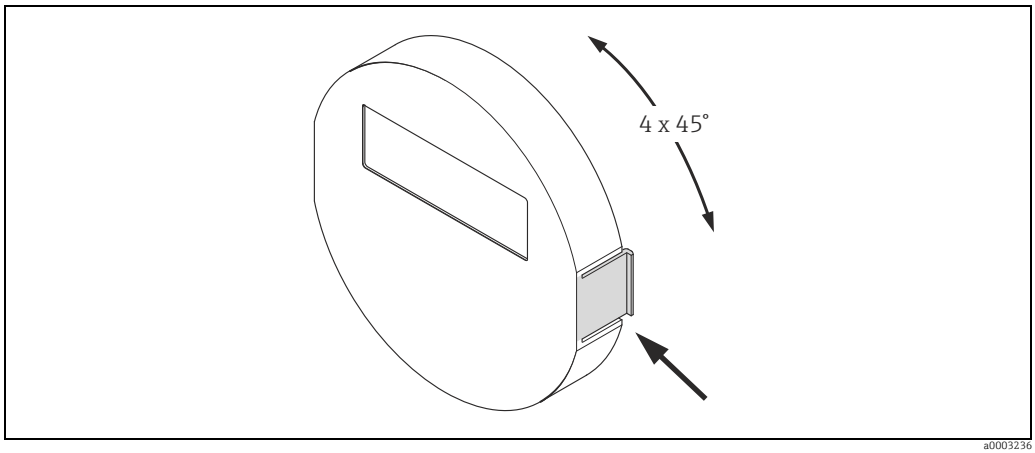

Fig. 27: Turning the local display (field housing)

3.3.9 Installing the wall-mount housing

There are various ways of installing the wall-mount transmitter housing:

- Direct wall mounting
- Installation in control panel (with separate mounting kit, accessories) → 🖹 45
- Pipe mounting (with separate mounting kit, accessories) → 🖹 45

Caution!

- Make sure that the ambient temperature does not exceed the permissible range at the mounting location, –20 to +60 °C (–4 to +140 °F), optional –40 to +60 °C (–40 to +140 °F). Install the device at a shady location. Avoid direct sunlight.
- Always install the wall-mount housing in such a way that the cable entries are pointing down.

Direct wall mounting

1. Drill the holes as illustrated in the graphic.
2. Remove the cover of the connection compartment (a).
3. Push the two securing screws (b) through the appropriate bores (c) in the housing.
   – Securing screws (M6): max. Ø 6.5 mm (0.26")
   – Screw head: max. Ø 10.5 mm (0.41")
4. Secure the transmitter housing to the wall as indicated.
5. Screw the cover of the connection compartment (a) firmly onto the housing.

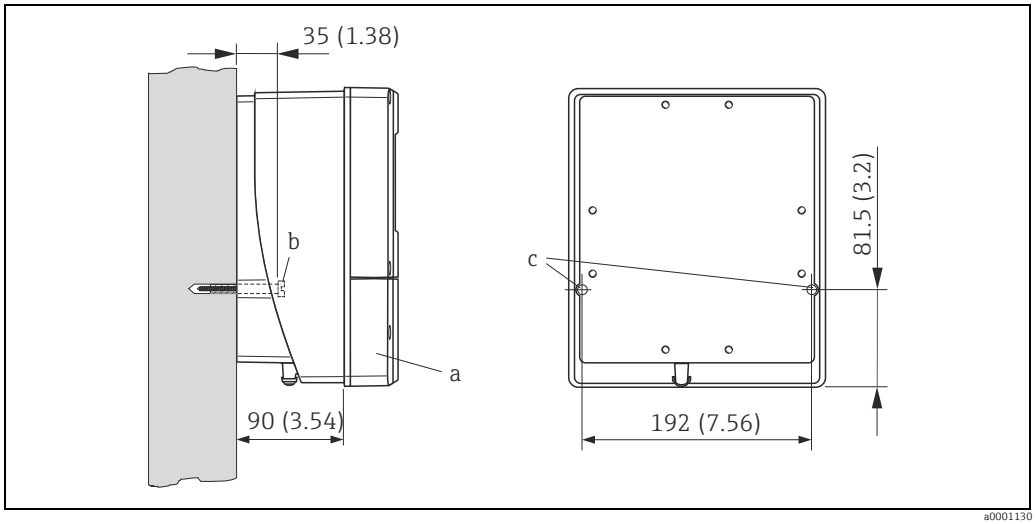

Fig. 28: Mounted directly on the wall

Panel-mounted installation

1. Prepare the opening in the panel as illustrated in the graphic.
2. Slide the housing into the opening in the panel from the front.
3. Screw the fasteners onto the wall-mount housing.
4. Place the threaded rods in the fasteners and screw them down until the housing is seated tightly against the panel. Afterwards, tighten the locking nuts. Additional support is not necessary.

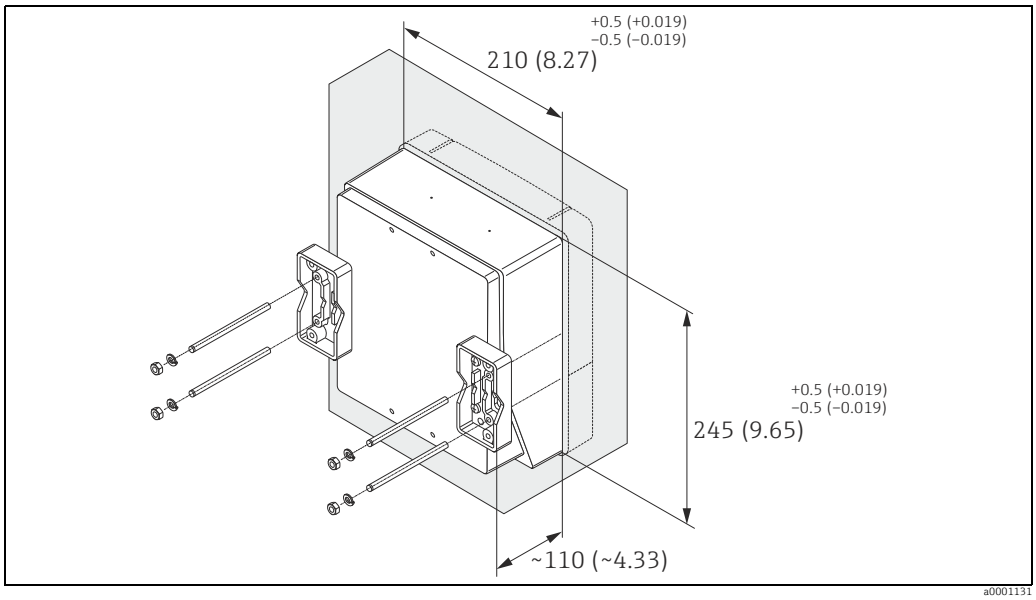

Fig. 29: Panel installation (wall-mount housing)

Pipe mounting

The assembly should be performed by following the instructions in the graphic.

Caution!
If the device is mounted to a warm pipe, make certain that the housing temperature does not exceed +60 °C (+140 °F), which is the maximum permissible temperature.

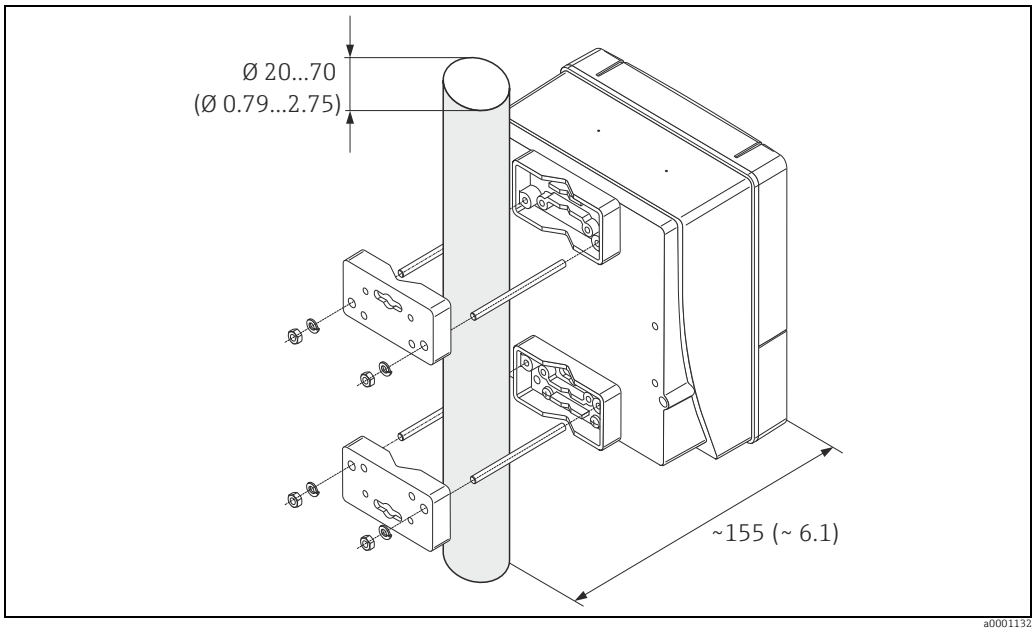

Fig. 30: Pipe mounting (wall-mount housing)

3.4 Post-installation check

Perform the following checks after installing the measuring device in the pipe:

Device condition and specifications	Notes
Is the device damaged (visual inspection)?	-
Does the device correspond to specifications at the measuring point, including process temperature and pressure, ambient temperature, minimum fluid conductivity, measuring range, etc.?	→ 🖹 104
Installation	**Notes**
Does the arrow on the sensor nameplate match the actual direction of flow through the pipe?	-
Is the position of the measuring electrode plane correct?	→ 🖹 14
Is the position of the empty pipe detection electrode correct?	→ 🖹 14
Were all screws tightened to the specified torques when the sensor was installed?	Promag D → 🖹 22 Promag E → 🖹 24 Promag L → 🖹 30 Promag P → 🖹 34 Promag W → 🖹 37
Were the correct seals used (type, material, installation)?	Promag D → 🖹 20 Promag E → 🖹 23 Promag H → 🖹 26 Promag L→ 🖹 29 Promag P → 🖹 33 Promag W → 🖹 37
Are the measuring point number and labeling correct (visual inspection)?	-
Process environment / process conditions	**Notes**
Were the inlet and outlet runs respected?	Inlet run ≥ 5 × DN Outlet run ≥ 2 × DN
Is the measuring device protected against moisture and direct sunlight?	-
Is the sensor adequately protected against vibration (attachment, support)?	Acceleration up to 2 g by analogy with IEC 600 68-2-8

4 Wiring

Warning!
When connecting Ex-certified devices, see the notes and diagrams in the Ex-specific supplement to these Operating Instructions.
Please do not hesitate to contact your Endress+Hauser representative if you have any questions.

Note!
The device does not have an internal circuit breaker. For this reason, assign the device a switch or power-breaker switch capable of disconnecting the power supply line from the mains.

4.1 Connecting the remote version

4.1.1 Connecting Promag D/E/H/L/P/W

Warning!
- Risk of electric shock! Switch off the power supply before opening the device. Do **not** install or wire the device while it is connected to the power supply. Failure to comply with this precaution can result in irreparable damage to the electronics.
- Risk of electric shock! Connect the protective conductor to the ground terminal on the housing before the power supply is applied.

Caution!
- Only sensors and transmitters with the same serial number can be connected to one another. Communication problems can occur if the devices are not connected in this way.
- Risk of damaging the coil driver. Always switch off the power supply before connecting or disconnecting the coil cable.

Procedure

1. Transmitter: Remove the cover from the connection compartment (a).
2. Sensor: Remove the cover from the connection housing (b).
3. Feed the signal cable (c) and the coil cable (d) through the appropriate cable entries.

   Caution!
   Route the connecting cables securely (see "Connecting cable length" → 19).
4. Terminate the signal and coil current cable as indicated in the table:
   Promag D/E/L/P/W → Refer to the table → 50
   Promag H → Refer to the "Cable termination" table → 51
5. Establish the wiring between the sensor and the transmitter.
   The electrical wiring diagram that applies to your device can be found:
   - In the corresponding graphic:
     → 31 (Promag D) → 32 (Promag E/L/P/W); → 33 (Promag H)
   - In the cover of the sensor and transmitter

   Note!
   The cable shields of the Promag H sensor are grounded by means of the strain relief terminals (see also the "Cable termination" table → 51)

   Caution!
   Insulate the shields of cables that are not connected to eliminate the risk of short-circuits with neighboring cable shields inside the connection housing.
6. Transmitter: Screw the cover on the connection compartment (a).
7. Sensor: Secure the cover on the connection housing (b).

Promag D

Cable termination for the remote version
Promag D/E/L/P/W

Terminate the signal and coil current cables as shown in the figure below (Detail A).
Ferrules must be provided on the fine-wire cores (Detail B: ① = red ferrules, ∅ 1.0 mm; ② = white ferrules, ∅ 0.5 mm).
* Stripping only for reinforced cables

Caution!
When fitting the connectors, pay attention to the following points:
- *Signal cable* → Make sure that the ferrules do not touch the wire shield on the sensor side. Minimum distance = 1 mm (exception "GND" = green cable)
- *Coil current cable* → Insulate one core of the three-core wire at the level of the core reinforcement; you only require two cores for the connection.

TRANSMITTER

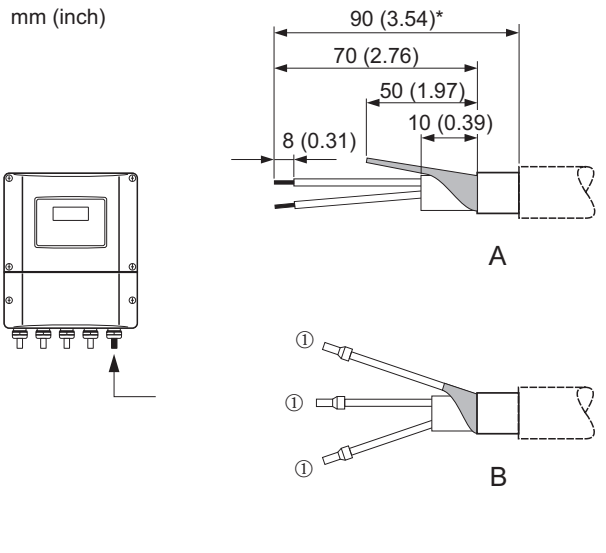
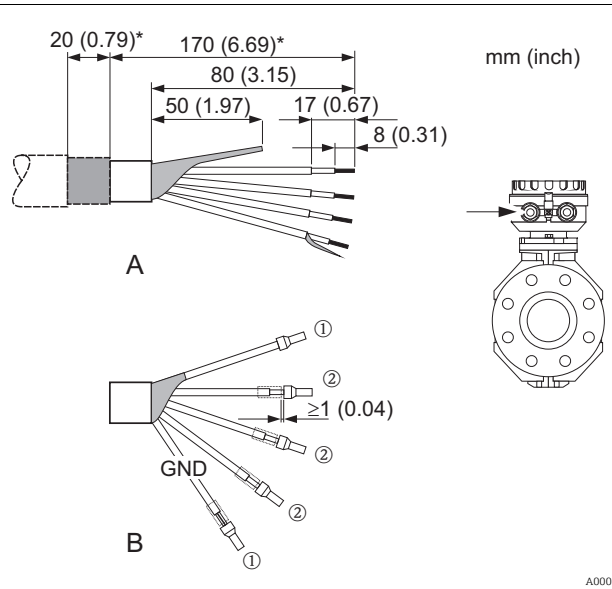
Coil current cable



SENSOR

Signal cable



Coil current cable

4.1.2 Cable specifications

Signal cable

- 3 × 0.38 mm² PVC cable with common, braided copper shield (∅ ~7 mm) and individually shielded cores
- With Empty Pipe Detection (EPD): 4 × 0.38 mm² PVC cable with common, braided copper shield (∅ ~ 7 mm) and individually shielded cores
- Conductor resistance: ≤ 50 Ω/km
- Capacitance: core/shield: ≤ 420 pF/m
- Permanent operating temperature: –20 to +80 °C
- Cable cross-section: max. 2.5 mm²

Coil cable

- 2 × 0.75 mm² PVC cable with common, braided copper shield (∅ ~ 7 mm)
- Conductor resistance: ≤ 37 Ω/km
- Capacitance: core/core, shield grounded: ≤ 120 pF/m
- Operating temperature: –20 to +80 °C
- Cable cross-section: max. 2.5 mm²
- Test voltage for cable insulation: ≥1433 V AC r.m.s. 50/60 Hz or ≥2026 V DC

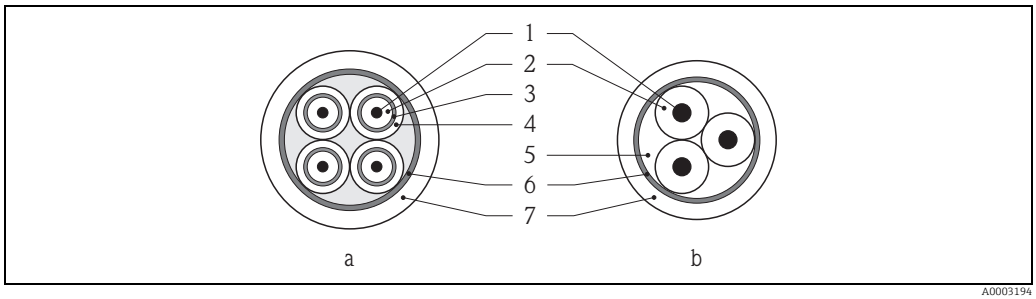

Fig. 34: Cable cross-section

6 Cable shield
7 Outer jacket

Reinforced connecting cables

As an option, Endress+Hauser can also deliver reinforced connecting cables with an additional, reinforcing metal braid. Reinforced connecting cables should be used when laying the cable directly in the ground, if there is a risk of damage from rodents or if using the measuring device below IP 68 degree of protection.

Operation in zones of severe electrical interference:

The measuring device complies with the general safety requirements in accordance with EN 61010 and the EMC requirements of IEC/EN 61326.

Caution!
Grounding is by means of the ground terminals provided for the purpose inside the connection housing. Ensure that the stripped and twisted lengths of cable shield to the ground terminal are as short as possible.

4.2 Connecting the measuring unit

4.2.1 Connecting the transmitter

Warning!
- Risk of electric shock! Switch off the power supply before opening the device. Do not install or wire the device while it is energized. Failure to comply with this precaution can result in irreparable damage to the electronics.
- Risk of electric shock! Connect the protective conductor to the ground terminal on the housing before the power supply is applied (not necessary if the power supply is galvanically isolated).
- Compare the specifications on the nameplate with the local voltage supply and frequency. Also comply with national regulations governing the installation of electrical equipment.

1. Remove the cover of the connection compartment (f) from the transmitter housing.
2. Feed the power supply cable (a) and the signal cable (b) through the appropriate cable entries.
3. Perform the wiring:
   – Wiring diagram (aluminum housing) → 🖼 35
   – Wiring diagram (stainless steel housing) → 🖼 36
   – Wiring diagram (wall-mount housing) → 🖼 37
   – Terminal assignment → 🖹 55
4. Screw the cover of the connection compartment (f) firmly onto the transmitter housing.

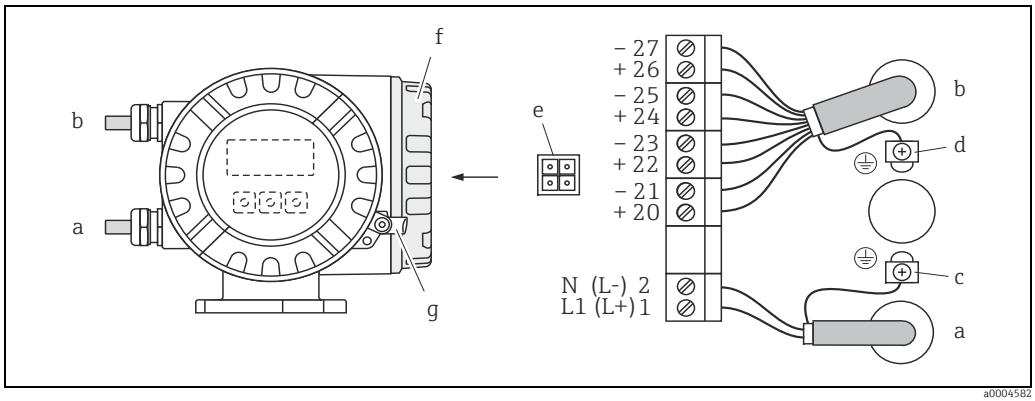

Fig. 35: Connecting the transmitter (aluminum field housing). Cable cross-section: max. 2.5 mm²

a Cable for power supply: 85 to 260 V AC, 20 to 55 V AC, 16 to 62 V DC

4.2.2 Terminal assignment

Order version	Terminal No. (inputs / outputs)			
	20 (+) / 21 (–)	22 (+) / 23 (–)	24 (+) / 25 (–)	26 (+) / 27 (–)
50***-***********W	-	-	-	Current output HART
50***-***********A	-	-	Frequency output	Current output HART
50***-***********D	Status input	Status output	Frequency output	Current output HART
50***-***********S	-	-	Frequency output Ex i	Current output, Ex i, active, HART
50***-***********T	-	-	Frequency output Ex i	Current output, Ex i, passive, HART

Note!
Functional values of the inputs and outputs → 99

4.2.3 HART connection

Users have the following connection options at their disposal:
- Direct connection to transmitter by means of terminals 26(+) and 27 (–)
- Connection by means of the 4 to 20 mA circuit.

Note!
- The measuring loop's minimum load must be at least 250 Ω.
- After commissioning, make the following settings:
- CURRENT SPAN function → "4–20 mA HART"
- Switch HART write protection on or off → 66

Connection of the HART handheld communicator

See also the documentation issued by the HART Communication Foundation, and in particular HCF LIT 20: "HART, a technical summary".

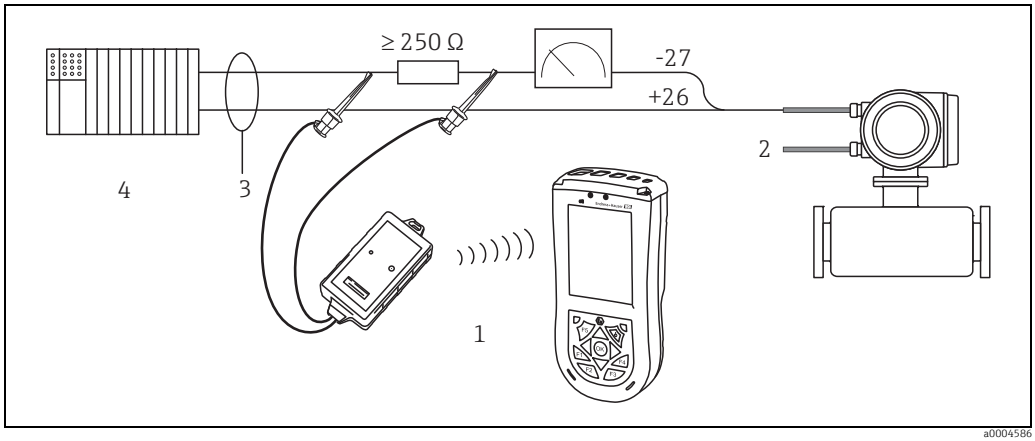

Fig. 38: Electrical connection of HART handheld Field Xpert SFX100

1 HART handheld Field Xpert SFX100
2 Auxiliary energy
3 Shielding
4 Other devices or PLC with passive input

Connection of a PC with an operating software

In order to connect a PC with operating software (e.g. "FieldCare"), a HART modem (e.g. "Commubox FXA195") is needed.

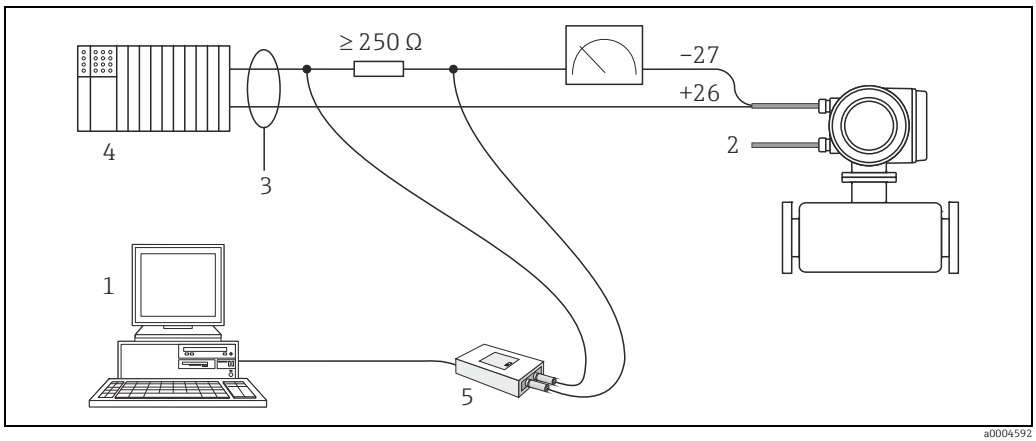

Fig. 39: Electrical connection of a PC with operating software

1 PC with operating software
2 Auxiliary energy
3 Shielding
4 Other devices or PLC with passive input
5 HART modem, e.g. Commubox FXA195

4.3 Potential equalization

Warning!
The measuring system must be included in the potential equalization.

Perfect measurement is only ensured when the fluid and the sensor have the same electrical potential. This is ensured by the reference electrode integrated in the sensor as standard.

The following should also be taken into consideration for potential equalization:
- Internal grounding concepts in the company
- Operating conditions, such as the material/grounding of the pipes (see Table)

4.3.1 Potential equalization for Promag D

- No reference electrode is integrated!
  For the two ground disks of the sensor an electrical connection to the fluid is always ensured.
- Exampels for connections → 57

4.3.2 Potential equalization for Promag E/L/P/W

- Reference electrode integrated in the sensor as standard
- Exampels for connections → 58

4.3.3 Potential equalization for Promag H

No reference electrode is integrated!
For the metal process connections of the sensor an electrical connection to the fluid is always ensured.

Caution!
If using process connections made of a synthetic material, ground rings have to be used to ensure that potential is equalized (→ 27). The necessary ground rings can be ordered separately from Endress+Hauser as accessories (→ 79).

4.3.4 Exampels for potential equalization connections for Promag D

Standard case

Operating conditions	Potential equalization
When using the measuring device in a: ▪ Metal, grounded pipe ▪ Plastic pipe ▪ Pipe with insulating lining Potential equalization takes place via the ground terminal of the transmitter (standard situation). Note! When installing in metal pipes, we recommend you connect the ground terminal of the transmitter housing with the piping.	 a00012172 *Fig. 40: Via the ground terminal of the transmitter*

Special cases

Operating conditions	Potential equalization
When using the measuring device in a: ▪ Metal pipe that is not grounded This connection method also applies in situations where: ▪ Customary potential equalization cannot be ensured ▪ Excessively high equalizing currents can be expected Potential equalization takes place via the ground terminal of the transmitter and the two pipe flanges. Here, the ground cable (copper wire, 6 mm² / 0.0093 in²) is mounted directly on the conductive flange coating with flange screws.	 a00012173 *Fig. 41: Via the ground terminal of the transmitter and the flanges of the pipe .*
When using the measuring device in a: ▪ Pipe with a cathodic protection unit The device is installed potential-free in the pipe. Only the two flanges of the pipe are connected with a ground cable (copper wire, 6 mm² (0.0093 in²)). Here, the ground cable is mounted directly on the conductive flange coating with flange screws. Note the following when installing: ▪ The applicable regulations regarding potential-free installation must be observed. ▪ There should be **no** electrically conductive connection between the pipe and the device. ▪ The mounting material must withstand the applicable torques.	 a00012174 *Fig. 42: Potential equalization and cathodic protection* *1 Power supply isolation transformer* *2 Electrically isolated*

4.3.5 Exampels for potential equalization connections for Promag E/L/P/W

Standard case

Operating conditions	Potential equalization
When using the measuring device in a: ▪ Metal, grounded pipe Potential equalization takes place via the ground terminal of the transmitter (standard situation). ✎ Note! When installing in metal pipes, we recommend you connect the ground terminal of the transmitter housing with the piping.	 A0011892 *Fig. 43: Via the ground terminal of the transmitter*

Special cases

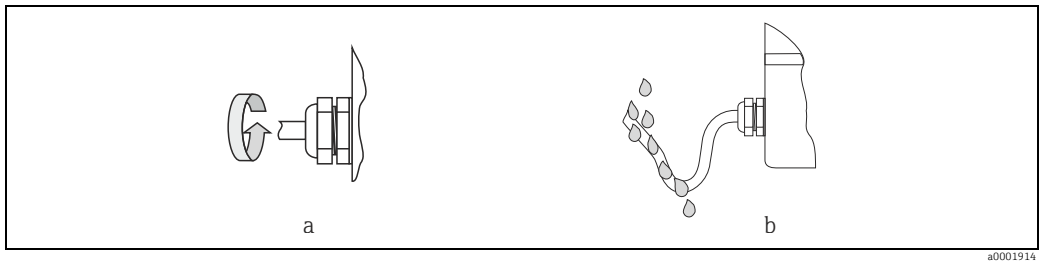
Operating conditions	Potential equalization
When using the measuring device in a: ▪ Metal pipe that is not grounded This connection method also applies in situations where: ▪ Customary potential equalization cannot be ensured ▪ Excessively high equalizing currents can be expected Both sensor flanges are connected to the pipe flange by means of a ground cable (copper wire, 6 mm² / 0.0093 in²) and grounded. Connect the transmitter or sensor connection housing, as applicable, to ground potential by means of the ground terminal provided for the purpose. Ground cable installation depends on the nominal diameter: ▪ DN ≤ 300 (12"): The ground cable is mounted directly on the conductive flange coating with the flange screws. ▪ DN ≥ 350 (14"): The ground cable is mounted directly on the metal transport bracket. ✎ Note! The ground cable for flange-to-flange connections can be ordered separately as an accessory from Endress+Hauser.	 A0011893 *Fig. 44: Via the ground terminal of the transmitter and the flanges of the pipe*
When using the measuring device in a: ▪ Plastic pipe ▪ Pipe with insulating lining This connection method also applies in situations where: ▪ Customary potential equalization cannot be ensured ▪ Excessively high equalizing currents can be expected Potential equalization takes place using additional ground disks, which are connected to the ground terminal via a ground cable (copper wire, min. 6 mm² / 0.0093 in²). When installing the ground disks, please comply with the enclosed Installation Instructions.	 A0011895 *Fig. 45: Via the ground terminal of the transmitter*

Operating conditions	Potential equalization
When using the measuring device in a: ▪ Pipe with a cathodic protection unit The device is installed potential-free in the pipe. Only the two flanges of the pipe are connected with a ground cable (copper wire, 6 mm² / 0.0093 in²). Here, the ground cable is mounted directly on the conductive flange coating with flange screws. Note the following when installing: ▪ The applicable regulations regarding potential-free installation must be observed. ▪ There should be **no** electrically conductive connection between the pipe and the device. ▪ The mounting material must withstand the applicable torques.	 A0011896 *Fig. 46: Potential equalization and cathodic protection* *1 Power supply isolation transformer* *2 Electrically isolated*

4.4 Degree of protection

The devices meet all the requirements of IP 67 degree of protection.

Compliance with the following points is mandatory following installation in the field or servicing in order to ensure that IP 67 protection is maintained:
- The housing seals must be clean and undamaged when inserted into their grooves. The seals must be dried, cleaned or replaced if necessary.
- All threaded fasteners and screw covers must be firmly tightened.
- The cables used for connection must be of the specified outside diameter → 52.
- Firmly tighten the cable entries.
- The cables must loop down before they enter the cable entries ("water trap"). This arrangement prevents moisture penetrating the entry. Always install the measuring device in such a way that the cable entries do not point up.
- Remove all unused cable entries and insert plugs instead.
- Do not remove the grommet from the cable entry.



a0001914

Fig. 47: Installation instructions, cable entries

Caution!
Do not loosen the threaded fasteners of the sensor housing, as otherwise the degree of protection guaranteed by Endress+Hauser no longer applies.

Note!
The Promag E/L/P/W sensors can be supplied with IP 68 rating (permanent immersion in water to a depth of 3 meters (10 ft)). In this case the transmitter must be installed remote from the sensor.
The Promag L sensors with IP 68 rating are only available with stainless steel flanges.

4.5 Post-connection check

Perform the following checks after completing electrical installation of the measuring device:

Device condition and specifications	Notes
Are cables or the device damaged (visual inspection)?	-
Electrical connection	**Notes**
Does the supply voltage match the specifications on the nameplate?	▪ 85 to 250 V AC (50 to 60 Hz) ▪ 20 to 28 V AC (50 to 60 Hz) 11 to 40 V DC
Do the cables used comply with the necessary specifications?	→ 🖹 52
Do the cables have adequate strain relief?	-
Is the cable type route completely isolated? Without loops and crossovers?	-
Are the power-supply and signal cables correctly connected?	See the wiring diagram inside the cover of the terminal compartment
Only remote version: Is the flow sensor connected to the matching transmitter electronics?	Check serial number on nameplates of sensor and connected transmitter.
Only remote version: Is the connecting cable between sensor and transmitter connected correctly?	→ 🖹 47
Are all screw terminals firmly tightened?	-
Have the measures for grounding/potential equalization been correctly implemented?	→ 🖹 56
Are all cable entries installed, firmly tightened and correctly sealed? Cables looped as "water traps"?	→ 🖹 59
Are all housing covers installed and firmly tightened?	-

5 Operation

5.1 Display and operating elements

The local display enables you to read all important parameters directly at the measuring point and configure the device.
The display area consists of two lines; this is where measured values are displayed, and/or status variables (direction of flow, partially filled pipe, bar graph, etc.). You can change the assignment of display lines to variables at will in order to customize the display to suit your needs and preferences (→ "Description of Device Functions" manual).

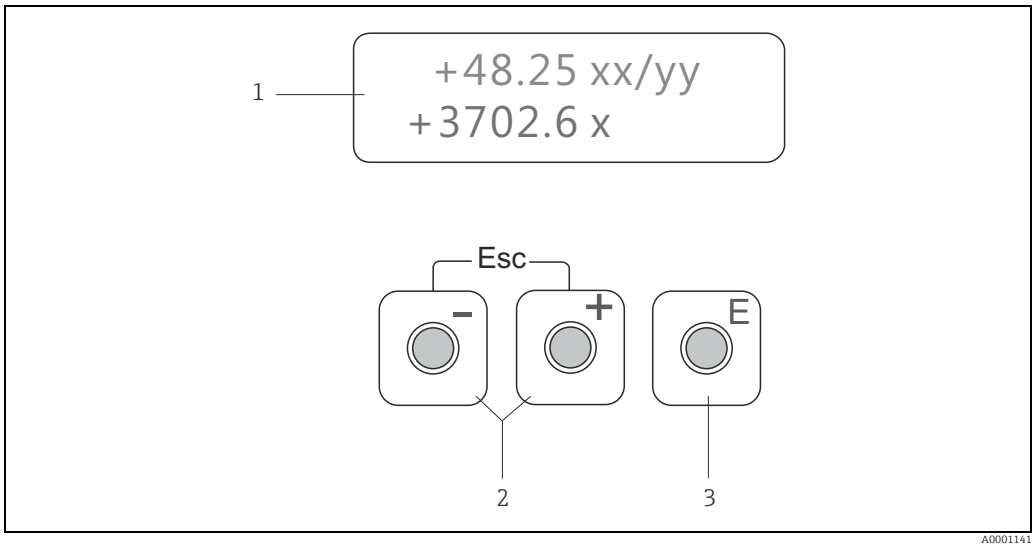


Fig. 48: Display and operating elements

1 Liquid crystal display
The two-line liquid-crystal display shows measured values, dialog texts, error messages and information messages. The display as it appears when normal measuring is in progress is known as the HOME position (operating mode).
- *Upper display line: Shows primary measured values, e.g. volume flow in [ml/min] or in [%].*
- *Lower display line: Shows supplementary measured variables and status variables, e.g. totalizer reading in [m3], bar graph, measuring point designation*

2 Plus/minus keys
- *Enter numerical values, select parameters*
- *Select different function groups within the function matrix*

Press the +/- keys simultaneously to trigger the following functions:
- *Exit the function matrix step by step → HOME position*
- *Press and hold down +/- keys for longer than 3 seconds → Return directly to HOME position*
- *Cancel data entry*

3 Enter key
- *HOME position → Entry into the function matrix*
- *Save the numerical values you input or settings you change*

5.2 Brief operating instructions on the function matrix

Note!
- See the general notes on → 63.
- Detailed description of all the functions → "Description of Device Functions" manual

The function matrix comprises two levels, namely the function groups and the functions of the function groups.
The groups are the highest-level grouping of the control options for the device. A number of functions is assigned to each group. You select a group in order to access the individual functions for operating and configuring the device.

1. HOME position → E → Enter the function matrix
2. Select a function group (e.g. OPERATION)
3. Select a function (e.g. LANGUAGE)
   Change parameter/enter numerical values:
   ± → select or enter enable code, parameters, numerical values
   E → save your entries
4. Exit the function matrix:
   – Press and hold down Esc key (Esc) for longer than 3 seconds → HOME position
   – Repeatedly press Esc key (Esc) → return step by step to HOME position

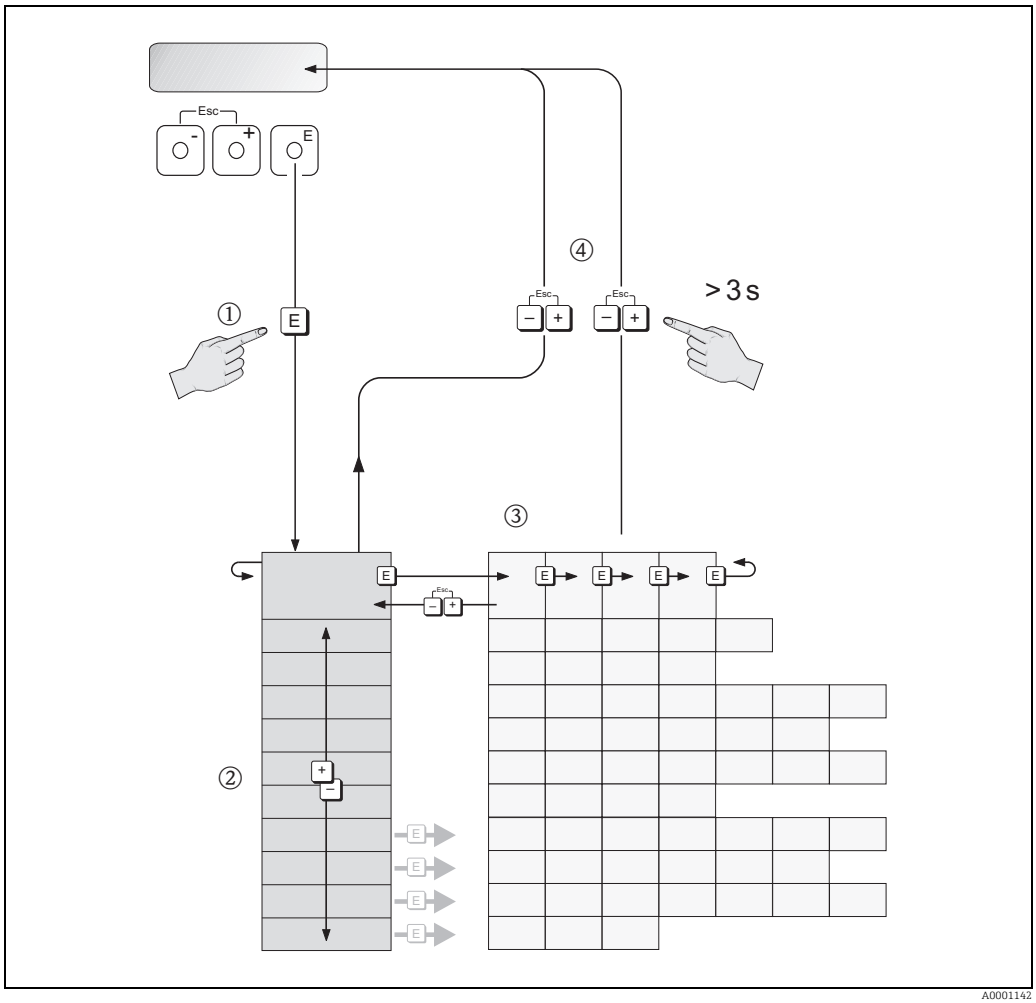

Fig. 49: Selecting functions and configuring parameters (function matrix)

5.2.1 General notes

The Quick Setup menu (→ 🖹 73) is adequate for commissioning in most instances. Complex measuring operations on the other hand necessitate additional functions that you can configure as necessary and customize to suit your process parameters. The function matrix, therefore, comprises a multiplicity of additional functions which, for the sake of clarity, are arranged in a number of function groups.

Comply with the following instructions when configuring functions:
- You select functions as described on → 🖹 62.
- You can switch off certain functions (OFF). If you do so, related functions in other function groups will no longer be displayed.
- Certain functions prompt you to confirm your data entries.
  Press ▫ to select "SURE [YES]" and press E again to confirm. This saves your setting or starts a function, as applicable.
- Return to the HOME position is automatic if no key is pressed for 5 minutes.

Note!
- The transmitter continues to measure while data entry is in progress, i.e. the current measured values are output via the signal outputs in the normal way.
- If the power supply fails, all preset and configured values remain safely stored in the EEPROM.

Caution!
All functions are described in detail, including the function matrix itself, in the "Description of Device Functions" manual, which is a separate part of these Operating Instructions.

5.2.2 Enabling the programming mode

The function matrix can be disabled. Disabling the function matrix rules out the possibility of inadvertent changes to device functions, numerical values or factory settings. A numerical code (factory setting = 50) has to be entered before settings can be changed.
If you use a code number of your choice, you exclude the possibility of unauthorized persons accessing data (→ see the "Description of Device Functions" manual).

Comply with the following instructions when entering codes:
- If programming is disabled and the ▫ operating elements are pressed in any function, a prompt for the code automatically appears on the display.
- If "0" is specified as the customer's code, programming is always enabled.
- The Endress+Hauser service organization can be of assistance if you mislay your personal code.

Caution!
Changing certain parameters such as all sensor characteristics, for example, influences numerous functions of the entire measuring system, particularly measuring accuracy.
There is no need to change these parameters under normal circumstances and consequently, they are protected by a special code known only to the Endress+Hauser service organization.
Please contact Endress+Hauser if you have any questions.

5.2.3 Disabling the programming mode

Programming is disabled if you do not press the operating elements within 60 seconds following automatic return to the HOME position.
You can also disable programming in the "ACCESS CODE" function by entering any number (other than the customer's code).

5.3 Displaying error messages

5.3.1 Type of error

Errors which occur during commissioning or measuring operation are displayed immediately. If two or more system or process errors occur, the error with the highest priority is the one shown on the display.

The measuring system distinguishes between two types of error:
- *System errors* → 📄 *83:*
  This group comprises all device errors, e.g. communication errors, hardware faults, etc.
- *Process errors* → 📄 85:
  This group comprises all application errors, e.g. empty pipe, etc.

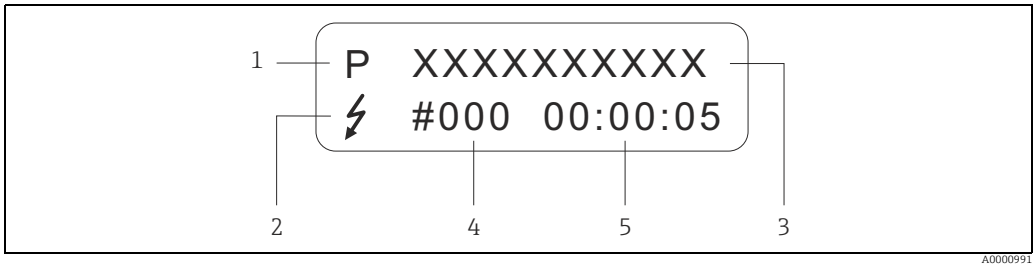

Fig. 50: Error messages on the display (example)

1 Error type:
– P = process error
– S = system error
2 Error message type:
– ϟ = fault message
– ! = notice message
3 Error designation: e.g. EMPTY PIPE = measuring tube is only partly filled or completely empty
4 Error number: e.g. #401
5 Duration of most recent error occurrence (in hours, minutes and seconds)

5.3.2 Error message types

Users have the option of weighting certain errors differently, in other words having them classed as "Fault messages" or "Notice messages". You can define messages in this way with the aid of the function matrix (→ "Description of Device Functions" manual).
Serious system errors, e.g. module defects, are always identified and classed as "fault messages" by the measuring device.

Notice message (!)

- Displayed as → Exclamation mark (!), error type (S: system error, P: process error)
- The error in question has no effect on the outputs of the measuring device.

Fault message (ϟ)

- Displayed as → Lightning flash (ϟ), error type (S: system error, P: process error).
- The error in question has a direct effect on the outputs.
  The response of the individual outputs (failsafe mode) can be defined in the function matrix using the "FAILSAFE MODE" function (→ "Description of Device Functions" manual).

Note!
For security reasons, error messages should be output via the status output.

5.4 Communication

In addition to local operation, the measuring device can be configured and measured values can be obtained by means of the HART protocol. Digital communication takes place using the 4–20 mA current output HART → 🖹 55.

The HART protocol allows the transfer of measuring and device data between the HART master and the field devices for configuration and diagnostics purposes.
The HART master, e.g. a handheld terminal or PC-based operating programs (such as FieldCare), require device description (DD) files which are used to access all the information in a HART device. Information is exclusively transferred using so-called "commands". There are three different command classes:

- *Universal commands:*
  All HART device support and use universal commands.
  The following functionalities are linked to them:
  – Identify HART devices
  – Reading digital measured values (volume flow, totalizer, etc.)
- *Common practice commands:*
  Common practice commands offer functions which are supported and can be executed by most but not all field devices.
- *Device-specific commands:*
  These commands allow access to device-specific functions which are not HART standard. Such commands access individual field device information, amongst other things, such as empty/full pipe calibration values, low flow cutoff settings, etc.

Note!
The device has access to all three command classes. A list of all the "Universal commands" and "Common practice commands" is provided on → 🖹 67.

5.4.1 Operating options

For the complete operation of the measuring device, including device-specific commands, there are DD files available to the user to provide the following operating aids and programs:

Field Xpert HART Communicator

Selecting device functions with a HART Communicator is a process involving a number of menu levels and a special HART function matrix.
The HART manual in the carrying case of the HART Communicator contains more detailed information on the device.

Operating program "FieldCare"

FieldCare is Endress+Hauser's FDT-based plant Asset Management Tool and allows the configuration and diagnosis of intelligent field devices. By using status information, you also have a simple but effective tool for monitoring devices. The Proline flow measuring devices are accessed via a service interface or via the service interface FXA193.

Operating program "SIMATIC PDM" (Siemens)

SIMATIC PDM is a standardized, manufacturer-independent tool for the operation, configuration,
maintenance and diagnosis of intelligent field devices.

Operating program "AMS" (Emerson Process Management)

AMS (Asset Management Solutions): program for operating and configuring devices.

5.4.2 Current device description files

The following table illustrates the suitable device description file for the operating tool in question and then indicates where these can be obtained.

HART protocol:

Valid for device software:	2.04.XX	→ Function DEVICE SOFTWARE
Device data HART Manufacturer ID: Device ID:	 11_{hex} (ENDRESS+HAUSER) 41_{hex}	 → Function MANUFACTURER ID → Function DEVICE ID
HART version data:	Device Revision 6/ DD Revision 1	
Software release:	01.2011	

Operating program:	Sources for obtaining device descriptions:
Handheld Field Xpert SFX100	Use update function of handheld terminal
FieldCare / DTM	▪ www.endress.com → Download ▪ CD-ROM (Endress+Hauser order number 56004088) ▪ DVD (Endress+Hauser order number 70100690)
AMS	www.endress.com → Download
SIMATIC PDM	www.endress.com → Download

Tester/simulator:	Sources for obtaining device descriptions:
Fieldcheck	Update by means of FieldCare with the flow device FXA193/291 DTM in the Fieldflash module

Note!
The "Fieldcheck" tester/simulator is used for testing flowmeters in the field. When used in conjunction with the "FieldCare" software package, test results can be imported into a database, printed out and used for official certification. Contact your Endress+Hauser representative for more information.

5.4.3 Device variables

The following device variables are available using the HART protocol:

Code (decimal)	Device variable
0	OFF (not assigned)
1	Volume flow
250	Totalizer 1
251	Totalizer 2

At the factory, the process variables are assigned to the following device variables:
- Primary process variable (PV) → Volume flow
- Second process variable (SV) → Totalizer 1
- Third process variable (TV) → not assigned
- Fourth process variable (FV) → not assigned

Note!
You can set or change the assignment of device variables to process variables using Command 51.

5.4.4 Switching HART write protection on/off

The HART write protection can be switched on and off using the HART WRITE PROTECT device function (→ "Description of Device Functions" manual).

5.4.5 Universal and common practice HART commands

The following table contains all the universal commands supported by the device.

Command No. HART command / Access type		Command data (numeric data in decimal form)	Response data (numeric data in decimal form)
Universal commands			
0	Read unique device identifier Access type = read	none	Device identification delivers information on the device and the manufacturer. It cannot be changed. The response consists of a 12 byte device ID: – Byte 0: fixed value 254 – Byte 1: Manufacturer ID, 17 = E+H – Byte 2: Device type ID, 65 = Promag 50 – Byte 3: Number of preambles – Byte 4: Universal commands rev. no. – Byte 5: Device-specific commands rev. no. – Byte 6: Software revision – Byte 7: Hardware revision – Byte 8: Additional device information – Bytes 9-11: Device identification
1	Read primary process variable Access type = read	none	– Byte 0: HART unit code of the primary process variable – Bytes 1-4: Primary process variable Factory setting: Primary process variable = Volume flow ✎ Note! ▪ Manufacturer-specific units are represented using the HART unit code "240". ▪ You can change the assignment of device variables to process variables using Command 51.
2	Read the primary process variable as current in mA and percentage of the set measuring range Access type = read	none	– Bytes 0-3: actual current of the primary process variable in mA – Bytes 4-7: % value of the set measuring range Factory setting: Primary process variable = Volume flow ✎ Note! You can change the assignment of device variables to process variables using Command 51.
3	Read the primary process variable as current in mA and four dynamic process variables Access type = read	none	24 bytes are sent as a response: – Bytes 0-3: primary process variable current in mA – Byte 4: HART unit code of the primary process variable – Bytes 5-8: Primary process variable – Byte 9: HART unit code of the second process variable – Bytes 10-13: Second process variable – Byte 14: HART unit code of the third process variable – Bytes 15-18: Third process variable – Byte 19: HART unit code of the fourth process variable – Bytes 20-23: Fourth process variable *Factory setting:* ▪ Primary process variable = Volume flow ▪ Second process variable = Totalizer 1 ▪ Third process variable = OFF (not assigned) ▪ Fourth process variable = OFF (not assigned) ✎ Note! ▪ Manufacturer-specific units are represented using the HART unit code "240". ▪ You can change the assignment of device variables to process variables using Command 51.
6	Set HART shortform address Access type = write	Byte 0: desired address (0 to 15) Factory setting: 0 ✎ Note! With an address >0 (multidrop mode), the current output of the primary process variable is set to 4 mA.	Byte 0: active address

Command No. HART command / Access type		Command data (numeric data in decimal form)	Response data (numeric data in decimal form)
11	Read unique device identification using the TAG (measuring point designation) Access type = read	Bytes 0-5: TAG	Device identification delivers information on the device and the manufacturer. It cannot be changed. The response consists of a 12 byte device ID if the given TAG agrees with the one saved in the device: – Byte 0: fixed value 254 – Byte 1: Manufacturer ID, 17 = E+H – Byte 2: Device type ID, 65 = Promag 50 – Byte 3: Number of preambles – Byte 4: Universal commands rev. no. – Byte 5: Device-specific commands rev. no. – Byte 6: Software revision – Byte 7: Hardware revision – Byte 8: Additional device information – Bytes 9-11: Device identification
12	Read user message Access type = read	none	Bytes 0-24: User message Note! You can write the user message using Command 17.
13	Read TAG, descriptor and date Access type = read	none	– Bytes 0-5: TAG – Bytes 6-17: descriptor – Bytes 18-20: Date Note! You can write the TAG, descriptor and date using Command 18.
14	Read sensor information on primary process variable	none	– Bytes 0-2: Sensor serial number – Byte 3: HART unit code of sensor limits and measuring range of the primary process variable – Bytes 4-7: Upper sensor limit – Bytes 8-11: Lower sensor limit – Bytes 12-15: Minimum span Note! ▪ The data relate to the primary process variable (= volume flow). ▪ Manufacturer-specific units are represented using the HART unit code "240".
15	Read output information of primary process variable Access type = read	none	– Byte 0: Alarm selection ID – Byte 1: Transfer function ID – Byte 2: HART unit code for the set measuring range of the primary process variable – Bytes 3-6: upper range, value for 20 mA – Bytes 7-10: lower range, value for 4 mA – Bytes 11-14: Damping constant in [s] – Byte 15: Write protection ID – Byte 16: OEM dealer ID, 17 = E+H Factory setting: Primary process variable = Volume flow Note! ▪ Manufacturer-specific units are represented using the HART unit code "240". ▪ You can change the assignment of device variables to process variables using Command 51.
16	Read the device production number Access type = read	none	Bytes 0-2: Production number
17	Write user message Access = write	You can save any 32-character long text in the device under this parameter: Bytes 0-23: Desired user message	Displays the current user message in the device: Bytes 0-23: Current user message in the device
18	Write TAG, descriptor and date Access = write	With this parameter, you can store an 8 character TAG, a 16 character descriptor and a date: – Bytes 0-5: TAG – Bytes 6-17: descriptor – Bytes 18-20: Date	Displays the current information in the device: – Bytes 0-5: TAG – Bytes 6-17: descriptor – Bytes 18-20: Date
19	Write the device production number Access = write	Bytes 0-2: Production number	Bytes 0-2: Production number

The following table contains all the common practice commands supported by the device.

Command No. HART command / Access type		Command data (numeric data in decimal form)	Response data (numeric data in decimal form)
Common practice commands			
34	Write damping value for primary process variable Access = write	Bytes 0-3: Damping value of the primary process variable "volume flow" in seconds *Factory setting:* Primary process variable = Current output damping	Displays the current damping value in the device: Bytes 0-3: Damping value in seconds
35	Write measuring range of primary process variable Access = write	Write the desired measuring range: – Byte 0: HART unit code of the primary process variable – Bytes 1-4: upper range, value for 20 mA – Bytes 5-8: lower range, value for 4 mA *Factory setting:* Primary process variable = Volume flow Note! ▪ The start of the measuring range (4 mA) must correspond to the zero flow. ▪ If the HART unit code is not the correct one for the process variable, the device will continue with the last valid unit.	The currently set measuring range is displayed as a response: – Byte 0: HART unit code for the set measuring range of the primary process variable – Bytes 1-4: upper range, value for 20 mA – Bytes 5-8: lower range, value for 4 mA Note! ▪ Manufacturer-specific units are represented using the HART unit code "240". ▪ You can change the assignment of device variables to process variables using Command 51.
38	Device status reset (configuration changed) Access = write	none	none Note! It is also possible to execute this HART command when write protection is activated (= ON)!
40	Simulate input current of primary process variable Access = write	Simulation of the desired output current of the primary process variable. An entry value of 0 exits the simulation mode: Bytes 0-3: Output current in mA *Factory setting:* Primary process variable = Volume flow Note! You can set the assignment of device variables to process variables using Command 51.	The momentary output current of the primary process variable is displayed as a response: Bytes 0-3: Output current in mA
42	Perform master reset Access = write	none	none
44	Write unit of primary process variable Access = write	Set unit of primary process variable. Only units which are suitable for the process variable are transferred to the device: Byte 0: HART unit code *Factory setting:* Primary process variable = Volume flow Note! ▪ If the written HART unit code is not the correct one for the process variable, the device will continue with the last valid unit. ▪ If you change the unit of the primary process variable, this has a direct impact on the system units.	The current unit code of the primary process variable is displayed as a response: Byte 0: HART unit code Note! Manufacturer-specific units are represented using the HART unit code "240".
48	Read additional device status Access = read	none	The device status is displayed in extended form as the response: Coding: see table → 🖹 71

Command No. HART command / Access type		Command data (numeric data in decimal form)	Response data (numeric data in decimal form)
50	Read assignment of the device variables to the four process variables Access = read	none	Display of the current variable assignment of the process variables: – Byte 0: Device variable code to the primary process variable – Byte 1: Device variable code to the second process variable – Byte 2: Device variable code to the third process variable – Byte 3: Device variable code to the fourth process variable *Factory setting:* ▪ Primary process variable: Code 1 for volume flow ▪ Second process variable: Code 250 for totalizer ▪ Third process variable: Code 0 for OFF (not assigned) ▪ Fourth process variable: Code 0 for OFF (not assigned)
51	Write assignment of the device variables to the four process variables Access = write	Setting of the device variables to the four process variables: – Byte 0: Device variable code to the primary process variable – Byte 1: Device variable code to the second process variable – Byte 2: Device variable code to the third process variable – Byte 3: Device variable code to the fourth process variable *Factory setting:* ▪ Primary process variable: Volume flow ▪ Second process variable: Totalizer 1 ▪ Third process variable: OFF (not assigned) ▪ Fourth process variable: OFF (not assigned)	The variable assignment of the process variables is displayed as a response: – Byte 0: Device variable code to the primary process variable – Byte 1: Device variable code to the second process variable – Byte 2: Device variable code to the third process variable – Byte 3: Device variable code to the fourth process variable
53	Write device variable unit Access = write	This command sets the unit of the given device variables. Only those units which suit the device variable are transferred: – Byte 0: Device variable code – Byte 1: HART unit code Code of the supported device variables: See information → 🖹 66 ✎ Note! ▪ If the written unit is not the correct one for the device variable, the device will continue with the last valid unit. ▪ If you change the unit of the device variable, this has a direct impact on the system units.	The current unit of the device variables is displayed in the device as a response: – Byte 0: Device variable code – Byte 1: HART unit code ✎ Note! Manufacturer-specific units are represented using the HART unit code "240".
59	Write number of preambles in response message Access = write	This parameter sets the number of preambles which are inserted in the response messages: Byte 0: Number of preambles (4 to 20)	The current number of preambles is displayed in the response telegram: Byte 0: Number of preambles

5.4.6 Device status and error messages

You can read the extended device status, in this case, current error messages, via Command "48". The command delivers information which is partly coded in bits (see table below).

Note!
- You can find a detailed explanation of the device status and error messages and their elimination on → 71
- Bits and bytes not listed are not assigned.

Byte	Bit	Error No.	Short error description
0	0	001	Serious device error
	1	011	Measuring amplifier has faulty EEPROM
	2	012	Error when accessing data of the measuring amplifier EEPROM
1	1	031	S-DAT: defective or missing
	2	032	S-DAT: Error accessing saved values
	5	051	I/O and the amplifier are not compatible.
3	3	111	Totalizer checksum error
	4	121	I/O board and amplifier not compatible.
4	3	251	Internal communication fault on the amplifier board.
	4	261	No data reception between amplifier and I/O board
5	0	321	Coil current of the sensor is outside the tolerance.
	7	339	Flow buffer: The temporarily buffered flow portions (measuring mode for pulsating flow) could not be cleared or output within 60 seconds.
6	0	340	
	1	341	
	2	342	
	3	343	Frequency buffer: The temporarily buffered flow portions (measuring mode for pulsating flow) could not be cleared or output within 60 seconds.
	4	344	
	5	345	
	6	346	
	7	347	Pulse buffer: The temporarily buffered flow portions (measuring mode for pulsating flow) could not be cleared or output within 60 seconds.
7	0	348	
	1	349	
	2	350	
	3	351	Current output: Flow is out of range.
	4	352	
	5	353	
	6	354	
	7	355	Frequency output: Flow is out of range.
8	0	356	
	1	357	
	2	358	

Byte	Bit	Error No.	Short error description
8	3	359	Pulse output: Flow is out of range.
	4	360	
	5	361	
	6	362	
10	7	401	Measuring tube partially filled or empty
11	2	461	EPD calibration not possible because the fluid's conductivity is either too low or too high.
	4	463	The EPD calibration values for empty pipe and full pipe are identical, and therefore incorrect.
12	1	474	Maximum flow value entered is overshot
	7	501	Amplifier software version is loaded. Currently no other commands are possible.
13	0	502	Upload/download of device files. Currently no other commands are possible.
14	3	601	Positive zero return active
	7	611	Simulation current output active
15	0	612	
	1	613	
	2	614	
	3	621	Simulation frequency output active
	4	622	
	5	623	
	6	624	
	7	631	Simulation pulse output active
16	0	632	
	1	633	
	2	634	
	3	641	Simulation status output active
	4	642	
	5	643	
	6	644	
17	7	671	Simulation of the status input active
18	0	672	
	1	673	
	2	674	
	3	691	Simulation of response to error (outputs) active
	4	692	Simulation of volume flow active

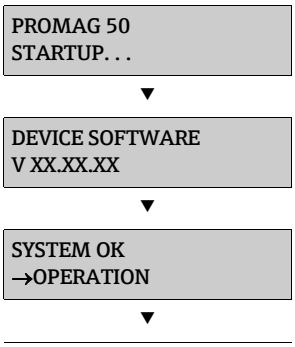
6 Commissioning

6.1 Function check

Make sure that all final checks have been completed before you start up your measuring point:
- Checklist for "Post-installation check" → 46
- Checklist for "Post-connection check" → 60

6.2 Switching on the measuring device

Once the connection checks have been successfully completed, it is time to switch on the power supply. The device is now operational. The measuring device performs a number of post switch-on self-tests. As this procedure progresses the following sequence of messages appears on the local display:



Start-up message

Current software version

Beginning of normal measuring mode

Normal measuring mode commences as soon as start-up completes.
Various measured-value and/or status variables (HOME position) appear on the display.

Note!
If start-up fails, an error message indicating the cause is displayed.

6.3 Quick Setup

In the case of measuring devices without a local display, the individual parameters and functions must be configured via the operating program, e.g. FieldCare.
If the measuring device is equipped with a local display, all the important device parameters for standard operation, as well as additional functions, can be configured quickly and easily by means of the following Quick Setup menu.

6.3.1 "Commissioning" Quick Setup menu

This Quick Setup menu guides you systematically through the setup procedure for all the major device functions that have to be configured for standard measuring operation.

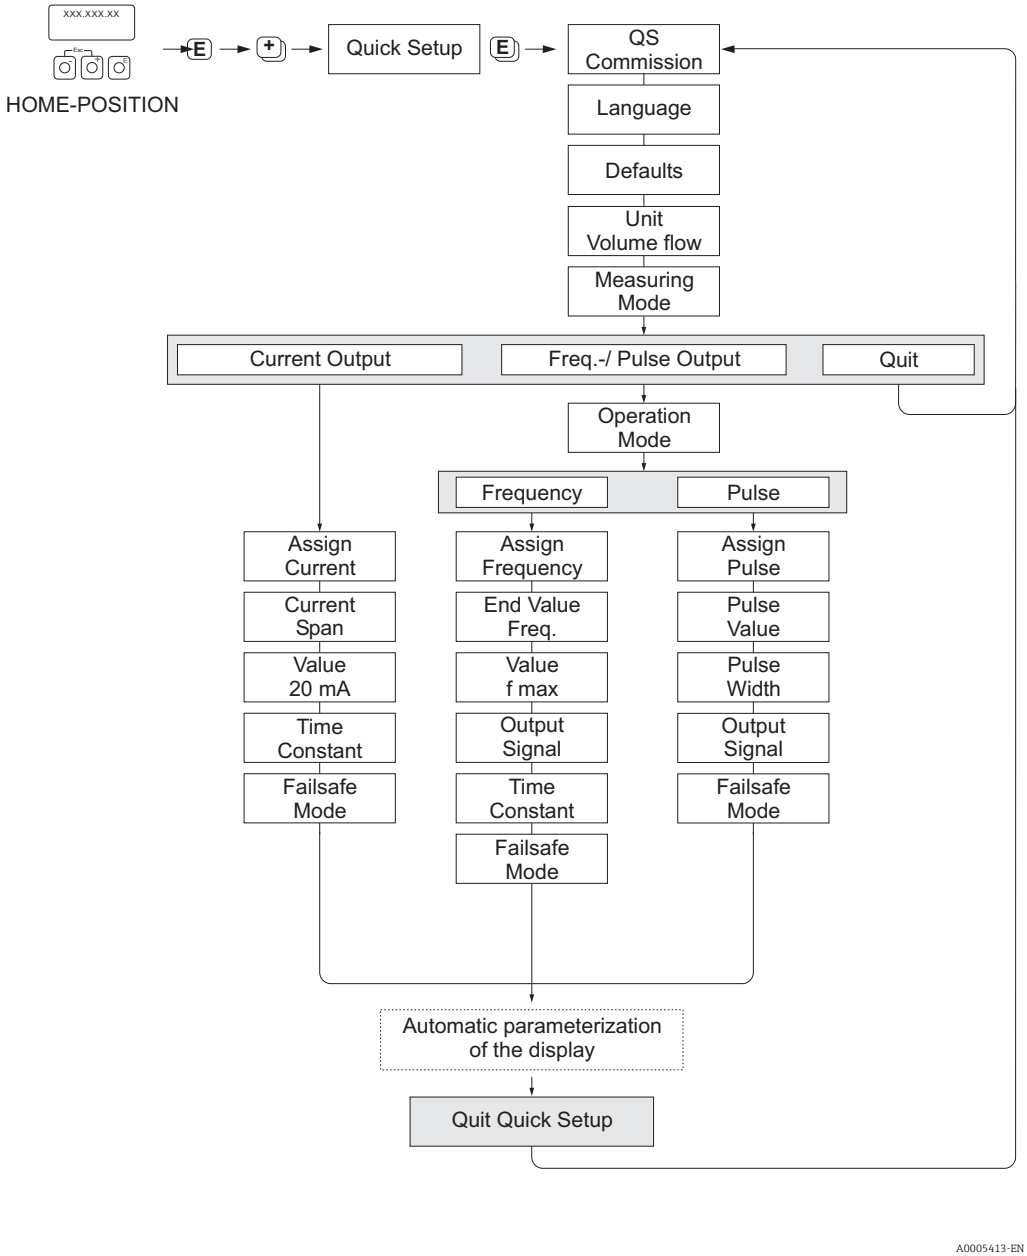


Fig. 51: "QUICK SETUP COMMISSIONING" menu for the rapid configuration of important device functions

6.4 Configuration

6.4.1 Current output: active/passive

The current output is configured as "active" or "passive" by means of various jumpers on the I/O board.

Warning!
Risk of electric shock! Exposed components carry dangerous voltages. Make sure that the power supply is switched off before you remove the cover of the electronics compartment.

1. Switch off power supply.
2. Remove the I/O board → 90
3. Position the jumper → 52

   Caution!
   Risk of destroying the measuring device. Set the jumpers exactly as shown in the graphic. Pay strict attention to the position of the jumpers as indicated in the graphic.
4. Installation of the I/O board is the reverse of the removal procedure.

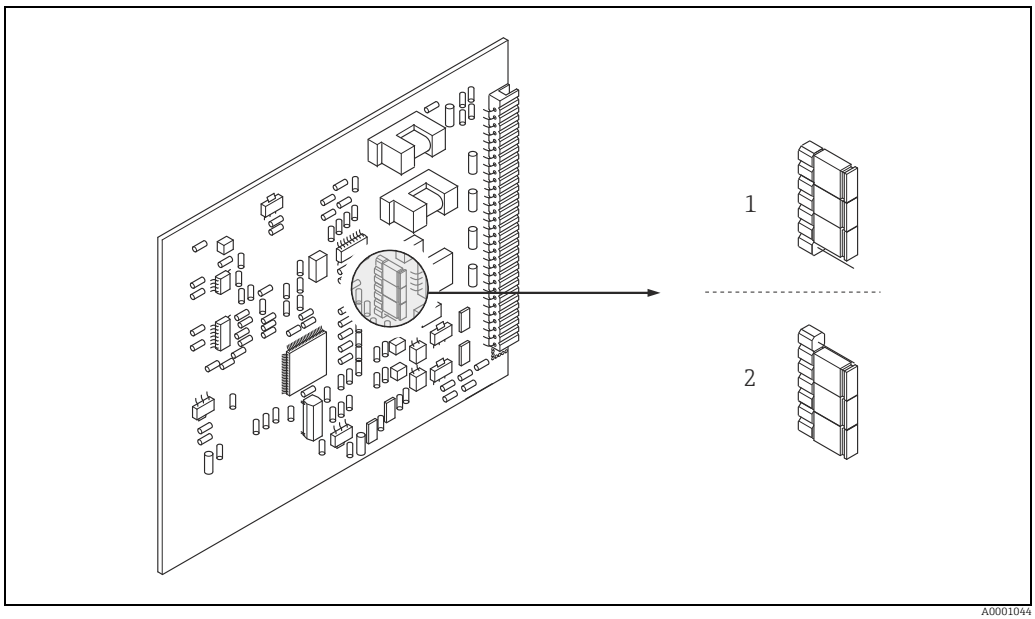

Fig. 52: Configuring current outputs using jumpers (I/O board)

1 Active current output (factory setting)
2 Passive current output

6.5 Adjustment

6.5.1 Empty-pipe/full-pipe adjustment

Flow cannot be measured correctly unless the measuring tube is completely full.
This status can be permanently monitored using the Empty Pipe Detection:

- EPD = Empty Pipe Detection (with the help of an EPD electrode)
- OED = Open Electrode Detection (Empty Pipe Detection with the help of the measuring electrodes, if the sensor is not equipped with an EPD electrode or the orientation is not suitable for using EPD).

Caution!
Detailed information on the empty-pipe/full-pipe adjustment procedure can be found in the "Description of Device Functions" manual:

- EPD/OED ADJUSTMENT (carrying out the adjustment).
- EPD (switching on and off EPD/OED).
- EPD RESPONSE TIME (input of the response time for EPD/OED).

Note!

- The EPD function is not available unless the sensor is fitted with an EPD electrode.
- The devices are already calibrated at the factory with water (approx. 500 µS/cm). If the fluid conductivity differs from this reference, empty-pipe/full-pipe adjustment has to be performed again on site.
- The default setting for EPD when the devices are delivered is OFF; the function has to be activated if required.
- The EPD process error can be output by means of the configurable relay output.

Performing empty-pipe and full-pipe adjustment (EPD)

1. Select the appropriate function in the function matrix:
   HOME → E → ± → PROCESS PARAMETER → E → ± → EPD ADJUSTMENT
2. Empty the piping:
   – The wall of the measuring tube should still be wet with fluid during EPD empty pipe adjustment
   – The wall of the measuring tube/the measuring electrodes should **no longer** be wet with fluid during OED empty pipe adjustment
3. Start empty-pipe adjustment: Select "EMPTY PIPE ADJUST" or "OED EMPTY ADJUST" and press E to confirm.
4. After empty-pipe adjustment, fill the piping with fluid.
5. Start full-pipe adjustment: Select "FULL PIPE ADJUST" or "OED FULL ADJUST" and press E to confirm.
6. Having completed the adjustment, select the setting "OFF" and exit the function by pressing E.
7. Switch on empty pipe detection in the EPD function:
   – EPD empty pipe adjustment: Select ON STANDARD or ON SPECIAL and press E to confirm
   – OED empty pipe adjustment: Select OED and confirm with E.

   Caution!
   The adjustment coefficients must be valid before you can activate the EPD function. If adjustment is incorrect the following messages might appear on the display:
   – FULL = EMPTY
     The adjustment values for empty pipe and full pipe are identical. In cases of this nature you must repeat empty-pipe or full-pipe adjustment!
   – ADJUSTMENT NOT OK
     Adjustment is not possible because the fluid's conductivity is out of range.

6.6 Data storage device (HistoROM)

At Endress+Hauser, the term HistoROM refers to various types of data storage modules on which process and measuring device data are stored. It is possible to plug these modules into other devices to copy device configurations from one device to another, for example.

6.6.1 HistoROM/S-DAT (sensor-DAT)

The S-DAT is an exchangeable data storage device in which all sensor relevant parameters are stored, i.e., diameter, serial number, calibration factor, zero point.

7 Maintenance

No special maintenance work is required.

7.1 Exterior cleaning

When cleaning the exterior of measuring devices, always use cleaning agents that do not attack the surface of the housing and the seals.

7.2 Seals

The seals of the Promag H sensor must be replaced periodically, particularly in the case of gasket seals (aseptic version).
The period between changes depends on the frequency of cleaning cycles, the cleaning temperature and the fluid temperature.

Replacement seals (accessories) → 🖹 79.

8 Accessories

Various accessories, which can be ordered separately from Endress+Hauser, are available for the transmitter and the sensor. Your Endress+Hauser service organization can provide detailed information on the specific order codes on request.

8.1 Device-specific accessories

Accessory	Description	Order code
Proline Promag 50 transmitter	Transmitter for replacement or storage. Use the order code to define the following specifications: ▪ Approvals ▪ Degree of protection/version ▪ Cable for remote version ▪ Cable entry ▪ Display/power supply/operation ▪ Software ▪ Outputs/inputs	50XXX – XXXXX******

8.2 Measuring principle-specific accessories

Accessory	Description	Order code
Mounting set for Promag 50 transmitter	Mounting set for the transmitter (remote version). Suitable for: ▪ Wall mounting ▪ Pipe mounting ▪ Panel-mounted installation Mounting set for aluminum field housing. Suitable for: ▪ Pipe mounting	DK5WM – *
Wall-mounting kit for Promag H	Wall-mounting kit for the Promag H sensor.	DK5HM – **
Cable for remote version	Coil and signal cables, various lengths.	DK5CA – **
Mounting kit for Promag D, wafer version	▪ Mounting bolts ▪ Nuts incl. washers ▪ Flange seals ▪ Centering sleeves (if required for the flange)	DKD** – **
Set of seals for Promag D	Set of seals consisting of two flange seals.	DK5DD – ***
Mounting kit for Promag H	▪ 2 process connections ▪ Threaded fasteners ▪ Seals	DKH** – ****
Set of seals for Promag H	For regular replacement of the seals of the Promag H sensor.	DK5HS – ***
Welding jig for Promag H	Weld nipple as process connection: welding jig for installation in pipe.	DK5HW – ***
Adapter connection for Promag A, H	Adapter connections for installing a Promag 10 H instead of a Promag 30/33 A or Promag 30/33 H DN 25.	DK5HA – *****
Ground rings for Promag H	Ground rings for potential equalization.	DK5HR – ***
Ground cable for Promag E/L/P/W	Ground cable for potential equalization.	DK5GC – ***
Ground disk for Promag E/L/P/W	Ground disk for potential equalization.	DK5GD – * * ***
Process display RIA45	Multifunctional 1-channel display unit: ▪ Universal input ▪ Transmitter power supply ▪ Limit relay ▪ Analog output	RIA45 – ******

Accessory	Description	Order code
Process display RIA251	Digital display device for looping into the 4 to 20 mA current loop.	RIA251 – **
Field display unit RIA16	Digital field display device for looping into the 4 to 20 mA current loop.	RIA16 – ***
Application Manager RMM621	Electronic recording, display, balancing, control, saving and event and alarm monitoring of analog and digital input signals. Values and conditions determined are output by means of analog and digital output signals. Remote transmission of alarms, input values and calculated values using a PSTN or GSM modem.	RMM621 – **********

8.3 Communication-specific accessories

Accessory	Description	Order code
HART Communicator Field Xpert SFX 100	Handheld terminal for remote configuration and for obtaining measured values via the HART current output (4 to 20 mA) and FOUNDATION Fieldbus. Contact your Endress+Hauser representative for more information.	SFX100 – *******
Fieldgate FXA320	Gateway for remote interrogation of HART sensors and actuators via Web browser: ▪ 2-channel analog input (4 to 20 mA) ▪ 4 binary inputs with event counter function and frequency measurement ▪ Communication via modem, Ethernet or GSM ▪ Visualization via Internet/Intranet in Web browser and/or WAP cellular phone ▪ Limit value monitoring with alarm by e-mail or SMS ▪ Synchronized time stamping of all measured values.	FXA320 – *****
Fieldgate FXA520	Gateway for remote interrogation of HART sensors and actuators via Web browser: ▪ Web server for remote monitoring of up to 30 measuring points ▪ Intrinsically safe version [EEx ia]IIC for applications in hazardous areas ▪ Communication via modem, Ethernet or GSM ▪ Visualization via Internet/Intranet in Web browser and/or WAP cellular phone ▪ Limit value monitoring with alarm by e-mail or SMS ▪ Synchronized time stamping of all measured values ▪ Remote diagnosis and remote configuration of connected HART devices	FXA520 – ****
FXA195	The Commubox FXA195 connects intrinsically safe Smart transmitters with HART protocol to the USB port of a personal computer. This makes the remote operation of the transmitters possible with the aid of configuration programs (e.g. FieldCare). Power is supplied to the Commubox by means of the USB port	FXA195 – *

8.4 Service-specific accessories

Accessory	Description	Order code
Applicator	Software for selecting and planning flowmeters. The Applicator software can be downloaded from the Internet or ordered on CD-ROM for installation on a local PC. Contact your Endress+Hauser representative for more information.	DXA80 – *
Fieldcheck	Tester/simulator for testing flowmeters in the field. When used in conjunction with the "FieldCare" software package, test results can be imported into a database, printed out and used for official certification. Contact your Endress+Hauser representative for more information.	50098801
FieldCare	FieldCare is Endress+Hauser's FDT-based asset management tool. It can configure all intelligent field units in your system and helps you manage them. By using status information, it is also a simple but effective way of checking their status and condition.	See the product page on the Endress+Hauser Web site: www.endress.com
Memograph M graphic display recorder	The Memograph M graphic display recorder provides information on all the relevant process variables. Measured values are recorded correctly, limit values are monitored and measuring points analyzed. The data are stored in the 256 MB internal memory and also on a DSD card or USB stick. Memograph M boasts a modular design, intuitive operation and a comprehensive security concept. The ReadWin® 2000 PC software is part of the standard package and is used for configuring, visualizing and archiving the data captured. The mathematics channels which are optionally available enable continuous monitoring of specific power consumption, boiler efficiency and other parameters which are important for efficient energy management.	RSG40 – **********
FXA193	Service interface from the device to the PC for operation via FieldCare.	FXA193 – *

9 Troubleshooting

9.1 Troubleshooting instructions

Always start troubleshooting with the checklist below if faults occur after start-up or during operation. The routine takes you directly to the cause of the problem and the appropriate remedial measures.

Check the display	
No display visible and no output signals present.	1. Check the supply voltage → terminals 1, 2 2. Check the power line fuse → 🖹 94 85 to 260 V AC: 0.8 A slow-blow / 250 V 20 to 55 V AC / 16 to 62 V DC: 2 A slow-blow / 250 V 3. Measuring electronics defective → order spare parts → 🖹 89
No display visible, but output signals are present.	1. Check whether the ribbon-cable connector of the display module is correctly plugged into the amplifier board → 🖹 90 2. Display module defective → order spare parts → 🖹 89 3. Measuring electronics defective → order spare parts → 🖹 89
Display texts are in a foreign language.	Switch off power supply. Press and hold down both the OS buttons and switch on the measuring device. The display text will appear in English (default) and is displayed at maximum contrast.
Measured value indicated, but no signal at the current or pulse output.	Electronics board defective → order spare parts → 🖹 89
↓	
Error messages on display	
Errors which occur during commissioning or measuring operation are displayed immediately. Error messages consist of a variety of icons: the meanings of these icons are as follows (example): – Error type: **S** = system error, **P** = process error – Error message type: ϟ = fault message, **!** = notice message – **EMPTY PIPE** = Type of error, e.g. measuring tube is only partly filled or completely empty – **03:00:05** = duration of error occurrence (in hours, minutes and seconds) – **#**401 = error number ☞ Caution! ▪ See the information on → 🖹 64! ▪ The measuring system interprets simulations and positive zero return as system errors, but displays them as notice message only.	
Error number: No. 001 – 399 No. 501 – 699	System error (device error) has occurred → 🖹 83
Error number: No. 401 - 499	Process error (application error) has occurred → 🖹 85
↓	
Other error (without error message)	
Some other error has occurred.	Diagnosis and rectification → 🖹 86

9.2 System error messages

Serious system errors are **always** recognized by the device as "Fault message", and are shown as a lightning flash (ϟ) on the display. Fault messages immediately affect the outputs.

Caution!
In the event of a serious fault, a flowmeter might have to be returned to the manufacturer for repair. The necessary procedures on → 🖹 5 must be carried out before you return a flowmeter to Endress+Hauser. Always enclose a duly completed "Declaration of Contamination" form. You will find a master copy of this form at the back of this manual.

Note!
Also observe the information on → 🖹 64.

No.	Error message / Type	Cause	Remedy (spare part → 🖹 89)
S = System error ϟ = Fault message (with an effect on the outputs) ! = Notice message (without an effect on the outputs)			
No. # 0xx → Hardware error			
001	S: CRITICAL FAILURE $: # 001	Serious device error	Replace the amplifier board.
011	S: AMP HW EEPROM $: # 011	Amplifier: Defective EEPROM	Replace the amplifier board.
012	S: AMP SW EEPROM $: # 012	Amplifier: Error accessing EEPROM data	The EEPROM data blocks in which an error has occurred are displayed in the TROUBLESHOOTING function. Press Enter to acknowledge the errors in question; default values are automatically inserted instead of the errored parameter values. Note! The measuring device has to be restarted if an error has occurred in a totalizer block (see error No. 111 / CHECKSUM TOTAL).
031	S: SENSOR HW DAT $: # 031	1. S-DAT is not plugged into the amplifier board correctly (or is missing). 2. S-DAT is defective.	1. Check whether the S-DAT is correctly plugged into the amplifier board. 2. Replace the S-DAT if it is defective. Check that the new replacement DAT is compatible with the measuring electronics. Check the: - Spare part set number - Hardware revision code 3. Replace measuring electronics boards if necessary. 4. Plug the S-DAT into the amplifier board.
032	S: SENSOR SW DAT $: # 032		
No. # 1xx → Software error			
101	S: GAIN ERROR AMP $: # 101	Gain deviation compared to reference gain > 25%.	Replace the amplifier board.
111	S: CHECKSUM TOTAL $: # 111	Totalizer checksum error.	1. Restart the measuring device. 2. Replace the amplifier board if necessary.
121	S: A / C COMPATIB. !: # 121	Due to different software versions, I/O board and amplifier board are only partially compatible (possibly restricted functionality). Note! – This message is only listed in the error history. – Nothing is shown on the display.	Module with lower software version has either to be updated by FieldCare with the required software version or the module has to be replaced.

No.	Error message / Type	Cause	Remedy (spare part → 🖹 89)
No. # 2xx → Error in DAT / no communication			
251	S: COMMUNICATION I/O $: # 251	Internal communication fault on the amplifier board.	Replace the amplifier board.
261	S: COMMUNICATION I/O $: # 261	No data reception between amplifier and I/O board or faulty internal data transfer.	Check the BUS contacts.
No. # 3xx → System limits exceeded			
321	S: TOL. COIL CURR. $: # 321	Sensor: Coil current is out of tolerance.	⚠ Warning! Switch off power supply before manipulating the coil current cable, coil current cable connector or measuring electronics boards! Remote version: 1. Check wiring of terminals 41/42 → 🖹 47 2. Check coil current cable connector. Compact and remote version: Replace measuring electronics boards if necessary
339 to 342	S: STACK CUR OUT n !: # 339 to 342	The temporarily buffered flow portions (measuring mode for pulsating flow) could not be cleared or output within 60 seconds.	1. Change the upper or lower limit setting, as applicable. 2. Increase or reduce flow, as applicable. Recommendations in the event of fault category = FAULT MESSAGE ($) ▪ Configure the fault response of the output to "ACTUAL VALUE" so that the temporary buffer can be cleared. ▪ Clear the temporary buffer by the measures described under Item 1.
343 to 346	S: STACK FREQ. OUT n !: # 343 to 346		
347 to 350	S: STACK PULSE OUT n !: # 343 to 346	The temporarily buffered flow portions (measuring mode for pulsating flow) could not be cleared or output within 60 seconds.	1. Increase the setting for pulse weighting 2. Increase the max. pulse frequency if the totalizer can handle a higher number of pulses. 3. Increase or reduce flow, as applicable. Recommendations in the event of fault category = FAULT MESSAGE ($) ▪ Configure the fault response of the output to "ACTUAL VALUE" so that the temporary buffer can be cleared. ▪ Clear the temporary buffer by the measures described under Item 1.
351 to 354	S: CURRENT RANGE n !: # 351 to 354	Current output: flow is out of range.	1. Change the upper or lower limit setting, as applicable. 2. Increase or reduce flow, as applicable.
355 to 358	S: FREQ. RANGE n !: # 355 to 358	Frequency output: flow is out of range.	1. Change the upper or lower limit setting, as applicable. 2. Increase or reduce flow, as applicable.
359 to 362	S: PULSE RANGE !: # 359 to 362	Pulse output: the pulse output frequency is out of range.	1. Increase the setting for pulse weighting 2. When selecting the pulse width, choose a value that can still be processed by a connected counter (e.g. mechanical counter, PLC etc.). *Determine the pulse width:* – Variant 1: Enter the minimum duration that a pulse must be present at the connected counter to ensure its registration. – Variant 2: Enter the maximum (pulse) frequency as the half "reciprocal value" that a pulse must be present at the connected counter to ensure its registration. Example: The maximum input frequency of the connected counter is 10 Hz. The pulse width to be entered is: $\frac{1}{2 \cdot 10\ \text{Hz}} = 50\ \text{ms}$ a0004437 3. Reduce flow.

No.	Error message / Type	Cause	Remedy (spare part → 89)
No. # 5xx → Application error			
501	S: SW.-UPDATE ACT. !: # 501	New amplifier or communication (I/O module) software version is loaded. Currently no other functions are possible.	Wait until the procedure is finished. The device will restart automatically.
502	S: UP-/DOWNLOAD ACT !: # 502	Uploading or downloading the device data via operating program. Currently no other functions are possible.	Wait until the procedure is finished.
No. # 6xx → Simulation mode active			
601	S: POS. ZERO-RETURN !: # 601	Positive zero return active Caution! This message has the highest display priority!	Switch off positive zero return
611 to 614	S: SIM. CURR. OUT. n !: # 611 to 614	Simulation current output active	
621 to 624	S: SIM. FREQ. OUT. n !: # 621 to 624	Simulation frequency output active	Switch off simulation
631 to 634	S: SIM. PULSE n !: # 631 to 634	Simulation pulse output active	Switch off simulation
641 to 644	S: SIM. STAT. OUT n !: # 641 to 644	Simulation status output active	Switch off simulation
671 to 674	S: SIM. STATUS IN n !: # 671 to 674	Simulation status input active	Switch off simulation
691	S: SIM. FAILSAFE !: # 691	Simulation of response to error (outputs) active	Switch off simulation
692	S: SIM. MEASURAND !: # 692	Simulation of a measured variable active (e.g. mass flow).	Switch off simulation
698	S: DEV. TEST ACT. !: # 698	The measuring device is being checked on site via the test and simulation device.	–

9.3 Process error messages

Note!
Also observe the information on → 64.

No.	Error message / Type	Cause	Remedy (spare part → 89)
P = Process error $ = Fault message (with an effect on the outputs) ! = Notice message (without an effect on the outputs)			
401	EMPTY PIPE $: # 401	Measuring tube partially filled or empty	1. Check the process conditions of the plant 2. Fill the measuring tube
461	ADJ. NOT OK !: # 461	EPD calibration not possible because the fluid's conductivity is either too low or too high.	The EPD function cannot be used with fluids of this nature.
463	FULL = EMPTY $: # 463	The EPD calibration values for empty pipe and full pipe are identical, therefore incorrect.	Repeat calibration, making sure procedure is correct → 76.

9.4 Process errors without messages

Symptoms	Rectification
Remark: You may have to change or correct certain settings in functions in the function matrix in order to rectify the fault.	
Flow values are negative, even though the fluid is flowing forwards through the pipe.	1. Remote version: – Switch off the power supply and check the wiring → 🖹 47 – If necessary, reverse the connections at terminals 41 and 42 2. Change the setting in the "INSTALLATION DIRECTION SENSOR" function accordingly
Measured-value reading fluctuates even though flow is steady.	1. Check grounding and potential equalization → 🖹 56 2. Check the fluid for presence of gas bubbles. 3. In the "SYSTEM DAMPING" function → increase the value
Measured-value reading shown on display, even though the fluid is at a standstill and the measuring tube is full.	1. Check grounding and potential equalization → 🖹 56 2. Check the fluid for presence of gas bubbles. 3. Activate the "LOW FLOW CUTOFF" function, i.e. enter or increase the value for the switching point.
Measured-value reading on display, even though measuring tube is empty.	1. Perform empty-pipe/full-pipe adjustment and then switch on Empty Pipe detection → 🖹 76 2. Remote version: Check the terminals of the EPD cable → 🖹 47 3. Fill the measuring tube.
The current output signal is always 4 mA, irrespective of the flow signal at any given time.	1. Select the "BUS ADDRESS" function and change the setting to "0". 2. Value for creepage too high. Reduce the value in the "LOW FLOW CUTOFF" function.
The fault cannot be rectified or some other fault not described above has arisen. In these instances, please contact your Endress+Hauser service organization.	The following options are available for tackling problems of this nature: **Request the services of an Endress+Hauser service technician** If you contact our service organization to have a service technician sent out, please be ready to quote the following information: – Brief description of the fault – Nameplate specifications (→ 🖹 6): order code, serial number **Returning devices to Endress+Hauser** The necessary procedures (→ 🖹 5) must be carried out before you return a flowmeter requiring repair or calibration to Endress+Hauser. Always enclose a duly completed "Declaration of Conformity" form with the flowmeter. You will find a master copy of this form at the back of this manual. **Replace transmitter electronics** Components in the measuring electronics defective → order spare parts → 🖹 89

9.5 Response of outputs to errors

Note!
The failsafe mode of totalizers, current, pulse and frequency outputs can be customized by means of various functions in the function matrix. You will find detailed information on these procedures in the "Description of Device Functions" manual.

You can use positive zero return to set the signals of the current, pulse and status outputs to their fallback value, for example when measuring has to be interrupted while a pipe is being cleaned. This function takes priority over all other device functions: simulations, for example, are suppressed.

Failsafe mode of outputs and totalizers		
	Process/system error is current	**Positive zero return is activated**
Caution! System or process errors defined as "Notice messages" have no effect whatsoever on the inputs and outputs. See the information on → 67		
Current output	MINIMUM VALUE 0–20 mA → 0 mA 4–20 mA → 2 mA 4–20 mA HART → 2 mA 4–20 mA NAMUR →3.5 mA 4–20 mA HART NAMUR →3.5 mA 4–20 mA US → 3.75 mA 4–20 mA HART US → 3,75 mA 0–20 mA (25 mA) → 0 mA 4–20 mA (25 mA) → 2 mA 4–20 mA (25 mA) HART → 2 mA MAXIMUM VALUE 0–20 mA → 22 mA 4–20 mA → 22 mA 4–20 mA HART → 22 mA 4–20 mA NAMUR → 22.6 mA 4–20 mA HART NAMUR → 22.6 mA 4–20 mA US → 22.6 mA 4–20 mA HART US → 22.6 mA 0–20 mA (25 mA) → 25 mA 4–20 mA (25 mA) → 25 mA 4–20 mA (25 mA) HART → 25 mA HOLD VALUE Last valid value (preceding occurrence of the fault) is output. ACTUAL VALUE Measured value display on the basis of the current flow measurement. The fault is ignored.	Output signal corresponds to "zero flow"
Pulse output	MIN/MAX VALUE → FALLBACK VALUE Signal output → no pulses HOLD VALUE Last valid value (preceding occurrence of the fault) is output. ACTUAL VALUE Fault is ignored, i.e. normal measured-value output on the basis of ongoing flow measurement.	Output signal corresponds to "zero flow"
Frequency output	*FALLBACK VALUE* Signal output → 0 Hz *FAILSAFE LEVEL* Output of the frequency specified in the FALÌLSAFE VALUE function. *HOLD VALUE* Measured value display on the basis of the last saved value preceding occurrence of the fault. *ACTUAL VALUE* Measured value display on the basis of the current flow measurement. The fault is ignored.	Output signal corresponds to "zero flow"

Failsafe mode of outputs and totalizers		
	Process/system error is current	**Positive zero return is activated**
Totalizer	*STOP* The totalizers are paused until the error is rectified. *ACTUAL VALUE* The fault is ignored. The totalizer continues to count in accordance with the current flow value. *HOLD VALUE* The totalizer continues to count the flow in accordance with the last valid flow value (before the error occurred).	Totalizer stops
Status output	In the event of a fault or power supply failure: Status output → non-conductive	No effect on status output

9.6 Spare parts

Detailed troubleshooting instructions are provided in the previous sections → 🖹 82
The measuring device, moreover, provides additional support in the form of continuous self-diagnosis and error messages.
Fault rectification can entail replacing defective components with tested spare parts. The illustration below shows the available scope of spare parts.

Note!
You can order spare parts directly from your Endress+Hauser service organization by providing the serial number printed on the transmitter's nameplate → 🖹 6

Spare parts are shipped as sets comprising the following parts:
- Spare part
- Additional parts, small items (threaded fasteners, etc.)
- Mounting instructions
- Packaging

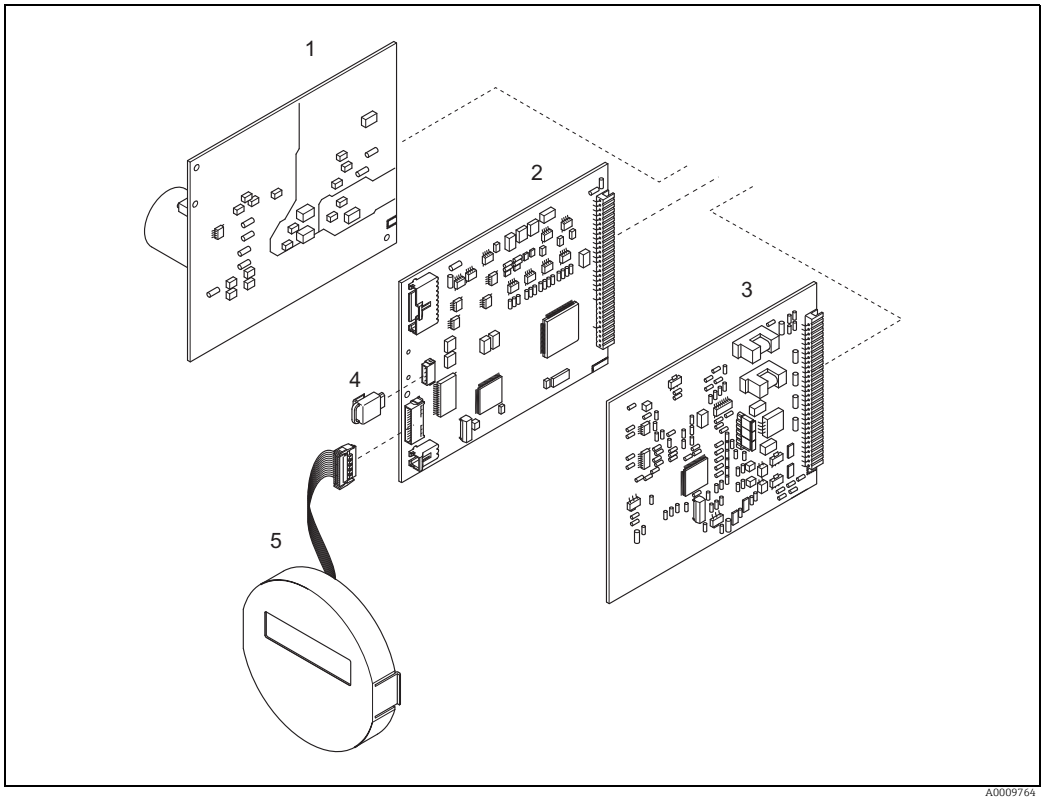

Fig. 53: Spare parts for Promag 50 transmitter (field and wall-mounted housings)

1 Power unit board (85 to 260 V AC, 20 to 55 V AC, 16 to 62 V DC)
2 Amplifier board
3 I/O board (COM module)
4 HistoROM / S-DAT (sensor data memory)
5 Display module

9.6.1 Removing and installing printed circuit boards

Field housing: removing and installing printed circuit boards → 54

Warning!
- Risk of electric shock!
  Exposed components carry dangerous voltages. Make sure that the power supply is switched off before you remove the cover of the electronics compartment.
- Risk of damaging electronic components (ESD protection). Static electricity can damage electronic components or impair their operability. Use a workplace with a grounded working surface purpose-built for electrostatically sensitive devices!
- If you cannot guarantee that the dielectric strength of the device is maintained in the following steps, then an appropriate inspection must be carried out in accordance with the manufacturer's specifications.
- When connecting Ex-certified devices, see the notes and diagrams in the Ex-specific supplement to these Operating Instructions.

Caution!
Use only original Endress+Hauser parts.

1. Switch off power supply.
2. Unscrew cover of the electronics compartment from the transmitter housing.
3. Remove the local display (1) as follows:
   – Press in the latches (1.1) at the side and remove the display module.
   – Disconnect the ribbon cable (1.2) of the display module from the amplifier board.
4. Remove the screws and remove the cover (2) from the electronics compartment.
5. Remove the boards (4, 6): Insert a suitable tool into the hole (3) provided for the purpose and pull the board clear of its holder.
6. Remove amplifier board (5):
   – Disconnect the plug of the electrode signal cable (5.1) including S-DAT (5.3) from the board.
   – Loosen the plug locking of the coil current cable (5.2) and gently disconnect the plug from the board, i.e. without moving it to and fro.
   – Insert a thin pin into the hole (3) provided for the purpose and pull the board clear of its holder.
7. Installation is the reverse of the removal procedure.

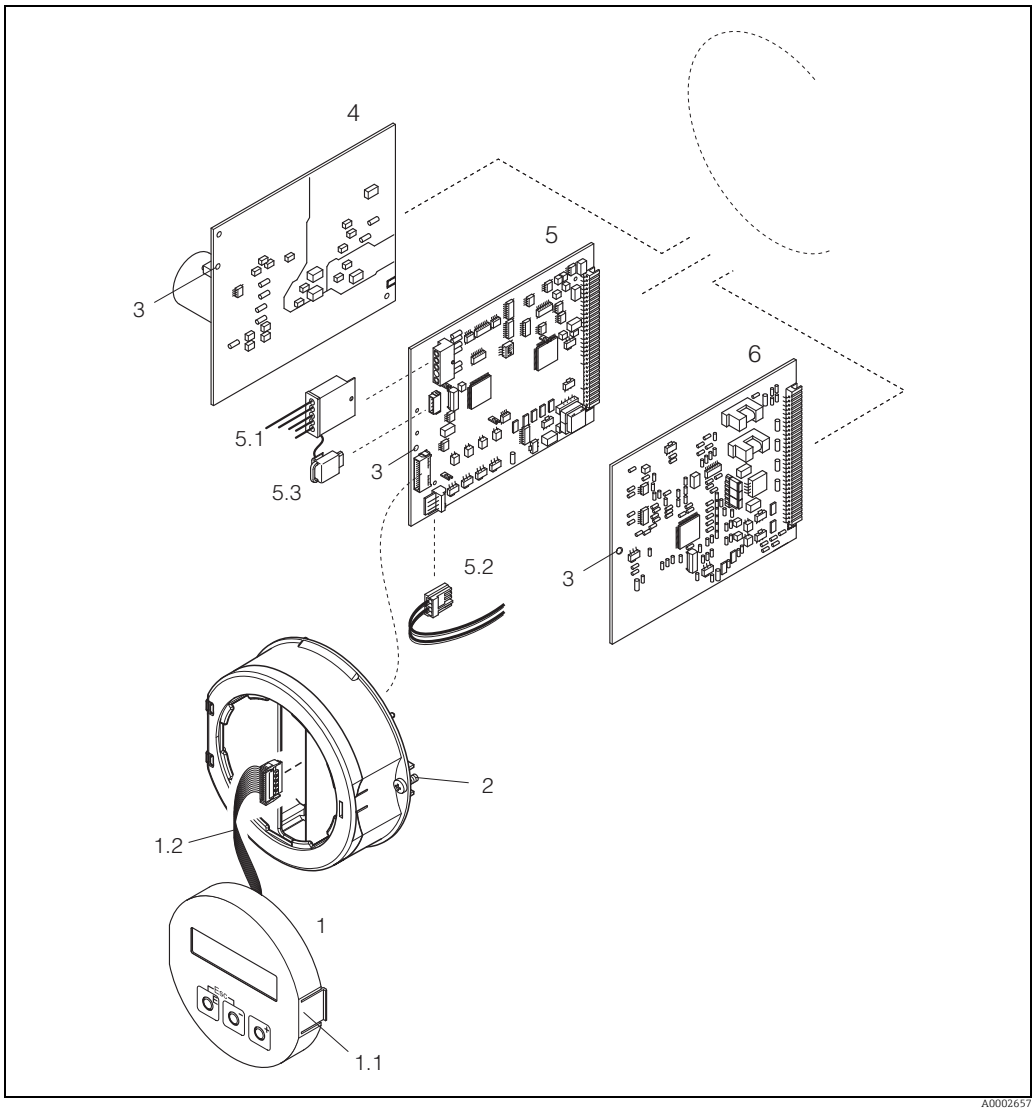

Fig. 54: Field housing: removing and installing printed circuit boards

1 Local display
1.1 Latch
1.2 Ribbon cable (display module)
2 Screws of electronics compartment cover
3 Aperture for installing/removing boards
4 Power supply board
5 Amplifier board
5.1 Electrode signal cable (sensor)
5.2 Coil current cable (sensor)
5.3 Histo-ROM / S-DAT (sensor data memory)
6 I/O board

Wall-mount housing: removing and installing printed circuit boards → 55

Warning!
- Risk of electric shock!
  Exposed components carry dangerous voltages. Make sure that the power supply is switched off before you remove the cover of the electronics compartment.
- Risk of damaging electronic components (ESD protection). Static electricity can damage electronic components or impair their operability. Use a workplace with a grounded working surface purpose-built for electrostatically sensitive devices!
- If you cannot guarantee that the dielectric strength of the device is maintained in the following steps, then an appropriate inspection must be carried out in accordance with the manufacturer's specifications.
- When connecting Ex-certified devices, see the notes and diagrams in the Ex-specific supplement to these Operating Instructions.

Caution!
Use only original Endress+Hauser parts.

1. Switch off power supply.
2. Remove the screws and open the hinged cover (1) of the housing. Remove screws of the electronics module (2).
3. Then push up electronics module and pull it as far as possible out of the wall-mounted housing.
4. Disconnect the following cable plugs from amplifier board (7):
   – Electrode signal cable plug (7.1) including S-DAT (7.3).
   – Plug of coil current cable (7.2). To do so, loosen the plug locking of the coil current cable and gently disconnect the plug from the board, i.e. without moving it to and fro.
   – Ribbon cable plug (3) of the display module.
5. Remove the screws and remove the cover (4) from the electronics compartment.
6. Remove the boards (6, 7, 8): Insert a suitable tool into the hole (5) provided for the purpose and pull the board clear of its holder.
7. Installation is the reverse of the removal procedure.

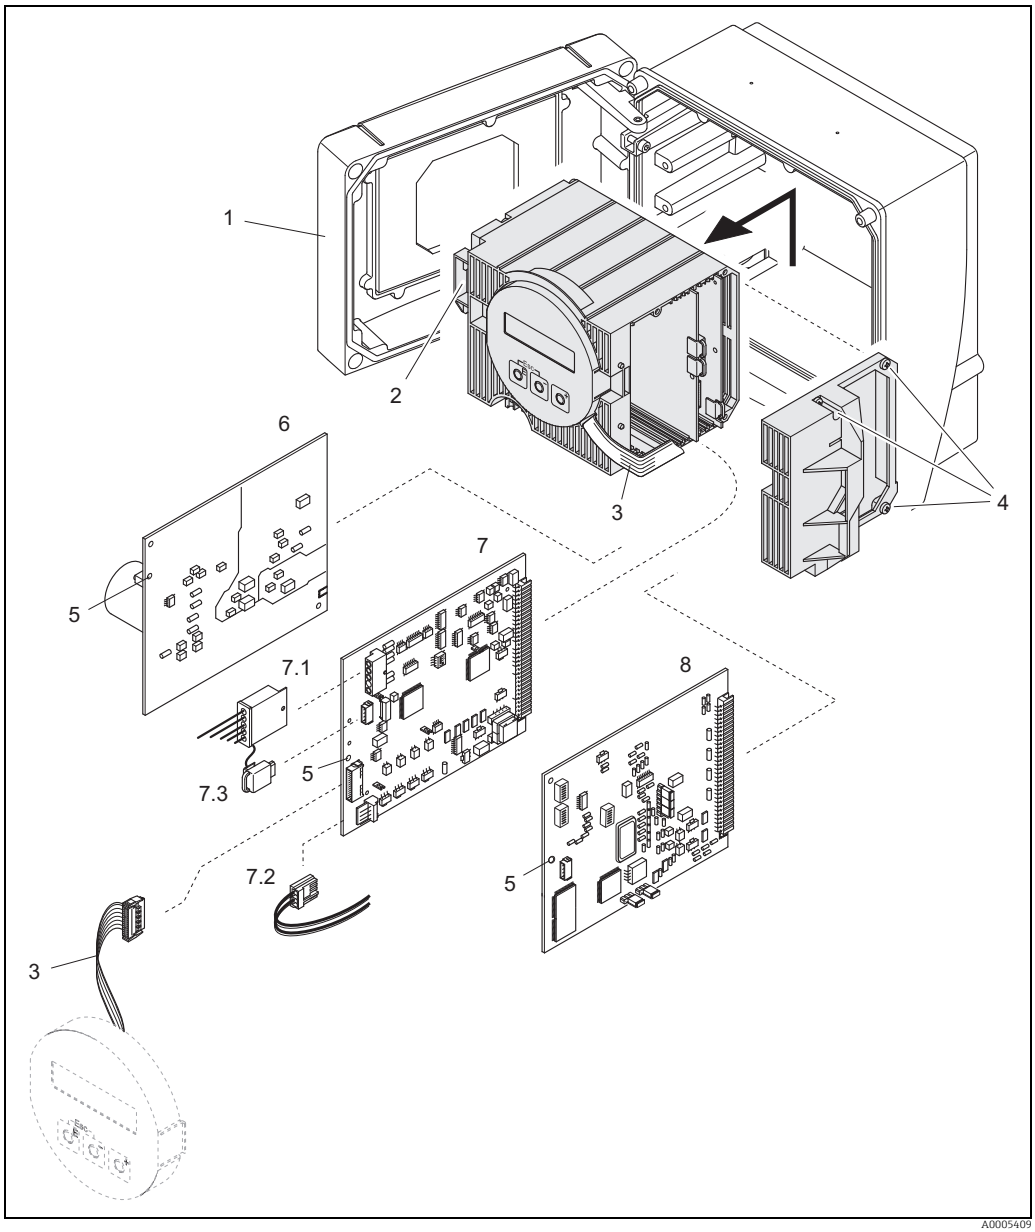

Fig. 55: Wall-mount housing: removing and installing printed circuit boards

7.2 Coil current cable (sensor)
7.3 Histo-ROM / S-DAT (sensor data memory)
8 I/O board

9.6.2 Replacing the device fuse

Warning!
Risk of electric shock! Exposed components carry dangerous voltages. Make sure that the power supply is switched off before you remove the cover of the electronics compartment.

The main fuse is on the power supply board (→ 56).
The procedure for replacing the fuse is as follows:

1. Switch off power supply.
2. Remove the power supply board: field housing → 90, wall-mount housing → 92
3. Remove cap (1) and replace the device fuse (2).
   Use only fuses of the following type:
   – Power supply 20 to 55 V AC / 16 to 62 V DC → 2.0 A slow-blow / 250 V; 5.2 × 20 mm
   – Power supply 85 to 260 V AC → 0.8 A slow-blow / 250 V; 5.2 × 20 mm
   – Ex-rated devices → see the Ex documentation.
4. Installation is the reverse of the removal procedure.

Caution!
Use only original Endress+Hauser parts.

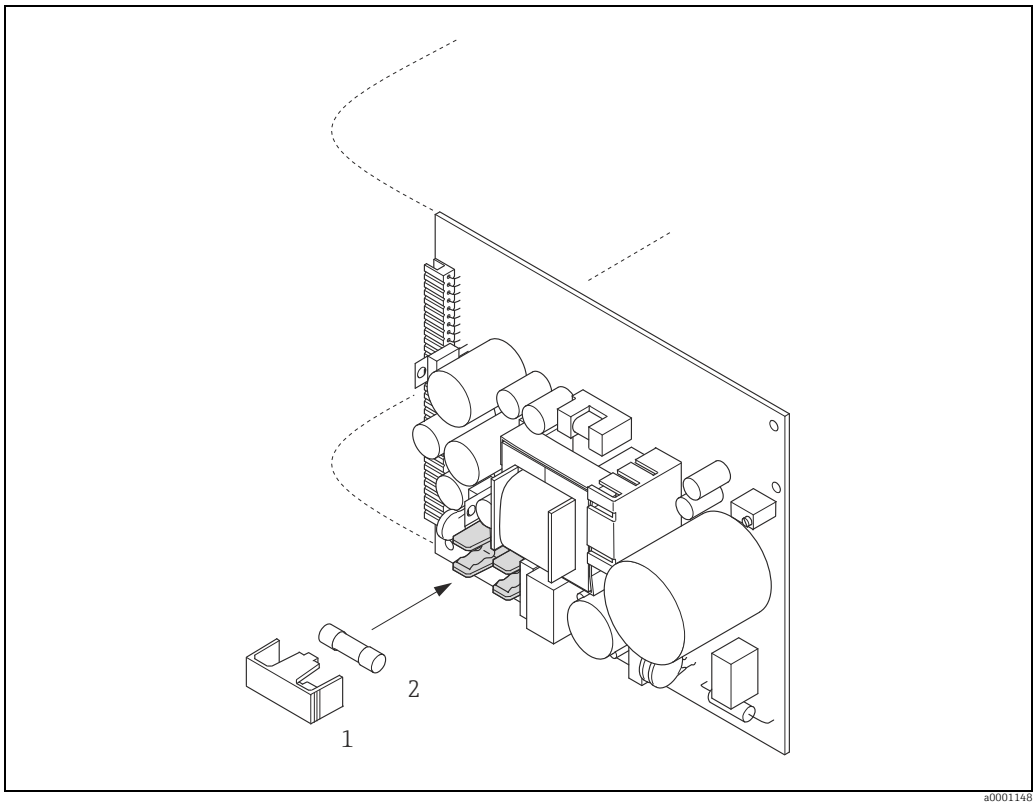

Fig. 56: Replacing the device fuse on the power supply board

1 Protective cap
2 Device fuse

9.6.3 Replacing the exchangeable electrode

The Promag W sensor (DN 350 to 2000 / 14 to 78") is available with exchangeable measuring electrodes as an option. This design permits the measuring electrodes to be replaced or cleaned under process conditions.

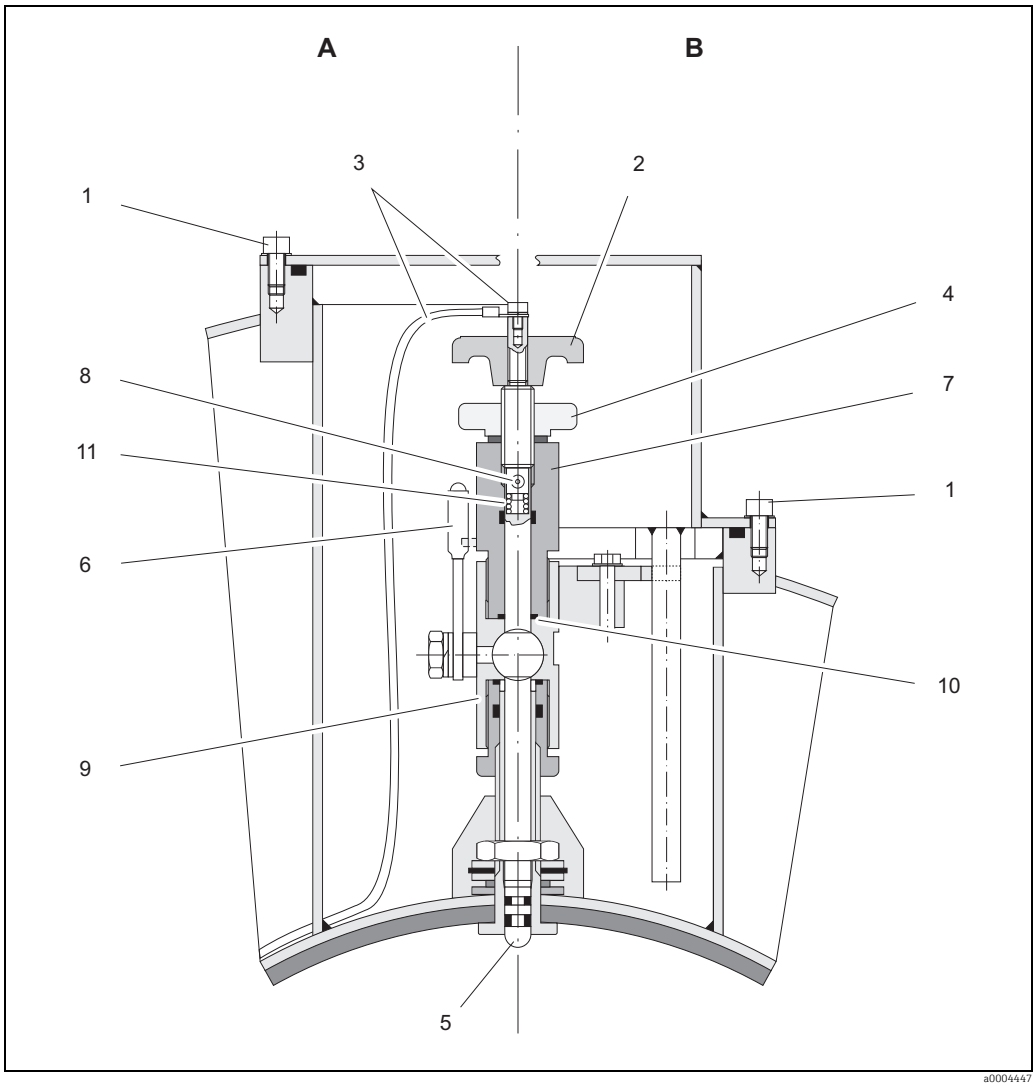

Fig. 57: Apparatus for replacing exchangeable measuring electrodes

View A = DN 1200 to 2000 (48 to 78")

View B = DN 350 to 1050 (14 to 42")

1 Allen screw
2 Handle
3 Electrode cable
4 Knurled nut (locknut)
5 Measuring electrode
6 Stop cock (ball valve)
7 Retaining cylinder
8 Locking pin (for handle)
9 Ball-valve housing
10 Seal (retaining cylinder)
11 Coil spring

Removing the electrode	Installing the electrode
1 Loosen Allen screw (1) and remove the cover.	1 Insert new electrode (5) into retaining cylinder (7) from below. Make sure that the seals at the tip of the electrode are clean.
2 Remove electrode cable (3) secured to handle (2).	2 Mount handle (2) on the electrode and insert locking pin (8) to secure it in position. Caution! Make sure that coil spring (11) is inserted. This is essential to ensure correct electrical contact and correct measuring signals.
3 Loosen knurled nut (4) by hand. This knurled nut acts as a locknut.	3 Pull the electrode back until the tip of the electrode no longer protrudes from retaining cylinder (7).
4 Remove electrode (5) by turning handle (2). The electrode can now be pulled out of retaining cylinder (7) as far as a defined stop. Warning! Risk of injury. Under process conditions (pressure in the piping system) the electrode can recoil suddenly against its stop. Apply counter-pressure while releasing the electrode.	4 Screw the retaining cylinder (7) onto ball-valve housing (9) and tighten it by hand. Seal (10) on the cylinder must be correctly seated and clean. Note! Make sure that the rubber hoses on retaining cylinder (7) and stop cock (6) are of the same color (red or blue).
5 Close stop cock (6) after pulling out the electrode as far as it will go. Warning! Do not subsequently open the stop cock, in order to prevent fluid escaping.	5 Open stop cock (6) and turn handle (2) to screw the electrode all the way into the retaining cylinder.
6 Remove the electrode complete with retaining cylinder (7).	6 Screw knurled nut (4) onto the retaining cylinder. This firmly locates the electrode in position.
7 Remove handle (2) from electrode (5) by pressing out locking pin (8). Take care not to lose coil spring (11).	7 Use the Allen screw to secure electrode cable (3) to handle (2). Caution! Make sure that the machine screw securing the electrode cable is firmly tightened. This is essential to ensure correct electrical contact and correct measuring signals.
8 Remove the old electrode and insert the new electrode. Replacement electrodes can be ordered separately from Endress+Hauser.	8 Reinstall the cover and tighten Allen screw (a).

9.7 Return

Caution!
Do not return a measuring device if you are not absolutely certain that all traces of hazardous substances have been removed, e.g. substances which have penetrated crevices or diffused through plastic.
Costs incurred for waste disposal and injury (burns, etc.) due to inadequate cleaning will be charged to the owner-operator.

The following steps must be taken before returning a flow measuring device to Endress+Hauser, e.g. for repair or calibration:
- Always enclose a duly completed "Declaration of contamination" form. Only then can Endress+Hauser transport, examine and repair a returned device.
- Enclose special handling instructions if necessary, for example a safety data sheet as per EC REACH Regulation No. 1907/2006.
- Remove all residues. Pay special attention to the grooves for seals and crevices which could contain residues. This is particularly important if the substance is hazardous to health, e.g. flammable, toxic, caustic, carcinogenic, etc.

Note!
You will find a preprinted "Declaration of contamination" form at the back of these Operating Instructions.

9.8 Disposal

Observe the regulations applicable in your country!

9.9 Software history

Note!
Uploads or downloads between the individual software versions are only possible with a special service software.

10 Technical data

10.1 Technical data at a glance

10.1.1 Application

→ 🖹 4

10.1.2 Function and system design

Measuring principle

Electromagnetic flow measurement on the basis of Faraday's Law.

Measuring system

→ 🖹 6

10.1.3 Input

Measured variable

Flow velocity (proportional to induced voltage)

Measuring range

Typically v = 0.01 to 10 m/s (0.033 to 33 ft/s) with the specified accuracy

Operable flow range

Over 1000 : 1

Input signal

Status input (auxiliary input)

- Galvanically isolated
- U = 3 to 30 V DC
- Ri = 5 kΩ
- Can be configured for: totalizer reset, positive zero return, error message reset.

10.1.4 Output

Output signal

Current output

- Galvanically isolated
- Active/passive can be selected:
  - Active: 0/4 to 20 mA, R_L < 700 Ω (HART: $R_L \geq 250$ Ω)
  - Passive: 4 to 20 mA, supply voltage V_S 18 to 30 V DC, $R_i \geq 150$ Ω)
- Time constant can be selected (0.01 to 100s)
- Full scale value adjustable
- Temperature coefficient: typ. 0.005% o.f.s./°C, resolution: 0.5 µA

o.f.s. = of full scale value

Pulse/frequency output

- Galvanically isolated
- Passive: 30 V DC / 250 mA
- Open collector
- Can be configured as:
  - Pulse output
    Pulse value and pulse polarity can be selected, max. pulse width adjustable (0.5 to 2000 ms)
  - Frequency output
    Full scale frequency 2 to 1000 Hz (f_{max} = 1.25 Hz), on/off ratio 1:1, pulse width max. 10 s

Signal on alarm

Current output

Failsafe mode can be selected (e.g. in accordance with NAMUR Recommendation NE 43)

Pulse/frequency output

Failsafe mode can be selected

Status output

"Not conductive" in the event of fault or power supply failure

Load

See "Output signal"

Switching output

Status output

- Galvanically isolated
- Max. 30 V DC/250 mA
- Open collector
- Can be configured for: error messages, empty pipe detection (EPD), flow direction, limit values

Low flow cut off

Low flow cut off, switch-on point can be selected as required

Galvanic isolation

All circuits for inputs, outputs, and power supply are galvanically isolated from each other.

10.1.5 Power supply

Electrical connections

→ 📄 47

Supply voltage (power supply)

- 20 to 55 V AC, 45 to 65 Hz
- 85 to 260 V AC, 45 to 65 Hz
- 16 to 62 V DC

Cable entry

Power supply and signal cables (inputs/outputs):

- Cable entry M20 × 1.5 (8 to 12 mm/0.31 to 0.47 inch)
- Sensor cable entry for armored cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63 inch)
- Threads for cable entries ½" NPT, G ½"

Connecting cable for remote version:

- Cable entry M20 × 1.5 (8 to 12 mm/0.31 to 0.47 inch)
- Sensor cable entry for armored cables M20 × 1.5 (9.5 to 16 mm / 0.37 to 0.63 inch)
- Threads for cable entries ½" NPT, G ½"

Cable specifications

→ 🖹 52

Power consumption

Power consumption

- AC: <15 VA (incl. sensor)
- DC: <15 W (incl. sensor)

Switch-on current

- max. 8.5 A (< 50 ms) for 24 V DC
- max. 3 A (< 5 ms) for 260 V AC

Power supply failure

- Lasting min. 1 cycle frequency:
- EEPROM saves measuring system data
- S-DAT: exchangeable data storage chip which stores the data of the sensor (nominal diameter, serial number, calibration factor, zero point etc.)

Potential equalization

→ 🖹 56

10.1.6 Performance characteristics

Reference operating conditions

To DIN EN 29104 and VDI/VDE 2641:

- Fluid temperature: +28 ± 2 °C (+82 ± 4 °F)
- Ambient temperature: +22 ± 2 °C (+72 ± 4 °F)
- Warm-up period: 30 minutes

Installation:

- Inlet run >10 × DN
- Outlet run > 5 × DN
- Sensor and transmitter grounded.
- The sensor is centered in the pipe.

Maximum measured error

- Current output: plus typically ± 5 µA
- Pulse output: ± 0.5% o.r. ± 1 mm/s
  Option: ± 0.2% o.r. ± 2 mm/s (o.r. = of reading)

Fluctuations in the supply voltage do not have any effect within the specified range.

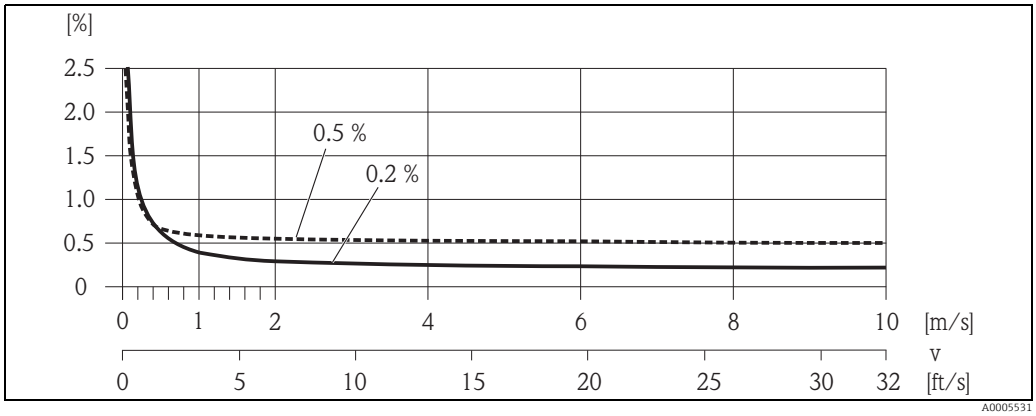

Fig. 58: Max. measured error in % of reading

Repeatability

Max. ± 0.1% o.r. ± 0.5 mm/s (o.r. = of reading)

10.1.7 Installation

Installation instructions

Any orientation (vertical, horizontal), restrictions and installation instructions → 12

Inlet and outlet run

If possible, install the sensor upstream from fittings such as valves, T-pieces, elbows, etc. The following inlet and outlet runs must be observed in order to meet accuracy specifications (→ 15, → 12):

- Inlet run: ≥ 5 × DN
- Outlet run: ≥ 2 × DN

Adapters

→ 16

Length of connecting cable

→ 19

10.1.8 Environment

Ambient temperature range

- Transmitter: −20 to +60 °C (−4 to +140 °F)

  Note!
  At ambient temperatures below −20 (−4 °F) the readability of the display may be impaired.
- Sensor (Flange material carbon steel): −10 to +60 °C (+14 to +140 °F)

Caution!
- The permitted temperature range of the measuring tube lining may not be undershot or overshot (→ "Operating conditions: Process" → "Medium temperature range").
- Install the device in a shady location. Avoid direct sunlight, particularly in warm climatic regions.
- The transmitter must be mounted separate from the sensor if both the ambient and fluid temperatures are high.

Storage temperature

The storage temperature corresponds to the operating temperature range of the measuring transmitter and the appropriate measuring sensors.

Caution!
- The measuring device must be protected against direct sunlight during storage in order to avoid unacceptably high surface temperatures.
- A storage location must be selected where moisture does not collect in the measuring device. This will help prevent fungus and bacteria infestation which can damage the liner.

Degree of protection

- Standard: IP 67 (NEMA 4X) for transmitter and sensor
- Optional: IP 68 (NEMA 6P) for remote version of Promag E/L/P/W sensor. Promag L only with stainless steel flanges.

Shock and vibration resistance

Acceleration up to 2 g following IEC 60068-2-6
(high-temperature version: no data available)

CIP cleaning

Caution!
The maximum fluid temperature permitted for the device may not be exceeded.

CIP cleaning is possible:
Promag E (100 °C / 212 °F), Promag H/P

CIP cleaning is not possible:
Promag D/L/W

SIP cleaning

Caution!
The maximum fluid temperature permitted for the device may not be exceeded.

SIP cleaning is possible:
Promag H

SIP cleaning is not possible:
Promag D/E/L/P/W

Electromagnetic compatibility (EMC)

- As per IEC/EN 61326 and NAMUR Recommendation NE 21
- Emission: to limit value for industry EN 55011

10.1.9 Process

Medium temperature range

The permissible temperature depends on the lining of the measuring tube

Promag D

0 to +60 °C (+32 to +140 °F) for polyamide

Promag E

−10 to +110 °C (+14 to +230 °F) for PTFE,
Restrictions → see the following diagram

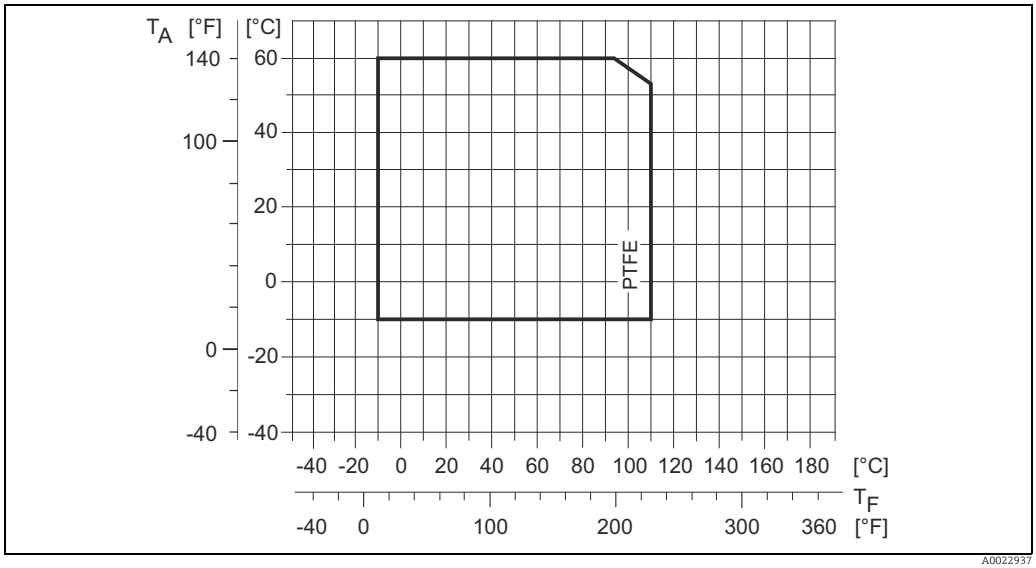

Fig. 59: Compact and remote version Promag E (TA = ambient temperature; TF = fluid temperature)

Promag H

Sensor:
- DN 2 to 25 (1/12 to 1"): −20 to +150 °C (−4 to +302 °F)
- DN 40 to 100 (1 ½ to 4"): −20 to +150 °C (−4 to +302 °F)

Seals:
- EPDM: −20 to +150 °C (−4 to +302 °F)
- Silicone (VMQ): −20 to +150 °C (−4 to +302 °F)
- Viton (FKM): −20 to +150 °C (−4 to +302 °F)
- Kalrez: −20 to +150 °C (−4 to +302 °F)

Promag L

- 0 to +80 °C (+32 to +176 °F) for hard rubber (DN 350 to 2400 / 14 to 90")
- −20 to +50 °C (−4 to +122 °F) for polyurethane (DN 25 to 1200 / 1 to 48")
- −20 to +90 °C (−4 to +194 °F) for PTFE (DN 25 to 300 / 1 to 12")

Promag P

Standard
- −40 to +130 °C (−40 to +266 °F) for PTFE (DN 15 to 600 / ½ to 24"),
  Restrictions → see the following diagrams
- −20 to +130 °C (−4 to +266 °F) for PFA/HE (DN 25 to 200 / 1 to 8"),
  Restrictions → see the following diagrams
- −20 to +150 °C (−4 to +302 °F) for PFA (DN 25 to 200 / 1 to 8"),
  Restrictions → see the following diagrams

Optional
High-temperature version (HT): −20 to +180 °C (−4 to +356 °F) for PFA (DN 25 to 200 / 1 to 8")

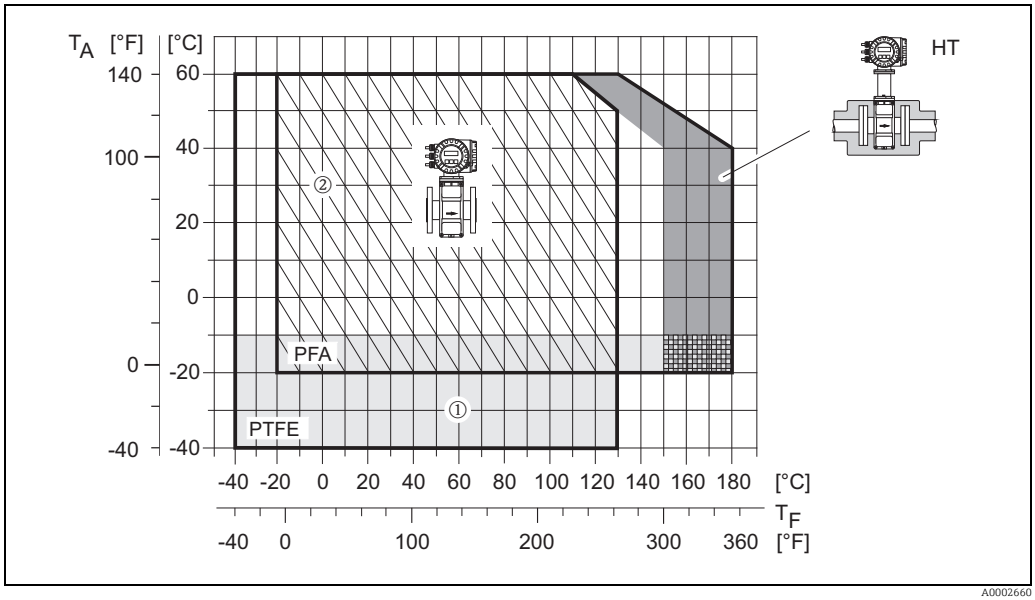

Abb. 60: Compact version Promag P (with PFA- or PTFE-lining)

TA = ambient temperature; TF = fluid temperature; HT = high-temperature version with insulation
m = light gray area → temperature range from −10 to −40 °C (−14 to −40 °F) is valid for stainless steel version only
n = diagonal hatched area → foam lining (HE) and degree of protection IP 68 = fluid temperature max. 130°C / 266 °F

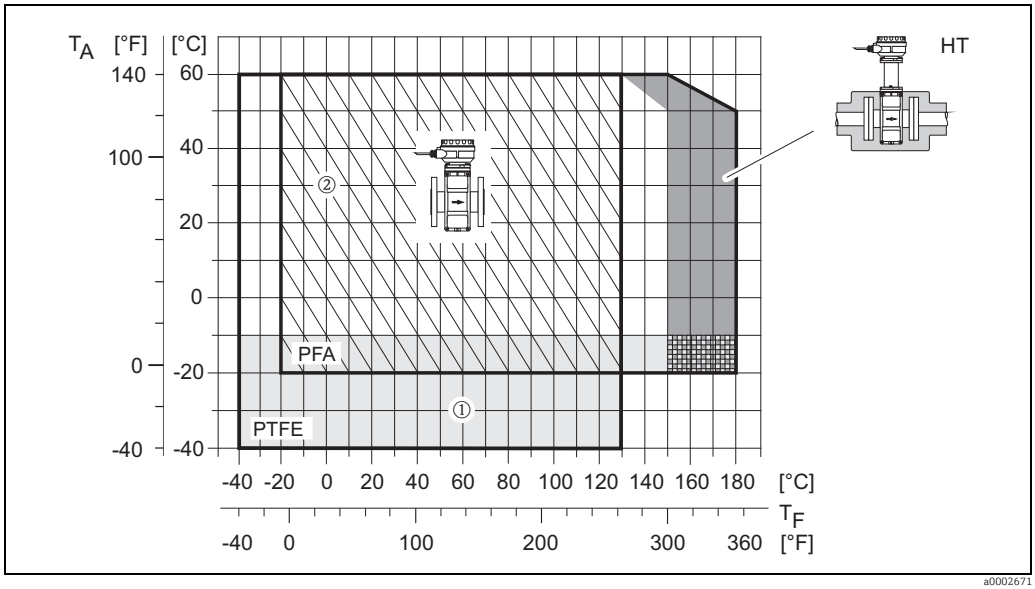

Abb. 61: Remote version Promag P (with PFA- or PTFE-lining)

TA = ambient temperature; TF = fluid temperature; HT = high-temperature version with insulation
m = light gray area → temperature range from −10 to −40 °C (−14 to −40 °F) is valid for stainless steel version only
n = diagonal hatched area → foam lining (HE) and degree of protection IP68 = fluid temperature max. 130°C / 266 °F

Promag W

- 0 to +80 °C (+32 to +176 °F) for hard rubber (DN 50 to 2000 / 2 to 78")
- −20 to +50 °C (−4 to +122 °F) for polyurethane (DN 25 to 1200 / 1 to 48")

Conductivity

The minimum conductivity is ≥ 5 µS/cm (≥ 20 µS/cm for demineralized water)

Note!
Note that in the case of the remote version, the requisite minimum conductivity is also influenced by the length of the connecting cable → 🖹 19

Medium pressure range (nominal pressure)

Promag D

- EN 1092-1 (DIN 2501)
  - PN 16
- ASME B 16.5
  - Class 150
- JIS B2220
  - 10K

Promag E

- EN 1092-1 (DIN 2501)
  - PN 10 (DN 200 to 600 / 8 to 24")
  - PN 16 (DN 65 to 600 / 3 to 24")
  - PN 40 (DN 15 to 150 / ½ to 2")
- ASME B 16.5
  - Class 150 (½ to 24")
- JIS B2220
  - 10K (DN 50 to 300 / 2 to 12")
  - 20K (DN 15 to 40 / ½ to 1½")

Promag H

The permissible nominal pressure depends on the process connection and the seal:
- PN 16, PN 40, Class 150, 10 K → Welding nipple, couplings, flanges, hose connection, adhesive fitting (with O-ring seal)
- PN 16 → Welding nipple, couplings, clamp, flange (with aseptic gasket seal)

Promag L

- EN 1092-1 (DIN 2501)
  - PN 6 (DN 350 to 2400 / 14 to 90")
  - PN 10 (DN 200 to 2400 / 8 to 90")
  - PN 16 (DN 25 to 300 / 1 to 12")
- EN 1092-1, lap joint flange, stampel plate
  - PN 10 (DN 25 to 300 / 1 to 12")
- ASME B16.5
  - Class 150 (1 to 24")
- AWWA
  - Class D (28 to 90")
- AS2129
  - Table E (350 to 1200 / 14 to 48")
- AS4087
  - PN 16 (350 to 1200 / 14 to 48")

Promag P

- EN 1092-1 (DIN 2501)
  - PN 10 (DN 200 to 600 / 8 to 24")
  - PN 16 (DN 65 to 600 / 3 to 24")
  - PN 25 (DN 200 to 600 / 8 to 24")
  - PN 40 (DN 25 to 150 / 1 to 6")

- ASME B 16.5
  - Class 150 (1 to 24")
  - Class 300 (1 to 6")
- JIS B2220

Limiting flow

→ 🖹 17

Pressure loss

- No pressure loss if the sensor is installed in a pipe of the same nominal diameter (Promag H: only DN 8 and larger).
- Pressure losses for configurations incorporating adapters according to DIN EN 545 (see "Adapters" → 🖹 16)

10.1.10 Mechanical construction

Design, dimensions

The dimensions and installation lengths of the sensor and transmitter can be found in the "Technical Information" for the device in question. This document can be downloaded as a PDF file from www.endress.com. A list of the "Technical Information" documents available is provided in the "Documentation" section on → 🖹 127.

Transmitter Promag (compact version): 7.5 lbs (Weight data valid for standard pressure ratings and without packaging material)						

Material

Promag D

- Transmitter housing: powder-coated die-cast aluminum
- Sensor housing: powder-coated die-cast aluminum
- Measuring tube: polyamide, O-rings EPDM
  (Drinking water approvals: WRAS BS 6920, ACS, NSF 61, KTW/W270)
- Electrodes: 1.4435 (316, 316L)
- Ground disks: 1.4301 (304)

Promag E

- Transmitter housing
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mount housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 25 to 300 (1 to 12"): powder-coated die-cast aluminum
  - DN 350 to 600 (14 to 24"): with protective lacquering
- Measuring tube
  - DN ≤ 300 (12"): stainless steel 1.4301 (304) or 1.4306 (304L) (with Al/Zn protective coating)
  - DN ≥ 350 (14"): stainless steel 1.4301 (304) or 1.4306 (304L) (with protective lacquering)
- Electrodes: 1.4435 (316, 316L), Alloy C22, Tantalum
- Flanges (with protective lacquering)
  - EN 1092-1 (DIN2501): RSt37-2 (S235JRG2); Alloy C22; Fe 410W B
  - ANSI: A105
  - JIS: RSt37-2 (S235JRG2); HII
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435 (316, 316L) or Alloy C22

Promag H

- Transmitter housing:
  - Compact housing: powder-coated die-cast aluminum
    or stainless steel field housing (1.4301 (316L))
  - Wall-mounted housing: powder-coated die-cast aluminum
  - Window material: glas or polycarbonate
- Sensor housing: stainless steel 1.4301 (304)
- Wall mounting kit: stainless steel 1.4301 (304)
- Measuring tube: stainless steel 1.4301 (304)
- Liner: PFA (USP class VI; FDA 21 CFR 177.1550: 3A)
- Electrodes:
  - Standard: 1.4435 (316, 316L)
  - Option: Alloy C22, Tantalum, Platinum
- Flange:
  - All connections stainless-steel 1.4404 (316L)
  - EN (DIN), ASME, JIS made of PVDF
  - Adhesive fitting made of PVC
- Seals
  - DN 2 to 25 (1/12 to 1"): O-ring (EPDM, Viton, Kalrez), gasket seal (EPDM*, Viton, Silicone*)
  - DN 40 to 100 (1½ to 4"): gasket seal (EPDM*, Silicone*)
    * = USP class VI; FDA 21 CFR 177.2600: 3A
- Ground rings: 1.4435 (316, 316L) (optional: Tantalum, Alloy C22)

Promag L

- Transmitter housing:
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mounted housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 25 to 300 (1 to 12"): powder-coated die-cast aluminum
  - DN 350 to 1200 (14 to 48"): with protective lacquering

- Measuring tube:
  - DN ≤ 300 (12"); stainless steel 1.4301 (304) or 1.4306 (304L)
  - DN ≥ 350 (14"); stainless steel 202 or 304
- Electrodes: 1.4435 (316, 316L), Alloy C22
- Flange
  - EN 1092-1 (DIN 2501): DN ≤ 300: 1.4306; 1.4307; 1.4301 (304); 1.0038 (S235JRG2)
  - EN 1092-1 (DIN 2501): DN ≥ 350: A105; 1.0038 (S235JRG2)
  - AWWA: A181/A105; 1.0425 (316L) (P265GH); 1.0044 (S275JR)
  - AS 2129: A105; 1.0345 (P235GH); 1.0425 (316L) (P265GH); 1.0038 (S235JRG2); FE 410 WB
  - AS 4087: A105; 1.0425 (316L) (P265GH); 1.0044 (S275JR)
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435 (316, 316L) or Alloy C22

Promag P

- Transmitter housing:
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mounted housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 15 to 300 (½ to 12"): powder-coated die-cast aluminum
  - DN 350 to 2000 (14 to 84"): with protective lacquering
- Measuring tube
  - DN ≤ 300 (12"): stainless steel 1.4301 (304) or 1.4306 (304L); for flanges made of carbon steel with Al/Zn protective coating
  - DN ≥ 350 (14"): stainless steel 1.4301 (304) or 1.4306 (304L); for flanges made of carbon steel with Al/Zn protective coating
- Electrodes: 1.4435 (316, 316L), Platinum, Alloy C22, Tantalum, Titanium
- Flange
  - EN 1092-1 (DIN2501): 1.4571 (316L); RSt37-2 (S235JRG2); Alloy C22; FE 410W B (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - ASME: A105; F316L (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AWWA: 1.0425
  - JIS: RSt37-2 (S235JRG2); HII; 1.0425 (316L) (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AS 2129
    - DN 25 (1"): A105 or RSt37-2 (S235JRG2)
    - DN 40 (1½"): A105 or St44-2 (S275JR)
  - AS 4087: A105 or St44-2 (S275JR)
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435 (316, 316L) or Alloy C22

Promag W

- Transmitter housing:
  - Compact housing: powder-coated die-cast aluminum
  - Wall-mounted housing: powder-coated die-cast aluminum
- Sensor housing
  - DN 25 to 300 (1 to 12"): powder-coated die-cast aluminum
  - DN 350 to 2000 (14 to 84"): with protective lacquering

- Measuring tube
  - DN ≤ 300 (12"): stainless steel 1.4301 (304) or 1.4306 (304L)
    (for flanges made of carbon steel with Al/Zn protective coating)
  - DN ≥ 350 (14"): stainless steel 1.4301 (304) or 1.4306 (304)
    (for flanges made of carbon steel with protective lacquering)
- Electrodes: 1.4435 (316, 316L) or Alloy C22, Tantalum
- Flange
  - EN 1092-1 (DIN2501): 1.4571 (316L); RSt37-2 (S235JRG2); Alloy C22; FE 410 WB
    (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - ASME: A105; F316L
    (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AWWA: 1.0425
  - JIS: RSt37-2 (S235JRG2); HII; 1.0425 (316L)
    (DN ≤ 300 (12") with Al/Zn protective coating; DN ≥ 350 (14") with protective lacquering)
  - AS 2129
    - DN 150 to 300 (6 to 12"), DN 600 (24"): A105 or RSt37-2 (S235JRG2)
    - DN 80 to 100 (3 to 4"), 350 to 500 (14 to 20"): A105 or St44-2 (S275JR)
  - AS 4087: A105 or St44-2 (S275JR)
- Seals: to DIN EN 1514-1
- Ground disks: 1.4435 (316, 316L), Alloy C22, Titanium, Tantalum

Pressure-temperature ratings

The material load diagrams (pressure-temperature graphs) for the process connections are to be found in the "Technical Information" documents of the device in question:
List of supplementary documentation → 🖹 127.

Fitted electrodes

Promag D

- 2 measuring electrodes for signal detection

Promag E/L/P/W

- 2 measuring electrodes for signal detection
- 1 EPD electrode for empty pipe detection
- 1 reference electrode for potential equalization

Promag H

- 2 measuring electrodes for signal detection
- 1 EPD electrode for empty pipe detection (apart from DN 2 to 15)

Process connections

Promag D

Wafer version → without process connections

Promag E

Flange connections:
- EN 1092-1 (DIN 2501)
  - DN ≤ 300 (12") = form A
  - DN ≥ 350 (14") = flat face
  - DN 65 PN 16 and DN 600 PN 16 only as per EN 1092-1
- ASME
- JIS

Promag H

With O-ring:
- Weld nipple DIN (EN), ISO 1127, ODT/SMS
- Flange EN (DIN), ASME, JIS
- Flange made of PVDF EN (DIN), ASME, JIS
- External thread
- Internal thread
- Hose connection
- PVC adhesive fitting

With gasket seal:
- Weld nipple DIN 11850, ODT/SMS
- Clamp ISO 2852, DIN 32676, L14 AM7
- Threaded joint DIN 11851, DIN 11864-1, ISO 2853, SMS 1145
- Flange DIN 11864-2

Promag L

Flange connection:
- EN 1092-1 (DIN 2501)
  - DN ≤ 300 (12") = form A
  - DN ≥ 350 (14") = form B
- ASME B16.5
- AWWA C207
- AS

Promag P/W

Flange connections:
- EN 1092-1 (DIN 2501)
  - DN ≤ 300 = form A
  - DN ≥ 350 = flat face
  - DN 65 PN 16 and DN 600 PN 16 only as per EN 1092-1
- ASME
- AWWA (only Promag W)
- JIS
- AS

Surface roughness

All data relate to parts in contact with fluid.

- Liner → PFA: ≤ 0.4 µm (15 µin)
- Electrodes: 0.3 to 0.5 µm (12 to 20 µin)
- Process connection made of stainless-steel (Promag H):
  - with O-ring seal: ≤ 1.6 µm (63 µin)
  - with aseptic gasket seal: ≤ 0.8 µm (31.5 µin)
  - optional: ≤ 0.38 µm (15 µin)

10.1.11 Human interface

Display elements

- Liquid crystal display: illuminated, two-line, 16 characters per line
- Custom configurations for presenting different measured-value and status variables
- 2 totalizers

Note!
At ambient temperatures below −20 (−4 °F) the readability of the display may be impaired.

Operating elements

- Local operation with three keys (⊖⊕Ⓔ)
- "Quick Setup" menus for straightforward commissioning

Language groups

Language groups available for operation in different countries:
- Western Europe and America (WEA):
  English, German, Spanish, Italian, French, Dutch and Portuguese
- Eastern Europe/Scandinavia (EES):
  English, Russian, Polish, Norwegian, Finnish, Swedish and Czech
- Southeast Asia (SEA):
  English, Japanese, Indonesian

Note!
You can change the language group via the operating program "FieldCare".

Remote operation

Operation via HART protocol and Fieldtool

10.1.12 Certificates and approvals

CE mark

The measuring system is in conformity with the statutory requirements of the EC Directives. Endress+Hauser confirms successful testing of the device by affixing to it the CE mark.

C-tick mark

The measuring system meets the EMC requirements of the "Australian Communications and Media Authority (ACMA)".

Ex approval

Information about currently available Ex versions (ATEX, FM, CSA, IECEx, NEPSI etc.) can be supplied by your Endress+Hauser Sales Center on request. All explosion protection data are given in a separate documentation which is available upon request.

Sanitary compatibility

Promag D/E/L/P/W

No applicable approvals or certification

Promag H

- 3A authorization and EHEDG-certified
- Seals: in conformity with FDA (except Kalrez seals)

Drinking water approval

Promag D/L/W

- WRAS BS 6920
- ACS
- NSF 61
- KTW/W270

Promag E/H/P

No drinking water approval

Pressure Equipment Directive

Promag D/L

No pressure measuring device approval

Promag E/H/P/W

The devices can be ordered with or without a PED approval. If a device with a PED approval is required, this must be explicitly stated in the order. For devices with nominal diameters less than or equal to DN 25 (1"), this is neither possible nor necessary.

- With the PED/G1/x (x = category) marking on the sensor nameplate, Endress+Hauser confirms compliance with the "Essential Safety Requirements" specified in Annex I of the Pressure Equipment Directive 97/23/EC.
- Devices bearing this marking (PED) are suitable for the following types of medium: Media in Group 1 and 2 with a vapor pressure greater than, or smaller and equal to 0.5 bar (7.3 psi)
- Devices not bearing this marking (PED) are designed and manufactured according to good engineering practice. They meet the requirements of Art.3 Section 3 of the Pressure Equipment Directive 97/23/EC. The range of application is indicated in tables 6 to 9 in Annex II of the Pressure Equipment Directive.

Other standards and guidelines

- EN 60529
  Degrees of protection by housing (IP code).
- EN 61010-1
  Safety requirements for electrical equipment for measurement, control and laboratory use
- IEC/EN 61326
  Electromagnetic compatibility (EMC requirements)
- ASME/ISA-S82.01
  Safety Standard for Electrical and Electronic Test, Measuring, Controlling and related Equipment - General Requirements. Pollution degree 2, Installation Category II.
- CAN/CSA-C22.2 (No. 1010.1-92)
  Safety requirements for Electrical Equipment for Measurement and Control and Laboratory Use. Pollution degree 2, Installation Category I.
- NAMUR NE 21
  Electromagnetic compatibility (EMC) of industrial process and laboratory control equipment.
- NAMUR NE 43
  Standardization of the signal level for the breakdown information of digital transmitters with analog output signal.

10.1.13 Ordering information

Detailed ordering information is available from the following sources:
- In the Product Configurator on the Endress+Hauser website: www.endress.com → Select country → Instruments → Select device → Product page function: Configure this product
- From your Endress+Hauser Sales Center: www.endress.com/worldwide

Note!
Product Configurator - the tool for individual product configuration
- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly in the Endress+Hauser Online Shop

10.1.14 Accessories

Various accessories, which can be ordered separately from Endress+Hauser, are available for the transmitter and the sensor → 🖹 79.
Your Endress+Hauser service organization can provide detailed information on the specific order codes on request.

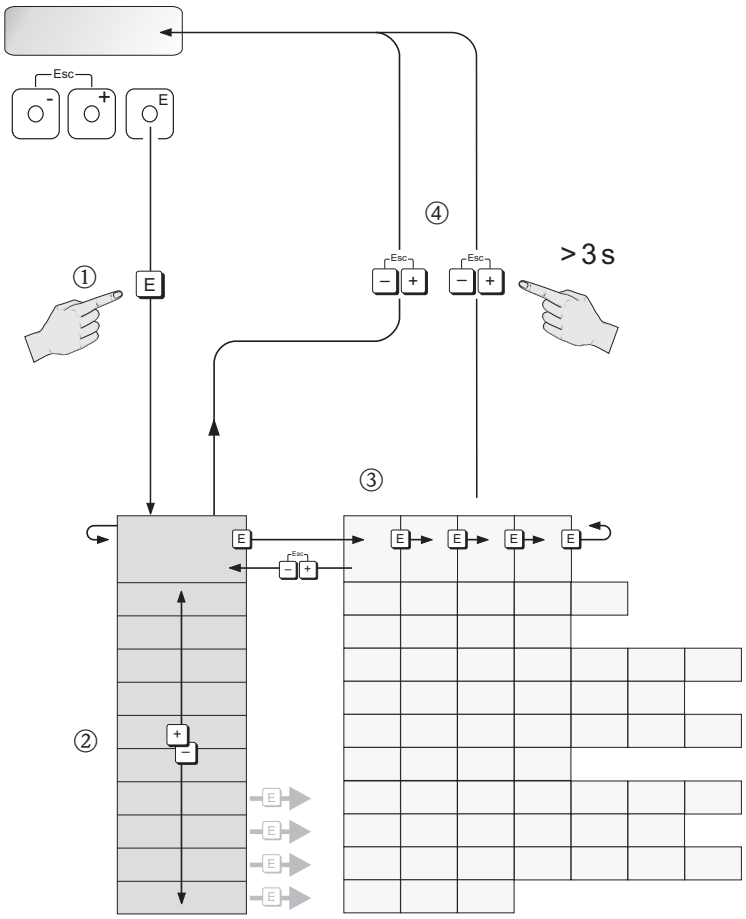
1 Function matrix Promag 50

1.1 The function matrix: layout and use

The function matrix is a two-level construct: the groups form one level and the groups' functions the other.
The groups are the highest-level grouping of the operating options for the measuring device.
A number of functions is assigned to each group.
You select a group in order to access the individual functions for operating and parameterizing the measuring device.
An overview of all the groups available is provided in the table of contents on Page 3 and in the graphical representation of the function matrix on Page 6.
An overview of all the functions available is provided on Page 6, complete with page references to the detailed function descriptions.
The descriptions of the individual functions start on Page 7.

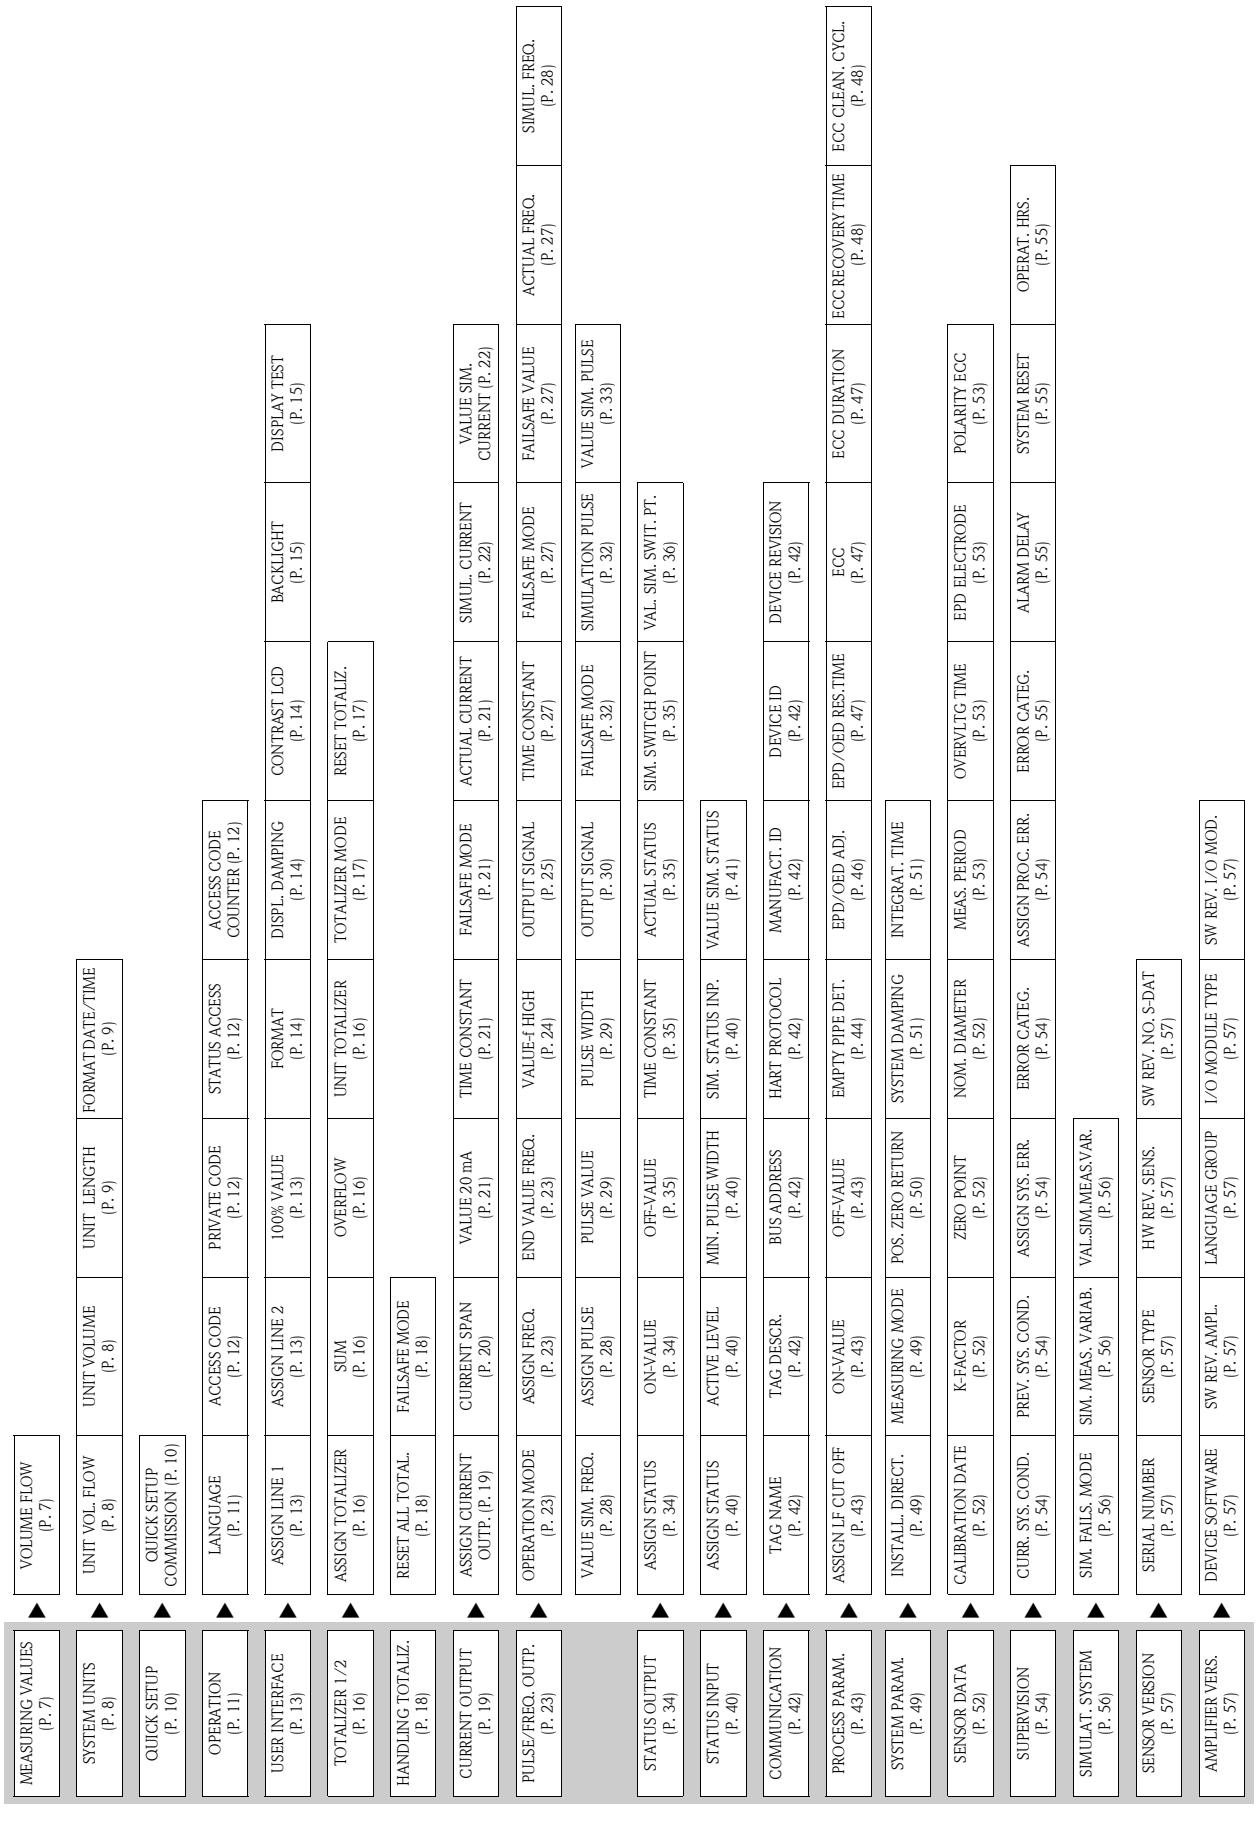
Example of how to parameterize a function (in this case changing the language for the UI):

1. Enter into the function matrix (E-key).
2. Select the OPERATION group.
3. Select the LANGUAGE function, change the setting from ENGLISH to DEUTSCH with ± and save with E (all text on the display now appears in German).
4. Exit the function matrix (ESC > 3 seconds).



A0001142

1.2 Illustration of the function matrix



2 Group MEASURING VALUES

Function description MEASURING VALUES	
✎ Note! ■ The engineering unit of the measured variable displayed here can be set in the SYSTEM UNITS group, (see Page 8). ■ If the fluid in the pipe flows backwards, a negative sign prefixes the flow reading on the display.	
VOLUME FLOW	The volume flow currently measured appears on the display. **User interface:** 5-digit floating-point number, including unit and sign (e.g. 5.5445 dm^3/min; 1.4359 m^3/h; –731.63 gal/d; etc.)

3 Group SYSTEM UNITS

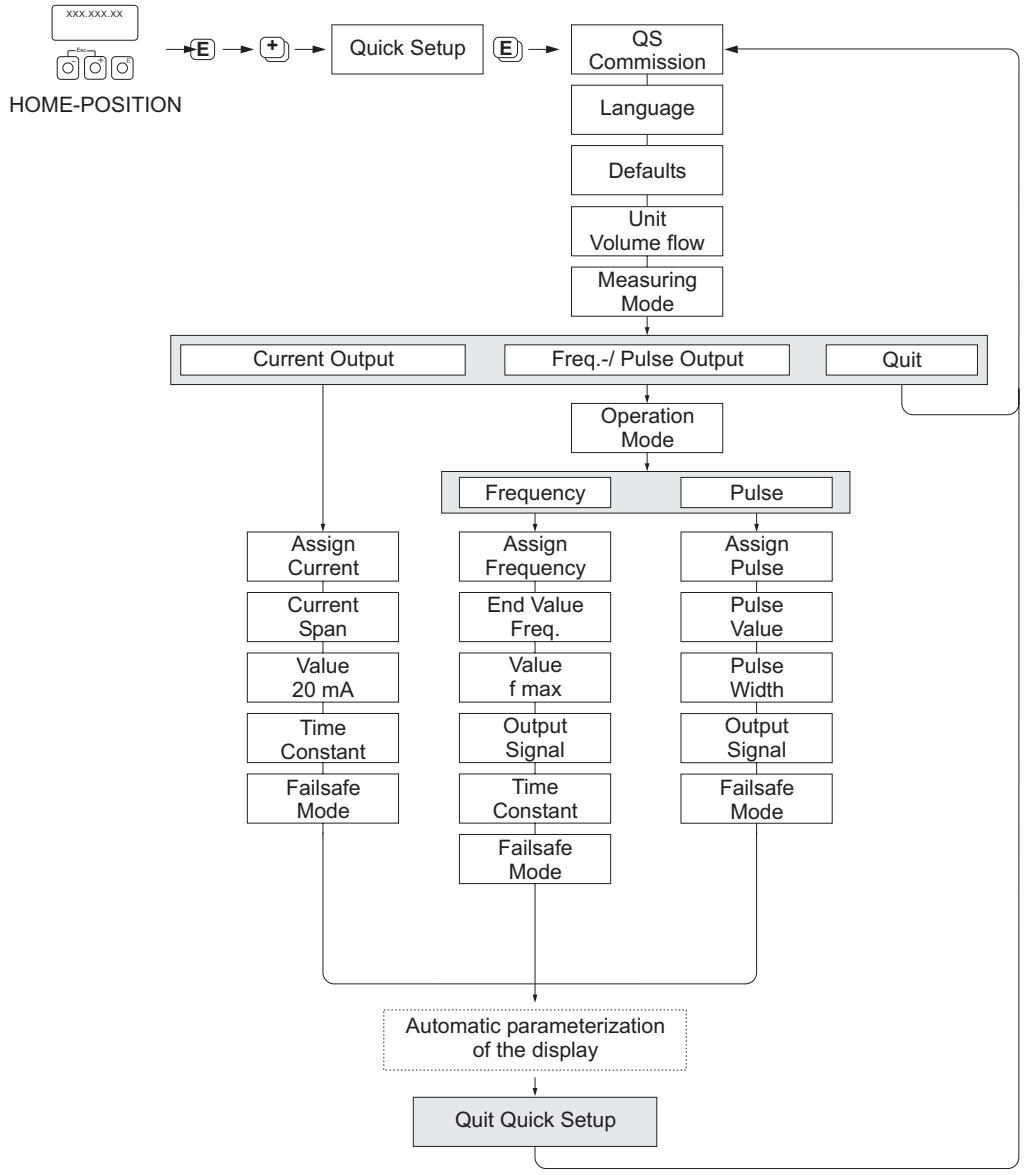
Function description SYSTEM UNITS	
Use this function group to select the unit for the measured variable.	
UNIT VOLUME FLOW	Use this function to select the unit for displaying the volume flow. The unit you select here is also valid for: ■ Current output ■ Frequency output ■ Switch points (limit value for volume flow, flow direction) ■ Low flow **Options:** Metric: Cubic centimeter → cm^3/s; cm^3/min; cm^3/h; cm^3/day Cubic decimeter → dm^3/s; dm^3/min; dm^3/h; dm^3/day Cubic meter → m^3/s; m^3/min; m^3/h; m^3/day Milliliter → ml/s; ml/min; ml/h; ml/day Liter → l/s; l/min; l/h; l/day Hectoliter → hl/s; hl/min; hl/h; hl/day Megaliter → Ml/s; Ml/min; Ml/h; Ml/day US: Cubic centimeter → cc/s; cc/min; cc/h; cc/day Acre foot → af/s; af/min; af/h; af/day Cubic foot → ft^3/s; ft^3/min; ft^3/h; ft^3/day Fluid ounce → oz f/s; oz f/min; oz f/h; oz f/day Gallon → gal/s; gal/min; gal/h; gal/day Kilo gallon → Kgal/s; Kgal/min; Kgal/h; Kgal/day Million gallon → Mgal/s; Mgal/min; Mgal/h; Mgal/day Barrel (normal fluids: 31.5 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day Barrel (beer: 31.0 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day Barrel (petrochemicals: 42.0 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day Barrel (filling tanks: 55.0 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day Imperial: Gallon → gal/s; gal/min; gal/h; gal/day Mega gallon → Mgal/s; Mgal/min; Mgal/h; Mgal/day Barrel (beer: 36.0 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day Barrel (petrochemicals: 34.97 gal/bbl) → bbl/s; bbl/min; bbl/h; bbl/day **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.).
UNIT VOLUME	Use this function to select the unit for displaying the volume. The unit you select here is also valid for: ■ Pulse weighting (e.g. m^3/p) **Options:** Metric → cm^3; dm^3; m^3; ml; l; hl; Ml Mega US → cc; af; ft^3; oz f; gal; Kgal; Mgal; bbl (normal fluids); bbl (beer); bbl (petrochemicals) → bbl (filling tanks) Imperial → gal; Mgal; bbl (beer); bbl (petrochemicals) **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.). ✎ Note! The unit of the totalizers is independent of your choice here. The unit for each totalizer is selected separately for the totalizer in question.

Function description SYSTEM UNITS	
UNIT LENGTH	Use this function to select the unit for displaying the length of the nominal diameter. The unit you select here is also valid for: ■ Nominal diameter of sensor (see function NOMINAL DIAMETER on Page 48) **Options:** MILLIMETER INCH **Factory setting:** MILLIMETER (SI units: not for USA and Canada) INCH (US units: only for USA and Canada)
FORMAT DATE/TIME	Use this function to select the format for the date and the time. The unit you select here is also valid for: Displaying the current calibration date (function CALIBRATION DATE on Seite 52) **Options:** DD.MM.YY 24H MM/DD/YY 12H A/P DD.MM.YY 12H A/P MM/DD/YY 24H **Factory setting:** DD.MM.YY 24H (SI units) MM/DD/YY 12H A/P (US units)

4 Group QUICK SETUP

Function description QUICK SETUP	
QUICK SETUP COMMISSION	Use this function to start the Quick Setup menu for commissioning. **Options:** YES NO **Factory setting:** NO

Note!
The display returns to the QUICK SETUP COMMISSION cell if you press the ESC key combination during interrogation.



a0005413-en

5 Group OPERATION

Function description OPERATION	
LANGUAGE	Use this function to select the language for all texts, parameters and messages shown on the local display. ✎ Note! The displayed options depend on the available language group shown in the LANGUAGE GROUP function. **Options:** Language group WEST EU / USA: ENGLISH DEUTSCH FRANCAIS ESPANOL ITALIANO NEDERLANDS PORTUGUESE Language group EAST EU / SCAND: ENGLISH NORSK SVENSKA SUOMI POLISH RUSSIAN CZECH Language group ASIA: ENGLISH BAHASA INDONESIA JAPANESE (Silbenschrift) **Factory setting:** Country-dependent (see Page 58 ff.) ✎ Note! ■ If you press the ⊞ keys simultaneously at startup, the language defaults to "ENGLISH". ■ You can change the language group via the configuration program FieldCare. Please do not hesitate to contact your Endress+Hauser sales office if you have any questions.

Function description OPERATION	
ACCESS CODE	All data of the measuring system are protected against inadvertent change. Programming is disabled and the settings cannot be changed until a code is entered in this function. If you press the ⊞ keys in any function, the measuring system automatically goes to this function and the prompt to enter the code appears on the display (when programming is disabled). You can enable programming by entering your personal code, (**factory setting = 50**, see function PRIVATE CODE on Page 12) **User input:** max. 4-digit number: 0...9999 ✎ Note! ■ The programming levels are disabled if you do not press a key within 60 seconds following automatic return to the HOME position. ■ You can also disable programming in this function by entering any number (other than the defined private code). ■ The Endress+Hauser service organization can be of assistance if you mislay your personal code.
PRIVATE CODE	Use this function to enter a personal code number for enabling programming. **User input:** 0...9999 (max. 4-digit number) **Factory setting:** 50 ✎ Note! ■ Programming is always enabled with the code "0". ■ Programming has to be enabled before this code can be changed. When programming is disabled this function is not available, thus preventing others from accessing your personal code.
STATUS ACCESS	Use this function to check the access status for the function matrix. **User interface:** ACCESS CUSTOMER (parameterization possible) LOCKED (parameterization disabled)
ACCESS CODE COUNTER	Displays how often the customer code, service code or the digit "0" (code-free) has been entered to gain access to the function matrix. **Display:** max. 7-digit number: 0...9999999 **Factory setting:** 0

6 Group USER INTERFACE

Function description USER INTERFACE	
ASSIGN LINE 1	Use this function to define which display value is assigned to the main line (top line of the local display) for display during normal measuring operation. **Options:** OFF VOLUME FLOW VOLUME FLOW IN % TOTALIZER 1 TOTALIZER 2 **Factory setting:** VOLUME FLOW
ASSIGN LINE 2	Use this function to define which display value is assigned to the additional line (bottom line of the local display) for display during normal measuring operation. **Options:** OFF VOLUME FLOW VOLUME FLOW IN % VOLUME FLOW BARGRAPH IN % TOTALIZER 1 TAG NAME OPERATING/SYSTEM CONDITION FLOW DIRECTION TOTALIZER 2 **Factory setting:** TOTALIZER 1
100% VALUE	✎ Note! This function is only available if VOLUME FLOW IN % or VOLUME FLOW BARGRAPH IN % was selected in the function ASSIGN LINE 1 or ASSIGN LINE 2. Use this function to define the flow value to be shown on the display as the 100% value. **User input:** 5-digit floating-point number **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.).

Function description USER INTERFACE	
FORMAT	Use this function to define the maximum number of places after the decimal point displayed for the reading in the main line. **Options:** XXXXX. – XXXX.X – XXX.XX – XX.XXX – X.XXXX **Factory setting:** X.XXXX ✎ Note! ■ Note that this setting only affects the reading as it appears on the display, it has no influence on the accuracy of the system's calculations. ■ The places after the decimal point as computed by the measuring device cannot always be displayed, depending on this setting and the engineering unit. In such instances an arrow appears on the display between the measuring value and the engineering unit (e.g. 1.2 → l/h), indicating that the measuring system is computing with more decimal places than can be shown on the display.
DISPLAY DAMPING	Use this function to enter a time constant defining how the display reacts to severely fluctuating flow variables, either very quickly (enter a low time constant) or with damping (enter a high time constant). **User input:** 0...100 seconds **Factory setting:** 3 s ✎ Note! Setting the time constant to zero seconds switches off damping.
CONTRAST LCD	Use this function to optimize display contrast to suit local operating conditions. **User input:** 10...100% **Factory setting:** 50%

Function description USER INTERFACE	
BACKLIGHT	Use this function to optimize the backlight to suit local operating conditions. **User input:** 0...100% ✎ Note! Entering the value "0" means that the backlight is "switched off". The display then no longer emits any light, i.e. the display texts can no longer be read in the dark. **Factory setting:** 50%
DISPLAY TEST	Use this function to test the operability of the local display and its pixels. **Options:** OFF ON **Factory setting:** OFF Test sequence: 1. Start the test by selecting ON. 2. All pixels of the main line and additional line are darkened for at least 0.75 seconds. 3. The main line and additional line show an "8" in each field for at least 0.75 seconds. 4. The main line and additional line show a "0" in each field for at least 0.75 seconds. 5. The main line and additional line show nothing (blank display) for at least 0.75 seconds. When the test completes the local display returns to its initial state and the setting changes to OFF.

7 Group TOTALIZER 1/2

Function description TOTALIZER 1/2	
ASSIGN TOTALIZER	Use this function to assign a measured variable (volume flow) to the totalizer. **Options:** OFF VOLUME FLOW **Factory setting:** VOLUME FLOW ✎ Note! The totalizer is reset to "0" as soon as the selection is changed.
SUM	Use this function to view the total for the totalizer measured variable aggregated since measuring commenced. The value can be positive or negative. **User interface:** max. 7-digit floating-point number, including sign and unit (e.g. 896,845.7 dm^3) ✎ Note! The totalizer response to faults is defined in the FAILSAFE MODE function (see Page 18).
OVERFLOW	Use this function to view the overflow for the totalizer aggregated since measuring commenced. Total flow quantity is represented by a floating decimal point number consisting of max. 7 digits. You can use this function to view higher numerical values (>9 999 999) as overflows. The effective quantity is thus the total of OVERFLOW plus the value returned by the SUM function. Example: Reading for 2 overflows: 2 E7 kg (= 2 000 000 dm^3) The value returned by the SUM function = 896,845.7 dm^3 Effective total quantity = 2,896,845.7 dm^3 **Display shows:** Integer with exponent, including sign and unit, e.g. 2 E7 dm^3
UNIT TOTALIZER	Use this function to define the unit for the totalizer. **Options:** Metric → cm^3; dm^3; m^3; ml; l; hl; Ml Mega US → cc; af; ft^3; oz f; gal; Kgal; Mgal; bbl (normal fluids); bbl (beer); bbl (petrochemicals); bbl (filling tanks) Imperial → gal; Mgal; bbl (beer); bbl (petrochemicals) **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.).

Function description TOTALIZER 1/2	
TOTALIZER MODE	Use this function to define how the flow components are to be totalised. **Options:** BALANCE Positive and negative flow components. The positive and negative flow components are balanced. In other words, net flow in the flow direction is registered. FORWARD Positive flow components only REVERSE Negative flow components only **Factory setting:** Totalizer 1 = BALANCE Totalizer 2 = FORWARD
RESET TOTALIZER	Use this function to reset the sum and the overflow of the totalizer to "zero" (= RESET). **Options:** NO YES **Factory setting:** NO ✎ Note! If the device is equipped with a status input and if it is appropriately configured, totalizer resetting can also be triggered by a pulse.

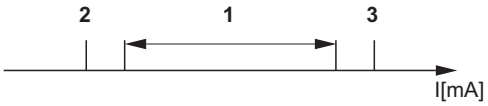
8 Group HANDLING TOTALIZER

Function description HANDLING TOTALIZER	
RESET ALL TOTALIZERS	Use this function to reset the totals (including all overflows) of the totalizers (1...2) to "zero". **Options:** NO YES **Factory setting:** NO ✎ Note! If the device has a status input and if it is appropriately configured, a reset for the totalizer (1...2) can also be triggered by a pulse (see the ASSIGN STATUS INPUT function on Page 31).
FAILSAFE MODE	Use this function to define the totalizer response in case of fault. **Options:** STOP The totalizer is paused until the fault is rectified. ACTUAL VALUE The totalizer continues to count on the basis of the current flow measuring value. The fault is ignored. HOLD VALUE The totalizer continues to count the flow that is based on the last valid flow measuring value (before the fault occurred). **Factory setting:** STOP

9 Group CURRENT OUTPUT

Function description CURRENT OUTPUT	
ASSIGN CURRENT OUTPUT	Use this function to assign a measured variable to the current output. **Options:** OFF VOLUME FLOW **Factory setting:** VOLUME FLOW ✎ Note! If you select OFF, the only function shown in this group is the function (ASSIGN CURRENT OUTPUT).

Function description CURRENT OUTPUT	
CURRENT SPAN	Use this function to define the current span. The selection specifies the operational range and the lower and upper signal on alarm. For the current output the option HART can be defined additionally. **Options:** 0–20 mA 4–20 mA 4–20 mA HART 4–20 mA NAMUR 4–20 mA HART NAMUR 4–20 mA US 4–20 mA HART US 0–20 mA (25 mA) 4–20 mA (25 mA) 4–20 mA (25 mA) HART **Factory setting:** 4–20 mA HART NAMUR **Current span, operational range and signal on alarm level**



a	1	2	3
0-20 mA	0 - 20.5 mA	0	22
4-20 mA	4 - 20.5 mA	2	22
4-20 mA HART	4 - 20.5 mA	2	22
4-20 mA NAMUR	3.8 - 20.5 mA	3.5	22.6
4-20 mA HART NAMUR	3.8 - 20.5 mA	3.5	22.6
4-20 mA US	3.9 - 20.8 mA	3.75	22.6
4-20 mA HART US	3.9 - 20.8 mA	3.75	22.6
0-20 mA (25 mA)	0 - 24 mA	0	25
4-20 mA (25 mA)	4 - 24 mA	2	25
4-20 mA (25 mA) HART	4 - 24 mA	2	25

A0001222

a = Current span
1 = Operational range (measuring information)
2 = Lower signal on alarm level
3 = Upper signal on alarm level

✎ Note!
- When switching the hardware from an active (factory setting) to a passive output signal select a current span of 4–20 mA.
- If the measured value exceeds the measuring range a notice message is generated (#351...354, current span).
- In case of a fault the behaviour of the current output is according to the selected option in the function FAILSAFE MODE (see Page 21). Change the error category in the function ASSIGN SYSTEM ERROR (see Page 54) to generate a fault message instead of a notice message.

Function description CURRENT OUTPUT	
VALUE 20 mA	Use this function to assign the 20 mA current a full scale value. Positive and negative values are permissible. The required measuring range is defined by defining the VALUE 20 mA. In the SYMMETRY measuring mode, (see Page 45), the value assigned applies to both flow directions; in the STANDARD measuring mode it applies only to the flow direction selected. **User input:** 5-digit floating-point number, with sign **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.). ✎ Note! ■ The appropriate unit is taken from the group SYSTEM UNITS, (see Page 8). ■ The value for 0 or 4 mA always corresponds to the zero flow (0 [unit]). This value is fixed and cannot be edited.
TIME CONSTANT	Use this function to enter a time constant defining how the current output signal reacts to severely fluctuating measured variables, either very quickly (enter a low time constant) or with damping (enter a high time constant). **User input:** fixed-point number 0.01...100.00 s **Factory setting:** 3.00 s
FAILSAFE MODE	For safety reasons it is advisable to ensure that the current output assumes a predefined state in the event of a fault. The setting you select here affects only the current output. The failsafe mode of other outputs and the totalizers is defined in the corresponding function groups. **Options:** MIN. CURRENT The current output adopts the value of the lower signal on alarm level (as defined in the function CURRENT SPAN). MAX. CURRENT The current output adopts the value of the upper signal on alarm level (as defined in the function CURRENT SPAN). HOLD VALUE (**not recommended**) Measuring value output is based on the last measuring value saved before the error occurred . ACTUAL VALUE Measured value output is based on the current flow measurement. The fault is ignored . **Factory setting:** MIN. CURRENT
ACTUAL CURRENT	Use this function to view the computed actual value of the output current. **User interface:** 0.00...25.00 mA

Function description CURRENT OUTPUT	
SIMULATION CURRENT	Use this function to activate simulation of the current output. **Options:** OFF ON **Factory setting:** OFF ✎ Note! ■ The "SIMULATION CURRENT OUTPUT" notice message indicates that simulation is active. ■ The measuring device continues to measure while simulation is in progress, i.e. the current measuring values are output correctly via the other outputs. ☝ Caution! The setting is not saved if the power supply fails.
VALUE SIMULATION CURRENT	✎ Note! This function is not available unless the function SIMULATION CURRENT is active (= ON). Use this function to define a selectable value (e.g. 12 mA) to be output at the current output. This value is used to test downstream devices and the measuring device itself. **User input:** Floating-point number: 0.00...25.00 mA **Factory setting:** 0.00 mA ☝ Caution! The setting is not saved if the power supply fails.

10 Group PULSE/FREQUENCY OUTPUT

Function description PULSE/FREQUENCY OUTPUT	
This group is not available unless the measuring device is equipped with a pulse/frequency output.	
OPERATION MODE	Use this function to configure the output as a pulse output or frequency output. The functions available in this function group vary, depending on which option you select here. **Options:** PULSE FREQUENCY **Factory setting:** PULSE
ASSIGN FREQUENCY	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to assign a measured variable to the frequency output. **Options:** OFF VOLUME FLOW **Factory setting:** VOLUME FLOW ✎ Note! If you select OFF, the only functions shown in this function group are the functions ASSIGN FREQUENCY and OPERATION MODE.
END VALUE FREQ.	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to define a full scale frequency for the frequency output. You define the associated measured value of the measuring range in the function VALUE-f HIGH on Page 24. **User input:** 4-digit fixed-point number 2...1250 Hz **Factory setting:** 1000 Hz Example: ■ VALUE-f HIGH = 1000 l/h, end frequency = 1000 Hz: i.e. at a flow of 1000 l/h, a frequency of 1000 Hz is output. ■ VALUE-f HIGH = 3600 l/h, end frequency = 1000 Hz: i.e. at a flow of 3600 l/h, a frequency of 1000 Hz is output. ✎ Note! ■ In the FREQUENCY operating mode the output signal is symmetrical (on/off ratio = 1:1). At low frequencies the pulse duration is limited to a maximum of 2 seconds, i.e. the on/off ratio is no longer symmetrical. ■ The initial frequency is always 0 Hz. This value is fixed and cannot be edited.

Function description PULSE/FREQUENCY OUTPUT	
VALUE-f HIGH	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to assign a value to the end value frequency. Positive and negative values are permissible. The required measuring range is defined by defining the VALUE-f HIGH. In the SYMMETRY measuring mode, (see Page 45), the value assigned applies to both flow directions; in the STANDARD measuring mode it applies only to the flow direction selected. **User input:** 5-digit floating-point number **Factory setting:** Depends on nominal diameter and country, [value] / [dm^3...m^3 or US-gal...US-Mgal] corresponds to the factory setting for the final value (see Page 58 ff.) .  A0001279 ① = *Value-f min.* ② = *Value-f high* ✎ Note! ■ The appropriate unit is taken from the group SYSTEM UNITS, (see Page 8). ■ The value-f min. for the initial frequency always corresponds to the zero flow (0 [unit]). This value is fixed and cannot be edited.

Function description PULSE/FREQUENCY OUTPUT

OUTPUT SIGNAL

✎ Note!
Function is not available unless the FREQUENCY setting was selected in the OPERATION MODE function.

For selecting the output configuration of the frequency output.

Options:
PASSIVE - POSITIVE
PASSIVE - NEGATIVE

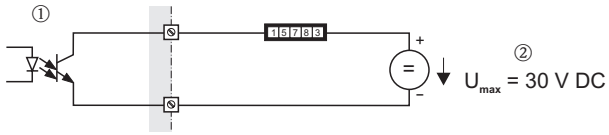
Factory setting: PASSIVE - POSITIVE

Explanation
- PASSIVE = power is supplied to the frequency output by means of an external power supply.

Configuring the output signal level (POSITIVE or NEGATIVE) determines the quiescent behaviour (at zero flow) of the frequency output.
The internal transistor is activated as follows:
- If POSITIVE is selected, the internal transistor is activated with a **positive** signal level.
- If NEGATIVE is selected, the internal transistor is activated with a **negative** signal level (0 V).

✎ Note!
With the passive output configuration, the output signal levels of the frequency output depend on the external circuit (see examples).

Example for passive output circuit (PASSIVE)
If PASSIVE is selected, the frequency output is configured as an open collector.

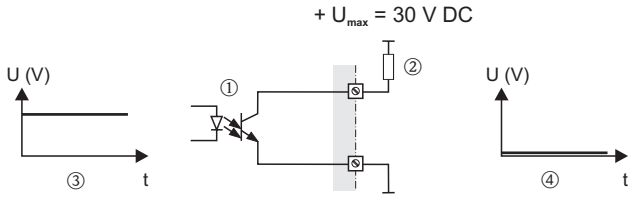


A0001225

① = *Open collector*
② = *External power supply*

✎ Note!
For continuous currents up to 25 mA (I_{max} = 250 mA / 20 ms).

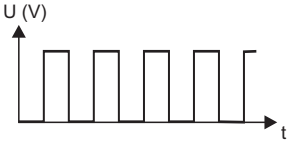
Example for output configuration PASSIVE-POSITIVE:
Output configuration with an external pull-up resistance.
In the quiescent state (at zero flow), the output signal level at the terminals is 0 V.



A0004687

① = *Open collector*
② = *Pull-up resistance*
③ = *Transistor activation in "POSITIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from 0 V to a positive voltage level.



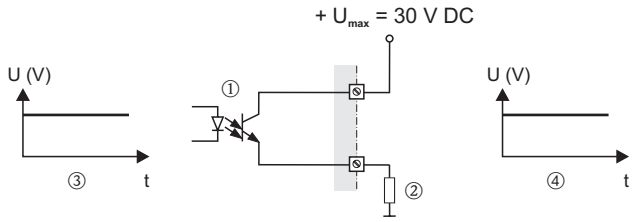
A0001975

(continued on next page)

Function description PULSE/FREQUENCY OUTPUT

OUTPUT SIGNAL
(continued)

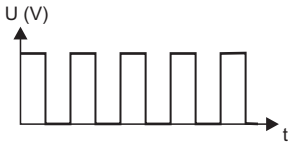
Example for output configuration PASSIVE-POSITIVE:
Output configuration with an external pull-down resistance.
In the quiescent state (at zero flow), a positive voltage level is measured via the pull-down resistance.



A0004689

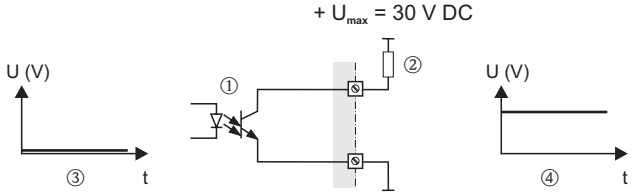
① = *Open collector*
② = *Pull-down resistance*
③ = *Transistor activation in "POSITIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from a positive voltage level to 0 V.



A0001981

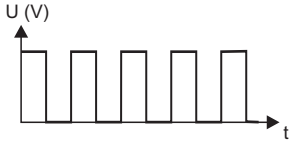
Example for output configuration PASSIVE-NEGATIVE:
Output configuration with an external pull-up resistance.
In the quiescent state (at zero flow), the output signal level at the terminals is at a positive voltage level.



A0004690

① = *Open collector*
② = *Pull-up resistance*
③ = *Transistor activation in "NEGATIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from a positive voltage level to 0 V.



A0001981

Function description PULSE/FREQUENCY OUTPUT	
TIME CONSTANT	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to enter a time constant defining how the frequency output signal reacts to severely fluctuating measured variables, either very quickly (enter a low time constant) or with damping (enter a high time constant). **User input:** Floating-point number 0.00...100.00 s **Factory setting:** 0.00 s
FAILSAFE MODE	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. For safety reasons it is advisable to ensure that the frequency output assumes a predefined state in the event of a fault. Use this function to define this state. The setting you select here affects only the frequency output. It has no effect on other outputs and the display (e.g. totalizers). **Options:** FALLBACK VALUE Output is 0 Hz. FAILSAFE LEVEL Output is the frequency specified in the FAILSAFE VALUE function. HOLD VALUE Measuring value output is based on the last measuring value saved before the error occurred. ACTUAL VALUE Measuring value output is based on the current flow measurement. The fault is ignored. **Factory setting:** FALLBACK VALUE
FAILSAFE VALUE	✎ Note! This function is not available unless FREQUENCY was selected in the OPERATION MODE function and FAILSAFE LEVEL was selected in the function FAILSAFE MODE. Use this function to define the frequency that the measuring device should output in the event of a fault. **User input:** max. 4-digit number: 0...1250 Hz **Factory setting:** 1250 Hz
ACTUAL FREQUENCY	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to view the computed value of the output frequency. **User interface:** 0...1250 Hz

Function description PULSE/FREQUENCY OUTPUT	
SIMULATION FREQUENCY	✎ Note! This function is not available unless the FREQUENCY setting was selected in the function OPERATION MODE. Use this function to activate simulation of the frequency output. **Options:** OFF ON **Factory setting:** OFF ✎ Note! ■ The "SIMULATION FREQUENCY OUTPUT" notice message indicates that simulation is active. ■ The measuring device continues to measure while simulation is in progress, i.e. the current measuring values are output correctly via the other outputs. ☝ Caution! The setting is not saved if the power supply fails.
VALUE SIMULATION FREQUENCY	✎ Note! This function is not available unless FREQUENCY was selected in the OPERATION MODE function and the function VALUE SIMULATION FREQUENCY is active (= ON). Use this function to define a selectable frequency value (e.g. 500 Hz) to be output at the frequency output. This value is used to test downstream devices and the measuring device itself. **User input:** 0...1250 Hz **Factory setting:** 0 Hz ☝ Caution! The setting is not saved if the power supply fails.
ASSIGN PULSE	✎ Note! This function is not available unless the PULSE setting was selected in the OPERATION MODE function. Use this function to assign a measured variable to the pulse output. **Options:** OFF VOLUME FLOW **Factory setting:** VOLUME FLOW ✎ Note! If you select OFF, the only functions shown in this function group are the functions ASSIGN PULSE and OPERATION MODE.

Function description PULSE/FREQUENCY OUTPUT	
PULSE VALUE	✎ Note! This function is not available unless the PULSE setting was selected in the OPERATION MODE function. Use this function to define the flow at which a pulse is triggered. These pulses can be totalled by an external totalizer and in this way the total flow since measuring commenced can be registered. **User input:** 5-digit floating-point number, [unit] **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.). ✎ Note! The appropriate unit is taken from the group SYSTEM UNITS (see Page 8).
PULSE WIDTH	✎ Note! This function is not available unless the PULSE setting was selected in the OPERATION MODE function. Use this function to enter the maximum pulse width of the output pulses. **User input:** 0.5...2000 ms **Factory setting:** 100 ms Pulse output is **always** with the pulse width (B) entered in this function. The intervals (P) between the individual pulses are automatically configured. However, they must at least correspond to the pulse width (B = P).  B = Pulse width entered (the illustration applies to positive pulses) P= Intervals between the individual pulses ✎ Note! When entering the pulse width, select a value that can still be processed by an external totalizer (e.g. mechanical totalizer, PLC, etc.). ☝ Caution! If the pulse number or frequency resulting from the pulse value entered, (see function PULSE VALUE on Page 27), and from the current flowis too large to maintain the pulse width selected (interval P is smaller than the pulse width B entered), a system error message (pulse memory) is generated after buffering/balancing time.

Function description PULSE/FREQUENCY OUTPUT

OUTPUT SIGNAL

✎ Note!
Function is not available unless the PULSE setting was selected in the OPERATION MODE function.

For selecting the output configuration of the pulse output.

Options:
PASSIVE - POSITIVE
PASSIVE - NEGATIVE

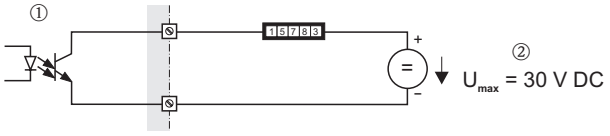
Factory setting: PASSIVE - POSITIVE

Explanation
- PASSIVE = power is supplied to the pulse output by means of an external power supply.

Configuring the output signal level (POSITIVE or NEGATIVE) determines the quiescent behaviour (at zero flow) of the pulse output.
The internal transistor is activated as follows:
- If POSITIVE is selected, the internal transistor is activated with a **positive** signal level.
- If NEGATIVE is selected, the internal transistor is activated with a **negative** signal level (0 V).

✎ Note!
With the passive output configuration, the output signal levels of the pulse output depend on the external circuit (see examples).

Example for passive output circuit (PASSIVE)
If PASSIVE is selected, the pulse output is configured as an open collector.

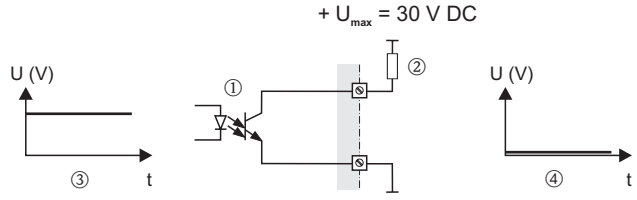


A0001225

① = *Open Collector*
② = *External power supply*

✎ Note!
For continuous currents up to 25 mA (I_{max} = 250 mA / 20 ms).

Example for output configuration PASSIVE-POSITIVE:
Output configuration with an external pull-up resistance.
In the quiescent state (at zero flow), the output signal level at the terminals is 0 V.



A0004687

① = *Open Collector*
② = *Pull-Up-Resistance*
③ = *Transistor activation in "POSITIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from 0 V to a positive voltage level.

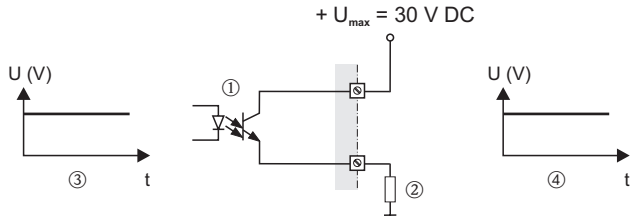
A0001975

(continued on next page)

Function description PULSE/FREQUENCY OUTPUT

OUTPUT SIGNAL
(continued)

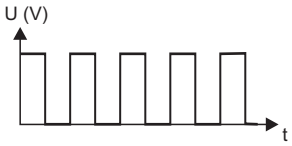
Example for output configuration PASSIVE-POSITIVE:
Output configuration with an external pull-down resistance. In the quiescent state (at zero flow), a positive voltage level is measured via the pull-down resistance.



A0004689

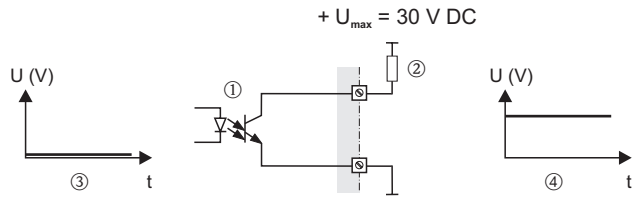
① = *Open Collector*
② = *Pull-Down-Resistance*
③ = *Transistor activation in "POSITIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from a positive voltage level to 0 V.



A0001981

Example for output configuration PASSIVE-NEGATIVE:
Output configuration with an external pull-up resistance. In the quiescent state (at zero flow), the output signal level at the terminals is at a positive voltage level.



A0004690

① = *Open Collector*
② = *Pull-Up-Resistance*
③ = *Transistor activation in "NEGATIVE" quiescent state (at zero flow)*
④ = *Output signal level in quiescent state (at zero flow)*

In the operating status (flow present), the output signal level changes from a positive voltage level to 0 V.

A0001981

Function description PULSE/FREQUENCY OUTPUT	
FAILSAFE MODE	✎ Note! This function is not available unless the PULSE setting was selected in the function OPERATION MODE. For safety reasons it is advisable to ensure that the pulse output assumes a predefined state in the event of a fault. Use this function to define this state. The setting you select here affects only the pulse output. It has no effect on other outputs and the display (e.g. totalizers). **Options:** FALLBACK VALUE Output is 0 pulse. ACTUAL VALUE Measuring value output is based on the current flow measurement. The fault is ignored. **Factory setting:** FALLBACK VALUE
SIMULATION PULSE	✎ Note! This function is not available unless the PULSE option was selected in the OPERATION MODE function. Use this function to activate simulation of the pulse output. **Options:** OFF COUNTDOWN The pulses specified in the VALUE SIMULATION PULSE function are output. CONTINUOUSLY Pulses are continuously output with the pulse width specified in the PULSE WIDTH function. Simulation is started once the CONTINUOUSLY option is confirmed with the E key. ✎ Note! Simulation is started by confirming the CONTINUOUSLY option with the E key. The simulation can be switched off again via the SIMULATION PULSE function. **Factory setting:** OFF ✎ Note! ■ The notice message #631 "SIM. PULSE" indicates that simulation is active. ■ The on/off ratio is 1:1 for both types of simulation. ■ The measuring device continues to measure while simulation is in progress, i.e. the current measured values are output correctly via the other outputs. ☝ Caution! The setting is not saved if the power supply fails.

Function description PULSE/FREQUENCY OUTPUT	
VALUE SIMULATION PULSE	Note! This function is not available unless the COUNTDOWN option was selected in the SIMULATION PULSE function. Use this function to specify the number of pulses (e.g. 50) which are output during the simulation. This value is used to test downstream devices and the measuring device itself. The pulses are output with the pulse width specified in the PULSE WIDTH function. The on/off ratio is 1:1. Simulation is started once the specified value is confirmed with the E key. The display remains at "0" if the specified pulses have been output. **User input:** 0...10000 **Factory setting:** 0 Note! Simulation is started by confirming the simulation value with the E key. The simulation can be switched off again via the SIMULATION PULSE function. Caution! The setting is not saved if the power supply fails.

11 Group STATUS OUTPUT

Function description STATUS OUTPUT	
This group is not available unless the measuring device is equipped with a status output.	
ASSIGN STATUS OUTPUT	Use this function to assign a switching function to the status output. **Options:** OFF ON (operation) FAULT MESSAGE NOTICE MESSAGE FAULT MESSAGE or NOTICE MESSAGE EPD or OED (Empty Pipe Detection / Open Electrode Detection, only if active) FLOW DIRECTION VOLUME FLOW LIMIT VALUE **Factory setting:** FAULT MESSAGE ✎ Note! ■ The behaviour of the status output is a normally closed behaviour, in other words the output is closed (transistor conductive) when normal, error-free measuring is in progress. ■ It is very important to read and comply with the information on the switching characteristics of the status output, (see Page 34). ■ If you select OFF, the only function shown in this function group is the function ASSIGN STATUS OUTPUT.
ON-VALUE	✎ Note! This function is not available unless LIMIT VALUE or FLOW DIRECTION was selected in the function ASSIGN STATUS OUTPUT. Use this function to assign a value to the switch-on point (status output pulls up). The value can be equal to, greater than or less than the switch-off point. Positive and negative values are permissible. **User input:** 5-digit floating-point number, [unit] **Factory setting:** 0 [unit] ✎ Note! ■ The appropriate unit is taken from the group SYSTEM UNITS, (see Page 8). ■ Only the switch-on point is available for flow direction output (no switch-off point). If you enter a value not equal to the zero flow (e.g. 5), the difference between the zero flow and the value entered corresponds to half the switchover hysteresis.

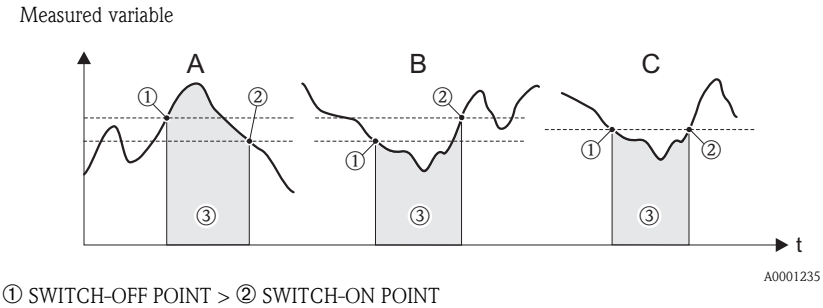
Function description STATUS OUTPUT	
OFF-VALUE	✎ Note! This function is not available unless LIMIT VALUE was selected in the function ASSIGN STATUS OUTPUT. Use this function to assign a value to the switch-off point (status output drops out). The value can be equal to, greater than or less than the switch-on point. Positive and negative values are permissible. **User input:** 5-digit floating-point number, [unit] **Factory setting:** 0 [unit] ✎ Note! ■ The appropriate unit is taken from the group SYSTEM UNITS, (see Page 8). ■ If SYMMETRY is selected in the function MEASURING MODE (Page 45) and values with different signs are entered for the switch-on and switch-off points, the notice message "INPUT RANGE EXCEEDED" appears.
TIME CONSTANT	Use this function to enter a time constant defining how the measuring signal reacts to severely fluctuating measured variables, either very quickly (enter a low time constant) or with damping (enter a high time constant). The purpose of damping, therefore, is to prevent the status output changing state continuously in response to fluctuations in flow. **User input:** fixed-point number 0.00...100.00 s **Factory setting:** 0.00 s
ACTUAL STATUS OUTPUT	Use this function to check the current status of the status output. **User interface:** NOT CONDUCTIVE CONDUCTIVE
SIMULATION SWITCH POINT	Use this function to activate simulation of the status output. **Options:** OFF ON **Factory setting:** OFF ✎ Note! ■ The "SIMULATION STATUS OUTPUT" message indicates that simulation is active. ■ The measuring device continues to measure while simulation is in progress, i.e. the current measuring values are output correctly via the other outputs. ☝ Caution! The setting is not saved if the power supply fails.

Function description STATUS OUTPUT	
VALUE SIMULATION SWITCH POINT	Note! This function is not available unless the function SIMULATION SWITCH POINT is active (= ON). Use this function to define the switching response of the status output during the simulation. This value is used to test downstream devices and the measuring device itself. **Options:** NOT CONDUCTIVE CONDUCTIVE **Factory setting:** NOT CONDUCTIVE Caution! The setting is not saved if the power supply fails.

11.1 Information on the response of the status output

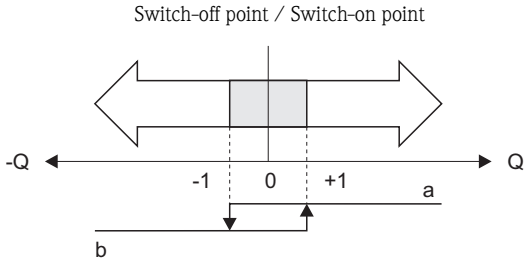
General
If you have configured the status output for "LIMIT VALUE" or "FLOW DIRECTION", you can configure the requisite switch points in the functions ON-VALUE and OFF-VALUE. When the measured variable in question reaches these predefined values, the status output switches as shown in the illustrations below.

Status output configured for limit value
The status output switches as soon as the measured variable undershoots or overshoots a defined switch point. Application: Monitoring flow or process-related boundary conditions.



A = Maximum safety → ① SWITCH-OFF POINT > ② SWITCH-ON POINT
B = Maximum safety → ① SWITCH-OFF POINT < ② SWITCH-ON POINT
C = Maximum safety → ① SWITCH-OFF POINT = ② SWITCH-ON POINT (this configuration is to avoid)
③ = Status output switched off (not conductive)

Status output configured for flow direction
The value entered in the function SWITCH-ON POINT defines the switch point for the positive and negative directions of flow. If, for example, the switch point entered is = 1 m^3/h, the status output switches off at –1 m^3/h (not conductive) and switches on again at +1 m^3/h (conductive).
Set the switch point to 0 if your process calls for direct switchover (no switching hysteresis). If low flow cut off is used, it is advisable to set hysteresis to a value greater than or equal to the low flow rate.



a = Status output conductive
b = Status output not conductive

11.2 Switching response of the status output

Function	Status	Open collector response (transistor)
ON (operation)	System in measuring mode  A0001052	conductive  A0001237
	System not in measuring mode (power supply failed) A0001291	not conductive  A0001238
Fault message	System OK  A0001052	conductive  A0001237
	(System or process error) Fault → Error response of outputs/inputs and totalizer A0001291	not conductive  A0001238
Notice message	System OK  A0001052	conductive  A0001237
	(System or process error) Fault → Continuation of measuring A0001291	not conductive  A0001238
Fault message or notice message	System OK  A0001052	conductive  A0001237
	(System or process error) Fault → Response to error or Note → Continuation of measuring A0001291	not conductive  A0001238
Empty pipe detection (EPD) / Open electrode detection (OED)	Measuring tube full A0001292	conductive  A0001237
	Measuring tube partially filled / empty measuring tube A0001293	not conductive  A0001238

Function	Status	Open collector response (transistor)
Flow direction	Forward A0001241	conduc- tive  A0001237
	Reverse A0001242	not conduc- tive  A0001238
Limit value Volume flow	Limit value not overshot or undershot  A0001243	conduc- tive  A0001237
	Limit value overshot or undershot  A0001244	not conduc- tive  A0001238

12 Group STATUS INPUT

Function description STATUS INPUT	
This group is not available unless the measuring device is equipped with a status input.	
ASSIGN STATUS INPUT	Use this function to assign a switching function to the status input. **Options:** OFF RESET TOTALIZER 1 POSITIVE ZERO RETURN RESET TOTALIZER 2 RESET ALL TOTALIZERS **Factory setting:** OFF ✎ Note! Positive zero return is active as long as the active level is available at the status input (continuous signal). All other assignments react to a change in level (pulse) at the status input.
ACTIVE LEVEL	Use this function to define whether the assigned switch function, (see function ASSIGN STATUS INPUT) is released or sustained when the level is present (HIGH) or not present (LOW). **Options:** HIGH LOW **Factory setting:** HIGH
MINIMUM PULSE WIDTH	Use this function to define a minimum pulse width which the input pulse must achieve in order to trigger the selected switching function. **User input:** 20...100 ms **Factory setting:** 50 ms
SIMULATION STATUS INPUT	Use this function to activate simulation of the status input, i.e. to trigger the function assigned to the status input, (see function ASSIGN STATUS INPUT on Page 31). **Options:** OFF ON **Factory setting:** OFF ✎ Note! ■ The "SIMULATION STATUS INPUT" notice message indicates that simulation is active. ■ The measuring device continues to measure while simulation is in progress, i.e. the current measuring values are output correctly via the outputs. ☝ Caution! The setting is not saved if the power supply fails.

Function description STATUS INPUT	
VALUE SIMULATION STATUS INPUT	Note! This function is not available unless the function SIMULATION STATUS INPUT is active (= ON). Use this function to select the level to be simulated at the status input. **Options:** HIGH LOW **Factory setting:** LOW Caution! The setting is not saved if the power supply fails.

13 Group COMMUNICATION

Function description COMMUNICATION	
TAG NAME	Use this function to enter a tag name for the measuring device. You can edit and read this tag name at the local display or via the HART protocol. **User input:** max. 8-character text, permitted characters are: A–Z, 0–9, +, –, punctuation marks **Factory setting:** "_ _ _ _ _ _ _ _" (no text)
TAG DESCRIPTION	Use this function to enter a tag description for the measuring device. You can edit and read this tag description at the local display or via the HART protocol. **User input:** max. 16-character text, permitted characters are: A–Z, 0–9, +, –, punctuation marks **Factory setting:** "_ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _" (No text)
BUS ADDRESS	Use this function to define the address for the exchange of data with the HART protocol. **User input:** 0...15 **Factory setting:** 0 ✎ Note! Addresses 1...15: a constant 4 mA current is applied.
HART PROTOCOL	Use this function to display if the HART protocol is active. **User interface:** OFF = HART protocol not active ON = HART protocol active ✎ Note! The HART protocol is activated by selecting 4–20 mA HART or 4–20 mA (25 mA) HART in the function CURRENT SPAN (see Page 20).
MANUFACTURER ID	Use this function to view the manufacturer. **User interface:** – Endress+Hauser – 17 (≅ 11 hex) for Endress+Hauser
DEVICE ID	Use this function to view the device ID in hexadecimal numerical format. **User interface:** 41 (≅ 65 dez) for Promag 50
DEVICE REVISION	Use this function to view the device-specific revision of the HART command interface. **User interface:** E.g.: 5

14 Group PROCESS PARAMETER

Function description PROCESS PARAMETER	
ASSIGN LOW FLOW CUT OFF	Use this function to assign the switch point for low flow cut off. **Options:** OFF VOLUME FLOW **Factory setting:** VOLUME FLOW
ON-VALUE LOW FLOW CUT OFF	Use this function to enter the switch-on point for low flow cut off. Low flow cut off is active if the value entered is not equal to 0. The sign of the flow value is highlighted on the display to indicate that low flow cut off is active. **User input:** 5-digit floating-point number, [unit] **Factory setting:** Depends on nominal diameter and country (see Page 58 ff.). ✎ Note! The appropriate unit is taken from the group SYSTEM UNITS (see Page 8).
OFF-VALUE LOW FLOW CUT OFF	Use this function to enter the switch-off point for low flow cut off. Enter the switch-off point as a positive hysteresis value from the switch-on point. **User input:** Integer 0...100% **Factory setting:** 50%  A0003882 *① = switch-on point , ② = switch-off point* *a = Low flow cut off is switched on* *b = Low flow cut off is switched off (a + a · H)* *H = Hysteresis value: 0 to 100%* *= Low flow cut off active* *Q = Flow*

Function description PROCESS PARAMETER	
EMPTY PIPE DETECTION (EPD)	Flow cannot be measured correctly unless the measuring tube is full. This status can be monitored at all times with the Empty Pipe Detection function. Use this function to activate Empty Pipe Detection (EPD) or Open Electrode Detection (OED). ■ EPD = Empty Pipe Detection (with the help of an EPD electrode) ■ OED = Open Electrode Detection (empty pipe detection with the help of the measuring electrodes, if the sensor is not equipped with an EPD electrode or the orientation is not suitable for using EPD). **Options:** OFF – ON SPECIAL – OED – ON STANDARD OFF (neither EPD nor OED are active) ON SPECIAL (only for DN <400): Switching on the Empty Pipe Detection (EPD) for devices in remote version (transmitter and sensor are installed separately). OED: Switching on the Open Electrode Detection (OED). ON STANDARD: Switching on the Empty Pipe Detection (EPD) for: – Devices in compact version (transmitter and sensor form a single mechanical unit). – Applications where a facing and coating of the fluid on the measuring tube line and measuring electrode accrues. **Factory setting:** OFF ✎ Note! ■ The options ON STANDARD and ON SPECIAL are not available unless the sensor is equipped with an EPD electrode. ■ The default setting for the EPD/OED functions when the device is delivered is OFF. The functions must be activated as required. ■ The devices are calibrated at the factory with water (approx. 500 µS/cm). If the conductivity of certain fluids deviates from this reference, empty pipe/full pipe adjustment must be performed again on site (see function EPD/OED ADJUSTMENT on page 46). ■ The adjustment coefficients must be valid before you can switch on the EPD or OED. If these coefficients are not available, the function EPD/OED ADJUSTMENT is displayed (see Page 44). ■ If there are problems with the adjustment, the following error messages appear on the screen: – ADJUSTMENT FULL = EMPTY: The adjustment values for empty pipe and full pipe are identical. In such instances, empty pipe adjustment/full pipe adjustment **must** be carried out **again**. – ADJUSTMENT NOT OK: Adjustment is not possible as the fluid conductivity values are outside the permitted range. (continued on next page)

Function description PROCESS PARAMETER	
EMPTY PIPE DETECTION (EPD) (continued)	**Notes on empty pipe detection (EPD and OED)** ■ Flow cannot be measured correctly unless the measuring pipe is completely full. This status can be monitored at all times by means of the EPD/OED. ■ An empty or partially filled pipe is a process error. A default factory setting defines that a fault message is issued and that this process error has an effect on the outputs. ■ The EPD/OED process error can be output via the configurable status output. ■ Use the function ASSIGN PROCESS ERROR to define whether a notice or fault message should be triggered (see Page 54). ■ A plausibility check of the adjustment values will only be executed by activating the empty pipe detection. If an empty or full pipe adjustment is performed during the empty pipe detection is active, the empty pipe detection has to be de- and again activated, after finishing the adjustment, to start the plausibility check. **Response to partially filled pipes** If the EPD/OED is switched on and responds to a partially filled or empty pipe, the fault message "EMPTY PIPE" appears on the display. If the pipe is partially empty and the EPD/OED is **not** switched on, the response can vary in identically configured systems: ■ Flow reading fluctuates ■ Zero flow ■ Excessively high flow values **Notes on Open Electrode Detection (OED)** Open Electrode Detection (OED) functions like the Empty Pipe Detection (EPD). In contrast to the EPD where the measuring device must be equipped with a separate (optional) electrode, the OED detects partial filling by means of the two measuring electrodes which are present as standard (fluid no longer covers the measuring electrodes). Open electrode detection can also be used if: ■ the sensor is not installed in the optimal position for using EPD (optimal = installed horizontally). ■ the sensor is not equipped with an additional (optional) EPD electrode. ✎ Note! ■ Cable connection length: When mounting a remote version, please observe the maximum permissible cable length of 15 metres in order to keep the OED function. ■ OED empty pipe adjustment: To achieve the best results for the open electrode detection, it is important to have the electrodes surface as dry as possible (no liquid film) while the empty-pipe adjustment is being made. Even during normal operation, the OED function is only secured if there is no longer any liquid film present on the electrodes when the measuring pipe is empty.

Function description PROCESS PARAMETER	
EPD/OED ADJUSTMENT	Use this function to activate the EPD/OED adjustment for an empty or full measuring tube. ✎ Note! A detailed description and other helpful hints for the empty-pipe/full-pipe adjustment procedure can be found on Page 44. **Options:** OFF FULL PIPE ADJUST EMPTY PIPE ADJUST OED FULL ADJUST OED EMPTY ADJUST **Factory setting:** OFF **Procedure for EPD or OED empty-pipe / full-pipe adjustment** 1. Empty the piping. In case of an EPD adjustment, the wall of the measuring tube should be wetted with fluid for the adjustment procedure but this is not the case with an OED adjustment! 2. Start empty-pipe adjustment: Select "EMPTY PIPE ADJUST" or "OED EMPTY ADJUST" and press E to confirm. 3. After empty-pipe adjustment, fill the piping with fluid. 4. Start full-pipe adjustment: Select "FULL PIPE ADJUST" or "OED FULL ADJUST" and press E to confirm. 5. Having completed the adjustment, select the setting "OFF" and exit the function by pressing E . 6. Now select the "EMPTY PIPE DETECTION" function. Switch on Empty Pipe Detection by selecting the following settings: – EPD → Select ON STANDARD or ON SPECIAL and press E to confirm. – OED → Select OED and confirm with E . ☝ Caution! The adjustment coefficients must be valid before you can activate the EPD/OED function. If adjustment is incorrect the following messages might appear on the display: – FULL = EMPTY The adjustment values for empty pipe and full pipe are identical. In cases of this nature you **must** repeat empty-pipe or full-pipe adjustment **again**! – ADJUSTMENT NOT OK Adjustment is not possible because the fluid's conductivity is out of range.

Function description PROCESS PARAMETER	
EPD/OED RESPONSE TIME	✎ Note! This function is not available unless ON STANDARD, ON SPECIAL or OED was selected in the EMPTY PIPE DETECTION function. Use this function to enter the time span for which the criteria for an "empty" pipe have to be satisfied without interruption before a notice message or fault message is generated. The setting defined here is used by the active empty pipe detection (EPD) or open electrode detection (OED). **User input:** fixed-point number 1.0...100 s **Factory setting:** 1.0 s ✎ Note! OED detection time: The recognition of open electrodes is, in contrast to the empty pipe detection (EPD), very slow reacting (delay at least 25 seconds) and is only activated after an aditional delay from the programmed response time! We recommend in most applications to use the empty pipe detection (EPD) which is an optimal solution for detecting partly filled measuring tubes.
ECC	✎ Note! This function is not available unless the measuring device is equipped with the optional electrode cleaning function (ECC). Use this function to activate cyclical electrode cleaning. **Options:** OFF ON **Factory setting:** ON (only if the optional electrode cleaning function ECC is available) **Notes on electrode cleaning (ECC)** Conductive deposits on the electrodes and on the walls of the measuring tube (e.g. magnetite) can falsify measurement values. The Electrode Cleaning Circuitry (ECC) was developed to prevent such conductive deposits accreting in the vicinity of the electrodes. ECC functions as described above for all available electrode materials except tantalum. If tantalum is used as the electrode material, the ECC protects the electrode surface only against oxidation. ☝ Caution! If the ECC is switched off for a prolonged period in applications with conductive deposits, a layer forms inside the measuring tube and this can falsify measurement values. If the layer is allowed to accrete beyond a certain level, it might no longer be possible to remove it by switching on the ECC. If this happens the measuring tube must be cleaned and the layer removed.
ECC DURATION	✎ Note! This function is not available unless the measuring device is equipped with the optional electrode cleaning function (ECC). Use this function to specify the electrode cleaning duration. **User input:** fixed-point number 0.01...30.0 s **Factory setting:** 2.0 s

Function description PROCESS PARAMETER	
ECC RECOVERY TIME	✎ Note! This function is not available unless the measuring device is equipped with the optional electrode cleaning function (ECC). Use this function to specify the recovery time for which the last flow value measured prior to cleaning is retained. A recovery time is necessary as the signal outputs can fluctuate after electrode cleaning on account of electrochemical interference voltages. **User input:** max. 3-digit number: 1... 600 s **Factory setting:** 5 s ☝ Caution! The last value measured prior to cleaning is output for the duration of the recovery time (max. 600 s). This in turn means that the measuring system does not register changes in flow, e.g. stoppage, during this time span.
ECC CLEANING CYCLE	✎ Note! This function is not available unless the measuring device is equipped with the optional electrode cleaning function (ECC). Use this function to specify the cleaning cycle for electrode cleaning. **User input:** Integer: 30...10080 min **Factory setting:** 40 min

15 Group SYSTEM PARAMETERS

Function description SYSTEM PARAMETERS	
INSTALLATION DIRECTION SENSOR	Use this function to reverse the sign of the flow quantity, if necessary. **Options:** NORMAL (flow as indicated by the arrow) INVERSE (flow opposite to direction indicated by the arrow) **Factory setting:** NORMAL ✎ Note! Ascertain the actual direction of fluid flow with reference to the direction indicated by the arrow on the sensor (nameplate).
MEASURING MODE	Use this function to select the measuring mode for all outputs. **Options:** STANDARD SYMMETRY **Factory setting:** STANDARD The responses of the individual outputs in each of the measuring modes are described in detail on the following pages: **Current output and frequency output** STANDARD Only the flow components for the selected flow direction are totalled, (positive or negative full scale value ② = flow direction). Flow components in the opposite direction are not taken into account (suppression). Example for current output:  A0001248 SYMMETRY The output signals of the current and frequency outputs are independent of the direction of flow (absolute amount of the measured variable). The "VALUE 20 mA" or "VALUE-f HIGH" ③ (e.g. backflow) corresponds to the mirrored VALUE 20 mA or VALUE-f HIGH ② (e.g. flow). Positive and negative flow components are taken into account. Example for current output:  A0001249 ✎ Note! The direction of flow can be output via the configurable status output. (continued on next page)

Function description SYSTEM PARAMETERS	
MEASURING MODE (continued)	**Pulse output** STANDARD Only positive flow components are totalled. Negative components are not taken into account. SYMMETRY Positive and negative flow components are taken into account. ✎ Note! The direction of flow can be output via the configurable status output. **Status output** ✎ Note! The information is only applicable if LIMIT VALUE was selected in the function ASSIGN STATUS OUTPUT. STANDARD The status output signal switches at the defined switch points. SYMMETRY The status output signal switches at the defined switch points, irrespective of the sign. In other words, if you define a switch point with a positive sign, the status output signal switches as soon as the value is reached in the negative direction (negative sign), (see illustration). Example for the SYMMETRY measuring mode: Switch-on point: Q = 4 Switch-off point: Q = 10 ① = Status output switched on (conductive) ② = Status output switched off (not conductive)  A0001247
POSITIVE ZERO RETURN	Use this function to interrupt evaluation of measured variables. This is necessary when a piping system is being cleaned, for example. This setting acts on all function and outputs of the measuring device. **Options:** OFF ON → Signal output is set to the "ZERO FLOW" value. **Factory setting:** OFF

Function description SYSTEM PARAMETERS	
SYSTEM DAMPING	Use this function to set the filter depth of the digital filter. This reduces the sensitivity of the measuring signal to interference peaks (e.g. high solids content, gas bubbles in the fluid, etc.). The system reaction time decreases with an increasing filter setting. **User input:** 0...15 **Factory setting:** 9 ✎ Note! The system damping acts on all functions and outputs of the measuring device.
INTEGRATION TIME	Use this function to set the integration time. Under normal circumstances it is not necessary to change the factory settings. **User input:** 3.3...65 ms **Factory setting:** 20 ms at 50 Hz → mains frequency (e.g. Europe) 16.7 ms at 60 Hz → mains frequency (e.g. USA) ☝ Caution! The integration time must not be selected with a greater value than the measuring period (see Page 53). ✎ Note! The integration time defines the duration of internal totaling of the induced voltage in the fluid (measured by the measuring electrode), i.e. the time in which the measuring device records the true flow (afterwards the magnetic field for the next integration is created from the opposite pole).

16 Group SENSOR DATA

Function description SENSOR DATA	
All sensor data (calibration factors, zero point and nominal diameter etc.) are set at the factory and saved on the S-DAT sensor memory chip. ☝ Caution! Under normal circumstances you should not change the following parameter settings, because changes affect numerous functions of the entire measuring facility in general and the accuracy of the measuring system in particular. For this reason, the functions described below cannot be changed even when you enter your personal code. Contact the Endress+Hauser service organization if you have any questions about these functions.	
CALIBRATION DATE	Use this function to view the current calibration date and time for the sensor. **User interface:** Calibration date and time **Factory setting:** Calibration date and time of the current calibration. ✎ Note! The calibration date and time format is defined in the FORMAT DATE TIME function, → Page 9.
K-FACTOR	Use this function to display the current calibration factor for the sensor. The calibration factor is determined and set at the factory. **User interface:** 5-digit fixed-point number: 0.5000...2.0000 **Factory setting:** Depends on nominal diameter and calibration ✎ Note! This value is also provided on the sensor nameplate.
ZERO POINT	This function shows the current zero-point correction value for the sensor. Zero-point correction is determined and set at the factory. **User interface:** max. 4-digit number: –1000...+1000 **Factory setting:** Depends on nominal diameter and calibration ✎ Note! This value is also provided on the sensor nameplate.
NOMINAL DIAMETER	This function shows the nominal diameter for the sensor. The nominal diameter depends on the size of the sensor and is set at the factory. **User interface:** 2...2000 mm or 1/12...78" **Factory setting:** Depends on the size of the sensor ✎ Note! This value is also provided on the sensor nameplate.

Function description SENSOR DATA	
MEASURING PERIOD	Use this function to set the time for a full measuring period. The duration of the measuring period is calculated from the rise time of the magnetic field, the brief recovery time, the integration time (which can be set) and the empty pipe detection time. **User input:** 0.0...1000 ms **Factory setting:** Depends on nominal diameter ✎ Note! The system checks the time entered and sets the measuring period which is actually used internally to a plausible value. If you enter 0 ms, the system automatically computes the shortest time.
OVERVOLTAGE TIME	Use this function to specify the time in which overvoltage is applied to the coil circuit in order to build up the magnetic field as fast as possible. The overvoltage time is adjusted automatically while measuring is in progress. The overvoltage time depends on the sensor type and the nominal diameter and is set at the factory. **User interface:** 4-digit floating-point number: 0.0...100.0 ms **Factory setting:** Depends on nominal diameter
EPD ELECTRODE	Use this function to check whether the sensor is equipped with an EPD electrode. **User interface:** YES NO **Factory setting:** YES → Electrode fitted as standard
POLARITY ECC	Use this function to display the actual current polarity for optional electrode cleaning (ECC). Electrode cleaning uses either a positive or negative current, depending on the electrode material. The measuring device automatically selects the correct polarity on the basis of the electrode-material data stored in the S-DAT. **User interface:** POSITIVE → for electrodes made of: 1.4435, Hastelloy C, platinum, titanium NEGATIVE → for electrodes made of: tantalum ☝ Caution! If the incorrect current is applied to the electrodes, the electrode material is destroyed.

17 Group SUPERVISION

Function description SUPERVISION	
CURRENT SYSTEM CONDITION	Use this function to check the present system status. **User interface:** "SYSTEM OK" or the fault / notice message with the highest priority.
PREVIOUS SYSTEM CONDITIONS	Use this function to view the fifteen most recent fault and notice messages since measuring last started. **User interface:** The last 15 fault/notice messages appear on the display
ASSIGN SYSTEM ERROR	Use this function to view all system errors and the associated error categories (fault message or notice message). By selecting a certain system error, its error category can be changed in the subsequent function ERROR CATEGORY. **Options:** CANCEL List of system errors ✎ Note! ■ You can exit this function as follows: select "CANCEL" and confirm with E. ■ A list of possible system errors is provided in the Operating Instructions Promag 50, BA 046D/06/en
ERROR CATEGORY	✎ Note! This function is only available if a system error has been selected in the function ASSIGN SYSTEM ERROR. Use this function to define whether a system error triggers a notice message or a fault message. If you select FAULT MESSAGES, all outputs respond to an error in accordance with their defined error response patterns. **Options:** NOTICE MESSAGES (display only) FAULT MESSAGES (outputs and display) ✎ Note! Press the E key twice to call up the ASSIGN SYSTEM ERROR function.
ASSIGN PROCESS ERROR	Use this function to view all process errors and the associated error categories (fault message or notice message). By selecting an individual process error, its error category can be changed in the subsequent function ERROR CATEGORY. **Options:** CANCEL List of process errors ✎ Note! ■ You can exit this function as follows: select "CANCEL" and confirm with E. ■ A list of possible process errors is provided in the Operating Instructions Promag 50, BA 046D/06/en

Function description SUPERVISION	
ERROR CATEGORY	✎ Note! This function is only available if a process error has been selected in the function ASSIGN PROCESS ERROR. Use this function to define whether a process error triggers a notice message or a fault message. If you select FAULT MESSAGES, all outputs respond to an error in accordance with their defined error response patterns. **Options:** NOTICE MESSAGES (display only) FAULT MESSAGES (outputs and display) ✎ Note! Press the E key twice to call up the ASSIGN PROCESS ERROR function.
ALARM DELAY	Use this function to define a time span in which the criteria for an error have to be satisfied without interruption before an error or notice message is generated. Depending on the setting and the type of error, this suppression acts on: ■ Display ■ Status output ■ Current output ■ Frequency output **User input:** 0...100 s (in steps of one second) **Factory setting:** 0 s ☝ Caution! If this function is activated error and notice messages are delayed by the time corresponding to the setting before being forwarded to the higher-order controller (process controller, etc.). It is therefore imperative to check in advance in order to make sure whether a delay of this nature could affect the safety requirements of the process. If error and notice messages cannot be suppressed, a value of 0 seconds must be entered here.
SYSTEM RESET	Use this function to perform a reset of the measuring system. **Options:** NO RESTART SYSTEM (restart without interrupting power supply) **Factory setting:** NO
OPERATION HOURS	The hours of operation of the device appear on the display. **Display:** Depends on the number of hours of operation elapsed: Hours of operation < 10 hours → display format = 0:00:00 (hr:min:sec) Hours of operation 10...10,000 hours → display format = 0000:00 (hr:min) Hours of operation > 10,000 hours → display format = 000000 (hr)
PERMANENT STORAGE	This function indicates whether permanent storage of all parameters in the EEPROM has been switched on or off. **Display:** 0 = OFF 1 = ON **Factory setting:** ON

18 Group SIMULATION SYSTEM

Function description SIMULATION SYSTEM	
SIMULATION FAILSAFE MODE	Use this function to set all inputs, outputs and the totalizer to their defined failsafe modes, in order to check whether they respond correctly. During this time, the words "SIMULATION FAILSAFE MODE" appear on the display. **Options:** ON OFF **Factory setting:** OFF
SIMULATION MEASURED VARIABLE	Use this function to set all inputs, outputs and the totalizer to their defined flow-response modes, in order to check whether they respond correctly. During this time, the words "SIMULATION MEASURAND" appear on the display. **Options:** OFF VOLUME FLOW **Factory setting:** OFF Caution! ■ The measuring device cannot be used for measuring while this simulation is in progress. ■ The setting is not saved if the power supply fails.
VALUE SIMULATION MEASURED VARIABLE	Note! This function is not available unless the SIMULATION MEASURED VARIABLE function is active (= VOLUME FLOW). Use this function to specify a selectable value (e.g. 12 m^3/s). This value is used to test downstream devices and the measuring device itself. **User input:** 5-digit floating-point number, [unit] **Factory setting:** 0 [unit] Caution! The setting is not saved if the power supply fails. Note! The appropriate unit is taken from the group SYSTEM UNITS, (see Page 8)

19 Group SENSOR VERSION

Function description SENSOR VERSION	
SERIAL NUMBER	Use this function to view the serial number of the sensor.
SENSOR TYPE	Use this function to view the sensor type.
HARDWARE REVISION NUMBER SENSOR	Use this function to view the hardware revision number of the sensor.
SOFTWARE REVISION NUMBER S-DAT	Use this function to view the software revision number of the software used to create the content of the S-DAT

20 Group AMPLIFIER VERSION

Function description AMPLIFIER VERSION	
DEVICE SOFTWARE	Displays the current device software version.
SOFTWARE REVISION NUMBER AMPLIFIER	Use this function to view the software revision number of the amplifier.
LANGUAGE GROUP	Use this function to view the language group. The following language groups can be ordered: WEST EU / USA, EAST EU / SCAND., ASIA. **Display:** available language group ✎ Note! ■ The language options of the available language group are displayed in the LANGUAGE function. ■ You can change the language group via the configuration software FieldCare. Please do not hesitate to contact your Endress+Hauser sales office if you have any questions.
I/O MODULE TYPE	Use this function to view the configuration of the I/O module complete with terminal numbers.
SOFTWARE REVISION NUMBER I/O MODULE	Use this function to view the software revision number of the I/O module.

DE- Sicherheitshinweise

Der Liquiphant M FTL50, FTL51 darf nur als Grenzschalter für Flüssigkeiten verwendet werden. Bei unsachgemäßem Einsatz können Gefahren von ihm ausgehen.

Das Gerät darf **nur von qualifiziertem und autorisiertem Fachpersonal** unter strenger Beachtung dieser Betriebsanleitung, der einschlägigen Normen, der gesetzlichen Vorschriften und der Zertifikate (je nach Anwendung) eingebaut, angeschlossen, in Betrieb genommen und gewartet werden.

In der Gebäudeinstallation ist ein Netzschalter für das Gerät leicht erreichbar in dessen Nähe zu installieren.

Er ist als Trennvorrichtung für das Gerät zu kennzeichnen.

EN- Notes on Safety

The Liquiphant M FTL50, FTL51 is designed for point level detection in liquids.

If used incorrectly it is possible that application-related dangers may arise.

The level limit switch Liquiphant M FTL50, FTL51 may be installed, connected, commissioned, operated and maintained **by qualified and authorised personnel only**, under strict observance of these operating instructions, any relevant standards, legal requirements, and, where appropriate, the certificate.

Install an easily accessible power switch in the proximity of the device.

Mark the power switch as a disconnector for the device.

FR- Conseils de sécurité

Le Liquiphant M FTL50, FTL51 doit être exclusivement utilisé comme détecteur de niveau pour liquides.

Il peut être source de danger en cas d'utilisation non conforme aux prescriptions.

L'appareil ne doit être installé, raccordé, mise en service et entretenu **que par un personnel qualifié et autorisé**, qui tiendra compte des indications contenues dans la présente mise en service, des normes en vigueur et des certificats disponibles (selon l'application).

Installer un commutateur réseau à proximité immédiate de l'appareil, en veillant à ce qu'il soit facilement accessible.

Marquer ce commutateur comme prise de coupure de l'appareil.

ES - Notas sobre seguridad

El detector de nivel Liquiphant M FTL50, FTL51 ha sido diseñado para la detección de límite en fluidos.
Su empleo inapropiado puede resultar peligroso.
El equipo deberá ser montado, conectado, instalado y mantenido **única y exclusivamente por personal cualificado y autorizado**, bajo rigurosa observación de las presentes instrucciones de servicio, de las normativas y legislaciones vigentes, así como de los certificados (dependiendo de la aplicación).
Instalar un interruptor de fácil acceso en las proximidades del equipo.
Identificar el interruptor como desconectador del equipo.

IT - Note sulla sicurezza

Il Liquiphant M FTL50, FTL51 è particolarmente studiato per l'impiego come soglia di livello in liquidi.
Un'installazione non corretta può determinare pericolo.
Lo strumento può essere montato **solamente da personale qualificato ed autorizzato**.
La messa in esercizio e la manutenzione devono rispettare le indicazioni di collegamento, le norme e i certificati di seguito riportati.
Installare un interuttore per l'alimentazione in prossimità del dispositivo.
Marcare l'interuttore come disconnessione del dispositivo.

NL- Veiligheidsinstructies

Gebruik de Liquiphant M FTL50, FTL51 alleen als niveauschakelaar voor vloeistoffen.
Indien niet correct gebruikt kunnen gevaarlijke situaties ontstaan.
Het instrument **alleen door gekwalificeerd en geautoriseerd personeel** laten inbouwen, aansluiten, in bedrijf nemen en onderhouden.
Neem de instructies in deze Inbedrijfstellingsvoorschriften, de desbetreffende normen, de wettelijke voorschriften en eventuele certificaten in acht.
Installeer een makkelijk bereikbare voedingschakelaar in de nabijheid van het instrument.
Kenmerk de voedingschakelaar specifiek voor het instrument.

DE- Behandlung
Am Gehäuse, Flansch oder Verlängerungsrohr anfassen.

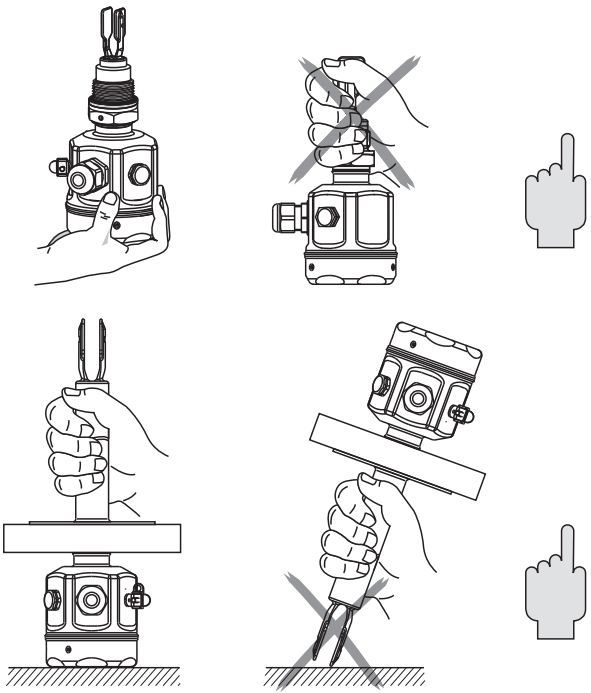
EN- Handling
Hold by housing, flange or extension tube.

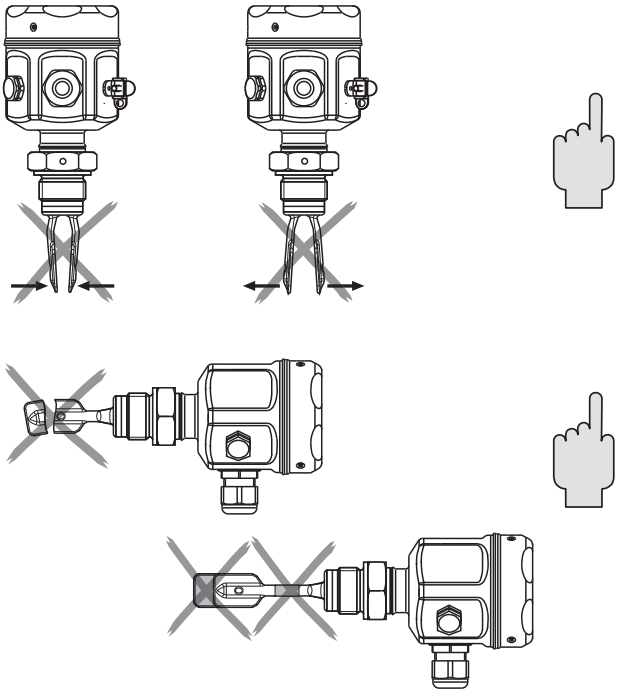
FR- Manipulation
Tenir par le boîtier, la bride ou le tube prolongateur.

ES - Modo de empleo
Coger por el cabezal, brida o tubo de extensión.

IT - Accorgimenti
Afferrare la custodia, per la flangia o per il tubo di estensione.

NL- Behandeling
Vastpakken via behuizing, flens of verlengbuis.





DE- **Nicht** verbiegen
Nicht kürzen
Nicht verlängern

EN- Do **not** bend
Do **not** shorten
Do **not** lengthen

FR- **Ne pas** déformer
Ne pas raccourcir
Ne pas rallonger

DE- Fehlersuche

Fehlfunktion	Ursache	Maßnahme
Schaltet nicht	Versorgungsspannung fehlt	Versorgung prüfen
	Signalleitung defekt	Signalleitung prüfen
	Elektronikeinsatz defekt - FEL51 direkt an L1 und N angeschlossen	Austauschen - FEL51 immer über externe Last anschließen
	Dichte der Flüssigkeit zu gering	Am Elektronikeinsatz Dichte auf > 0,5 einstellen
	Schwinggabel verkrustet	Schwinggabel säubern
	Schwinggabel korrodiert (Anzeige am FEL: rot/gelb blinkt, FEL58: grün blinkt 0,3 Hz)	Schwinggabel komplett mit Prozessanschluss austauschen
	FEL51: Relais mit zu großem Innenwiderstand angeschlossen	Geeignetes Relais anschließen
	FEL51: Relais mit zu geringem Haltestrom angeschlossen	Widerstand parallel zum Relais anschließen
	FEL54: Kontakte verschweißt (nach einem Kurzschluss)	FEL54 austauschen; Sicherung in den Kontaktstromkreis
Schaltet falsch	Minimum-/Maximum- Sicherheitsschaltung vertauscht	Am Elektronikeinsatz Sicherheitsschaltung richtig einstellen
Fehlschaltung, sporadisch	Dichter schwerer Schaum, wilde Turbulenzen, aufgeschäumte Flüssigkeit	Liquiphant im Bypass montieren
	Extreme Funkstörung	Verbindungskabel abschirmen
	Extreme Vibrationen	Entkoppeln, dämpfen, Schwinggabel 90° drehen
	Wasser im Gehäuse	Deckel und Kabeldurchführungen fest zuschrauben
	FEL52: Ausgang überlastet	Last, (Leitungs-) Kapazität verringern
Fehlschaltung nach Netzausfall	FEL57, Verhalten beim Einschalttest (wiederkehrende Prüfung)	Schaltverhalten FEL57 beachten; Anlagensteuerung nach Netzausfall bis ca. 45 s blockieren

Fault	Reason	Remedy
Does not switch	No power	Check power
	Faulty signal line	Check signal line
	Faulty electronic insert - FEL51 connected directly to L1 and N	Exchange - always connect FEL51 via external load
	Density of liquid too low	Set density to > 0.5 at electronic insert
	Fork encrusted	Clean fork
	Fork corroded (Indication on FEL: red/yellow flashes, FEL58: green flashes 0.3 Hz)	Exchange fork and process connection
	FEL51: Internal resistance of connected relay too large	Connect suitable relay
	FEL51: Holding current of connected relay too low	Connected resistor in parallel with relay
	FEL54: Contacts welded together (after short-circuit)	Exchange FEL54; put fuse in contact circuit
Switches incorrectly	Min-/Max- fail-safe mode set wrongly	Set correct mode at electronic insert
Sporadic faulty switching	Thick heavy foam, very turbulent conditions, foaming liquid	Mount Liquiphant in bypass
	Extreme RFI	Use screened cable
	Extreme vibration	Decouple, damp, turn fork 90°
	Water in housing	Screw cover and cable gland tight
	FEL52: Output overloaded	Reduce load,(cable) capacitance
Switches incorrectly after power failure	FEL57, behaviour during switch-on test (functional test)	Observe switching behaviour of FEL57; After power failure blockplant control for up to 45 s

FR- Recherche de défauts

Défaut	Cause	Mesure
Ne commute pas	Tension d'alimentation manquante	Vérifier la tension d'alimentation
	Câble de signal défectueux	Vérifier le câble de signal
	Electronique défectueuse - FEL51 relié directement á L1 et N	Remplacer - Relier FEL51 toujours via la charge externe
	Densité du liquide trop faible	Régler la densité sur > 0,5 sur l'électronique
	Lames vibrantes encroûtées	Nettoyer les lames vibrantes
	Lames vibrantes corrodées (Sur FEL: rouge/jaune clignote, FEL58: vert clignote 0,3 Hz)	Remplacer les lames vibrantes ainsi que le raccord process
	FEL51: relais avec résistance interne trop élevée	Raccorder un relais approprié
	FEL51: relais avec courant de maintien trop faible	Raccorder une résistance en parallèle au relais
	FEL54: contacts soudés (après un court-circuit)	Remplacer FEL54; fusible dans le circuit courant
Mauvaise commutation	Sécurité min/max inversée	Régler correctement le circuit de sécurité sur l'électronique
Mauvaise commutation, sporadique	Mousse dense et lourde, fortes turbulences, liquide émulsionné	Monter le Liquiphant en bypass
	Parasites puissants	Blinder le câble de liaison
	Vibrations importantes	Découpler, amortir, tourner la fourche de 90°
	Eau dans le boîtier	Visser fermement le couvercle et les entrées de câble
	FEL52: surcharge de la sortie	Réduire la charge et la capacité (de ligne)
Mauvaise commutation après coupure	FEL57, comportement lors du test de mise sous tension (test cyclique)	Observer le comportement du FEL57 à la mise sous tension; bloquer la commande de l'installation après coupure de courant pendant max. 45 s

Fallo	Causa	Solución
No conmuta	No hay alimentación	Comprobar alimentación
	Señal defectuosa	Comprobar cable de señal
	Electrónica defectuosa - FEL51 conectada directamente a L1 y N	Cambio - Siempre conectar FEL51 vía una carga externa
	Densidad del líquido demasiado baja	Fijar densidad a > 0.5 en la electrónica
	Horquillas con adherencias	Limpiar horquillas
	Horquillas corroidas (En FEL: rojo/amarillo parpadea, FEL58: verde parpadea 0.3 Hz)	Cambiar la horquilla y la conexión a proceso
	FEL51: Relé con resistencia interna demasiado grande	Conectar un relé adecuado
	FEL51: El relé conectado retiene muy poca corriente	Resistencia conectada en paralelo con el relé
	FEL54: Contactos soldados juntos (después del corto circuito)	Cambiar FEL54; poner fusible en el circuito de contacto
Conmuta incorrectamente	El modo de fallo mín./máx. está mal ajustado	Ajustar el modo correcto en la electrónica
Fallos de conmutación esporádicos	Espuma muy densa, turbulencias, líquidos espumosos	Montar el Liquiphant en bypass
	RFI extremo	Utilizar cable apantallado
	Vibraciones extremas	Desacoplar, amortiguar y girar las horquillas 90°
	Agua en el cabezal	Roscar la cubierta y el prensaestopas firmemente
	FEL52: Salida con sobretensión	Reducir carga, capacidad (cable)
Conmuta incorrectamente después de un fallo de alimentación	FEL57, comportamiento durante la comprobación de conmutación (test de funcionamiento)	Observar el comportamiento de conmutación del FEL57; del fallo de alimentación, bloqueo del control de la planta durante 45 s aprox.

IT - Individuazione e eliminazione delle anomalie

Guasto	Motivo	Rimedio
Non commuta	Mancanza alimentazione	Controllare l'alimentazione
	Linea segnale guasta	Controllare segnale linea
	Inserto elettronico guasto - FEL51 connesso direttamente a L1 e N	Sostituire - connettere sempre FEL51 mediante carico esterno
	Densità del liquido troppo bassa	Impostare la densità a > 0,5 sull'inserto elettronico
	Forcella incrostata	Pulire la forcella
	Forcella corrosa (Sul FEL: rosso/giallo lampeggiano, FEL58: verde lampeggiano 0,3 Hz)	Sostituire la forcella e la connessione al processo
	FEL51: resistenza interna del relè connesso troppo grande	Collegare il relè adeguato
	FEL51: corrente di mantenimento del relè connesso troppo grande	Connettere resistenza in parallelo al relè
	FEL54: contatti saldati insieme (dopo il corto circuito)	Sostituire FEL54; mettere il fusibile nel circuito di contatto
Commuta non correttamente	Modalità di sicurezza min-/max-impostata in modo errato	Impostare la modalità corretta nell'inserto elettronico
Commutazione sporadicamente difettosa	Schiuma pesante e torbida condizioni molto turbolente, liquido che produce schiuma	Montare il Liquiphant nel bypass
	RFI forte	Usare cavo schermato
	Forte vibrazione	Disaccoppiare, smorzare, ruotare la forcella di 90°
	Acqua nella custodia	Avvitare correttamente il coperchio e il passacavi
	FEL52: Uscita sovraccaricata	Ridurre il carico, capacità (cavo)
Commutazione non corretta dopo la mancanza alimentazione	FEL57, comportamento durante la fase di test all'accensione (test di funzionamento)	Osservare il comportamento di commutazione del FEL57; dopo il ripristino di una mancanza di alimentazione inibire il controllo dell'impianto per 45 s

Fout	Oorzaak	Maatregel
Schakelt niet	Voeding ontbreekt	Voeding kontroleren
	Signaalleiding defect	Signalleiding kontroleren
	Insert defect - FEL51 direct op L1 en N aangesloten	Ver vangen - FEL51 altijd via een belasting aansluiten
	Dichtheid van de vloeistof te gering	Op elektronica- insert dichtheid op > 0, 5 instellen
	Trilvork te veel vervuild	Trilvork reinigen
	Trilvork gecorrodeerd (LED op FEL knippert rood/geel, FEL58: groen knippert 0,3 Hz)	Trilvork compleet met procesaansluiting vervangen
	FEL51: Relais met te groteinwendige weerstand aangesloten	Passender relais aansluiten
	FEL51: Relais met te geringe houdstroom aangesloten	Weerstand parallel aan relais aansluiten
	FEL54: Contacten verkleeft (na een kortsluiting)	FEL54 vervangen; zekering in circuit aanbrengen
Schakelt foutief	Minimum- /Maximum- fail-safe instelling verwisseld	FEL fail-safe keuze correct instellen
Sporadische foutschakeling	Dik zwaar schuim, wilde turbulentie, opgeschuimde vloeistof	Liquiphant in by-pass monteren
	Extreme RFI invloed	Verbindingskabel afschermen
	Extreme vibraties	Ontkoppelen, dempen, vork 90° draaien
	Water in de behuizing	Deksel en wartels vast aandraaien
	FEL52: uitgang overbelast	Schakelbelasting verminderen
Foutmelding	FEL57, gedrag bij inschakelen na netuitval (periodieke testfunctie)	Schakelgedrag FEL57 controleren; procesherstart na netuitval ca. 45 s blokkeren

DE- Ergänzung Fehlersuche

Ist das Schaltverhalten der Gabel ungewöhnlich, kann an PIN 4 der Diagnosebuchse die Gabelfrequenz gemessen werden.
Bei den Elektronikeinsätzen FEL51/52/54/55/56/57/58 ist dies eine sinusförmige Schwingung deren Amplitude einen Rückschluss auf den Gabelzustand zulässt.
Bei FEL50A ist aufgrund eines Rechtecksignals nur noch die Gabelfrequenzmessung möglich.

EN- Trouble- shooting Supplement

If the switching behaviour of the fork is abnormal, the fork frequency can be measured at PIN 4 of the diagnosis socket.
With electronic inserts FEL51/52/54/55/56/57/58 this is a sinusoidal vibration whose amplitude makes it possible to determine the condition of the fork.
With FEL50A, only the fork frequency measurement is possible due to a rectangular pulse signal.

FR- Additif recherche de défauts

Si la commutation de la fourche est inhabituelle, il est possible de mesurer la fréquence de cette dernière au PIN 4 de la prise diagnostic.
Pour l es électroniques FEL51/52/54/55/56/57/58 il s'agit d'une oscillation sinusoïdale dont l'amplitude permet d'évaluer l'état de la fourche.
Pour FEL50A, le signal rectangulaire ne permet qu'une mesure de la fréquence de fourche.

ES – Suplemento para la identificación de fallos

Si el comportamiento de conmutación de la horquilla es anormal, puede medir la frecuencia de la misma en el PIN 4 del interruptor de diagnosis. Con las electrónicas FEL51/52/54/55/56/57/58 se consigue una vibración sinusoidal cuya amplitud hace posible determinar la condición de la horquilla.
Con FEL50A, sólo es posible medir la frecuencia de la horquilla debido a una señal de impulsos rectangular.

IT – Supplemento alla ricerca dei malfunzionamenti

Se le condizioni di commutazione dei rebbi non è normale la frequenza di vibrazione può essere misurata al PIN 4 del connettore per la diagnosi. Con gli inserti elettronici FEL51/52/54/55/56/57/58 è possibile determinare la condizione dei rebbi anche tramite l'ampiezza dell'onda sinusoidale. Con FEL50A il segnale è un onda quadra, per cui è possibile valutare solo il valore di frequenza.

NL– Bijlage problemen oplossen

Indien het schakelgedrag van de trilvork niet normaal verloopt kan de frequentie van de vork gemeten worden op pen 4 van de diagnoseconnector.
Bij de elektronica inserts van de FEL51/52/54/55/56/57/58 is dit een sinusvormige trilling waarvan de amplitude een beeld geeft van de conditie van de vork.
Bij de FEL50A is alleen de vorkfrequentie te meten als gevolg van een rechthoekig pulssignaal.

Installationsregel: Bei der Installation ist zu beachten, dass elektrische Betriebsmittel (Elektronikeinsätze) die mit nichteigensicheren Stromkreisen gespeist wurden, grundsätzlich **nicht** mehr mit eigensicheren Stromkreisen zusammengeschaltet werden dürfen.

Installation specification: During installation, please keep in mind that electrical resources (electronic inserts) which are powered by non-intrinsically-safe circuits may **no** longer be interconnected with intrinsically-safe circuits.

Directive d'installation : Lors de l'installation, tenir compte du fait que les matériels électriques (électroniques) alimentés par des circuits sans sécurité intrinsèque **ne** doivent plus être connectés à des circuits à sécurité intrinsèque.

Normas de instalación: Durante la instalación, tenga en cuenta que los elementos eléctricos (electrónicas) alimentadas por circuitos no instrínsecamente seguros, **no** podrán estar interconectadas con circuitos intrínsecamente seguros.

Specifiche di installazione: Durante l'installazione è necessario tenere presente che gli impianti elettrici (inserti elettronici) alimentati da circuiti elettrici non a sicurezza intrinseca **non** possono più essere collegati con circuiti elettrici a sicurezza intrinseca.

Installatievoorschrift: Bij de installatie moet erop worden gelet, dat elektrisch materieel (elektronica-units) die via niet-intrinsiekveilige circuits worden gevoed, in principe **niet** meer met intrinsiekveilige circuits mogen worden samengeschakeld.

d Sicherheitshinweise

Der FTE 31 darf nur als Füllstandsgrenzschalter für spezifizierte Schüttgüter eingesetzt werden. Bei unsachgemäßem Gebrauch können Gefahren von ihm ausgehen.

Das Gerät darf nur von **qualifiziertem und autorisiertem Fachpersonal unter besonderer Beachtung dieser Betriebsanleitung**, der gesetzlichen Vorschriften und der Zertifikate (je nach Anwendung) eingebaut, angeschlossen, in Betrieb genommen und gewartet werden.

Achtung!
= verboten - führt zu fehlerhaftem Betrieb oder Zerstörung.

e Notes on safety

The FTE 31 paddle switch is a level limit switch, designed for use in fine-grained bulk solids in non-hazardous areas.
If used incorrectly it is possible that application-related dangers may arise.
The FTE 31 paddle switch may be installed, connected, commissioned, operated and maintained **by qualified and authorised personnel only,** under strict observance of these operating instructions, any relevant standards, legal requirements, and, where appropriate, the certificate.

Caution!
= forbidden - leads to incorrect operation or destruction.

f Conseils de sécurité

Le FTE 31 est un détecteur de niveau à palette rotative pour produits solides en vrac de faible granulométrie, utilisable en zones non explosibles. Il peut être source de danger en cas d´utilisation non conforme aux prescriptions. L´appareil ne doit être installé, raccordé, mis en service et maintenu **que par un personnel qualifié et autorisé,** qui tiendra compte des indications contenues dans la présente mise en service, des normes en vigueur et des certificats disponibles (selon l´application).

Attention!
= interdit - peut provoquer des dysfonctionnements ou la destruction.

es - Notas sobre seguridad

Cerabar T está diseñado para medir presión absoluta y relativa en gases, vapores, liquidos y sólidos pulvurulentos. Su empleo inapropiado puede resultar peligroso. El equipo deberá ser montado, conectado, instalado y mantenido única y exclusivamente por personal cualificado y autorizado, bajo rigurosa observación de las presentes instrucciones de servicio y de la Informatión Técnica TI00415P, de las normativas y legislaciones vigentes, así como de los certificados (dependiendo de la aplicación).

it - Note sulla sicurezza

Il Cerabar T è stato progettato per la misura della pressione assoluta e relativa di gas, vapori, liquidi e polveri. Un'installazione non corretta può determinare pericolo per le persone e le cose. Lo strumento deve essere montato collegato e messo in servizio solamente da personale qualificato ed autorizzato, nel totale rispetto delle indicazioni operative qui riportate, delle prescrizioni presenti nelle informazioni tecniche TI00415P ed in accordo a tutte le norme e legislazioni vigenti e le certificazioni utilizzate.

nl - Veiligheidsinstructies

De Cerabar T is ontworpen voor het meten absoluut en overdruk van gassen, dampen, vloeistoffen en vaste stoffen. Bij niet correct gebruik kunnen gevaarlijke situaties onstaan. Het instrument mag uitsluitend door gekwalificeerd en geautoriseerd vakpersoneel geinstalleerd, aangesloten en inbedrijf genomen worden met inachtneming van dit inbedrij-fstellingsvoorschrift, het bijbehorende Technisch Informatie blad TI00415P en de betreffende normen, de wettelijke voorschriften en eventuele certificaten in acht.

de - Montage

- Die Funktion des Drucktransducers ist unabhängig von der Einbaulage.
- Zum Schutz des Gewindes und der Druckmembran darf die Schutzkappe am Gewindestutzen erst kurz vor dem Einbau entfernt werden.
- Der Drucktransducer ist nach den gleichen Richtlinien wie ein Manometer zu montieren. Wir empfehlen die Verwendung von Absperrhähnen und Wassersackrohren.
- Beim Einbau ist darauf zu achten, dass kein Tropfwasser in das Gehäuse eindringen kann.
- Einsatzgrenzen für Sauerstoff beachten (bei FKM Viton/O_2 gemäß BAM-Liste).
- Bei Anwendungen in explosionsfähiger Atmosphäre der Zone 2 (Zündschutzart Ex nA), Gehäuse vor Schlageinwirkung schützen.

en - Mounting

- The function of the transducer is independent of mounting orientation.
- To protect the thread and pressure diaphragm from damage, the protective cover on the threaded nozzle should be removed just before installation only.
- The pressure transducer is to be mounted like a manometer. The guidelines are identical. Isolating valves and water pocket pipes should be used.
- When installing, ensure that no water enters the housing.
- Note the application limits for oxygen (for FKM Viton/O_2 as per BAM list).
- In the event of applications in a Zone 2 explosive atmosphere (Ex nA explosion protection) protect the housing from impact.

fr - Montage

- Le fonctionnement du transducteur de pression est indépendant de son implantation.
- Afin de protéger le filetage et la membrane, ne retirer le capot de protection, placé sur le raccord fileté, qu'au moment du montage.
- Le transducteur de pression doit être monté conformément aux directives concernant les manomètres. Nous recommandons l'utilisation de robinets d'isolement et de siphons.
- Lors du montage, veiller à ce qu'il n'y ait pas d'infiltration d'eau dans le boîtier.
- Tenir compte des limites d'utilisation sur l'oxygène (pour FKP Viton/O_2 selon liste BAM).
- Les applications en atmosphère explosible de zone 2 (mode de protection antidéflagrant Ex nA), protéger le boîtier contre les chocs.

es - Montaje

- El funcionamiento del transmisor de presión es independiente de la orientación de montaje.
- No retirar la protección del casquillo roscado hasta el momento previo a su instalación para evitar dañar la rosca o el diafragma de presión.
- El transmisor de presión se deberá montar como un manómetro. El procedimiento es el mismo. Utilizar válvulas de corte y sifón.
- Durante la instalación asegurar que no entre agua en la caja.
- Observar los límites de utilización en oxígeno (para FKP Viton/O_2 según lista BAM).
- En las aplicaciones en atmósferas con riesgo de explosión de la zona 2 (tipo de protección contra ignición Ex nA) se debe proteger la carcasa contra el efecto de los impactos.

it - Montaggio

- Il funzionamento del trasduttore non dipende dalla posizione di montaggio.
- Per proteggere la filettatura e la membrana di pressione da eventuali danneggiamenti, eliminare il coperchio di protezione dell'ugello filettato solo immediatamente prima dell'installazione.
- Il trasduttore di pressione deve essere montato come un manometro. Utilizzare solo valvole di arresto e tubi separatori d'acqua.
- Durante l'installazione, assicurarsi che non entri acqua nella custodia.
- Osservare i limiti operativi per ossigeno (per FKM Viton/O_2 in accordo con lista BAM).
- Per l'utilizzo in ambienti a rischio di esplosione della zona 2 (Protezione antideflagrante Ex nA), proteggere le custodie contro gli urti.

nl - Montage

- Het functioneren van de Druk-transducer is onhafhankelijk van de montagepositie.
- Ter bescherming van de buitendraad en het membraan moet de beschermhuls pas vlak voor de montage verwijderd worden.
- De Druk-transducer moet identiek als een manometer gemonteerd worden. De richtlijnen t.a.v. gebruik van afsluitkranen, afstandsstukken en watersloten moeten worden aangehouden.
- Bij installatie ervoor zorgen dat er geen water in de behuizing kan komen, ook niet via de connector/wartel.
- Toepassingen in zuurstof bekijken (met FKM Viton/O_2 conform BAM lijst).
- Bescherm de behuizing tegen schokken bij toepassingen in explosiegevaarlijke atmosferen zone 2 (ontstekingsklasse Ex nA).

1 Safety instructions

1.1 Designated use

The Cerabar S is a pressure transmitter for measuring pressure and level.

The manufacturer accepts no liability for damages resulting from incorrect use or use other than that designated.

1.2 Installation, commissioning and operation

The device has been designed to operate safely in accordance with current technical, safety and EU standards. If installed incorrectly or used for applications for which it is not intended, however, it is possible that application-related dangers may arise, e.g. product overflow due to incorrect installation or calibration. For this reason, the instrument must be installed, connected, operated and maintained according to the instructions in this manual: personnel must be authorised and suitably qualified. The manual must have been read and understood, and the instructions followed. Modifications and repairs to the device are permissible only when they are expressly approved in the manual. Pay particular attention to the technical data on the nameplate.

1.3 Operational safety and process safety

Alternative monitoring measures must be taken to ensure operational safety and process safety during configuration, testing and maintenance work on the device.

1.3.1 Hazardous areas (optional)

Devices for use in hazardous areas are fitted with an additional nameplate (→ 6). If the device is to be installed in an explosion hazardous area, then the specifications in the certificate as well as all national and local regulations must be observed. The device is accompanied by separate "Ex documentation", which is an integral part of this Operating Instructions. The installation regulations, connection values and Safety Instructions listed in this Ex document must be observed. The documentation number of the related Safety Instructions is also indicated on the additional nameplate.

- Ensure that all personnel are suitably qualified.

1.3.2 Functional Safety SIL3 (optional)

If using devices for applications with safety integrity, the Functional Safety Manual (SD00190P) must be observed thoroughly.

1.4 Notes on safety conventions and icons

In order to highlight safety-relevant or alternative operating procedures in the manual, the following conventions have been used, each indicated by a corresponding icon in the margin.

Safety conventions	
	Warning! A warning highlights actions or procedures which, if not performed correctly, will lead to personal injury, a safety hazard or destruction of the instrument.
	Caution! Caution highlights actions or procedures which, if not performed correctly, may lead to personal injury or incorrect functioning of the instrument.
	Note! A note highlights actions or procedures which, if not performed correctly, may indirectly affect operation or may lead to an instrument response which is not planned.
	Device certified for use in explosion hazardous area If the device has this symbol embossed on its nameplate, it can be installed in an explosion hazardous area or a non-explosion hazardous area, according to the approval.
	Explosion hazardous area Symbol used in drawings to indicate explosion hazardous areas. – Devices used in hazardous areas must possess an appropriate type of protection.
	Safe area (non-explosion hazardous area) Symbol used in drawings to indicate, if necessary, non-explosion hazardous areas. – Devices used in hazardous areas must possess an appropriate type of protection. Lines used in hazardous areas must meet the necessary safety-related characteristic quantities.
	Direct voltage A terminal to which or from which a direct current or voltage may be applied or supplied.
	Alternating voltage A terminal to which or from which an alternating (sine-wave) current or voltage may be applied or supplied.
	Grounded terminal A grounded terminal, which as far as the operator is concerned, is already grounded by means of an earth grounding system.
	Protective grounding (earth) terminal A terminal which must be connected to earth ground prior to making any other connection to the equipment.
	Equipotential connection (earth bonding) A connection made to the plant grounding system which may be of type e.g. neutral star or equipotential line according to national or company practice.
	Temperature resistance of the connection cables States, that the connection cables must be resistant to a temperature of at least 85 °C (185 °F).
	**Safety instruction** For safety instructions refer to the manual for the appropriate instrument version.

2 Identification

2.1 Product identification

The following options are available for identification of the measuring device:
- Nameplate specifications
- Order code with breakdown of the device features on the delivery note
- Enter serial numbers from nameplates in W@M Device Viewer (www.endress.com/deviceviewer): All information about the measuring device is displayed.

For an overview of the technical documentation provided, enter the serial number from the nameplates in the W@M Device Viewer (www.endress.com/deviceviewer).

2.2 Device designation

2.2.1 Nameplate

Note!
- The MWP (maximum working pressure) is specified on the nameplate. This value refers to a reference temperature of 20°C (68°F) or 100°F (38 °C) for ASME flanges.
- The pressure values permitted at higher temperatures can be found in the following standards:
  – EN 1092-1: 2001 Tab. 18 [1)]
  – ASME B 16.5a – 1998 Tab. 2-2.2 F316
  – ASME B 16.5a – 1998 Tab. 2.3.8 N10276
  – JIS B 2220
- The test pressure corresponds to the over pressure limit (OPL) of the device = MWP x 1.5 [2)].
- The Pressure Equipment Directive (EC Directive 97/23/EC) uses the abbreviation "PS". The abbreviation "PS" corresponds to the MWP (maximum working pressure) of the measuring device.

1) With regard to their temperature stability properties, the materials 1.4404 and 1.4435 are grouped under 13E0 in EN 1092-1 Tab. 18. The chemical composition of the two materials can be identical.
2) The equation does not apply for PMP71 and PMP75 with a 40 bar (600 psi) or a 100 bar (1500 psi) measuring cell.

7 Approval-specific information and document number for safety instructions or drawing number

2.2.2 Identifying the sensor type

See parameter "Sensor Meas.Type" in Operating Instruction BA00274P.

2.3 Scope of delivery

The scope of delivery comprises:
- Cerabar S pressure transmitter
- For devices with the "HistoROM/M-DAT" option:
  CD-ROM with Endress+Hauser operating program
- Optional accessories

Documentation supplied:
- The Operating Instructions BA00271P and BA00274P are available via the Internet.
  → See: www.endress.com → Download.
- Brief Operating Instructions KA01019P
- Leporello KA00218P
- Final inspection report
- Also Safety Instructions with ATEX, IECEx and NEPSI devices
- Optional: factory calibration form, test certificates

2.4 Certificates and approvals

CE mark, declaration of conformity

The device is designed to meet state-of-the-art safety requirements, has been tested and left the factory in a condition in which it is safe to operate. The device complies with the applicable standards and regulations as listed in the EC declaration of conformity and thus complies with the statutory requirements of the EC Directives. Endress+Hauser confirms the successful testing of the device by affixing to it the CE mark.

3 Installation

3.1 Incoming acceptance, transport, storage

3.1.1 Incoming acceptance

- Check the packaging and the contents for damage.
- Check the shipment, make sure nothing is missing and that the scope of supply matches your order.

3.1.2 Transport

Caution!
Follow the safety instructions and transport conditions for devices of more than 18 kg (39.69 lbs). Transport the measuring device to the measuring point in its original packaging or at the process connection.

3.1.3 Storage

The device must be stored in a dry, clean area and protected against damage from impact (EN 837-2).

Storage temperature range:
- –40 °C to +90°C (–40 °F to +194°F)
- On-site display: –40 °C to +85°C (–40 °F to +185°F)
- Separate housing: –40 °C to +60°C (–40 °F to +140°F)

3.2 Installation conditions

3.2.1 Dimensions

For dimensions, please refer to "Mechanical construction" section in TI00383P.

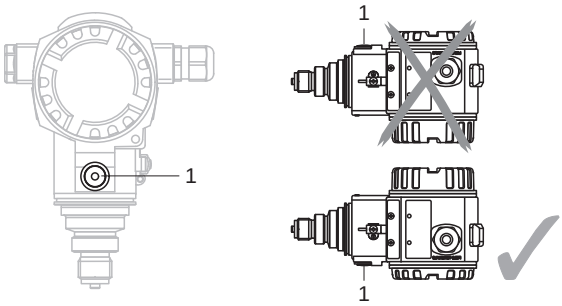
3.3 Installation instructions

Note!
- Due to the orientation of the Cerabar S, there may be a shift in the measured value, i.e. when the container is empty, the measured value does not display zero. You may correct this zero point shift either directly on the device using the "E"-key or by remote operation. See
  → 📄 26, "Function of the operating elements – on-site display not connected" or
  → 📄 41, "Position adjustment".
- For PMP75, please refer to → 📄 12, "Installation instructions for devices with diaphragm seals – PMP75".
- To ensure optimal readability of the on-site display, it is possible to rotate the housing up to 380°. → 📄 18, "Rotating the housing".
- Endress+Hauser offers a mounting bracket for installing on pipes or walls. → 📄 15, "Wall and pipe-mounting (optional)".

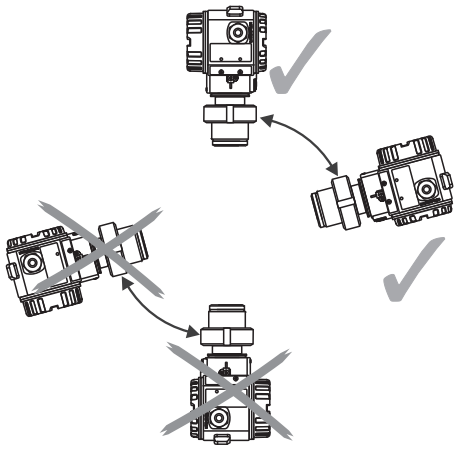
3.3.1 Installation instructions for devices without diaphragm seals – PMP71, PMC71

Note!
- If a heated Cerabar S is cooled during the cleaning (e.g. by cold water), a vacuum develops for a short time, whereby water can penetrate the sensor through the pressure compensation (1).

If this is the case, mount the sensor with the pressure compensation (1) pointing downwards.



- Keep the pressure compensation and GORE-TEX® filter (1) free from contaminations and water.
- Cerabar S without diaphragm seal are mounted as per the norms for a manometer (DIN EN 837-2). We recommend the use of shut-off devices and siphons. The orientation depends on the measuring application.
- Do not clean or touch process isolating diaphragm seals with hard or pointed objects.
- The device must be installed as follows in order to comply with the cleanability requirements of the ASME-BPE (Part SD Cleanability):



Pressure measurement in gases

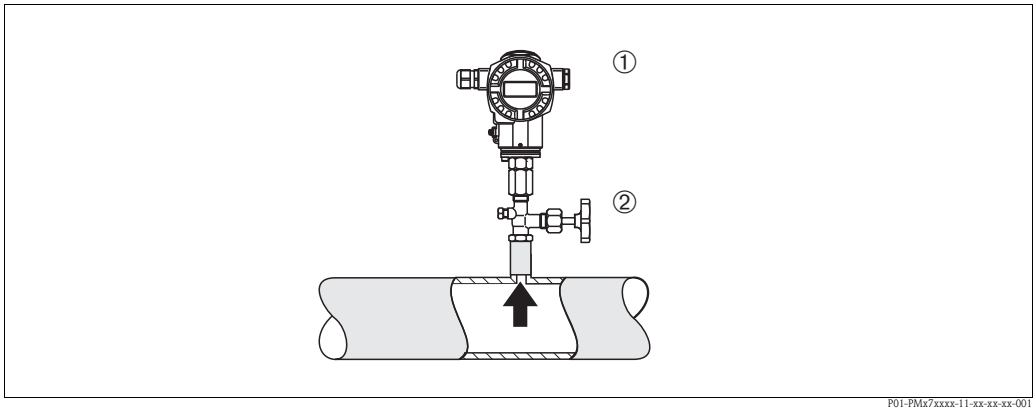


Fig. 5: Measuring arrangement for pressure measurement in gases

1 Cerabar S
2 Shut-off device

Mount Cerabar S with shut-off device above the tapping point so that any condensate can flow into the process.

Pressure measurement in steams

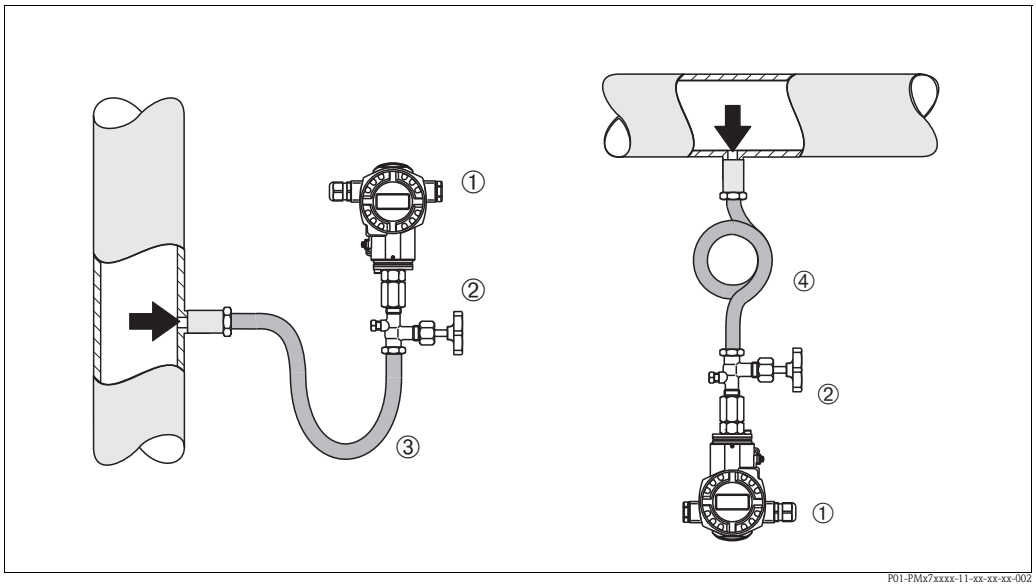

Fig. 6: Measuring arrangement for pressure measurement in steams

1 Cerabar S
2 Shut-off device
3 U-shaped siphon
4 Circular siphon

- Use siphons for pressure measurement in steam. The siphon reduces the temperature to almost ambient temperature. Preferably mount the Cerabar S with the siphon below the tapping point.
  Advantages:
  – defined water column only causes minimal/negligible measured errors
  – only minimal/negligible thermal effects on the device
  Mounting above the tapping point is also possible. Pay attention to the maximum permitted ambient temperature of the transmitter!
- Fill the siphon with liquid before commissioning.

Pressure measurement in liquids

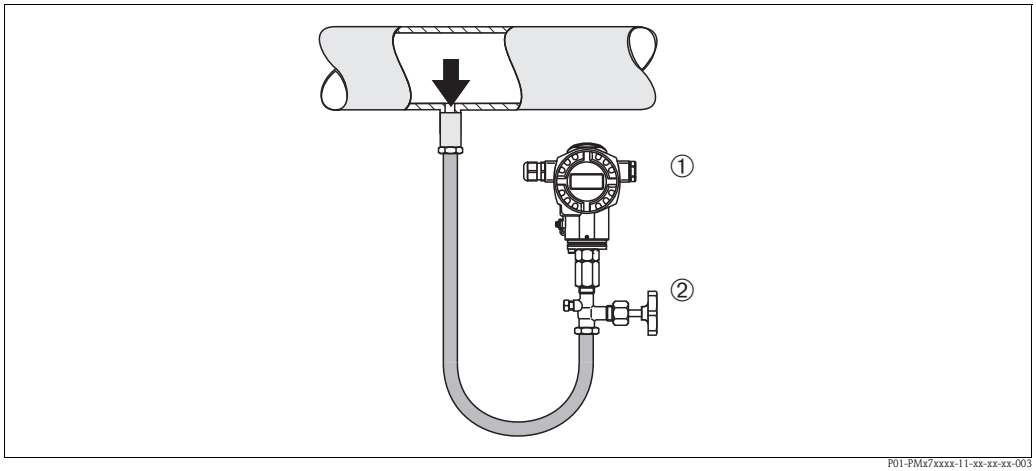

Fig. 7: Measuring arrangement for pressure measurement in liquids

1 Cerabar S
2 Shut-off device

Mount Cerabar S with shut-off device below or at the same level as the tapping point.

Level measurement

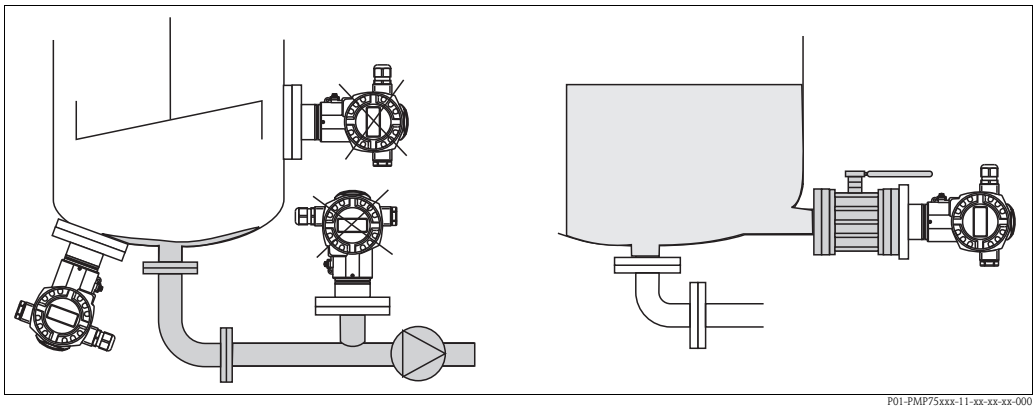

Fig. 8: Measuring arrangement for level

- Mount Cerabar S below the lowest measuring point.
- Do not mount the device at the following positions:
  In the fill flow, in the tank outlet or at a point in the container which could be affected by pressure pulses from an agitator.
- Do not mount the device in the suction area of a pump.
- The calibration and functional test can be carried out more easily if you mount the device after a shut-off device.

PVDF adapter

Note!
For instruments with PVDF adapter, a maximum torque of 7 Nm (5.16 lbf ft) is permitted.
The thread connection may become loose at high temperatures and pressures. This means that the integrity of the thread must be checked regularly and may need to be tightened using the torque given above. Teflon tape is recommended for sealing with the 1/2 NPT thread.

3.3.2 Installation instructions for devices with diaphragm seals – PMP75

Note!
- The Cerabar S with diaphragm seal is screwed in, flanged or clamped, depending on the type of diaphragm seal.
- The diaphragm seal and the pressure sensor together form a closed an calibrated system which is filled with filling fluid through a hole in the upper part. This hole is sealed and not to be opened.
- Do not clean or touch process isolating diaphragm of the diaphragm seals with hard or pointed objects.
- Do not remove the protection of the process isolating diaphragm until shortly before installation.
- When using a mounting bracket, sufficient strain relief must be ensured for the capillaries in order to prevent the capillary bending down (bending radius ≥ 100 mm (3.94 in)).
- Please note that the hydrostatic pressure of the liquid columns in the capillaries can cause zero point shift. The zero point shift can be corrected. → 41, "Position adjustment".
- Please note the application limits of the diaphragm seal filling oil as detailed in the Technical Information for Cerabar S TI00383P, Section "Planning instructions for diaphragm seal systems".

In order to obtain more precise measurement results and to avoid a defect in the device, mount the capillaries as follows:
- Vibration-free (in order to avoid additional pressure fluctuations)
- Not in the vicinity of heating or cooling lines
- Insulate if the ambient temperature is below ore above the reference temperature
- With a bending radius of ≥100 mm (3.94 in).

Vacuum application

For applications under vacuum, Endress+Hauser recommends mounting the pressure transmitter underneath the diaphragm seal. A vacuum load of the diaphragm seal caused by the presence of filling oil in the capillaries is hereby prevented.

When the pressure transmitter is mounted above the diaphragm seal, the maximum height difference H1 in accordance with the illustration below on the left must not be exceeded.
The maximum height difference is dependent on the density of the filling oil and the smallest ever pressure that is permitted to occur at the diaphragm seal (empty container), see illustration below, on the right.

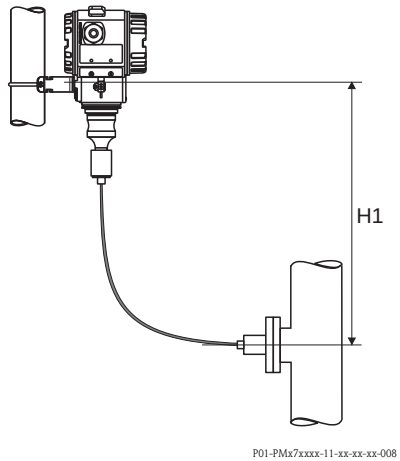

Fig. 9: Installation above the diaphragm seal

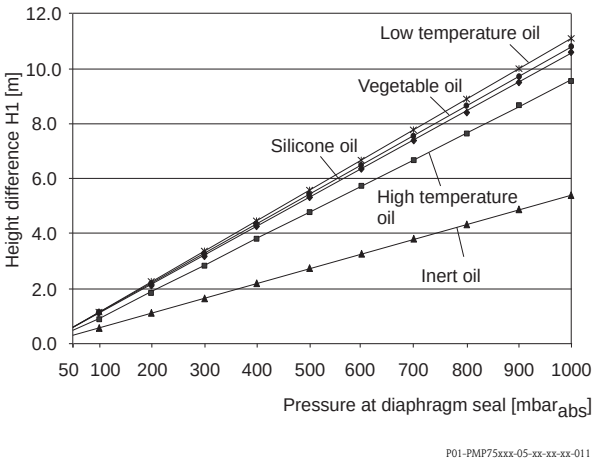

Fig. 10: Diagram of maximum installation height above the diaphragm seal for vacuum applications dependent on the pressure at the diaphragm seal

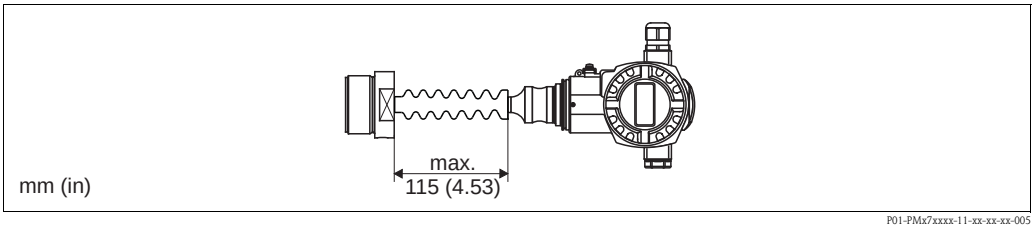
Mounting with temperature isolator



Endress+Hauser recommends the use of temperature separators in the event of constant extreme fluid temperatures which lead to the maximum permissible electronics temperature of +85 °C (+185 °F) being exceeded. To minimise the influence of rising heat, Endress+Hauser recommends the device be mounted horizontally or with the housing pointing downwards. The additional installation height also brings about a zero point shift of approx. 21 mbar (0.315 psi) due to the hydrostatic columns in the temperature isolator. You can correct this zero point shift. See also
→ 📄 26, "Function of the operating elements – on-site display not connected" or
→ 📄 41, "Position adjustment".

3.3.3 Seal for flange mounting

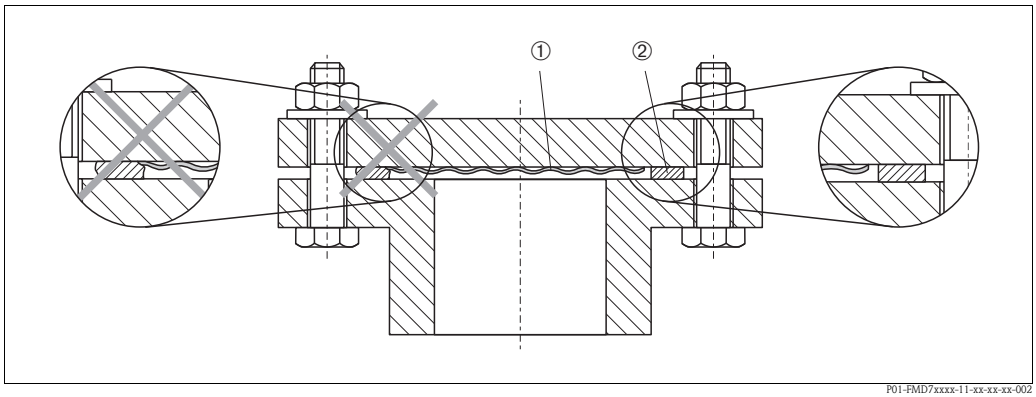


Fig. 11: Mounting the versions with flange or diaphragm seal

1 Process isolating diaphragm
2 Seal

⚠ Warning!
The seal is not allowed to press on the process isolating diaphragm as this could affect the measurement result.

3.3.4 Installation with heat insulation – PMC71 high temperature version and PMP75

The devices must only be insulated up to a certain height. The maximum permitted insulation height is labelled on the devices and applies to an insulation material with a specific heat conductivity and to the maximum permitted ambient and process temperature (see following table). The data were determined under the most critical application "quiescent air".

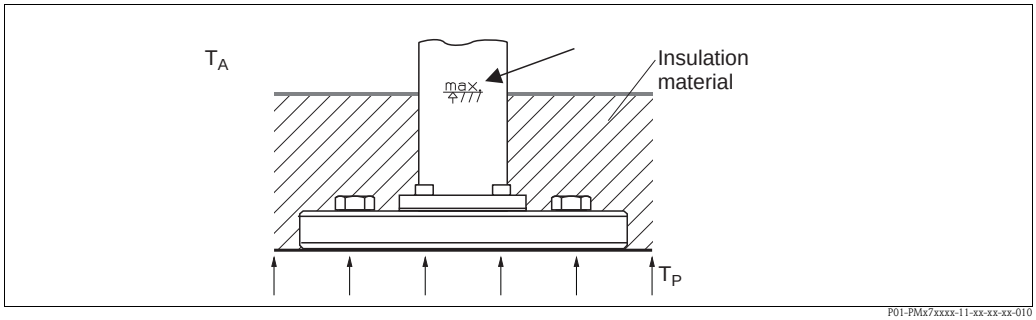

Fig. 12: Maximum insulation height, here e.g. PMC71 with flange

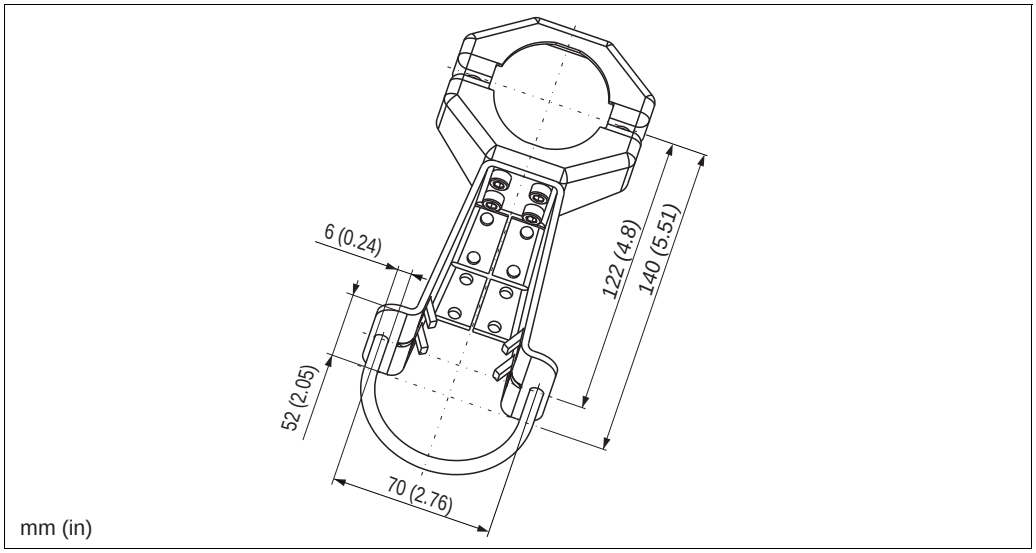
	PMC71	**PMP75**
Ambient temperature (T_A)	≤ 70°C (158°F)	≤ 70°C (158°F)
Process temperature (T_P)	≤ 150°C (302°F)	≤ 400°C (752°F) [1)]
Heat conductivity Insulation material	≤ 0,04 W/(m x K)	

1) Depending on the diaphragm seal filling oil used (see Technical Information TI00383P Cerabar S)

3.3.5 Wall and pipe-mounting (optional)

Endress+Hauser offers a mounting bracket for installing on pipes or walls.



Please note the following when mounting:
- Devices with capillary lines: mount capillaries with a bending radius of ≥ 100 mm (3.94 in).
- In the case of pipe mounting, the nuts on the bracket must be tightened uniformly with a torque of at least 5 Nm (3.69 lbf ft).

3.3.6 Assembling and mounting the "separate housing" version

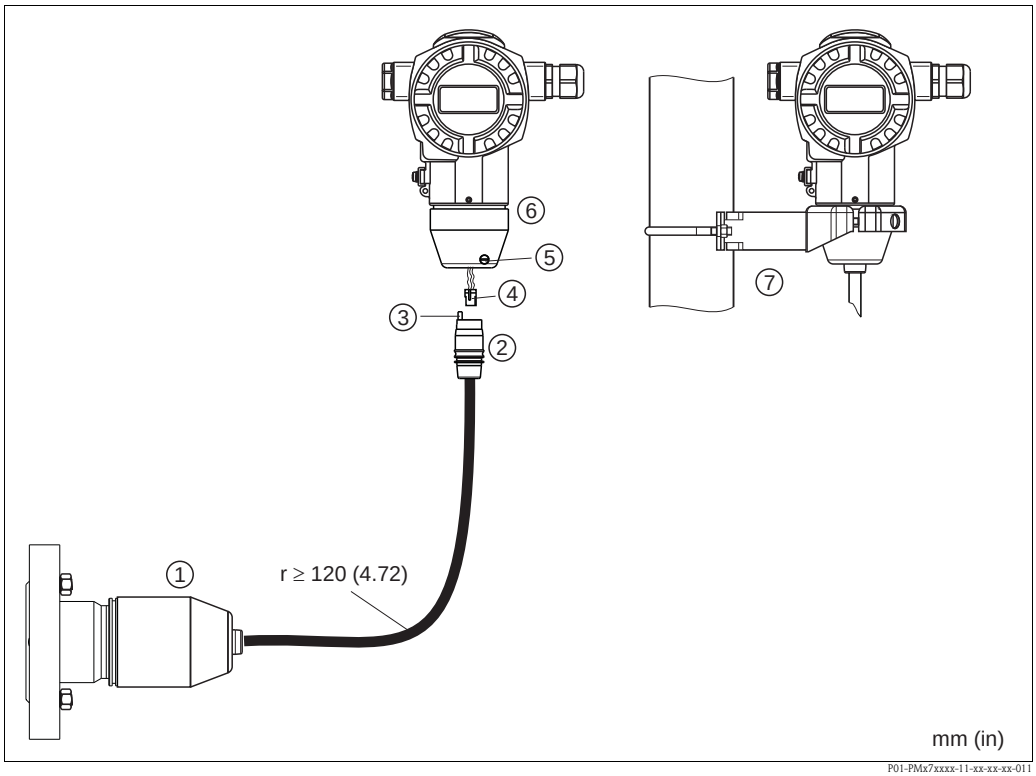


Fig. 13: "Separate housing" version

1 In the "separate housing" version, the sensor is supplied with process connection and cable fitted.
2 Cable with connection jack
3 Pressure compensation
4 Plug
5 Locking screw
6 Housing fitted with housing adapter, included
7 Mounting bracket suitable for wall and pipe mounting, included

Assembly and mounting

1. Connect plug (item 4) into the corresponding connection jack of the cable (item 2).
2. Plug the cable into the housing adapter (item 6).
3. Tighten the locking screw (item 5).
4. Mount the housing on a wall or pipe using the mounting bracket (item 7). When mounting on a pipe, tighten the nuts on the bracket uniformly with a torque of at least 5 Nm (3.69 lbf ft). Mount the cable with a bending radius (r) ≥ 120 mm (4.72 in).

3.3.7 PMP71, version prepared for diaphragm seal mount – welding recommendation

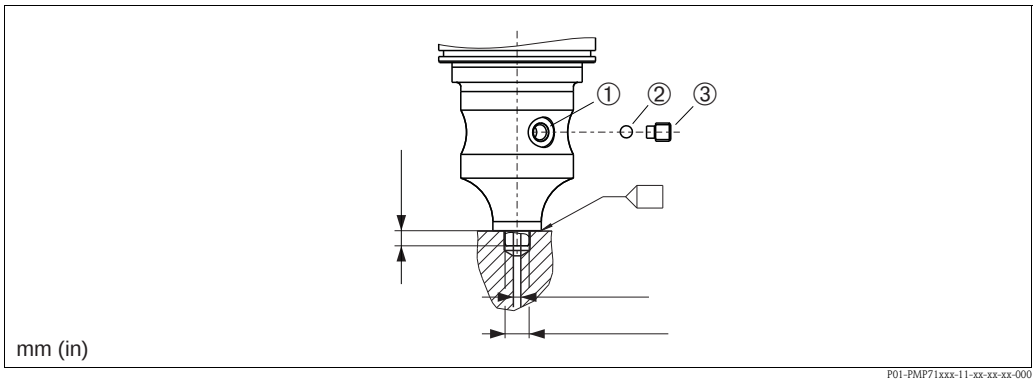

Fig. 14: Version U1: prepared for diaphragm seal mount

1 Hole for filling fluid
2 Bearing
3 Threaded pin
A1 See the following table "Welding recommendation"

Welding recommendation
For the "U1 Prepared for diaphragm seal mount" version in feature 70 "Process connection; Material" in the order code of up to including 40 bar (600 psi)-sensors, Endress+Hauser recommends welding on the diaphragm seal as follows: the total welding depth of the fillet weld is 1 mm (0.04 in) at an external diameter of 16 mm (0.63 in). Welding is performed according to the WIG method.

Consecutive seam no.	Sketch/welding groove shape, dimension as per DIN 8551	Base material matching	Welding process DIN EN ISO 24063	Welding position	Inert gas, additives
A1 for sensors ≤ 40 bar (600 psi)	 P01-PMP71xxx-11-xx-xx-xx-001	Adapter made of 316L (1.4435) to be welded to diaphragm seal made of 316L (1.4404/1.4435)	141	PB	Inert gas Ar/H 95/5 Additive: 1.4430 (ER 316L Si)

3.3.8 Rotating the housing

The housing can be rotated up to 380° by loosening the Allen screw.

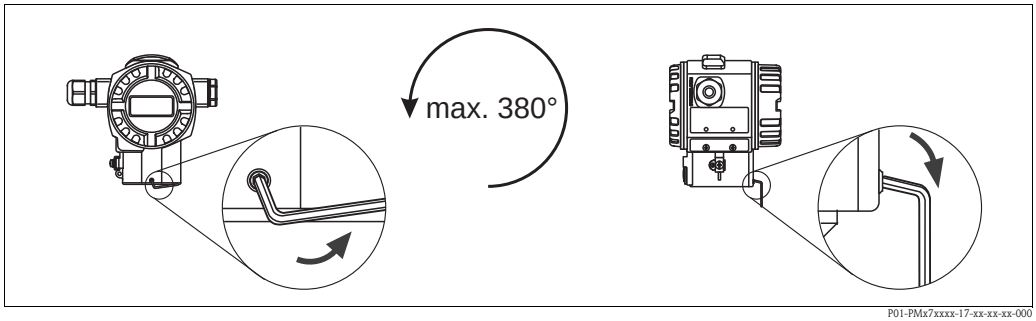

Fig. 15: Aligning the housing

– T14 housing: Loosen setscrew with a 2 mm (0.08 in) Allen key.
Hygenic T17 housing:Loosen setscrew with a 3 mm (0.12 in) Allen key.
– Rotate housing (max. up to 380°).
– Retighten setscrew with 1 Nm (0,74 lbf ft).

3.3.9 Closing the housing cover

Note!
When closing the housing cover, please ensure that the thread of the cover and housing are free from dirt, e.g. sand.If you feel any resistance when closing the cover, check the thread on both again to ensure that they are free from dirt.

Close cover on a hygenic stainless steel housing (T17)

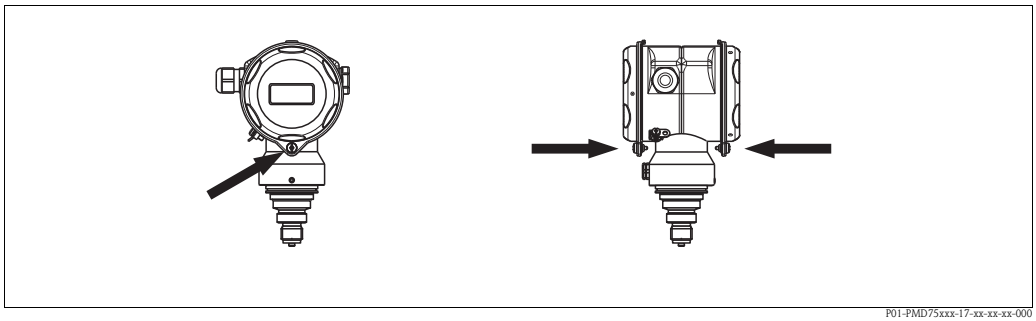

Fig. 16: Close cover

The covers for the terminal and electronics compartment are hooked into the casing and closed with a screw. These screws should be finger-tightened (2 Nm (1.48 lbf ft)) to the stop to ensure that the covers sit tightly.

3.4 Post-installation check

After installing the device, carry out the following checks:
- Are all screws firmly tightened?
- Are the housing covers screwed down tight?

4 Wiring

4.1 Connecting the device

Warning!
Risk of electric shock!
If the operating voltage is > 35 VDC: Dangerous contact voltage at terminals.
In a wet environment, do not open the cover if voltage is present.

Warning!
Limitation of electrical safety due to incorrect connection!

- Risk of electric shock and/or explosion in hazardous areas! In a wet environment, do not open the cover if voltage is present.
- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.
- Devices with integrated overvoltage protection must be earthed.
- Protective circuits against reverse polarity, HF influences and overvoltage peaks are installed.
- The supply voltage must match the supply voltage on the nameplate (→ 🖹 6, "Nameplate").
- Switch off the supply voltage before connecting the device.
- Remove housing cover of the terminal compartment.
- Guide cable through the gland. Preferably use twisted, screened two-wire cable.
- Connect device in accordance with the following diagram.
- Screw down housing cover.
- Switch on supply voltage.

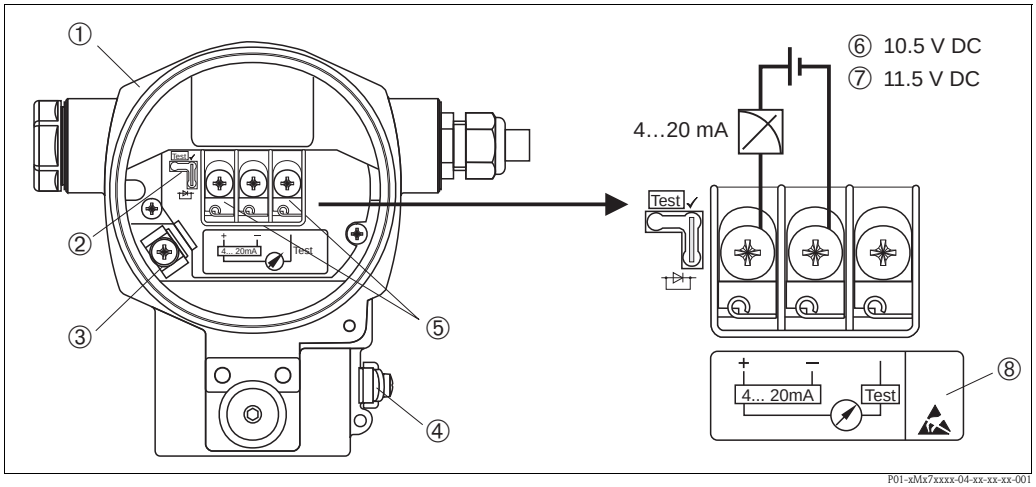

Fig. 17: Electrical connection 4 to 20 mA HART. Observe also → 🖹 21, "Supply voltage".

1 Housing
2 Jumper for 4 to 20 mA test signal.
→ 🖹 21, "Taking 4 to 20 mA test signal" part.
3 Internal earth terminal
4 External earth terminal
5 4 to 20 mA test signal between plus and test terminal
6 Minimum supply voltage = 10.5 V DC, jumper is inserted in accordance with the illustration.
7 Minimum supply voltage = 11.5 V DC, jumper is inserted in "Test" position.
8 Devices with integrated overvoltage protection are labelled OVP (overvoltage protection) here.

4.1.1 Devices with Harting plug Han7D

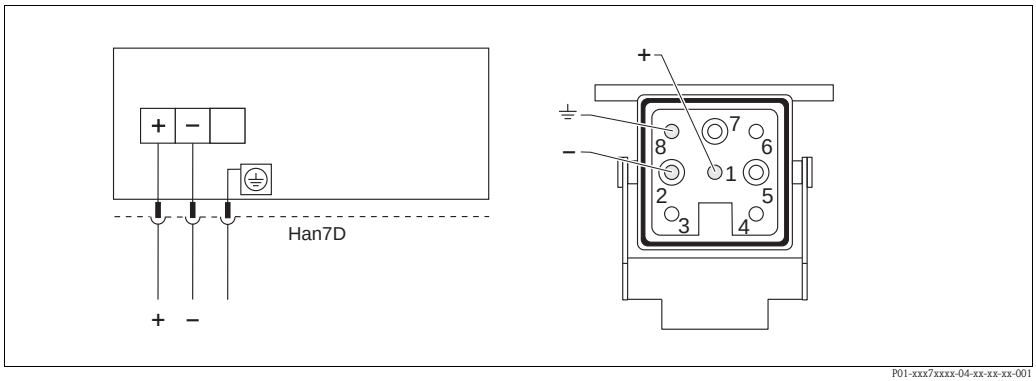

Fig. 18: Left: electrical connection for devices with Harting plug Han7D
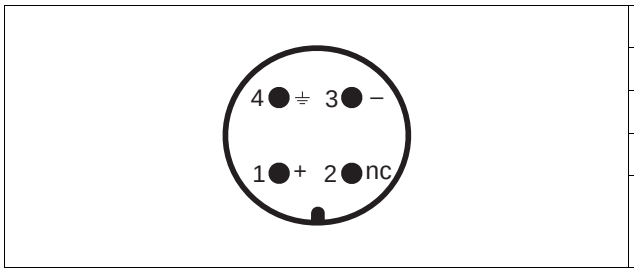
Right: view of the plug connector at the device

4.1.2 Devices with M12 plug



PIN	Meaning
1	signal +
2	not used
3	signal -
4	ground

4.1.3 Connecting the cable version

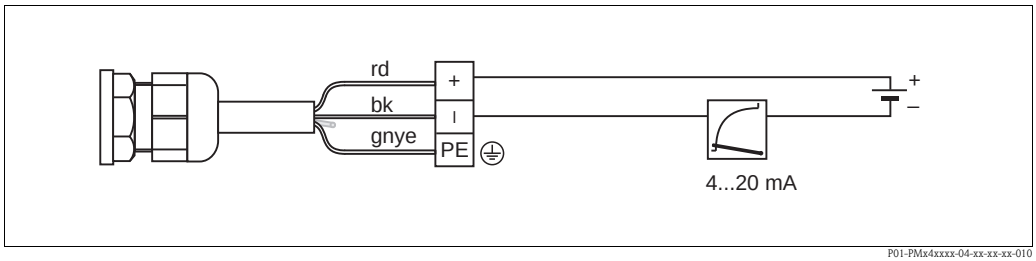


Fig. 19: rd = red, bk = black, gnye = green-yellow

4.2 Connecting the measuring unit

4.2.1 Supply voltage

Note!
- All explosion protection data are given in separate documentation which is available upon request. The Ex documentation is supplied as standard with all devices approved for use in explosion hazardous areas.
- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.

Electronic version	Jumper for 4 to 20 mA test signal in "Test" position (Delivery status)	Jumper for 4 to 20 mA test signal in "Non-Test" position
4 to 20 mA HART, for non-hazardous areas	11.5 to 45 V DC	10.5 to 45 V DC

Taking 4 to 20 mA test signal

A 4 to 20 mA signal may be measured via the positive and test terminal without interrupting the measurement. The minimum supply voltage of the device can be reduced by simply changing the position of the jumper. As a result, operation is also possible with lower voltage sources. To keep the measured error below 0.1 %, the current measuring device should display an internal resistance of < 0.7 Ω. Observe the position of the jumper in accordance with the following table.

Jumper position for test signal	Description
	– Taking 4 to 20 mA test signal via plus and test terminal: possible. (Thus, the output current can be measured without interruption via the diode.) – Delivery status – Minimum supply voltage: 11.5 V DC
	– Taking 4 to 20 mA test signal via plus and test terminal: not possible. – Minimum supply voltage: 10.5 V DC

4.2.2 Cable specification

- Endress+Hauser recommends using twisted, screened two-wire cables.
- Terminals for wire cross-sections 0.5 to 2.5 mm^2 (20 to 14 AWG)
- Cable external diameter: 5 to 9 mm (0.2 to 0.35 in)

4.2.3 Load

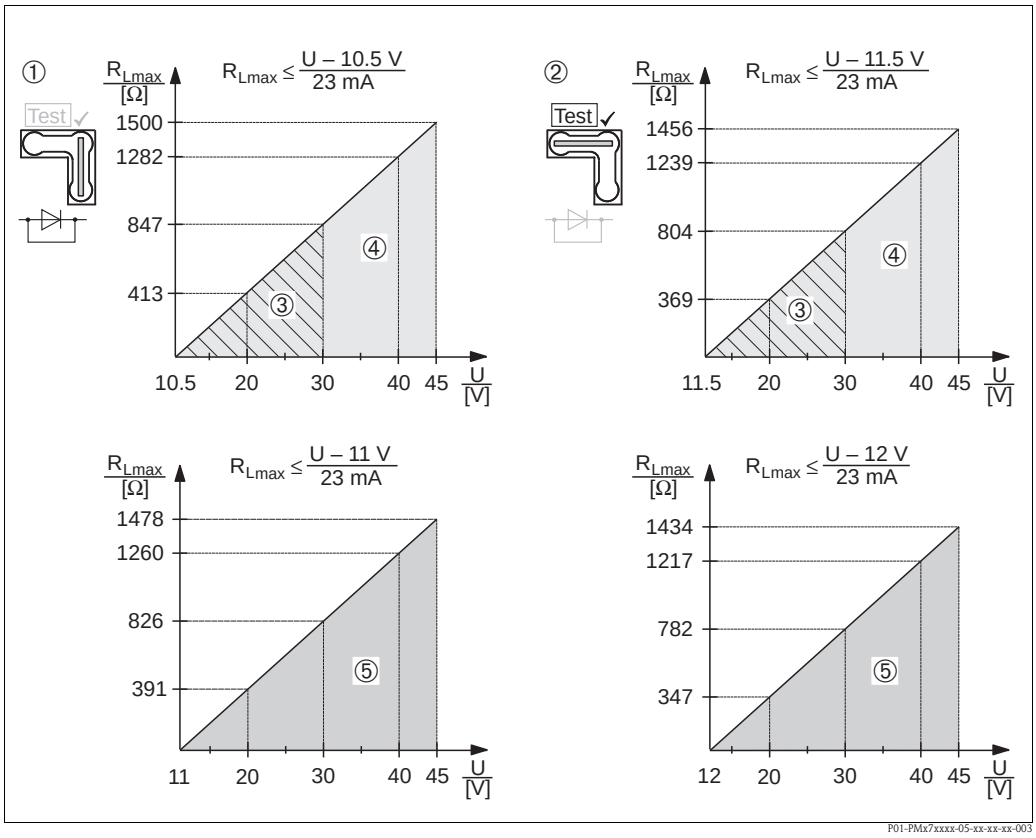

Fig. 20: Load diagram, observe the position of the jumper and the explosion protection.
(→ 🖹 21, "Taking 4 to 20 mA test signal" part.)

1 Jumper for the 4 to 20 mA test signal inserted in "Non-Test" position
2 Jumper for the 4 to 20 mA test signal inserted in "Test" position
3 Supply voltage 10.5 (11.5) to 30 V DC for 1/2 G, 1 GD, 1/2 GD, FM IS , CSA IS, IECEx ia, NEPSI Ex ia
4 Supply voltage10.5 (11.5) to 45 V DC for devices for non-hazardous areas, 1/2 D, 1/3 D, 2 G Ex d, 3 G Ex nA, FM XP, FM DIP, FM NI, CSA XP and CSA Dust-Ex, NEPSI Ex d
5 Supply voltage 11 (12) to 45 V DC for PMC71, Ex d[ia], NEPSI Ex d[ia]
R_{Lmax} Maximum load resistance
U Supply voltage

Note!
When operating via a handheld terminal or via PC with an operating program, a minimum communication resistance of 250 Ω must exist within the loop.

4.2.4 Screening/potential matching

- You achieve optimum screening against disturbances if the screening is connected on both sides (in the cabinet and on the device). If you have to reckon with potential equalisation currents in the plant, only earth screening on one side, preferably at the transmitter.
- When using in hazardous areas, you must observe the applicable regulations.
  Separate Ex documentation with additional technical data and instructions is included with all Ex systems as standard.

4.2.5 Connecting Field Xpert SFX100

Compact, flexible and robust industry handheld terminal for remote parametrization and measured value inspection via the HART current output (4-20mA).
For details refer to Operating Instructions BA00060S/04/EN.

4.2.6 Connecting Commubox FXA195

The Commubox FXA195 connects intrinsically safe transmitters with the HART protocol to a computer's USB port. This allows remote operation of the transmitter using Endress+Hauser's FieldCare operating program. Power is supplied to the Commubox through the USB port. The Commubox is also suitable for connection to intrinsically safe circuits. → See Technical Information TI00404F for further information.

4.2.7 Connecting Commubox FXA291/ToF Adapter FXA291 for operation via FieldCare

Connecting Commubox FXA291

The Commubox FXA291 connects Endress+Hauser field instruments with CDI interface (= Endress+Hauser Common Data Interface) to the USB interface of a personal computer or a notebook. For details refer to TI00405C/07/EN.

Note!
For the device you need the "ToF Adapter FXA291" as an additional accessory.

Connecting ToF Adapter FXA291

The ToF Adapter FXA291 connects the Commubox FXA291 via the USB interface of a personal computer or a notebook to the device. For details refer to KA00271F/00/A2.

4.3 Potential matching

Ex applications: Connect all devices to the local potential matching.
Observe the applicable regulations.

4.4 Overvoltage protection (optional)

Devices showing version "M" in feature 100 "Additional options 1" or feature 110 "Additional options 2" in the order code are equipped with overvoltage protection (see also Technical Information TI00383P "Ordering information".

- Overvoltage protection:
  - Nominal functioning DC voltage: 600 V
  - Nominal discharge current: 10 kA
- Surge current check î = 20 kA as per DIN EN 60079-14: 8/20 µs satisfied
- Arrester AC current check I = 10 A satisfied

Warning!
Devices with integrated overvoltage protection must be earthed.

4.5 Post-connection check

Perform the following checks after completing electrical installation of the device:

- Does the supply voltage match the specifications on the nameplate?
- Is the device properly connected (→ 19)?
- Are all screws firmly tightened?
- Are the housing covers screwed down tight?

As soon as voltage is applied to the device, the green LED on the electronic insert lights up for a few seconds or the connected on-site display lights up.

5 Operation

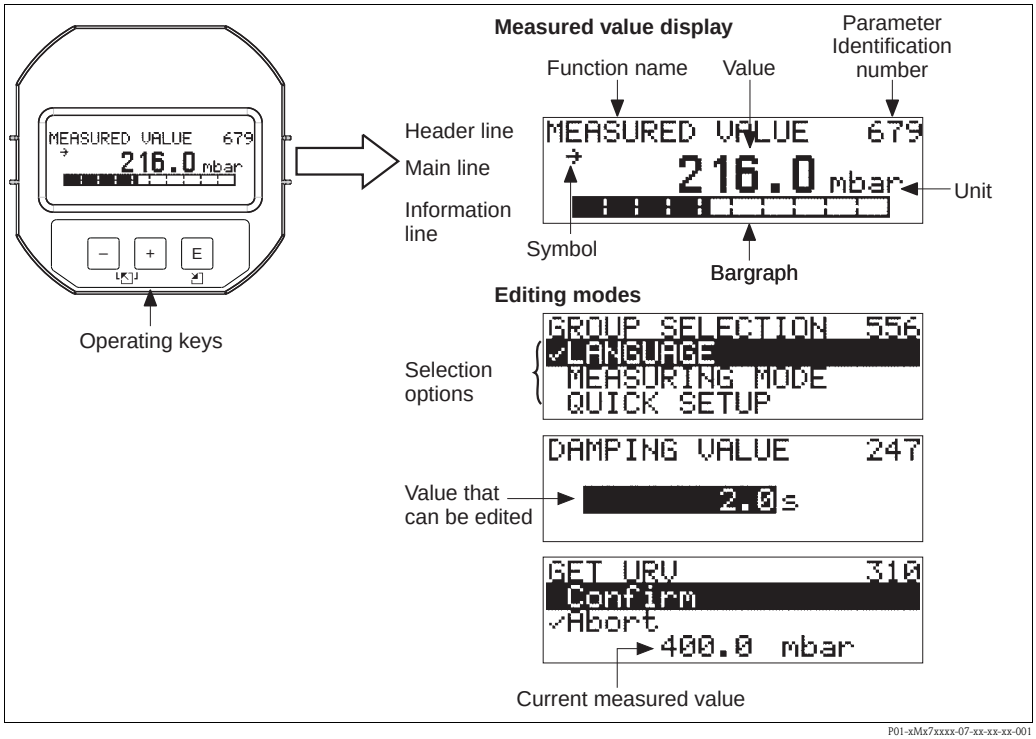
Feature 20 "Output; operation" in the order code provides you with information on the operating options available to you.

Versions in the order code		Operation
A	4 to 20 mA HART; external operation, LCD	Via on-site display and 3 keys on the exterior of the device
B	4 to 20 mA HART; internal operation, LCD	Via on-site display and 3 keys on the inside of the device
C	4 to 20 mA; internal operation	Without on-site display, 3 keys on the inside of the device

5.1 On-site display (optional)

A 4-line liquid crystal display (LCD) is used for display and operation.
The on-site display shows measured values, dialog texts, fault messages and notice messages.
The display of the device can be turned in 90° steps. Depending on the installation position of the device, this makes it easy to operate the device and read the measured values.

Functions:
- 8-digit measured value display including sign and decimal point, bargraph for current display
- Simple and complete menu guidance thanks to separation of the parameters into several levels and groups
- Each parameter is given a 3-digit ID number for easy navigation
- Option for configuring the display according to individual requirements and desires, such as language, alternating display, contrast setting, display of other measured values such as sensor temperature
- Comprehensive diagnostic functions (fault and warning message, peak-hold indicators, etc.)
- Rapid and safe commissioning with the Quick Setup menus



The following table illustrates the symbols that can appear on the on-site display. Four symbols can occur at one time.

Symbol	Meaning
	Alarm symbol – Symbol flashing: warning, device continues measuring. – Symbol permanently lit: error, device does not continue measuring. *Note:* The alarm symbol may overlie the tendency symbol.
	Lock symbol The operation of the device is locked. Unlock device, → 38.
	Communication symbol Data transfer via communication. *Note:* The alarm symbol may overlie the communication symbol.
	Tendency symbol (increasing) The measured value is increasing.
	Tendency symbol (decreasing) The measured value is decreasing.
	Tendency symbol (constant) The measured value has remained constant over the past few minutes.

5.2 Operating elements

5.2.1 Position of operating elements

With regard to aluminium or stainless steel housings (T14), the operating keys are located either outside the device under the protection cap or inside on the electronic insert. In hygenic stainless steel housings (T17), the operating keys are always located inside on the electronic insert.

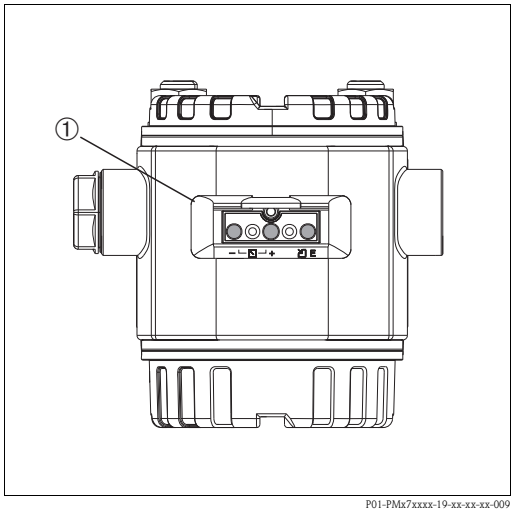


Fig. 21: Operating keys, external

1 Operating keys on the exterior of the device under the protective flap

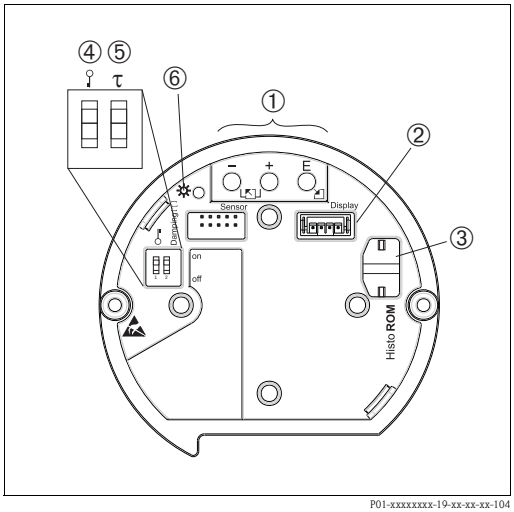

Fig. 22: Operating keys, internal

1 Operating keys
2 Slot for optional display
3 Slot for optional HistoROM®/M-DAT
4 DIP-switch for locking/unlocking measured-value-relevant parameters
5 DIP-switch for damping on/off
6 Green LED to indicate value being accepted

5.2.2 Function of the operating elements – on-site display not connected

Press and hold the key or the key combination for at least 3 seconds to execute the corresponding function. Press the key combination for at least 6 seconds for a reset.

Operating key(s)	Meaning
−	Adopt lower range value. A reference pressure is present at the device. See also → 27, "Pressure measuring mode" or → 28, "Level measuring mode".
+	Adopt upper range value. A reference pressure is present at the device. See also → 27, "Pressure measuring mode" or → 28, "Level measuring mode".
E	Position adjustment
+ and − and E	Reset all parameters. The reset via operating keys corresponds to the software reset code 7864.
+ and E	Copy the configuration data from the optional HistoROM®/M-DAT module to the device.
− and E	Copy the configuration data from the device to the optional HistoROM®/M-DAT module.
 P01-xxxxxxxx-19-xx-xx-xx-057	– DIP-switch 1: for locking/unlocking measured-value-relevant parameters Factory setting: off (unlocked) – DIP-switch 2: damping on/off, Factory setting: on (damping on)

5.2.3 Function of the operating elements – on-site display connected

Operating key(s)	Meaning
+	– Navigate upwards in the picklist – Edit the numerical values and characters within a function
−	– Navigate downwards in the picklist – Edit the numerical values and characters within a function
E	– Confirm entry – Jump to the next item
+ and E	Contrast setting of on-site display: darker
− and E	Contrast setting of on-site display: brighter
+ and −	ESC functions: – Exit edit mode without saving the changed value. – You are in a menu within a function group. The first time you press the keys simultaneously, you go back a parameter within the function group. Each time you press the keys simultaneously after that, you go up a level in the menu. – You are in a menu at a selection level. Each time you press the keys simultaneously, you go up a level in the menu. *Note:* The terms function group, level and selection level are explained in → 30, "General structure of the operating menu".

5.3 On-site operation – on-site display not connected

Note!
To operate the device with a HistoROM®/M-DAT module see → 32, "HistoROM®/M-DAT (optional)".

5.3.1 Pressure measuring mode

If no on-site display is connected, the following functions are possible by means of the three keys on the electronic insert or on the exterior of the device:
- Position adjustment (zero point correction)
- Setting lower range value and upper range value
- Device reset, → 26, "Function of the operating elements – on-site display not connected".

Note!
- The operation must be unlocked. → 37, "Locking/unlocking operation".
- The device is configured for the Pressure measuring mode as standard. You can switch measuring modes by means of the MEASURING MODE parameter. → 40, "Selecting language and measuring mode".
- The pressure applied must be within the nominal pressure limits of the sensor. See information on the nameplate.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

Carry out position adjustment.[1]	
Pressure is present at device.	
↓	
Press "E"-key for 3 s.	
↓	
Does the LED on the electronic insert light up briefly?	
Yes	No
↓	↓
Applied pressure for position adjustment has been accepted.	Applied pressure for position adjustment has not been accepted. Observe the input limits.

Setting lower range value.	
Desired pressure for lower range value is present at device.	
↓	
Press "–"-key for 3 s.	
↓	
Does the LED on the electronic insert light up briefly?	
Yes	No
↓	↓
Applied pressure for lower range value has been accepted.	Applied pressure for lower range value has not been accepted. Observe the input limits.

Setting upper range value.	
Desired pressure for upper range value is present at device.	
↓	
Press "+"-key for 3 s.	
↓	
Does the LED on the electronic insert light up briefly?	
Yes	No
↓	↓
Applied pressure for upper range value has been accepted.	Applied pressure for upper range value has not been accepted. Observe the input limits.

1) Observe "Warning", → 40, "Commissioning".

5.3.2 Level measuring mode

If no on-site display is connected, the following functions are possible by means of the three keys on the electronic insert or on the exterior of the device:
- Position adjustment (zero point correction)
- Set the lower and upper pressure value and assign to the lower and upper level value
- Device reset, → 📄 26, "Function of the operating elements – on-site display not connected".

Note!
- The "-" and "+"- keys only have a function in the following cases:
  – LEVEL SELECTION "Level Easy Pressure", CALIBRATION MODE "Wet"
  – LEVEL SELECTION "Level Standard", LEVEL MODE "Linear", CALIBRATION MODE "Wet"

  The keys have no function in other settings.
- The device is configured for the Pressure measuring mode as standard. You can switch measuring modes by means of the MEASURING MODE parameter. → 📄 40, "Selecting language and measuring mode".

  The following parameters are set to the following values in the factory:
  – LEVEL SELECTION: Level Easy Pressure
  – CALIBRATION MODE: Wet
  – OUTPUT UNIT or LIN. MEASURAND: %
  – EMPTY CALIB.: 0.0
  – FULL CALIB.: 100.0.
  – SET LRV: 0.0 (corresponds to 4 mA value)
  – SET URV: 100.0 (corresponds to 20 mA value)

  These parameters can only be modified by means of the on-site display or remote operation such as the FieldCare.
- The operation must be unlocked. → 📄 37, "Locking/unlocking operation".
- The pressure applied must be within the nominal pressure limits of the sensor. See information on the nameplate.
- See also → 📄 44, "Level measurement". For parameter description see Operating Instructions BA00274P.
- LEVEL SELECTION, CALIBRATION MODE, LEVEL MODE, EMPTY CALIB., FULL CALIB, SET LRV and SET URV are parameter names used for on-site display or remote operation such as FieldCare, for instance.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

Carry out position adjustment.[1)]		**Setting lower pressure value.**		**Setting upper pressure value.**	
Pressure is present at device.		Desired pressure for lower pressure value (EMPTY PRESSURE[2)]) is present at device.		Desired pressure for upper pressure value (FULL PRESSURE[1]) is present at device.	
↓		↓		↓	
Press "E"-key for 3 s.		Press "–"-key for 3 s.		Press "+"-key for 3 s.	
↓		↓		↓	
Does the LED on the electronic insert light up briefly?		Does the LED on the electronic insert light up briefly?		Does the LED on the electronic insert light up briefly?	
Yes	No	Yes	No	Yes	No
↓	↓	↓	↓	↓	↓
Applied pressure for position adjustment has been accepted.	Applied pressure for position adjustment has not been accepted. Observe the input limits.	The pressure present was saved as the lower pressure value (EMPTY PRESSURE[1]) and assigned to the lower level value (EMPTY CALIB.[1]).	The pressure present was not saved as the lower pressure value. Observe the input limits.	The pressure present was saved as the upper pressure value (FULL PRESSURE[1]) and assigned to the upper level value (FULL CALIB.[1]).	The pressure present was not saved as the upper pressure value. Observe the input limits.

1) Observe "Warning", → 📄 40, "Commissioning".

2) Parameter name used for the on-site display or remote operation such as the FieldCare.

5.4 On-site operation – on-site display connected

If the on-site display is connected, the three operating keys are used to navigate through the operating menu, → 📄 26, "Function of the operating elements – on-site display connected".

5.4.1 General structure of the operating menu

The menu is split into four levels. The three upper levels are used to navigate while you use the bottom level to enter numerical values, select options and save settings. The structure of the OPERATING MENU depends on the measuring mode selected, e.g. if the "Pressure" measuring mode is selected, only the functions necessary for this mode are displayed.

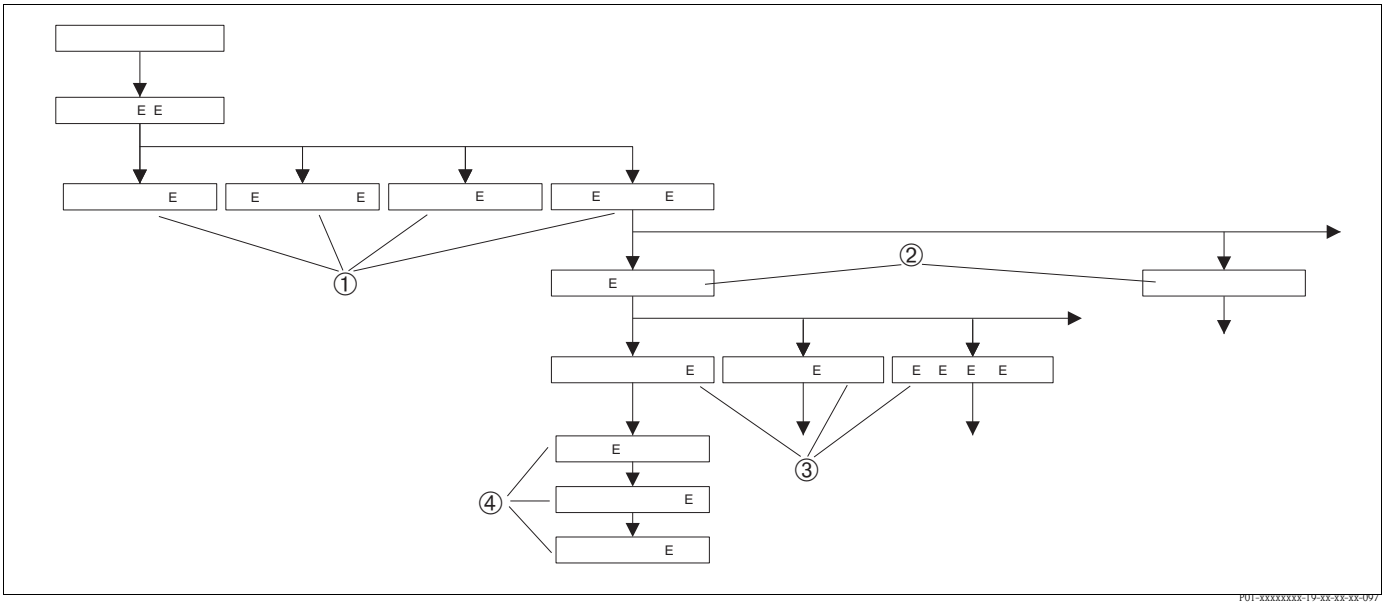

Fig. 23: Structure of the operating menu

1 1. Selection level
2 2. Selection level
3 Function groups
4 Parameter

Note!
The LANGUAGE and MEASURING MODE parameters are only displayed via the on-site display on the 1st selection level. In the digital communication, the LANGUAGE parameter is displayed in the DISPLAY group and the MEASURING MODE parameter is displayed in the QUICK SETUP menus or in the BASIC SETUP function group.

5.4.2 Selecting an option

Example: select "English" as the language of the menu.

On-site display	Operation
 P01-xxxxxxxx-19-xx-xx-xx-017	German is selected as the language. A ✓in front of the menu text indicates the active option.
 P01-xxxxxxxx-19-xx-xx-xx-033	Select English with "+" or "–".
 P01-xxxxxxxx-19-xx-xx-xx-034	1. Confirm your choice with "E". A ✓ in front of the menu text indicates the active option. (English is now selected as the menu language.) 2. Jump to the next item with "E".

5.4.3 Editing a value

Example: adjusting DAMPING VALUE function from 2.0 s to 30.0 s.
→ 📄 26, "Function of the operating elements – on-site display connected".

On-site display	Operation
 P01-xxxxxxxx-19-xx-xx-xx-023	The on-site display shows the parameter to be changed. The value highlighted in black can be changed. The "s" unit is fixed and cannot be changed.
 P01-xxxxxxxx-19-xx-xx-xx-027	1. Press "+" or "–" to get to the editing mode. 2. The first digit is highlighted in black.
 P01-xxxxxxxx-19-xx-xx-xx-028	1. Use "+" to change "2" to "3". 2. Confirm "3" with "E". The cursor jumps to the next position (highlighted in black).
 P01-xxxxxxxx-19-xx-xx-xx-029	The decimal point is highlighted in black, i.e. you can now edit it.
 P01-xxxxxxxx-19-xx-xx-xx-030	1. Keep pressing "+" or "–" until "0" is displayed. 2. Confirm "0" with "E". The cursor jumps to the next position. ↵ is displayed and is highlighted in black. → See next graphic.

On-site display	Operation
 P01-xxxxxxxx-19-xx-xx-xx-031	Use "E" to save the new value and exit the editing mode. See next graphic.
 P01-xxxxxxxx-19-xx-xx-xx-032	The new value for the damping is now 30.0 s. – Jump to the next parameter with "E". – You can get back to the editing mode with "+" or "–".

5.4.4 Taking pressure applied at device as value

Example: configuring upper range value – assign 20 mA to the pressure value 400 mbar (6 psi).

On-site display	Operation
 P01-xxxxxxxx-19-xx-xx-xx-035	The bottom line on the on-site display displays the pressure present, here 400 mbar (6 psi).
 P01-xxxxxxxx-19-xx-xx-xx-036	Use "+" or "–" to switch to the "Confirm" option. The active selection is highlighted in black.
 P01-xxxxxxxx-19-xx-xx-xx-037	Use "E" to assign the value (400 mbar (6 psi)) to the GET URV parameter. The device confirms the calibration and jumps back to the parameter, here GET URV (see next graphic).
 P01-xxxxxxxx-19-xx-xx-xx-035	Switch to the next parameter with "E".

5.5 HistoROM®/M-DAT (optional)

HistoROM®/M-DAT is a memory module, which is attached to the electronic insert and fulfils the following functions:
- Back-up copy of configuration data
- Copying configuration data of a transmitter into another transmitter
- Cyclic recording of pressure and sensor-temperature measured values
- Recording diverse events, such as alarms, configuration changes, counters for measuring range undershooting and exceeding for pressure and temperature, exceeding and undershooting the user limits for pressure and temperature, etc.

⚠ Warning!
Detach HistoROM®/M-DAT from the electronic insert or attach it to the insert in a deenergised state only.

Note!
- The HistoROM®/M-DAT module may be retrofitted at any time (Order No.: 52027785).
- The HistoROM data and the data in the device are analysed once a HistoROM®/M-DAT is attached to the electronic insert and power is reestablished to the device. During the analysis, the messages "W702, HistoROM data not consistent" and "W706, Configuration in HistoROM and device not identical" can occur. For measures, → 📄 49, "Messages."

5.5.1 Copying configuration data

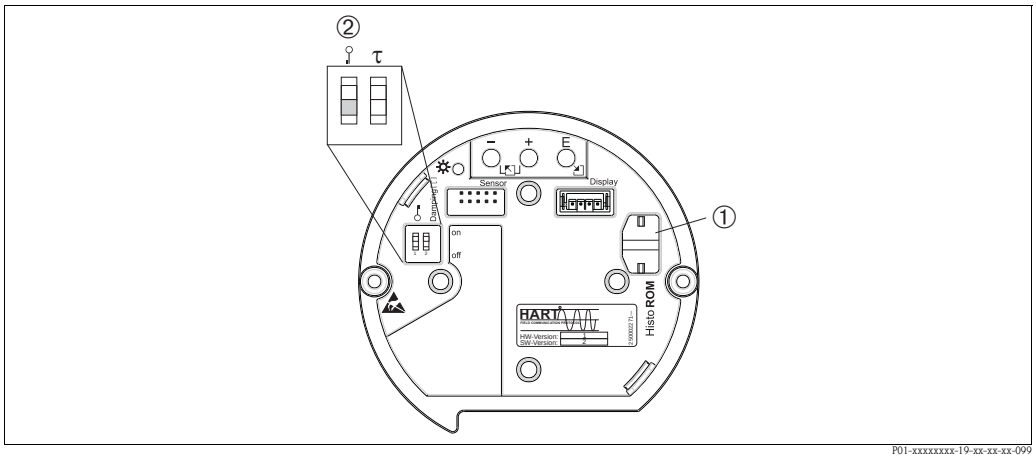

Abb. 24: Electronic insert with optional HistoROM®/M-DAT memory module

1 Optional HistoROM®/M-DAT
2 To copy configuration data from the HistoROM®/M-DAT module to a device or from a device to a HistoROM®/M-DAT, the operation must be unlocked DIP-switch 1, Position "off" ,parameter INSERT PIN NO. = 100). Observe → 📄 37, "Locking/unlocking operation".

On-site operation – on-site display not connected

Copying configuration data from a device to a HistoROM®/M-DAT module:

Note!
The operation must be unlocked.

1. Disconnect device from supply voltage.
2. Attach the HistoROM®/M-DAT module to the electronic insert.
3. Reestablish supply voltage to the device.
4. Press "E" and "-"-keys (for at least 3 seconds) until the LED on the electronic insert lights up.
5. Wait approx. 20 seconds. Configuration data are loaded from the device to the HistoROM®/M-DAT. The device is not restarted.
6. Disconnect device from the supply voltage again.
7. Detach memory module.
8. Reestablish supply voltage to the device.

Copying configuration data from a HistoROM®/M-DAT to a device:

Note!
The operation must be unlocked.

1. Disconnect device from supply voltage.
2. Attach the HistoROM®/M-DAT module to the electronic insert. Configuration data from another device are stored in the HistoROM®/M-DAT.
3. Reestablish supply voltage to the device.
4. Press "E" und "+"-keys (for at least 3 seconds) until the LED on the electronic insert lights up.
5. Wait approx. 20 seconds. All parameters except DEVICE SERIAL No, DEVICE DESIGN., CUST. TAG NUMBER, LONG TAG NUMBER, DESCRIPTION, BUS ADDRESS, CURRENT MODE and the parameters in the POSITION ADJUSTMENT and PROCESS CONNECTION group are loaded into the device by HistoROM®/M-DAT. The device is restarted.
6. Before removing the HistoROM®/M-DAT again from the electronic insert, disconnect the device from supply voltage.

On-site operation via on-site display (optional) or remote operation

Copying configuration data from a device to a HistoROM®/M-DAT:

Note!
The operation must be unlocked.

1. Disconnect device from supply voltage.
2. Attach the HistoROM®/M-DAT module to the electronic insert.
3. Reestablish supply voltage to the device.
4. The DOWNLOAD SELECT. parameter setting has no influence on an upload from the device into HistoROM.
   (Menu path: (GROUP SELECTION →) OPERATING MENU → OPERATION)
5. Using the HistoROM CONTROL parameter select the option "Device → HistoROM" as the data transfer direction.
   (Menu path: GROUPSELECTION → OPERATING MENU → OPERATION)
6. Wait approx. 20 seconds. Configuration data are loaded from the device to the HistoROM®/M-DAT. The device is not restarted.
7. Disconnect device from the supply voltage again.
8. Detach memory module.
9. Reestablish supply voltage to the device.

Copying configuration data from a HistoROM®/M-DAT to a device:

Note!
The operation must be unlocked.

1. Disconnect device from supply voltage.
2. Attach the HistoROM®/M-DAT module to the electronic insert. Configuration data from another device are stored in the HistoROM®/M-DAT.
3. Reestablish supply voltage to the device.
4. Use the DOWNLOAD SELECT parameter to select which parameters are to be overwritten (Menu path: (GROUPS SELECTION →) OPERATING MENU → OPERATION).

   The following parameters are overwritten according to the selection:
   – **Configuration copy (factory setting):**
     all parameters except DEVICE SERIAL No., DEVICE DESIGN, CUST. TAG NUMBER, LONG TAG NUMBER, DESCRIPTION, BUS ADDRESS, CURRENT MODE and the parameters in the POSITION ADJUSTMENT, PROCESS CONNECTION, CURR. TRIM (SERVICE/SYSTEM 2), SENSOR TRIM and SENSOR DATA group.
   – **Device replacement:**
     all parameters except DEVICE SERIAL No., DEVICE DESIGN and the parameters in the POSITION ADJUSTMENT, PROCESS CONNECTION, CURR. TRIM (SERVICE/SYSTEM 2), SENSOR TRIM and SENSOR DATA group.
   – **Electronics replace**:
     all parameters except the parameters in the CURR. TRIM (SERVICE/SYSTEM 2) and SENSOR DATA group.

   Factory setting: Configuration copy
5. Using the HistoROM CONTROL parameter select the option "HistoROM → Device" as the data transfer direction.
   (Menu path: GROUP SELECTION → OPERATING MENU → OPERATION)
6. Wait approx. 20 seconds. Configuration data are loaded from the device to the HistoROM®/M-DAT. The device is restarted.
7. Before removing the HistoROM®/M-DAT again from the electronic insert, disconnect the device from supply voltage.

5.6 Operation via SFX100

Compact, flexible and robust industry handheld terminal for remote parametrization and measured value inspection via the HART current output (4-20mA).
For details refer to Operating Instructions BA00060S/04/EN.

5.7 Endress+Hauser operating program

The operating program FieldCare is an Endress+Hauser Plant Asset Management Tool based on FDT technology. You can use FieldCare to configure all your Endress+Hauser devices, as well as devices from other manufacturers that support the FDT standard. Hardware and software requirements you can find on the www.endress.com → select your country → Search: FieldCare → FieldCare → Technical Data.

FieldCare supports the following functions:
- Configuration of transmitters in online operation
- Loading and saving device data (upload/download)
- Tank linearization
- HistoROM®/M-DAT analysis
- Documentation of the measuring point

Connection options:
- HART via Fieldgate FXA520
- HART via Commubox FXA195 and USB interface of a computer
- Commubox FXA291 with ToF Adapter FXA291 via service interface

Note!
- See also → 📄 23, "Connecting Commubox FXA195".
- In the "Level Standard" measuring mode, the configuration data that were loaded with FDT upload cannot be written again (FDT download). These data are only used to document the measuring point.
- Further information on the FieldCare can be found on the Internet: http://www.endress.com → Download → Text Search: FieldCare.

5.8 Locking/unlocking operation

Once you have entered all the parameters, you can lock your entries against unauthorised and undesired access.

You have the following possibilities for locking/unlocking the operation:
- Via a DIP-switch on the electronic insert, locally on the display.
- Via the on-site display (optional)
- Via digital communication.

The -symbol on the on-site display indicates that operation is locked. Parameters which refer to how the display appears, e.g. LANGUAGE and DISPLAY CONTRAST can still be altered.

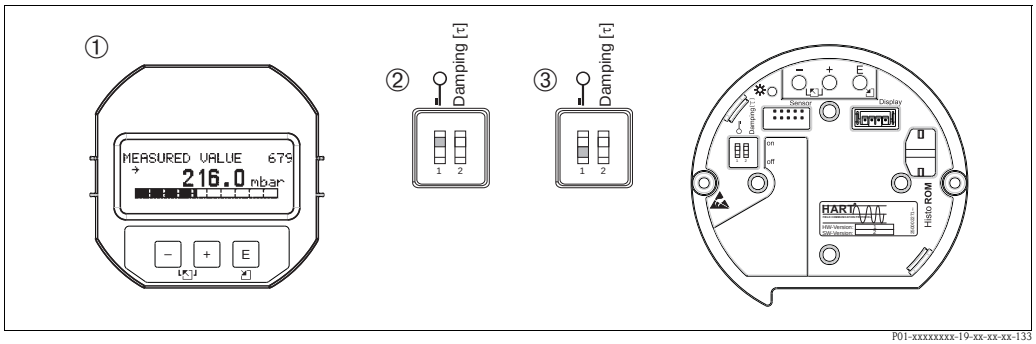
Note!
If operation is locked by means of the DIP-switch, you can only unlock operation again by means of the DIP-switch. If operation is locked by means of the on-site display or remote operation e.g. FieldCare, you can only unlock operation again by means of the on-site display or remote operation.

The table provides an overview of the locking functions:

Locking via	View/read parameter	Modify/write via[1]		Unlocking via		
		On-site display	Remote operation	DIP-switch	On-site display	Remote operation
DIP-switch	Yes	No	No	Yes	No	No
On-site display	Yes	No	No	No	Yes	Yes
Remote operation	Yes	No	No	No	Yes	Yes

1) Parameters which refer to how the display appears, e.g. LANGUAGE and DISPLAY CONTRAST can still be altered.

5.8.1 Locking/unlocking operation locally via DIP-switch



P01-xxxxxxxx-19-xx-xx-xx-133

Fig. 25: DIP-switch position "Hardware locking" on the electronic insert

1 If necessary, remove on-site display (optional)
2 DIP-switch is at "on": operation is locked.
3 DIP-switch is at "off": operation is unlocked (operation possible)

5.8.2 Locking/unlocking operation via on-site display or remote operation

	Description
Locking operation	1. Select INSERT PIN NO. parameter, Menu path: OPERATING MENU → OPERATION → INSERT PIN NO. 2. To lock operation, enter a number for this parameter between 0 to 9999 that is ≠100.
Unlocking operation	1. Select INSERT PIN NO. parameter. 2. To unlock operation, enter "100" for the parameter.

5.9 Factory setting (reset)

By entering a certain code, you can completely, or partially, reset the entries for the parameters to the factory settings. (For factory settings refer to the Operating Instructions BA00274P "Cerabar S/ Deltabar S/Deltapilot S, Description of device functions".) Enter the code by means of the ENTER RESET CODE parameter (Menu path: (GROUP SELECTION →) OPERATING MENU → OPERATING).
There are various reset codes for the device. The following table illustrates which parameters are reset by the particular reset codes. Operation must be unlocked to reset parameters (→ 37, "Locking/unlocking operation").

Note!
Any customer-specific configuration carried out by the factory is not affected by a reset (customer-specific configuration remains). If, after a reset, you wish the parameters to be reset to the factory settings, please contact Endress+Hauser Service.

Reset code	Description and effect
1846	**Display reset** – This reset resets all parameters which have to do with how the display appears (DISPLAY group). – Any simulation which may be running is ended. – The device is restarted.
62	**PowerUp reset (warm start)** – This reset resets all the parameters in the RAM. Data are read back anew from the EEPROM (processor is initialised again). – Any simulation which may be running is ended. – The device is restarted.
2710	**Measuring mode level reset** – Depending on the settings for the LEVEL MODE, LIN MEASURAND, LINdMEASURAND or COMB. MEASURAND parameters, the parameters needed for this measuring task will be reset. – Any simulation which may be running is ended. – The device is restarted. Example LEVEL MODE = linear and LIN. MEASURAND = Height ■ HEIGHT UNIT = m ■ CALIBRATION MODE = wet ■ EMPTY CALIB. = 0 ■ FULL CALIB. = Sensor end value converted to mH_2O, e.g. 4.79 mH_2O for a 400 mbar (6 psi) sensor
333	**User reset** – Affects the following parameters: – Function group POSITION ADJUSTMENT – Function group BASIC SETUP, except for the customer-specific units – Function group EXTENDED SETUP – Group OUTPUT – Function group HART DATA: CURRENT MODE, BUS ADDRESS and PREAMBLE NUMBER – Any simulation which may be running is ended. – The device is restarted.

Reset code	Description and effect
7864	**Total reset** – Affects the following parameters: – Function group POSITION ADJUSTMENT – Function group BASIC SETUP – Function group EXTENDED SETUP – Function group LINEARISATION (an existing linearisation table is erased) – Group OUTPUT – Function group PEAK HOLD INDICATOR – Function group HART DATA – All configurable messages ("Error" type) are set to factory setting. → 49, "Messages" and → 57, "Response of outputs to errors". – Function group USER LIMITS – Function group SYSTEM 2 – Any simulation which may be running is ended. – The device is restarted.
8888	**HistoROM reset** The measured value memory and event memory are cleared. During the reset, the HistoROM must be attached to the electronic insert.

6 Commissioning

Warning!
- If a pressure smaller than the minimum permitted pressure is present at the device, the messages "E120 Sensor low pressure" and "E727 Sensor pressure error – overrange" are output in succession.
- If a pressure greater than the maximum permitted pressure is present at the device, the messages "E115 Sensor overpressure" and "E727 Sensor pressure error – overrange" are output in succession.
- Messages E727, E115 and E120 are "Error"-type messages and can be configured as a "Warning" or an "Alarm". These messages are configured as "Warning" messages at the factory. This setting prevents the current output from assuming the set alarm current value for applications (e.g. cascade measurement) where the user is consciously aware of the fact that the sensor range can be exceeded
- We recommend setting messages E727, E115 and E120 to "Alarm" in the following instances:
  – The sensor range does not have to be exceeded for the measuring application.
  – Position adjustment has to be carried out that has to correct a large measured error as a result of the orientation of the device (e.g. devices with a diaphragm seal).

Note!
The device is configured for the Pressure measuring mode as standard. The measuring range and the unit in which the measured value is transmitted correspond to the specifications on the nameplate.

6.1 Function check

Carry out a post-installation and a post-connection check as per the checklist before commissioning the device.

- "Post-installation check" checklist, → 18.
- "Post-connection check" checklist, → 23.

6.2 Selecting language and measuring mode

6.2.1 On-site operation

The LANGUAGE and MEASURING MODE parameters are located on the top menu level.
See also → 30, "General structure of the operating menu".

The following measuring modes are available:
- Pressure
- Level

6.2.2 Digital communication

The MEASURING MODE parameter is displayed in the digital communication in the QUICK SETUP menus and in the BASIC SETUP function group (OPERATING MENU → SETTINGS → BASIC SETUP).

The following measuring modes are available:
- Pressure
- Level

The LANGUAGE parameter is arranged in the DISPLAY group (OPERATING MENU → DISPLAY).
- Use the LANGUAGE parameter to select the menu language for the on-site display.
- Select the menu language for FieldCare by means of the "Language Button" in the configuration window. Select the menu language for the FieldCare frame via the "Extra" menu → "Options" → "Display" → "Language".

6.3 Position adjustment

Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the measured value parameter does not display zero. There are three options to choose from when performing position adjustment.
(Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → POSITION ADJUSTMENT)

Parameter name	Description
POS. ZERO ADJUST (685) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. **Example:** – MEASURED VALUE = 2.2 mbar (0.032 psi) – Correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present. – MEASURED VALUE (after pos. zero adjust) = 0.0 mbar – The current value is also corrected. The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. **Factory setting:** 0.0
POS. INPUT VALUE (563) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. To correct the pressure difference, you need a reference measurement value (e. g. from a reference device). **Example:** – MEASURED VALUE = 0.5 mbar (0.0073 psi) – For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE, e.g. 2.0 mbar (0.029 psi). (MEASURED $VALUE_{new}$ = POS. INPUT VALUE) – MEASURED VALUE (after entry for POS. INPUT VALUE) = 2.0 mbar (0.029 psi) – The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. CALIB. OFFSET = MEASURED $VALUE_{old}$ – POS. INPUT VALUE, here: CALIB. OFFSET = 0.5 mbar (0.0073 psi) – 2.0 mbar (0.029 psi) = – 1.5 mbar (0.022 psi)) – The current value is also corrected. **Factory setting:** 0.0
CALIB. OFFSET (319) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure is known. **Example:** – MEASURED VALUE = 2.2 mbar (0.032 psi) – Via the CALIB. OFFSET parameter, enter the value by which the MEASURED VALUE should be corrected. To correct the MEASURED VALUE to 0.0 mbar, you must enter the value 2.2 here. (MEASURED $VALUE_{new}$ = MEASURED $VALUE_{old}$ – CALIB. OFFSET) – MEASURED VALUE (after entry for calib. offset) = 0.0 mbar – The current value is also corrected. **Factory setting:** 0.0

6.4 Pressure measurement

6.4.1 Information on pressure measurement

Note!

- There is a Quick Setup menu for each of the measuring modes Pressure and Level which guides you through the most important basic functions. With the setting in the MEASURING MODE parameter, you specify which Quick Setup menu should be displayed.
  → 40, "Selecting language and measuring mode".
- For a detailed description of the parameters see the Operating Instructions BA00274P "Cerabar S/Deltabar S/Deltapilot S, Description of device functions"
  – Table 6, POSITION ADJUSTMENT
  – Table 7, BASIC SETUP
  – Table 15, EXTENDED SETUP
- For pressure measurement, select the "Pressure" option by means of the MEASURING MODE parameter. The operating menu is structured appropriately.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

6.4.2 Quick Setup menu for Pressure measuring mode

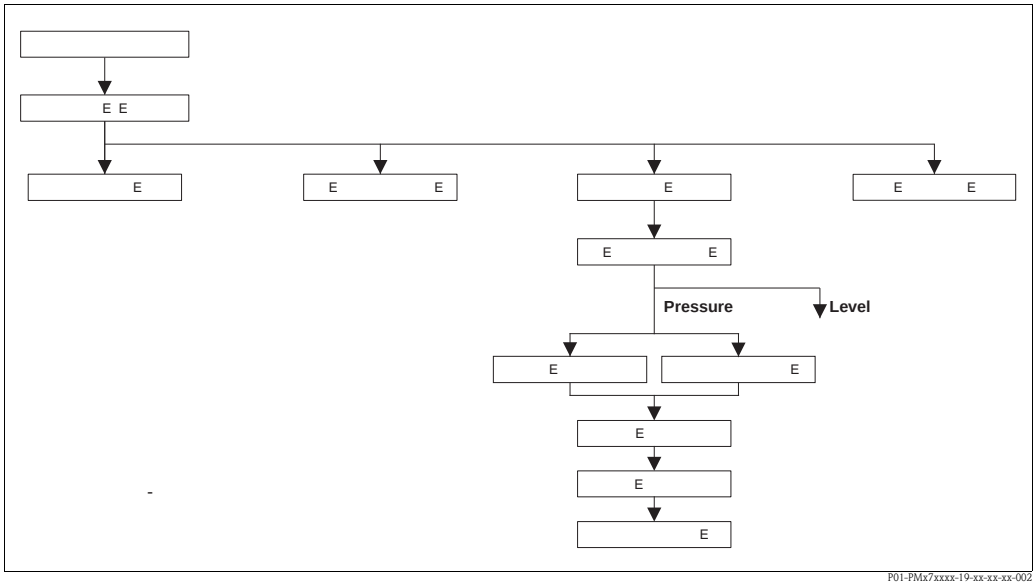


Fig. 26: Quick Setup menu for Pressure measuring mode

On-site operation
Measured value display On-site display: Switch from the measured value display to GROUP SELECTION with E.
GROUP SELECTION Select MEASURING MODE.
MEASURING MODE Select "Pressure" option.
GROUP SELECTION Select QUICK SETUP menu.

Digital communication
Measured value display Select QUICK SETUP menu.
MEASURING MODE Select "Pressure" option.

On-site operation
POS. ZERO ADJUST Due to orientation of the device, there may be a shift in the measured value. You correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option, i. e. you assign the value 0.0 to the pressure present.
POS. INPUT VALUE Due to orientation of the device, there may be a shift in the measured value. For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE.
SET LRV Set the measuring range (enter 4 mA value). Specify a pressure value for the lower current value (4 mA value). A reference pressure does not have to be present at the device.
SET URV Set the measuring range (enter 20 mA value). Specify a pressure value for the upper current value (20 mA value). A reference pressure does not have to be present at the device.
DAMPING TIME Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure.

Digital communication
POS. ZERO ADJUST Due to orientation of the device, there may be a shift in the measured value. You correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option, i. e. you assign the value 0.0 to the pressure present.
POS. INPUT VALUE Due to orientation of the device, there may be a shift in the measured value. For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE.
SET LRV Set the measuring range (enter 4 mA value). Specify a pressure value for the lower current value (4 mA value). A reference pressure does not have to be present at the device.
SET URV Set the measuring range (enter 20 mA value). Specify a pressure value for the upper current value (20 mA value). A reference pressure does not have to be present at the device.
DAMPING TIME Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure.

Note!
For on-site operation, see also
→ 26, "Function of the operating elements – on-site display connected" and
→ 30, "On-site operation – on-site display connected".

6.5 Level measurement

6.5.1 Information on level measurement

Note!

- The Pressure and Level operating modes each have a quick setup menu which guides you through the most important basic functions. → 46, "Quick Setup menu for Level measuring mode".
- Furthermore, the three level modes "Level Easy Pressure", "Level Easy Height" and "Level Standard" are available to you for level measurement. You can select from the "Linear", "Pressure linearized" and "Height linearized" level types for the "Level Standard" level mode. The table in the "Overview of level measurement" section below provides an overview of the various measuring tasks.
  - In the "Level Easy Pressure" and "Level Easy Height" level modes, the values entered are not tested as extensively as in the "Level Standard" level mode. The values entered for EMPTY CALIB./FULL CALIB., EMPTY PRESSURE/FULL PRESSURE, EMPTY HEIGHT/FULL HEIGHT and SET LRV/SET URV must have a minimum interval of 1 % for the "Level Easy Pressure" and "Level Easy Height" level modes. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly.
  - The "Level Easy Pressure" and "Level Easy Height" level modes encompass fewer parameters than the "Level Standard" mode and are used for quick and easy configuration of a level application.
  - Customer-specific units of fill level, volume and mass or a linearization table may only be entered in the "Level Standard" level mode.
  - Where the device is intended for use as a subsystem in a safety function (SIL), a "Device configuration with enhanced parameter security" (SAFETY CONFIRM.) is only possible for the "Level" operating mode in the "Level Easy Pressure" level mode. All parameters previously entered are checked after a password is entered. Once the "Level Easy Height" or "Level Standard" has been selected, the configuration will first have to be reset to the ex-works setting using the RESET parameter (menu path: (GROUP SELECTION →) OPERATING MENU → OPERATION) using the reset code "7864".
    For further information see the Cerabar S (SD00190P) Functional Safety Manual.
- See the Operating Instructions BA00274P "Cerabar S/Deltabar S/Deltapilot S, Description of device functions".

6.5.2 Overview of level measurement

Measuring task	LEVEL SELECTION/ LEVEL MODE	Measured variable options	Description	Comment	Measured value display
The measured variable is in direct proportion to the measured pressure. Calibration is performed by entering two pressure-level value pairs.	LEVEL SELECTION: Level Easy Pressure	Via OUTPUT UNIT parameter: %, level, volume or mass units.	– Calibration with reference pressure – wet calibration, see Operating Instructions BA00274P. – Calibration without reference pressure – dry calibration, see Operating Instructions BA00274P.	– Incorrect entries are possible – SIL mode possible – Customised units are not possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is in direct proportion to the measured pressure. Calibration is performed by entering the density and two height-level value pairs.	LEVEL SELECTION: Level Easy Height	Via OUTPUT UNIT parameter: %, level, volume or mass units.	– Calibration with reference pressure – wet calibration, see Operating Instructions BA00274P. – Calibration without reference pressure – dry calibration, see Operating Instructions BA00274P.	– Incorrect entries are possible – SIL mode not possible – Customised units are not possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is in direct proportion to the measured pressure.	LEVEL SELECTION: Level standard/ LEVEL MODE: Linear	Via LIN. MEASURAND parameter: – % (level) – Level – Volume – Mass	– Calibration with reference pressure – wet calibration, see Operating Instructions BA00274P. – Calibration without reference pressure – dry calibration, see Operating Instructions BA00274P.	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is not in direct proportion to the measured pressure as, for example, with containers with a conical outlet. A linearisation table must be entered for the calibration.	LEVEL SELECTION: Level standard/ LEVEL MODE: Pressure linearized	Via LINd MEASURAND parameter: – Pressure + % – Pressure + volume – Pressure + mass	– Calibration with reference pressure: semiautomatic entry of linearisation table, see Operating Instructions BA00274P. – Calibration without reference pressure: manual entry of linearisation table, see Operating Instructions BA00274P.	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the TANK CONTENT parameter show the measured value.
– Two measured variables are required or – The container shape is given by value pairs, such as height and volume. The 1st measured variable %-height or height must be in direct proportion to the measured pressure. The 2nd measured variable volume, mass or % must not be in direct proportion to the measured pressure. A linearisation table must be entered for the 2nd measured variable. The 2nd measured variable is assigned to the 1st measured variable by means of this table.	LEVEL SELECTION: Level standard/ LEVEL MODE: Height linearized	Via COMB. MEASURAND parameter: – Height + volume – Height + mass – Height + % – %-Height + volume – %-Height + mass – %-Height + %	– Calibration with reference pressure: wet calibration and semiautomatic entry of linearisation table, see Operating Instructions BA00274P. – Calibration without reference pressure: dry calibration and manual entry of linearisation table, see Operating Instructions BA00274P.	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the TANK CONTENT parameter show the 2nd measured value (volume, mass or %). The LEVEL BEFORE LIN parameter displays the 1st measured value (%-height or height).

6.5.3 Quick Setup menu for Level measuring mode

Note!

- Some parameters are only displayed if other parameters are appropriately configured. For example, the EMPTY CALIB. parameter is only displayed in the following cases:
  – LEVEL SELECTION "Level Easy Pressure" and CALIBRATION MODE "Wet"
  – LEVEL SELECTION "Level Standard", LEVEL MODE "Linear" and CALIBRATION MODE "WET"
  You can find the LEVEL MODE parameter in the BASIC SETTINGS function group (menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETTINGS).
- The following parameters are set to the following values in the factory:
  – LEVEL SELETION: Level Easy Pressure
  – CALIBRATION MODE: Wet
  – OUTPUT UNIT or LIN. MEASURAND: %
  – EMPTY CALIB.: 0.0
  – FULL CALIB.: 100.0
  – SET LRV (BASIC SETTINGS group): 0.0 (corresponds to 4 mA value)
  – SET URV (BASIC SETTINGS group): 100.0 (corresponds to 20 mA value).
- The quick setup is suitable for simple and quick commissioning. If you wish to make more complex settings, e.g. change the unit from "%" to "m", you will have to calibrate using the BASIC SETTINGS group. See Operating Instructions BA00274P.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

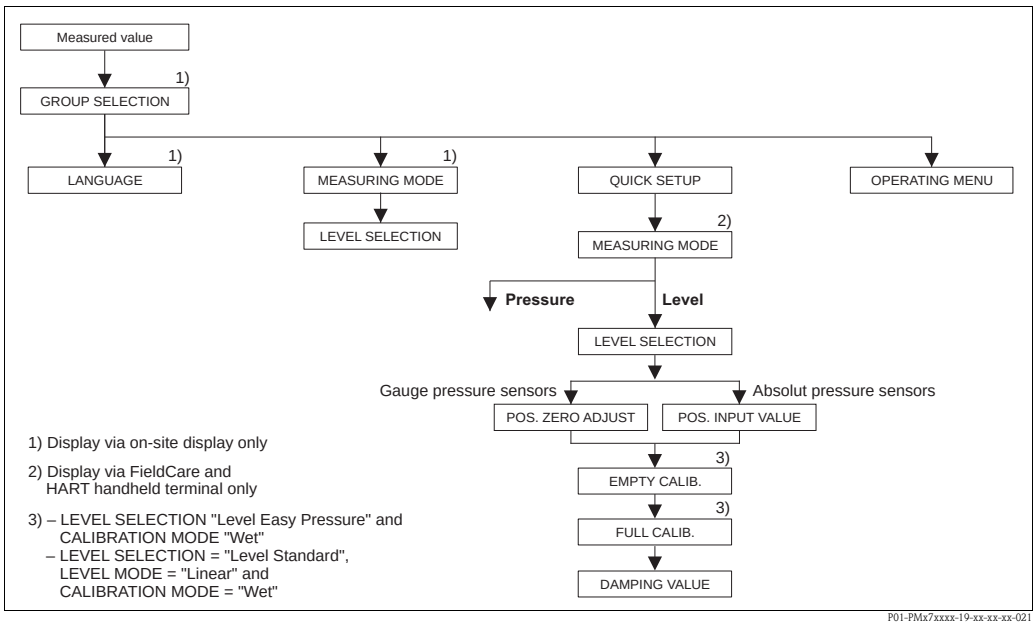

Fig. 27: Quick Setup menu for the Level measuring mode

On-site operation
Measured value display On-site display: Switch from the measured value display to GROUP SELECTION with E.
GROUP SELECTION Select MEASURING MODE.
MEASURING MODE Select "Level" option.

Digital communication
Measured value display Select QUICK SETUP menu.
MEASURING MODE Select "Level" option.

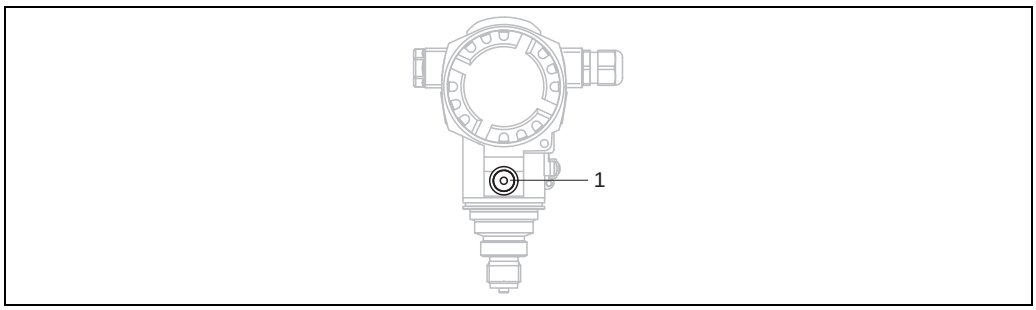
On-site operation	Digital communication
LEVEL SELECTION Select level mode. For an overview see → 45.	**LEVEL SELECTION** Select level mode. For an overview see → 45.
GROUP SELECTION Select QUICK SETUP menu.	
POS. ZERO ADJUST Due to orientation of the device, there may be a shift in the measured value. You correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option, i. e. you assign the value 0.0 to the pressure present.	**POS. ZERO ADJUST** Due to orientation of the device, there may be a shift in the measured value. You correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option, i. e. you assign the value 0.0 to the pressure present.
POS. INPUT VALUE Due to orientation of the device, there may be a shift in the measured value. For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE.	**POS. INPUT VALUE** Due to orientation of the device, there may be a shift in the measured value. For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE.
EMPTY CALIB. [1)] Enter level for the lower calibration point. For this parameter, enter a level value which is assigned to the pressure present at the device.	**EMPTY CALIB.** [1] Enter level for the lower calibration point. For this parameter, enter a level value which is assigned to the pressure present at the device.
FULL CALIB. [1] Enter level for the upper calibration point. For this parameter, enter a level value which is assigned to the pressure present at the device.	**FULL CALIB.** [1] Enter level for the upper calibration point. For this parameter, enter a level value which is assigned to the pressure present at the device.
DAMPING TIME Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure.	**DAMPING TIME** Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure.

1) – LEVEL SELECTION "Level Easy Pressure" and CALIBRATION MODE "Wet"
– LEVEL SELECTION "Level Standard", LEVEL MODE "Linear" and CALIBRATION MODE "Wet"

Note!
For on-site operation, see also
→ 26, "Function of the operating elements – on-site display connected" and
→ 30, "On-site operation – on-site display connected".

7 Maintenance

Keep the pressure compensation and GORE-TEX® filter (1) free from contaminations and water.



P01-PMC71xxx-17-xx-xx-xx-001

7.1 Cleaning instructions

Endress+Hauser offer flushing rings as accessories to clean process isolating diaphragms without taking the transmitters out of the process.
For further information please contact your local Endress+Hauser Sales Center.

7.1.1 PMP75

We recommend you perform CIP (cleaning in place (hot water)) before SIP (sterilization in place (steam)) for pipe diaphragm seals.
A frequent use of sterilization in place (SIP) will increase the stress on the process isolating diaphragm. Under unfavorable circumstances in the long term view we cannot exclude that a frequent temperature change could lead to a material fatigue of the process isolating diaphragm and possibly to a leakage.

7.2 Exterior cleaning

Please note the following points when cleaning the device:
- The cleaning agents used should not attack the surface and the seals.
- Mechanical damage to the process isolating diaphragm, e.g. due to pointed objects, must be avoided.
- Observe degree of protection. See therefor nameplate if necessary (→ 🖹 6).

8 Trouble-shooting

8.1 Messages

The following table lists all the possible messages that can occur.
The device differentiates between the error types "Alarm", "Warning" and "Error". You may specify whether the instrument should react as if for an "Alarm" or "Warning" for "Error" messages.
→ See "Error type/NA 64" column and Section 8.2 "Response of outputs to errors".

In addition, the "Error type/NA 64" column classifies the messages in accordance with NAMUR Recommendation NA 64:
- Break down: indicated with "B"
- Maintenance need: indicated with "C" (check request)
- Function check: indicated with "I" (in service)

Error message display on the on-site display:
- The measured value display shows the message with the highest priority. → See "Priority" column.
- The ALARM STATUS parameter shows all the messages present in descending order of priority. You can scroll through all the messages present with the −-key or +-key.

Message display via the digital communication:
The ALARM STATUS parameter shows the message with the highest priority.
See "Priority" column.

Note!
- If the device detects a defect in the on-site display during initialization, special error messages are generated. For the error messages → 57, "On-site display error messages".
- For support and further information, please contact Endress+Hauser Service.
- See also Section "Repair", "Repair of Ex-certified devices" and "Spare Parts".

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
101 (A101)	Alarm B	Failure (F)	B>Sensor electronic EEPROM error	– Electromagnetic effects are greater than specifications in the technical data. (→ 63) This message normally only appears briefly. – Sensor defect.	– Wait a few minutes. – Restart the device. Perform reset (Code 62). – Block off electromagnetic effects or eliminate source of disturbance. – Replace sensor.	17
102 (W102)	Warning C	Maintenance request (M)	C>Checksum error in EEPROM: peakhold segment	– Main electronics defect. Correct measurement can continue as long as you do not need the peak hold indicator function.	– Replace main electronics.	53
106 (W106)	Warning C	Funktion check (C)	C>Downloading - please wait	– Downloading.	– Wait for download to complete.	52
110 (A110)	Alarm B	Failure (F)	B>Checksum error in EEPROM: configuration segment	– The supply voltage is disconnected when writing. – Electromagnetic effects are greater than specifications in the technical data. (→ 63) – Main electronics defect.	– Reestablish supply voltage. Perform reset (Code 7864) if necessary. Carry out calibration again. – Block off electromagnetic effects or eliminate sources of disturbance. – Replace main electronics.	6
113 (A113)	Alarm B	Failure (F)	B>ROM failure in transmitter electronic	– Main electronics defect.	– Replace main electronics.	1

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
115 (E115)	Error B factory setting: Warning C	Out of specification (S)	B>Sensor overpressure	– Overpressure present. – Sensor defect.	– Reduce pressure until message disappears. – Replace sensor.	29
116 (W116)	Warning C	Maintenance request (M)	C>Download error, repeat download	– The file is defect. – During the download, the data are not correctly transmitted to the processor, e.g. because of open cable connections, spikes (ripple) on the supply voltage or electromagnetic effects.	– Use another file. – Check cable connection PC – transmitter. – Block off electromagnetic effects or eliminate sources of disturbance. – Perform reset (Code 7864) and carry out calibration again. – Repeat download.	36
120 (E120)	Error B factory setting: Warning C	Out of specification (S)	B>Sensor low pressure	– Pressure too low. – Sensor defect.	– Increase pressure until message disappears. – Replace sensor.	30
121 (A121)	Alarm B	Failure (F)	B>Checksum error in factory segment of EEPROM	– Main electronics defect.	– Replace main electronics.	5
122 (A122)	Alarm B	Failure (F)	B>Sensor not connected	– Cable connection sensor –main electronics disconnected. – Electromagnetic effects are greater than specifications in the technical data. (→ 🖹 63) – Main electronics defect. – Sensor defect.	– Check cable connection and repair if necessary. – Block off electromagnetic effects or eliminate source of disturbance. – Replace main electronics. – Replace sensor.	13
130 (A130)	Alarm B	Failure (F)	B>EEPROM is defect.	– Main electronics defect.	– Replace main electronics.	10
131 (A131)	Alarm B	Failure (F)	B>Checksum error in EEPROM: min/max segment	– Main electronics defect.	– Replace main electronics.	9
132 (A132)	Alarm B	Failure (F)	B>Checksum error in totalizer EEPROM	– Main electronics defect.	– Replace main electronics.	7
133 (A133)	Alarm B	Failure (F)	B>Checksum error in History EEPROM	– An error occurred when writing. – Main electronics defect.	– Perform reset (Code 7864) and carry out calibration again. – Replace electronics.	8
602 (W602)	Warning C	Funktion check (C)	C>Linearisation curve not monoton	– The linearisation table is not monotonic increasing or decreasing.	– Add to linearisation table or perform linearisation again.	57

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
604 (W604)	Warning C	Funktion check (C)	C>Linearisation table not valid. Less than 2 points or points too close	– The linearisation table consists of less than 2 points. – At least 2 points in the linearisation table are too close together. A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.	– Add to linearisation table. If necessary, perform linearisation again. – Correct linearisation table and accept again.	58
613 (W613)	Warning I	Funktion check (C)	I>Simulation is active	– Simulation is switched on, i.e. the device is not measuring at present.	– Switch off simulation.	60
620 (E620)	Error C Factory setting: Warning C	Out of specification (S)	C>Current output out of range	The current is outside the permitted range 3.8 to 20.5 mA. – The pressure applied is outside the set measuring range (but within the sensor range). – Loose connection at sensor cable	– Check pressure applied, reconfigure measuring range if necessary (See also Operating Instructions BA00274P, chapter 4 to 6 or these Operating Instructions) – Perform reset (Code 7864) and carry out calibration again. – Wait a short period of time and tighten the connection, or avoid loose connection.	49
700 (W700)	Warning C	Maintenance request (M)	C>Last configuration not stored	– An error occurred when writing or reading configuration data or the power supply was disconnected. – Main electronics defect.	– Perform reset (Code 7864) and carry out calibration again. – Replace main electronics.	54
701 (W701)	Warning C	Funktion check (C)	C>Measuring chain config. exceeds sensor range	– The calibration carried out would result in the sensor nominal operating range being undershot or overshot.	– Carry out calibration again.	50
702 (W702)	Warning C	Maintenance request (M)	C>HistoROM data not consistent.	– Data were not written correctly to the HistoROM, e.g. if the HistoROM was detached during the writing process. – HistoROM does not have any data.	– Repeat upload. – Perform reset (Code 7864) and carry out calibration again. – Copy suitable data to the HistoROM. (See also → 📄 33, "Copying configuration data".)	55
703 (A703)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	22
704 (A704)	Alarm B	Funktion check (C)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	12
705 (A705)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	21

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
706 (W706)	Warning C	Maintenance request (M)	C>Configuration in HistoROM and device not identical	– Configuration (parameters) in the HistoROM and in the device is not identical.	– Copy data from the device to the HistoROM. (See also → 📄 33, "Copying configuration data".) – Copy data from the HistoROM to the device. (See also → 📄 33, "Copying configuration data".) The message remains if the HistoROM and the device have different software versions. The message goes out if you copy the data from the device to the HistoROM. – Device reset codes such as 7864 do not have any effect on the HistoROM. That means that if you do a reset, the configurations in the HistoROM and in the device may not be the same.	59
707 (A707)	Alarm B	Funktion check (C)	B>X-VAL. of lin. table out of edit limits.	– At least one X-VALUE in the linearisation table is either below the value for HYDR. PRESS MIN. or MIN. LEVEL or above the value for HYDR. PRESS. MAX. or LEVEL MAX.	– Carry out calibration again. (See also Operating Instructions BA00274P, chapter 5 or these Operating Instructions)	38
710 (W710)	Warning C	Funktion check (C)	B>Set span too small. Not allowed.	– Values for calibration (e.g. lower range value and upper range value) are too close together. – The sensor was replaced and the customer-specific configuration does not suit the sensor. – Unsuitable download carried out.	– Adjust calibration to suit sensor. (See also Operating Instructions BA00274P, parameter description MINIMUM SPAN or these Operating Instructions) – Adjust calibration to suit sensor. – Replace sensor with a suitable sensor. – Check configuration and perform download again.	51
711 (A711)	Alarm B	Funktion check (C)	B>LRV or URV out of edit limits	– Lower range value and/or upper range value undershoot or overshoot the sensor range limits. – The sensor was replaced and the customer-specific configuration does not suit the sensor. – Unsuitable download carried out.	– Reconfigure lower range value and/or upper range value to suit the sensor. Pay attention to position factor. – Reconfigure lower range value and/or upper range value to suit the sensor. Pay attention to position factor. – Replace sensor with a suitable sensor. – Check configuration and perform download again.	37
713 (A713)	Alarm B	Funktion check (C)	B>100% POINT level out of edit limits	– The sensor was replaced.	– Carry out calibration again.	39
715 (E715)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor over temperature	– The temperature measured in the sensor is greater than the upper nominal temperature of the sensor. (See also Operating Instructions BA00274P, parameter description Tmax SENSOR or these Operating Instructions) – Unsuitable download carried out.	– Reduce process temperature/ ambient temperature. – Check configuration and perform download again.	32

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Prio rity
716 (E716)	Error B Factory setting: Alarm B	Failure (F)	B>Process isolating diaphragm broken	– Sensor defect.	– Replace Sensor. – Reduce pressure.	24
717 (E717)	Error C Factory setting: Warning C	Out of specification (S)	C>Transmitter over temperature	– The temperature measured in the electronics is greater than the upper nominal temperature of the electronics (+88 °C (+190 °F)). – Unsuitable download carried out.	– Reduce ambient temperature. – Check configuration and perform download again.	34
718 (E718)	Error C Factory setting: Warning C	Out of specification (S)	C>Transmitter under temperature	– The temperature measured in the electronics is smaller than the lower nominal temperature of the electronics (–43 °C (-45 °F)). – Unsuitable download carried out.	– Increase ambient temperature. Insulate device if necessary. – Check configuration and perform download again.	35
719 (A719)	Alarm B	Funktion check (C)	B>Y-VAL of lin. table out of edit limits	– At least on Y-VALUE in the linearisation table is below the MIN. TANK CONTANT or above the MAX. TANK CONTENT.	– Carry out calibration again. (See also Operating Instructions BA00274P, chapter 5 or these Operating Instructions)	40
720 (E720)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor under temperature	– The temperature measured in the sensor is smaller than the lower nominal temperature of the sensor. (See also Operating Instructions BA00274P, parameter description Tmin SENSOR or Operating Instructions) – Unsuitable download carried out. – Loose connection at sensor cable	– Increase process temperature/ ambient temperature. – Check configuration and perform download again. – Wait a short period of time and tighten the connection, or avoid loose connection.	33
721 (A721)	Alarm B	Funktion check (C)	B>ZERO POSITION level out of edit limits	– LEVEL MIN or LEVEL MAX has been changed.	– Perform reset (Code 2710) and carry out calibration again.	41
722 (A722)	Alarm B	Funktion check (C)	B>EMPTY CALIB. or FULL CALIB. out of edit limits	– LEVEL MIN or LEVEL MAX has been changed.	– Perform reset (Code 2710) and carry out calibration again.	42
723 (A723)	Alarm B	Funktion check (C)	B>MAX. FLOW out of edit limits	– FLOW-MEAS. TYPE has been changed.	– Carry out calibration again.	43
725 (A725)	Alarm B	Failure (F)	B>Sensor connection error, cycle disturbance	– Electromagnetic effects are greater than specifications in the technical data. (→ See Section 9.) – Setscrew loose. – Sensor or main electronics defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Retighten setscrew with 1 Nm (0,74 lbf ft) (see Chap. 3.3.8). – Replace sensor or main electronics.	25

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
726 (E726)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor temperature error - overrange	– Electromagnetic effects are greater than specifications in the technical data. (→ 63) – Process temperature is outside permitted range. – Sensor defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Check temperature present, reduce or increase if necessary. – If the process temperature is within the permitted range, replace sensor.	31
727 (E727)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor pressure error - overrange	– Electromagnetic effects are greater than specifications in the technical data. (→ 63) – Pressure is outside permitted range. – Sensor defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Check pressure present, reduce or increase if necessary. – If the pressure is within the permitted range, replace sensor.	28
728 (A728)	Alarm B	Failure (F)	B>RAM error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	2
729 (A729)	Alarm B	Failure (F)	B>RAM error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	3
730 (E730)	Error C Factory setting: Warning C	Out of specification (S)	C>LRV user limits exceeded	– Pressure measured value has undershot the value specified for the Pmin ALARM WINDOW parameter. – Loose connection at sensor cable	– Check system/pressure measured value. – Change value for Pmin ALARM WINDOW if necessary. (See also Operating Instructions BA00274P, parameter description Pmin ALARM WINDOW or these Operating Instructions) – Wait a short period of time and tighten the connection, or avoid loose connection.	46
731 (E731)	Error C Factory setting: Warning C	Out of specification (S)	C>URV user limits exceeded	– Pressure measured value has overshot the value specified for the Pmax ALARM WINDOW parameter.	– Check system/pressure measured value. – Change value for Pmax ALARM WINDOW if necessary. (See also Operating Instructions BA00274P, parameter description Pmax ALARM WINDOW or these Operating Instructions)	45
		Out of specification (S)		– Loose connection at sensor cable	– Wait a short period of time and tighten the connection, or avoid loose connection.	
732 (E732)	Error C Factory setting: Warning C		C>LRV Temp. User limits exceeded	– Temperature measured value has undershot the value specified for the Tmin ALARM WINDOW parameter.	– Check system/temperature measured value. – Change value for Tmin ALARM WINDOW if necessary. (See also Operating Instructions BA00274P, parameter description Tmin ALARM WINDOW or these Operating Instructions)	48
733 (E733)	Error C Factory setting: Warning C	Out of specification (S)	C>URV Temp. User limits exceeded	– Temperature measured value has overshot the value specified for the Tmax ALARM WINDOW parameter.	– Check system/temperature measured value. – Change value for Tmax ALARM WINDOW if necessary. (See also Operating Instructions BA00274P, parameter description Tmax ALARM WINDOW or these Operating Instructions)	47

Perform reset (Code 7864). – Block off electromagnetic effects or eliminate source of disturbance. – Reduce or increase pressure.	26
747 (A747)	Alarm B	Failure (F)	B>Sensor software not compatible to electronics	– Sensor does not suit the device (electronic sensor nameplate).	– Replace sensor with a suitable sensor.	16
748 (A748)	Alarm B	Failure (F)	B>Memory failure in signal processor	– Electromagnetic effects are greater than specifications in the technical data. (→ 63) – Main electronics defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Replace main electronics.	15

8.1.1 On-site display error messages

If the device detects a defect in the on-site display during initialization, the following error messages can be displayed:

Message	Measure
Initialization, VU Electr. Defect A110	Exchange on-site display.
Initialization, VU Electr. Defect A114	
Initialization, VU Electr. Defect A281	
Initialization, VU Checksum Err. A110	
Initialization, VU Checksum Err. A112	
Initialization, VU Checksum Err. A171	

8.2 Response of outputs to errors

The device differentiates between the error types Alarm, Warning and Error.
See the following table and → 📄 49, "Messages".

Output	A (Alarm)	W (Warning)	E (Error: Alarm/Warning)
Current output	Assumes the value specified via the OUTPUT FAIL MODE[1)], ALT. CURR. OUTPUT[1] and SET MAX. ALARM[1] parameter. See also the following section "Configuring current output for an alarm".	Device continues measuring.	For this error, you can enter whether the device should react as in the event of an alarm or as in the event of a warning. See corresponding "Alarm" or "Warning" column. (See also Operating Instructions BA00274P, parameter description SELECT ALARM TYPE or these Operating Instructions)
Bargraph (on-site display)	The bargraph adopts the value defined by the OUTPUT FAIL MODE [1] parameter.	The bargraph adopts the value which corresponds to the current value.	See this table, "Alarm" or "Warning" column, depending on selection.
On-site display	– The measured value and message are displayed alternately – Measured value display: ↯ -symbol is permanently displayed. Message display – 3-digit number such as A122 and description	– The measured value and message are displayed alternately – Measured value display: ↯ -symbol flashes. Message display: – 3-digit number such as W613 and description	– The measured value and message are displayed alternately – Measured value display: see corresponding "Alarm" or "Warning" column Message display: – 3-digit number such as E731 and description
Remote operation (digital communication)	In the case of an alarm, the ALARM STATUS[2)] parameter displays a 3-digit number such as 122 for "Sensor not connected".	In the case of a warning, the ALARM STATUS[2] parameter displays a 3-digit number such as 613 for "Simulation is active".	In the case of an error, the ALARM STATUS[2] parameter displays a 3-digit number such as 731 for "URV user limits exceeded".

1) Menu path: (GROUP SELECTION →) OPERATING MENU → OUTPUT

2) Menu path: (GROUP SELECTION →) OPERATING MENU → MESSAGES

8.2.1 Configuring current output for an alarm

You can configure the current output for the event of an alarm by means of the OUTPUT FAIL MODE, ALT. CURR. OUTPUT and SET MAX. ALARM parameters. These parameters are displayed in the OUTPUT group (menu path: (GROUP SELECTION →) OPERATING MENU → OUTPUT).

In the event of an alarm, the current and the bargraph assume the value entered with the OUTPUT FAIL MODE parameter.

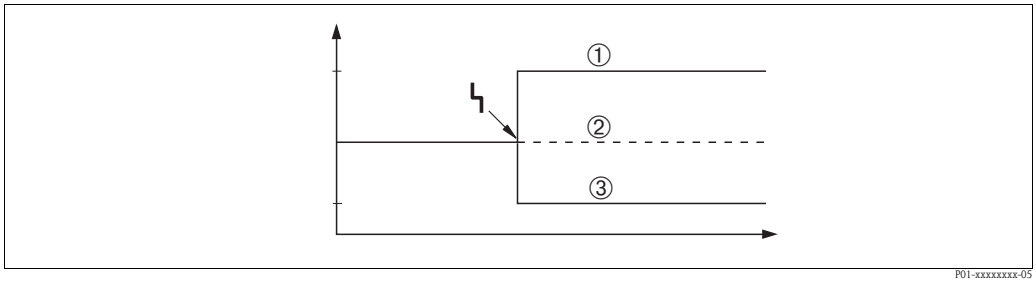

Fig. 28: Current output in the event of an alarm

Options:
1 Max. alarm (110%): can be set between 21 to 23 mA via the SET MAX. ALARM parameter
2 Hold meas. value: last measured value is kept
3 Min. alarm (–10%): 3.6 mA

Factory setting:
- OUTPUT FAIL MODE: Max. Alarm (110%)
- SET MAX. ALARM: 22 mA

Use the ALT. CURR. OUTPUT parameter to set the current output value for the error messages E 120 "Sensor low pressure" and E 115 "Sensor overpressure". You have the following options:
- Normal: the current output assumes the value set via the OUTPUT FAIL MODE and SET MAX. ALARM parameters.
- Special
  – Lower sensor limit undershot (E 120 "Sensor low pressure"): 3.6 mA
  – Upper sensor limit overshot (E 115 "Sensor overpressure") overshot: current output assumes the value set via the SET MAX ALARM parameter.

  Attention : when using the case "special", the behavior is limited to an over/underpressure in a range LRL -10% up to LRL -30% and URL +10% up to URL +30%.

Factory setting:
ALT. CURR. OUTPUT: normal

8.3 Confirming messages

Depending on the settings for the ALARM DISPL. TIME and ACK. ALARM MODE parameters, the following measures should be taken to clear a message:

Settings [1]	Measures
– ALARM DISPL. TIME = 0 s – ACK. ALARM MODE = off	– Rectify cause of the message (→ 🖹 49).
– ALARM DISPL. TIME > 0 s – ACK. ALARM MODE = off	– Rectify cause of the message (→ 🖹 49). – Wait for the alarm display time to elapse.
– ALARM DISPL. TIME = 0 s – ACK. ALARM MODE = on	– Rectify cause of the message (→ 🖹 49). – Confirm message using ACK. ALARM parameter.
– ALARM DISPL. TIME > 0 s – ACK. ALARM MODE = on	– Rectify cause of the message (→ 🖹 49). – Confirm message using ACK. ALARM parameter. – Wait for the alarm display time to elapse. If a message appears and the alarm display time elapses before the message has been acknowledged, the message will be cleared once it has been acknowledged.

1) Menu path for ALARM DISPL. TIME and ACK. ALARM MODE: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → MESSAGES

If the on-site display displays a message, you can suppress it with the E-key.
If there are several messages, the on-site display shows the message which has the highest priority (→ 🖹 49). Once you have suppressed this message using the E-key, the message with the next highest priority is displayed. You can use the E-key to suppress each message, one after the other. The ALARM STATUS parameter continues to display all the messages present.

8.4 Repair

The Endress+Hauser repairs concept provides for measuring devices to have a modular design and also the customer may carry out repairs (→ 60, "Spare Parts").

Note!
- For certified devices, please consult Chapter "Repair of Ex-certified devices".
- For more information on service and spare parts contact the Endress+Hauser Service. See www.endress.com/worldwide.

8.5 Repair of Ex-certified devices

Warning!
When repairing Ex-certified devices, please note the following:
- Only specialist personnel or Endress+Hauser may undertake repairs of certified devices.
- Relevant standards, national hazardous area regulations and Safety Instructions and Certificates must be observed.
- Only genuine Endress+Hauser spare parts may be used.
- When ordering spare parts, please check the device designation on the nameplate. Identical parts may only be used as replacements.
- Electronic inserts or sensors already in use in a standard instrument may not be used as spare parts for a certified device.
- Carry out repairs according to the instructions. After repairs, the device must fulfil the requirements of the specified individual tests.
- A certified device may only be converted into another certified variant by Endress+Hauser.
- All repairs and modifications must be documented.

8.6 Spare Parts

- Some replaceable measuring device components are identified by means of a spare part nameplate. This contains information about the spare part.
- All the spare parts for the measuring device along with the order code are listed In the W@M Device Viewer (www.endress.com/deviceviewer) and can be ordered. If available, users can also download the associated Installation Instructions.

Note!
Measuring device serial number:
- Located on the device and spare part nameplate.
- Can be read out via the "DEVICE SERIAL No" parameter in the "TRANSMITTER DATA" submenu.

8.7 Return

The measuring device must be returned if repairs or a factory calibration are required, or if the wrong measuring device has been ordered or delivered. According to legal regulations, Endress+Hauser, as a ISO-certified company, is required to follow certain procedures when handling returned products that are in contact with process fluids.
To ensure swift, safe and professional device returns, please read the return procedures and conditions on the Endress+Hauser website at www.services.endress.com/return-material.

8.8 Disposal

When disposing, separate and recycle the device components based on the materials.

8.9 Software history

Date	Software version	Changes software	Documentation	
			Operating Instructions	Description of Instrument Functions
11.2003	01.00.zz	Original software. Compatible with: – ToF Tool Field Tool Package, version 1.04.00 or higher – Commuwin II version 2.08.-1, Update G or higher – HART Communicator 375 with Device Rev.: 10, DD Rev.: 1	BA271P/00/EN/10.03 52020517	—
06.2004	02.00.zz	– Number of parameters in the Quick Setup menus has been reduced. – On-site operation: LANGUAGE and MEASURING MODE parameters have been moved to the top level. – New SAFETY CONFIRM. group implemented for SIL. → See also SD00190P Safety Manual Cerabar S. – MEASURING MODE "Level", LEVEL MODE "Linear": AREA UNIT and TANK SECTION parameters have been replaced with the TANK VOLUME and TANK HEIGHT parameters. – Function of the UNIT FLOW parameter has been split across four parameters. – Function of the SIMULATED VALUE parameter has been split across six parameters. – SENSOR TRIM and CURRENT TRIM groups have been removed. – Sensor adapt reset, code 1209 and sensor calibration reset, code 2509 have been removed. – Quick Setup menus are available via ToF Tool. Compatible with: – ToF Tool Field Tool Package version 2.00.00 or higher – Commuwin II version 2.08.-1, Update > G – HART Communicator 375/475 with Device Rev.: 20, DD Rev.: 1	BA271P/00/EN/05.04 52022795	BA274P/00/EN/05.04 52021469
06.2005	02.01.zz	– Operating keys also integrated on the optional on-site display. – Chinese and Japanese are available as the menu language on request. Compatible with: – ToF Tool Field Tool Package version 3.00.00 or higher – FieldCare version 2.01.00, DTM Library version 2.06.00, DTM: Deltabar S/MD7x/V02.00 V 1.4.98.74* – HART Communicator 375/475 with Device Rev.: 20, DD Rev.: 1* * Menu languages Chinese and Japanese not selectable	BA271P/00/EN/06.05 71000115	BA274P/00/EN/05.04 52021469

Index 151

1 Notes on use

Section 7 describes all the parameters in order of how they appear in the menu. Sections 4 to 6 provide typical examples of configuration.

Sections 1.1 to 1.3 describe ways of finding a certain parameter description more easily.

1.1 Finding parameter description using ID numbers

Each parameter is shown on the on-site display with a unique identification number (ID). Section 2 lists all the parameters in numerical order. The page reference/link takes you to the parameter in question.
In the Operating program, additional parameters and, to an extent, other parameters are displayed. These parameters are not listed in Section 2. You can find these parameters by means of the index.
→ See also Section 1.3.

1.2 Finding function group using graphic representation

All the function groups are shown in table form in Section 3. The page reference/link takes you to the function group in question. In Section 7, all the parameters of a function group are compiled in a table.

1.3 Finding parameter description using parameter names (index)

The index lists all the parameters in alphabetical order. The page reference/link takes you to the parameter in question.

2 Finding parameter description using ID numbers

ID number	Parameter name	Description, see page
001	DENSITY UNIT – Level Selection "Level Easy Pressure"	64 or 97
003	HEIGHT UNIT	64

4 Pressure measurement

4.1 Calibration with reference pressure

Example:
In this example, a device with a 500 mbar (7.5 psi) sensor is configured for the 0...+300 mbar (4.5 psi)measuring range, i.e. 0 mbar and 300 mbar (4.5 psi) are assigned to the 4 mA value and 20 mA value respectively.

Prerequisite:
- The pressure values 0 mbar and 300 mbar (4.5 psi) can be specified. The device is already installed, for example.

Note!
- See also Operating Instructions Deltabar S (BA00270P), Section 6.6 "Differential pressure measurement", Cerabar S (BA00271P), Section 6.4 "Pressure measurement" or Deltapilot S (BA00332P), Section 6.5 "Pressure measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 55, Table 7: BASIC SETUP.
- For a description of further relevant parameters, see
  – Page 96, Table 15: EXTENDED SETUP
  – Page 121, Table 25: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description	
1	Deltabar S: before configuring the device for your application, the pressure piping must be cleaned and filled with fluid. See Operating Instructions BA00270P, Section 6.6.	 P01-PMD75xxx-19-xx-xx-xx-000
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.	
3	If necessary, select the "Pressure" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE	
4	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP	 P01-xxxxxxxx-05-xx-xx-xx-010
5	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.	
6	The pressure for the lower range value (4 mA value) is present at the device, here 0 mbar for example.	
	Select GET LRV parameter.	
	Confirm value present. The pressure value present is assigned to the lower current value (4 mA).	
7	The pressure for the upper range value (20 mA value) is present at the device, here 300 mbar (4.5 psi) for example.	
	Select GET URV parameter.	
	Confirm value present. The pressure value present is assigned to the upper current value (20 mA).	
8	Result: The measuring range is set for 0...+300 mbar (4.5 psi).	

Fig. 1: Calibration with reference pressure

1 See table, step 6.
2 See table, step 7.

Note!
- You can also specify a customer-specific unit. See parameter description for PRESS. ENG. UNIT (→ Page 56).

4.2 Calibration without reference pressure

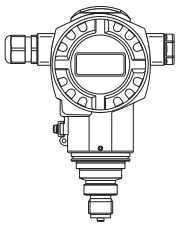
Example:
In this example, a device with a 400 mbar (6 psi) sensor is configured for the 0...+300 mbar (4.5 psi) measuring range, i.e. 0 mbar and 300 mbar (4.5 psi) are assigned to the 4 mA value and 20 mA value respectively.

Prerequisite:
- This is a theoretical calibration, i.e. the pressure values for the lower range and upper range value are known.

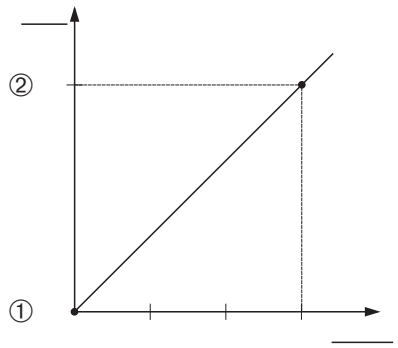
Note!
- See also Operating Instructions Deltabar S (BA00270P), Section 6.6 "Differential pressure measurement", Cerabar S (BA00271P), Section 6.4 "Pressure measurement" or Deltapilot S (BA00332P), Section 6.5 "Pressure measurement".
- Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. → To perform a position adjustment see also Page 53, Table 6: Position adjustment.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 55, Table 7: BASIC SETUP.
- For a description of further relevant parameters, see
  – Page 96, Table 15: EXTENDED SETUP
  – Page 121, Table 27: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	If necessary, select the "Pressure" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE
2	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP
3	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
4	Select SET LRV parameter.
	Enter value, here 0 mbar, for the SET LRV parameter and confirm. This pressure value is assigned to the lower current value (4 mA).
5	Select SET URV parameter.
	Enter value, here 300 mbar (4.5 psi), for the SET URV parameter and confirm. This pressure value is assigned to the upper current value (20 mA).
6	Result: The measuring range is set for 0...+300 mbar (4.5 psi).



P01-PMP71xxx-19-xx-xx-xx-000



P01-xxxxxxxx-05-xx-xx-xx-010

Fig. 2: Calibration without reference pressure

1 See table, step 4.
2 See table, step 5.

Note!
- You can also perform calibration without reference pressure by means of the QUICK SETUP menu. → See Page 47 ff, Table 3: QUICK SETUP menu.
- You can also specify a customer-specific unit. See parameter description for PRESS. ENG. UNIT (→ Page 56).

5 Level measurement

5.1 Overview of level measurement

Measuring task	LEVEL SELECTION/ LEVEL MODE	Measured variable options	Description	Comment	Measured value display
The measured variable is in direct proportion to the measured pressure. Calibration is performed by entering two pressure-level value pairs.	LEVEL SELECTION: Level Easy Pressure	Via OUTPUT UNIT parameter: %, level, volume or mass units.	– Calibration with reference pressure – wet calibration, see Page 15, Section 5.2.1 – Calibration without reference pressure – dry calibration, see Page 17, Section 5.2.2	– Incorrect entries are possible – SIL mode possible – Customised units are not possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is in direct proportion to the measured pressure. Calibration is performed by entering the density and two height-level value pairs.	LEVEL SELECTION: Level Easy Height	Via OUTPUT UNIT parameter: %, level, volume or mass units.	– Calibration with reference pressure – wet calibration, see Page 19, Section 5.3.1 – Calibration without reference pressure – dry calibration, see Page 22, Section 5.3.2	– Incorrect entries are possible – SIL mode not possible – Customised units are not possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is in direct proportion to the measured pressure.	LEVEL SELECTION: Level standard/ LEVEL MODE: Linear	Via LIN. MEASURAND parameter: – % (Level) – Level – Volume – Mass	– Calibration with reference pressure – wet calibration, see Page 24, Section 5.4.1 – Calibration without reference pressure – dry calibration, see Page 26, Section 5.4.2	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the LEVEL BEFORE LIN parameter show the measured value.
The measured variable is not in direct proportion to the measured pressure as, for example, with containers with a conical outlet. A linearisation table must be entered for the calibration.	LEVEL SELECTION: Level standard/ LEVEL MODE: Pressure Linearized	Via LINd MEASURAND parameter: – Pressure + % – Pressure + Volume – Pressure + Mass	– Calibration with reference pressure: semiautomatic entry of linearisation table, see Page 28, Section 5.5.1 – Calibration without reference pressure: manual entry of linearisation table, see Page 31, Section 5.5.2	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the TANK CONTENT parameter show the measured value.
– Two measured variables are required or – The container shape is given by value pairs, such as height and volume. The 1st measured variable %-height or height must be in direct proportion to the measured pressure. The 2nd measured variable volume, mass or % must not be in direct proportion to the measured pressure. A linearisation table must be entered for the 2nd measured variable. The 2nd measured variable is assigned to the 1st measured variable by means of this table.	LEVEL SELECTION: Level standard/ LEVEL MODE: Height Linearized	Via COMB. MEASURAND parameter: – Height + Volume – Height + Mass – Height + % – %-Height + Volume – %-Height + Mass – %-Height + %	– Calibration with reference pressure: wet calibration and semiautomatic entry of linearisation table, see Page 33, Section 5.6.1 – Calibration without reference pressure: dry calibration and manual entry of linearisation table, see Page 37, Section 5.6.2	– Incorrect entries are rejected by the device – SIL mode not possible – Customised level, volume and mass units are possible	The measured value display and the TANK CONTENT parameter show the 2nd measured value (volume, mass or %). The LEVEL BEFORE LIN parameter displays the 1st measured value (%-height or height).

5.2 "Level Easy Pressure" level selection

5.2.1 Calibration with reference pressure – wet calibration

Example:
In this example, the level in a tank should be measured in m. The maximum level is 3 m (9.8 ft). The pressure range is set to 0 to 300 mbar (4.5 psi).

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- The tank can be filled or emptied.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- The values entered for EMPTY CALIB./FULL CALIB. and SET LRV/SET URV must have a minimum interval of 1% for the "Level Easy Pressure" level mode. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 58, Table 8: LEVEL SELECTION "Level Easy Pressure"
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Deltabar S: Before you configure the device for your application, the pressure piping must be cleaned and filled with medium. See Operating Instructions BA00270P, Section 6.5.1
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.
3	If necessary, select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP→ MEASURING MODE
4	If necessary, select "Level Easy Pressure" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION

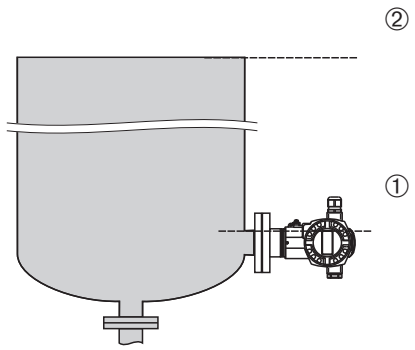


Fig. 3: Calibration with reference pressure – wet calibration

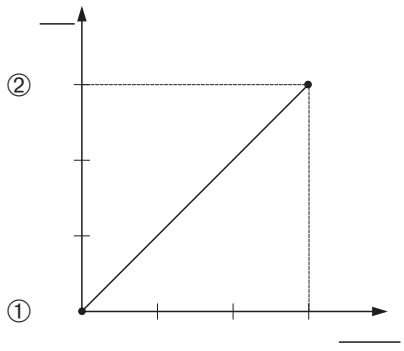
1 See Table, Step 9.
2 See Table, Step 10.

	Description
5	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP
6	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
7	Select a level unit via the OUTPUT UNIT parameter, here m for example.
8	Select the "Wet" option by means of the CALIBRATION MODE parameter.
9	Hydrostatic pressure for the lower calibration point is present at the device, here 0 mbar for example.
	Select EMPTY CALIB. parameter.
	Enter the level value, here 0 m for example. Confirm the value to assign the pressure value present to the lower level value. ✎ Note! To accept the value displayed you must first switch to the Edit mode (see the "Editing values" section) and then press the "E" button to save the value.
10	Hydrostatic pressure for the upper calibration point is present at the device, here 300 mbar (4.5 psi) for example.
	Select FULL CALIB. parameter.
	Enter the level value, here 3 m (9.8 ft) for example. Confirm the value to assign the pressure value present to the upper level value. ✎ Note! To accept the value displayed you must first switch to the Edit mode (see the "Editing values" section) and then press the "E" button to save the value.
11	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
12	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
13	Result: The measuring range is set for 0 to 3 m (9.8 ft).



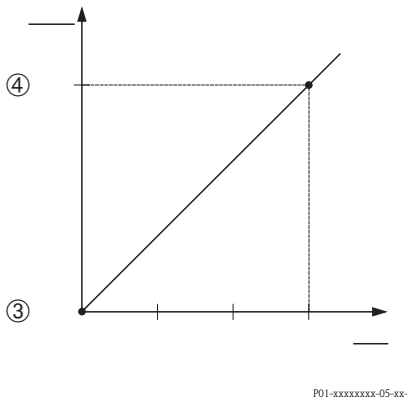


Fig. 4: Calibration with reference pressure – wet calibration

1 See Table, Step 9.
2 See Table, Step 10.
3 See Table, Step 11.
4 See Table, Step 12.

✎ Note!

1. You can also perform calibration with reference pressure by means of the QUICK SETUP menu. → See Page 49 ff, Table 4: QUICK SETUP menu.
2. For this level mode, the measured variables %, level, volume and mass are available. → See also parameter description for OUTPUT UNIT, Page 60.
3. For operation using the on-site display, the parameters EMPTY CALIB. (→ Page 61) and FULL CALIB. (→ Page 61) also show the respective pressure present at the device. For operation using Digital communication, the pressure present at the device is displayed in the PROCESS VALUES group (menu path: OPERATING MENU→ PROCESSINFO → PROCESS VALUES).

5.2.2 Calibration without reference pressure – dry calibration

Example:
In this example, the volume in a tank should be measured in litres.The maximum volume of 1000 litres (264 US gal) corresponds to a pressure of 450 mbar (6.75 psi). The minimum volume of 0 litres corresponds to a pressure of 50 mbar (0.75 psi), as the device is mounted below the level lower range value. The device is mounted below the level lower range value.

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- This is a theoretical calibration i.e. the pressure and volume values for the lower and upper calibration point must be known.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- The values entered for EMPTY CALIB./FULL CALIB. and SET LRV/SET URV must have a minimum interval of 1% for the "Level Easy Pressure" level mode. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly.
- Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. → To perform a position adjustment see also Page 53, Table 6: Position adjustment.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 58, Table 8: LEVEL SELECTION "Level Easy Pressure"
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP→ MEASURING MODE
2	If necessary, select "Level Easy Pressure" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION
3	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP

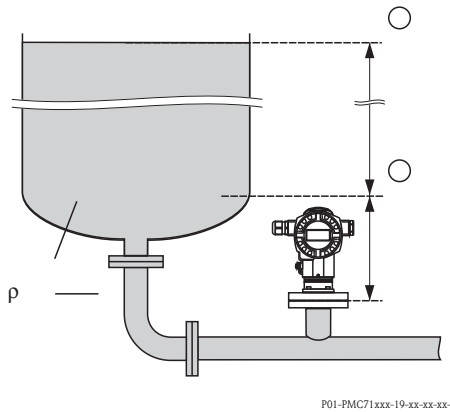

Fig. 5: Calibration without reference pressure – dry calibration

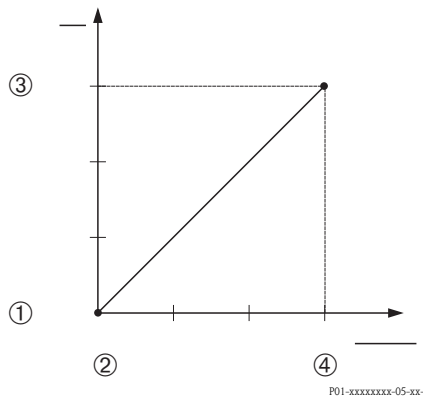
1 See Table, Steps 7 and 8.
2 See Table, Steps 9 and 10.

	Description
4	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
5	Select a volume unit via the OUTPUT UNIT parameter, here l (litres) for example..
6	Select the "Dry" option by means of the CALIBRATION MODE parameter.
7	Enter the volume value for the lower calibration point via the EMPTY CALIB. parameter, here 0 l for example.
8	Enter the pressure value for the lower calibration point via the EMPTY PRESSURE parameter, here 50 mbar (0.75 psi) for example.
9	Enter the volume value for the upper calibration point via the FULL CALIB. parameter, here 1000 l (264 gal) for example.
10	Enter the pressure value for the upper calibration point via the FULL PRESSURE parameter, here 450 mbar (6.75 psi) for example.
11	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
12	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
13	Result: The measuring range is set for 0 to 1000 l (264 gal).



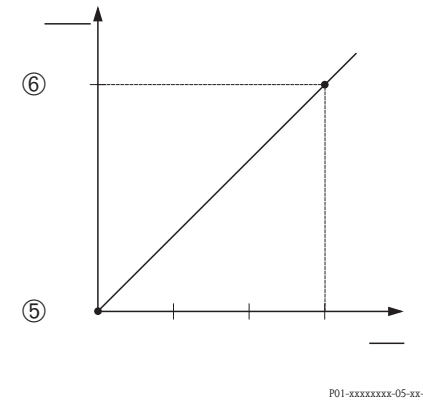


Fig. 6: Calibration with reference pressure – wet calibration

1 See Table, Step 7.
2 See Table, Step 8.
3 See Table, Step 9.
4 See Table, Step 10.
5 See Table, Step 11.
6 See Table, Step 12.

Note!

1. For this level mode, the measured variables %, level, volume and mass are available. → See also parameter description for OUTPUT UNIT, Page 60.

5.3 "Level Easy Height" level selection

5.3.1 Calibration with reference pressure – wet calibration

Example:
In this example, the volume in a tank should be measured in litres. The maximum volume of 1000 litres (264 US gal) corresponds to a level of 4.5 m (15 ft). The minimum volume of 0 litres corresponds to a level of 0.5 m (1.6 ft), as the device is mounted below the level lower range value. The density of the medium is 1 kg/dm^3.

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- The tank can be filled or emptied.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- The values entered for EMPTY CALIB./FULL CALIB., EMPTY PRESSURE/FULL PRESSURE, EMPTY HEIGHT/FULL HEIGHT and SET LRV/SET URV must have a minimum interval of 1% for the "Level Easy Height" level mode. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 62, Table 9: LEVEL SELECTION "Level Easy Height"
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Deltabar S: Before you configure the device for your application, the pressure piping must be cleaned and filled with medium. See Operating Instructions BA00270P, Section 6.5.1
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.
3	Select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP→ MEASURING MODE
4	If necessary, select the "Level Easy Height" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION
5	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP

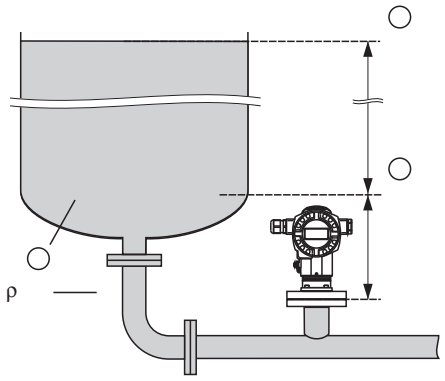

Fig. 7: Calibration with reference pressure – wet calibration

1 See Table, Steps 10 and 11.
2 See Table, Step 12.
3 See Table, Step 13.

	Description
6	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
7	Select a volume unit via the OUTPUT UNIT parameter, here l (litres) for example..
8	Select a height unit via the HEIGHT UNIT parameter, here m for example.
9	Select the "Wet" option via the CALIBRATION MODE parameter.
10	Select a density unit via the DENSITY UNIT parameter, here kg/dm^3 for example.
11	Enter the density of the fluid using the ADJUST DENSITY parameter, here kg/dm^3 for example.
12	Enter the volume value for the lower calibration point via the EMPTY CALIB. parameter, here 0 l for example. (The currently measured hydrostatic pressure is displayed as height, here 0.5 m (1.6 ft) for example.) Note! To accept the value displayed you must first switch to the Edit mode (see the "Editing values" section) and then press the "E" button to save the value.
13	Enter the volume value for the upper calibration point via the FULL CALIB. parameter, here 1000 l (264 US gal) for example. (The currently measured hydrostatic pressure is displayed as height, here 4.5 m (15 ft) for example.) Note! To accept the value displayed you must first switch to the Edit mode (see the "Editing values" section) and then press the "E" button to save the value.
14	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
15	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
16	Result: The measuring range is set for 0 to 1000 l (264 US gal).

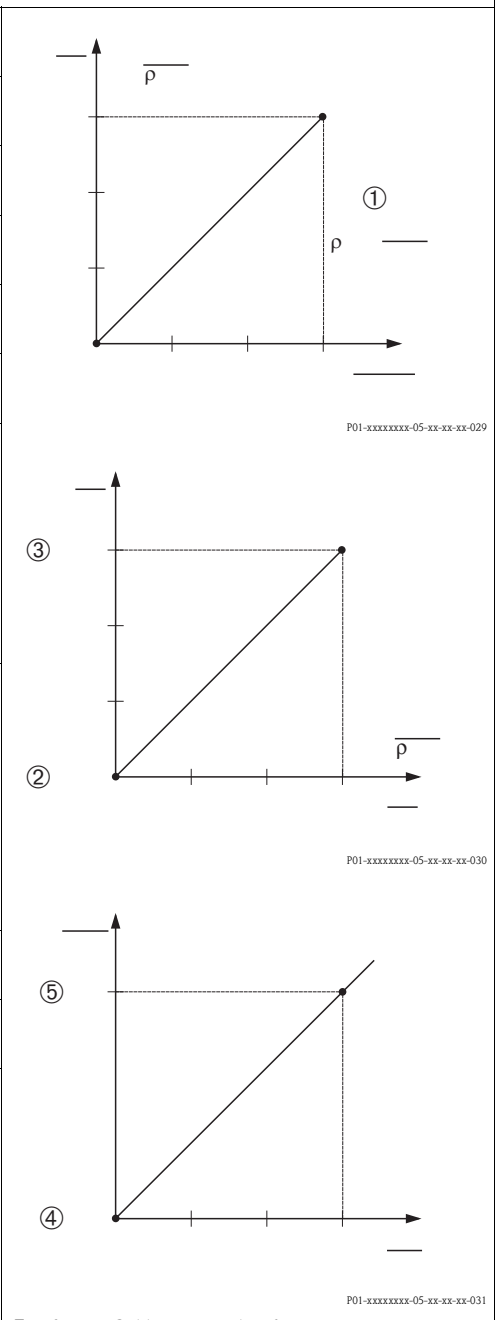

Fig. 8: Calibration with reference pressure – wet calibration

1 See Table, Steps 10 and 11.
2 See Table, Step 12.
3 See Table, Step 13.
4 See Table, Step 14.
5 See Table, Step 15.

Note!

1. For this level mode, the measured variables %, level, volume and mass are available. → See also parameter description for OUTPUT UNIT, Page 64.

5.3.2 Calibration without reference pressure – dry calibration

Example:
In this example, the volume in a tank should be measured in litres. The maximum volume is 1000 l (264 US gal), and the maximum height is 4.5 m (15 ft). The minimum volume of 0 litres corresponds to a level of 0.5 m (1.6 ft), as the device is mounted below the level lower range value. The density of the fluid is 1 kg/dm^3.

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- This is a theoretical calibration i.e. the height and volume values for the lower and upper calibration point must be known.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- The values entered for EMPTY CALIB./FULL CALIB., EMPTY PRESSURE/FULL PRESSURE, EMPTY HEIGHT/FULL HEIGHT and SET LRV/SET URV must have a minimum interval of 1% for the "Level Easy Height" level mode. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly.
- Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. → To perform a position adjustment see also Page , Table 6: Position adjustment.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 62, Table 9: LEVEL SELECTION "Level Easy Height"
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP→ MEASURING MODE
2	If necessary, select "Level Easy Height" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION
3	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP

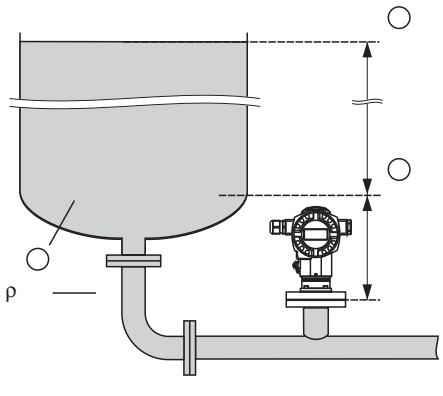

Fig. 9: Calibration without reference pressure – dry calibration

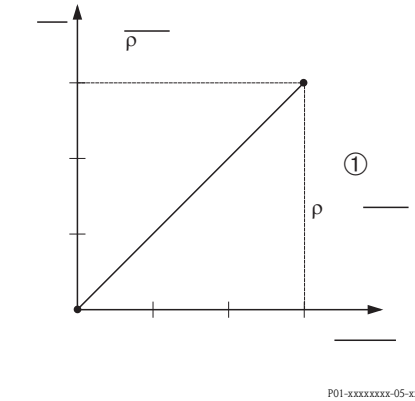
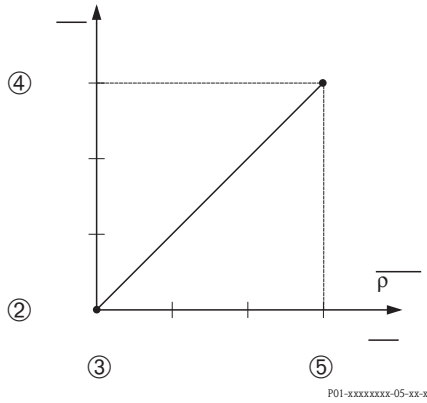
1 See Table, Steps 8 and 9.
2 See Table, Steps 10 and 11.
3 See Table, Steps 12 and 13.

	Description
4	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
5	Select a volume unit via the OUTPUT UNIT parameter, here l (litres) for example.
6	Select a height unit via the HEIGHT UNIT parameter, here m for example.
7	Select the "Dry" option via the CALIBRATION MODE parameter.
8	Select a density unit via the DENSITY UNIT parameter, here kg/dm^3 for example.
9	Enter the density of the fluid using the ADJUST DENSITY parameter, here kg/dm^3 for example.
10	Enter the volume value for the lower calibration point via the EMPTY CALIB. parameter, here 0 l for example.
11	Enter the height value for the lower calibration point via the EMPTY HEIGHT parameter, here 0.5 m (1.6 ft) for example.
12	Enter the volume value for the upper calibration point via the FULL CALIB. parameter, here 1000 l (litres) (264 US gal) for example.
13	Enter the height value for the upper calibration point via the FULL HEIGHT parameter, here 4.5 m (15 ft) for example.
14	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
15	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
16	Result: The measuring range is set for 0 to 1000 l (litres) (264 US gal).





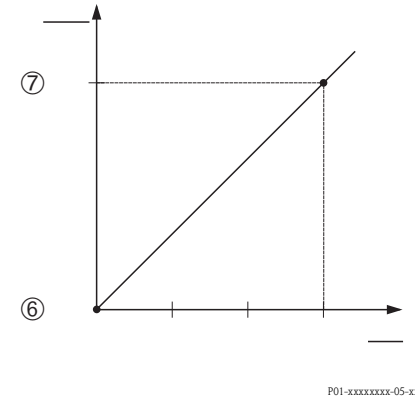


Fig. 10: Calibration with reference pressure – wet calibration

1 See Table, Steps 8 and 9.
2 See Table, Step 10.
3 See Table, Step 11.
4 See Table, Step 12.
5 See Table, Step 13.
6 See Table, Step 14.
7 See Table, Step 15.

Note!

1. For this level mode, the measured variables %, level, volume and mass are available. → See also parameter description for OUTPUT UNIT, Page 64.

5.4 "Level Standard" level selection, "Linear" level type

5.4.1 Calibration with reference pressure – wet calibration

Example:
In this example, the level in a tank should be measured in m. The maximum level is 3 m (9.8 ft). The pressure range is set to 0 to 300 mbar (4.5 psi).

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- The tank can be filled or emptied.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 67, Table 10: BASIC SETUP
  – Page 70, Table 11: BASIC SETUP – "Linear" level type.
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Deltabar S: before configuring the device for your application, the pressure piping must be cleaned and the device filled with fluid. See Operating Instructions BA00270P, Section 6.5.1
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.
3	If necessary, select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE
4	If necessary, select "Level Standard" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION

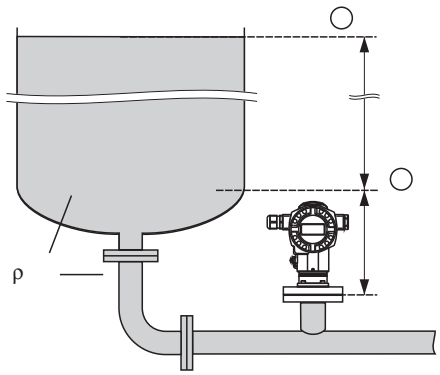

Fig. 11: Calibration with reference pressure – wet calibration

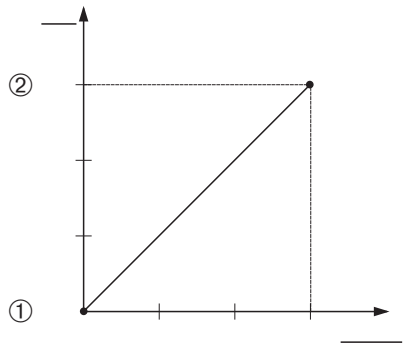
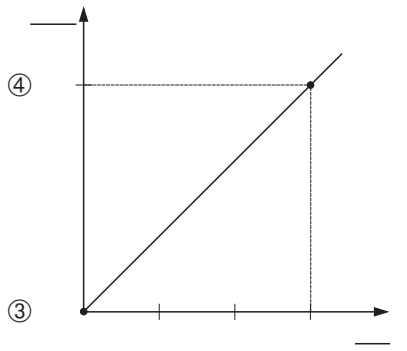
1 See table, step 11.
2 See table, step 12.

	Description
5	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP
6	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
7	Select the "Linear" option by means of the LEVEL MODE parameter.
8	Select the "Level" option by means of the LIN. MEASURAND parameter.
9	Select a level unit via the HEIGHT UNIT parameter, here m for example.
10	Select the "Wet" option by means of the CALIBRATION MODE parameter.
11	The pressure for the lower calibration point is present at the device, here 0 mbar for example.
	Select EMPTY CALIB. parameter.
	Enter the level value, here 0 m for example. Confirm the value to assign the pressure value present to the lower level value.
12	The pressure for the upper calibration point is present at the device, here 450 mbar (6.75 psi) for example.
	Select FULL CALIB. parameter.
	Enter the level value, here 3 m (9.8 ft) for example. Confirm the value to assign the pressure value present to the upper level value.
13	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
14	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
15	Result: The measuring range is set for 0...3 m (9.8 ft).



P01-xxxxxxxx-05-xx-xx-xx-034



P01-xxxxxxxx-05-xx-xx-xx-014

Fig. 12: Calibration with reference pressure – wet calibration

1 See table, step 11.
2 See table, step 12.
3 See table, step 13.
4 See table, step 14.

Note!

1. You can also perform calibration with reference pressure by means of the QUICK SETUP menu. → See Page 49 ff, Table 4: QUICK SETUP menu.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 70), UNIT VOLUME (→ Page 71) and MASS UNIT (→ Page 72).
3. For this level type, the measured variables %, level, volume and mass are available. → See Page 70 ff.
4. The EMPTY PRESSURE (→ Page 74) and FULL PRESSURE (→ Page 74) parameters display the pressure values belonging to the EMPTY CALIB. and FULL CALIB. parameters.

5.4.2 Calibration without reference pressure – dry calibration

Example:
In this example, the volume in a tank should be measured in m^3. The maximum volume is 5 m^3 and the maximum height 4 m (13 ft). The density of the fluid is 1 kg/dm^3. The device is mounted below the level lower range value.

Prerequisite:
- The measured variable is in direct proportion to the pressure.
- This is a theoretical calibration, i.e. the tank volume, tank height and density of the fluid are known.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. → To perform a position adjustment see also Page , Table 6: Position adjustment.
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 67, Table 10: BASIC SETUP
  – Page 70, Table 11: BASIC SETUP – "Linear" level type.
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 26: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE
2	If necessary, select "Level Standard" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION
3	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP

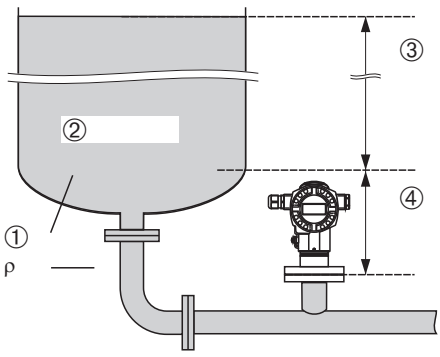


Fig. 13: Calibration without reference pressure – dry calibration

1 See table, step 9.
2 See table, step 10.
3 See table, step 11.
4 See table, step 12.

	Description
4	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
5	Select the "Linear" option by means of the LEVEL MODE parameter.
6	Select the "Volume" option by means of the LIN. MEASURAND parameter.
7	Select a volume unit via the UNIT VOLUME parameter, here m^3 for example.
8	Select the "Dry" option by means of the CALIBRATION MODE parameter. See also the following note, point 3.
9	Enter the value for density via the ADJUST DENSITY parameter, here 1 kg/dm^3 for example.
10	Enter the tank volume via the TANK VOLUME parameter, here 5 m^3 for example.
11	Enter the tank height via the TANK HEIGHT parameter, here 4 m (13 ft) for example.
12	Enter the level offset via the ZERO POSITION parameter, here –0.5 m (-1,6 ft) for example.
13	Set the value for the lower current value (4 mA) by means of the SET LRV parameter.
14	Set the value for the upper current value (20 mA) by means of the SET URV parameter.
15	Result: The measuring range is set for 0...5 m^3.

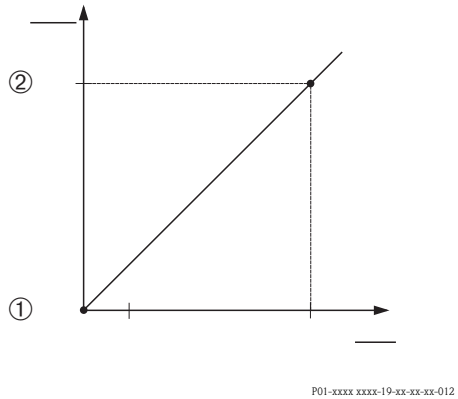

Fig. 14: Current output calibration

5 See table, step 13.
6 See table, step 14.

Note!

1. For this level type, the measured variables %, level, volume and mass are available.
→ See Page 70 ff.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 70), UNIT VOLUME (→ Page 71) and MASS UNIT (→ Page 72).
3. A level value is assigned to the lower and upper current value by means of the SET LRV (→ Page 77) and SET URV (→ Page 77) parameters respectively. Once you have selected the "Dry" calibration mode, the error message A711 "LRV or URV out of edit limits" can appear. The error message goes out as soon as level values which are within the editing limits are entered for the SET LRV and SET URV parameters.
By means of the ENTER RESET CODE parameter (→ Page 126), you can use the code 2710 to automatically set the SET LRV and SET URV parameters to level values which are within the editing limits.

5.5 "Level Standard" level selection, "Pressure Linearized" level type

5.5.1 Semiautomatic entry of the linearisation table

Example:
In this example, the volume in a tank with a conical outlet should be measured in m^3.

Prerequisite:
- The tank can be filled. The linearisation characteristic must rise continuously.
- A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.

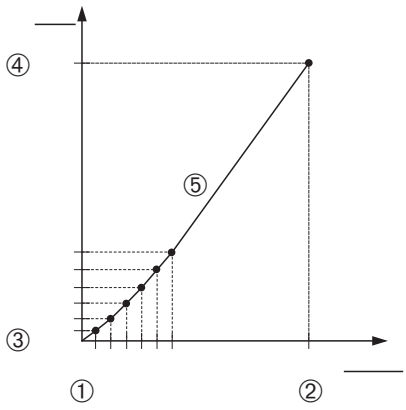
Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 67, Table 10: BASIC SETUP
  – Page 78, Table 11: BASIC SETUP – "Pressure Linearized" level type
  – Page 100, Table 18: LINEARISATION – on-site operation
  – Page 104, Table 19: LINEARISATION – Digital communication.
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 26: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

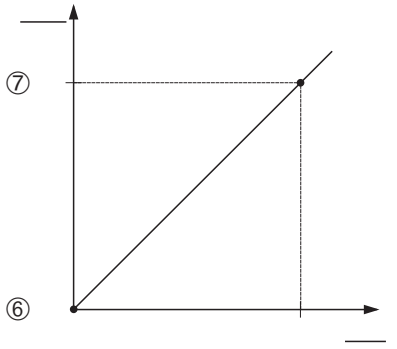
	Description	
1	Deltabar S: before configuring the device for your application, the pressure piping must be cleaned and filled with fluid. See Operating Instructions BA00270P, Section 6.5.1.	 P01-PMP75xxx-19-xx-xx-xx-002
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.	
	Carry out basic setup:	
3	If necessary, select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE	
4	If necessary, select "Level Standard" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION	

	Description	
5	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP	
6	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.	
7	Select the "Pressure Linearized" option by means of the LEVEL MODE parameter. See also the following note, point 3.	
8	Select the "Volume" option by means of the LINd. MEASURAND parameter.	
9	Select a volume unit via the UNIT VOLUME parameter, here m^3 for example.	
10	Select HYDR. PRESS MIN. parameter.	
	Enter the minimum hydrostatic pressure to be expected, here 0 mbar for example.	
11	Select HYDR. PRESS MAX .	
	Enter the maximum hydrostatic pressure to be expected.	
	Carry out linearisation:	
12	Change the function group: Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION	
13	Select TANK CONTENT MIN parameter.	
	Specify the minimum tank contents to be expected, here 0 m^3 for example.	
14	Select TANK CONTENT MAX parameter.	
	Specify the maximum tank contents to be expected, here 3.5 m^3 for example.	
15	On-site display: Select the "Editor table" option by means of the TABLE SELECTION parameter.	
16	Select the "Semiautomatic" option by means of the LIN. EDIT MODE parameter.	
17	Select the "New table" option by means of the EDITOR TABLE parameter.	

	Description	
18	Enter linearisation table (min. 2 points, max. 32 points).	
	Fill the tank to the height of the 1st point.	
	LINE-NUMB: confirm value displayed.	
	X-VAL.: the hydrostatic pressure present is displayed. On-site display, Digital communication: The X-VAL. displayed is saved by confirming the Y-value. See following line, Y-VAL. HART handheld terminal: Confirm X-VAL. displayed.	
	Y-VAL.: enter the volume value, here 0 m^3 for example, and confirm the value.	
19	On-site display: If you want to enter another point for the linearisation table, select the "Next point" option and enter the point as described in step 18. If you want to finish entering the values and activate the linearisation table, select the "Accept input table" option. Digital communication: You can enter further points for the linearisation table as explained in step 18. Once all the points have been entered, the table must be activated by means of the TAB. ACTIVATE parameter.	
19	Result: The linearisation table has been entered.	



P01-xxxxxxxx-05-xx-xx-xx-015



P01-xxxxxxxx-05-xx-xx-xx-016

Fig. 15: Semiautomatic entry of the linearisation table

1 See table, step 10.
2 See table, step 11.
3 See table, step 13.
4 See table, step 14.
5 See table, steps 15 – 19.
6 See the following note, point 4.
7 See the following note, point 4

Note!

1. For this level type, the measured variables %, volume and mass are available.
→ See Page 78 ff.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 79), UNIT VOLUME (→ Page 79) and MASS UNIT (→ Page 80).

3. Once you have selected the "Pressure Linearized" level type, the warning message "W710 Set span too small. Not allowed." can appear. At this stage the linearisation table already consists of two points as standard. It could be the case that the 2nd value, and thus the highest X-VAL. of the linearisation table, is smaller than the minimum span permitted (→ MINIMUM SPAN, Page 119). The message goes out as soon as the highest X-VAL. is larger than the minimum span.
4. A level value is assigned to both the lower and upper current value with the SET LRV (→ Page 98) and SET URV (→ Page 98) parameters. If you enter values for TANK CONTENT MIN (→ Page 101 or 104) and TANK CONTENT MAX (→ Page 101 or 105), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for TANK CONTENT MIN and TANK CONTENT MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

5.5.2 Manual entry of the linearisation table

Example:
In this example, the volume in a tank with a conical outlet should be measured in m^3.

Prerequisite:
- This is a theoretical calibration, i.e. the points for the linearisation table are known.
- A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 67, Table 10: BASIC SETUP
  – Page 78, Table 12: BASIC SETUP – "Pressure Linearized" level type
  – Page 100, Table 18: LINEARISATION – on-site operation
  – Page 104, Table 19: LINEARISATION – Digital communication.
- For a description of further relevant parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description	
1	Perform basic setup as per Section 5.3.1, steps 2 to 10.		Carry out linearisation:	
2	Change the function group: Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION	
3	Select TANK CONTENT MIN parameter .	
	Specify the minimum tank contents to be expected, here 0 m^3 for example.	
4	Select TANK CONTENT MAX parameter .	
	Specify the maximum tank contents to be expected, here 3.5 m^3 for example.	

	Description	
5	On-site display: Select the "Editor table" option by means of the TABLE SELECTION parameter.	
6	Select the "Manual" option by means of the LIN. EDIT MODE parameter.	
7	Select the "New table" option by means of the EDITOR TABLE parameter.	
8	Enter linearisation table (min. 2 points, max. 32 points).	
	LINE-NUMB: confirm value displayed.	
	X-VAL.: enter the pressure value and confirm.	
	Y-VAL.: enter the volume value, here 0 m^3 for example, and confirm.	
9	On-site display If you want to enter another point for the linearisation table, select the "Next point" option and enter the point as described in step 8. If you want to finish entering the values and activate the linearisation table, select the "Accept input table" option. Digital communication: You can enter further points for the linearisation table as explained in step 8. Once all the points have been entered, the table must be activated by means of the TAB. ACTIVATE parameter.	
10	Result: The linearisation table has been entered.

Fig. 16: Manual entry of the linearisation table

1 See Section 5.3.1, table, step 9.
2 See Section 5.3.1, table, step 10.
3 See table, step 3.
4 See table, step 4.
5 See table, steps 5 – 9.
6 See the following note, point 4.
7 See the following note, point 4.

Note!

1. For this level type, the measured variables %, volume and mass are available.
→ See Page 78 ff.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 79), UNIT VOLUME (→ Page 79) and MASS UNIT (→ Page 80).
3. Once you have selected the "Pressure Linearized" level type, the warning message "W710 Set span too small. Not allowed." can appear. At this stage the linearisation table already consists of two points as standard. It could be the case that the 2nd value, and thus the highest X-VAL. of the linearisation table, is smaller than the minimum span permitted (→ MINIMUM SPAN, Page 119). The message goes out as soon as the highest X-VAL. is larger than the minimum span.
4. A level value is assigned to both the lower and upper current value with the SET LRV (→ Page 98) and SET URV (→ Page 98) parameters. If you enter values for TANK CONTENT MIN (→ Page 101 or 104) and TANK CONTENT MAX (→ Page 101 or 105), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for TANK CONTENT MIN and TANK CONTENT MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

5.6 "Level Standard" level selection, "Height Linearized" level type

5.6.1 Wet calibration and semiautomatic entry of the linearisation table

Example:
In this example, the height and the volume should be measured at the same time.

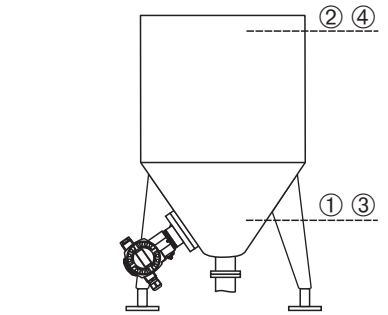
Prerequisite:
- The tank can be filled. The linearisation characteristic must rise continuously.
- A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 53, Table 6: POSITION ADJUSTMENT
  – Page 67, Table 10: BASIC SETUP
  – Page 83, Table 13: BASIC SETUP – "Height Linearized" level type
  – Page 100, Table 18: LINEARISATION – on-site operation
  – Page 104, Table 19: LINEARISATION – Digital communication.
- For a description of further parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

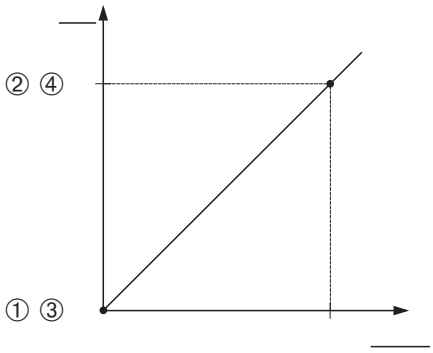
Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description	
1	Deltabar S: before configuring the device for your application, the pressure piping must be cleaned and filled with fluid. See Operating Instructions BA00270P, Section 6.5.1	
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.	
	Perform calibration for the 1st measured variable:	
3	If necessary, select the "Level" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE	
4	If necessary, select "Level Standard" level mode using the LEVEL SELECTION parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE "Level" → LEVEL SELECTION Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE "Level" → LEVEL SELECTION	

	Description
5	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION →OPERATING MENU → SETTINGS → BASIC SETUP
6	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
7	Select the "Height Linearized" option by means of the LEVEL MODE parameter.
8	Select the "Height + Volume" option by means of the COMB. MEASURAND parameter.
9	Select the unit for the 1st measured value via the HEIGHT UNIT parameter, here m for example.
10	Select the unit for the 2nd measured variable via the UNIT VOLUME parameter, here m3 for example.
11	Select LEVEL MIN parameter.
	Enter the minimum level to be expected, here 0 m for example.
12	Select LEVEL MAX parameter.
	Enter the maximum level to be expected, here 3 m (9.8 ft) for example.
13	Select the "Wet" option via the CALIBRATION MODE parameter (calibration mode for the 1st measured variable).
14	The pressure for the lower calibration point is present at the device, here 0 mbar for example.
	Select EMPTY CALIB. parameter.
	Enter the level value, here 0 m for example. Confirm the value to assign the pressure value present to the lower level value.
15	The pressure for the upper calibration point is present at the device, here 300 mbar (4.5 psi) for example.
	Select FULL CALIB. parameter.
	Enter the level value, here 3 m (9.8 ft) for example. Confirm the value to assign the pressure value present to the upper level value.
16	Result: The calibration for the 1st measured variable is carried out.



P01-PMP75xxx-19-xx-xx-xx-004



P01-xxxxxxxx-05-xx-xx-xx-017

Fig. 17: Calibrating the 1st measured variable

1 See table, step 11.
2 See table, step 12.
3 See table, step 14.
4 See Table, step 15.

	Description
	Perform linearisation (calibration for the 2nd measured variable)
17	Change the function group. Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION
18	Select TANK CONTENT MIN parameter.
	Specify the minimum tank contents to be expected, here 0 m^3 for example.
19	Select TANK CONTENT MAX parameter.
	Specify the maximum tank contents to be expected, here 5 m^3 for example.
20	On-site display: Select the "Editor table" option by means of the TABLE SELECTION parameter.
21	Select the "Semiautomatic" option by means of the LIN. EDIT MODE parameter.
22	Select the "New table" option by means of the EDITOR TABLE parameter.
23	Enter linearisation table (min. 2 points, max. 32 points).
	Fill the tank to the height of the 1st point.
	LINE-NUMB: confirm value displayed.
	X-VAL.: the hydrostatic pressure present is measured and converted to the corresponding level and displayed. On-site display, Digital communication: The X-VAL. displayed is saved by confirming the Y-value. See following line, Y-VAL. HART handheld terminal: Confirm X-VAL. displayed.
	Y-VAL.: enter the volume value, here 0 m^3 for example, and confirm the value.
24	On-site display If you want to enter another point for the linearisation table, select the "Next point" option and enter the point as described in step 23. If you want to finish entering the values and activate the linearisation table, select the "Accept input table" option. Digital communication: You can enter further points for the linearisation table as explained in step 23. Once all the points have been entered, the table must be activated by means of the TAB. ACTIVATE parameter.
25	Result: – The linearisation table has been entered. – The measured value display and the TANK CONTENT parameter display the 2nd measured value (here the volume). – The LEVEL BEFORE LIN parameter displays the 1st measured value (here the height). See also the following note, point 5.

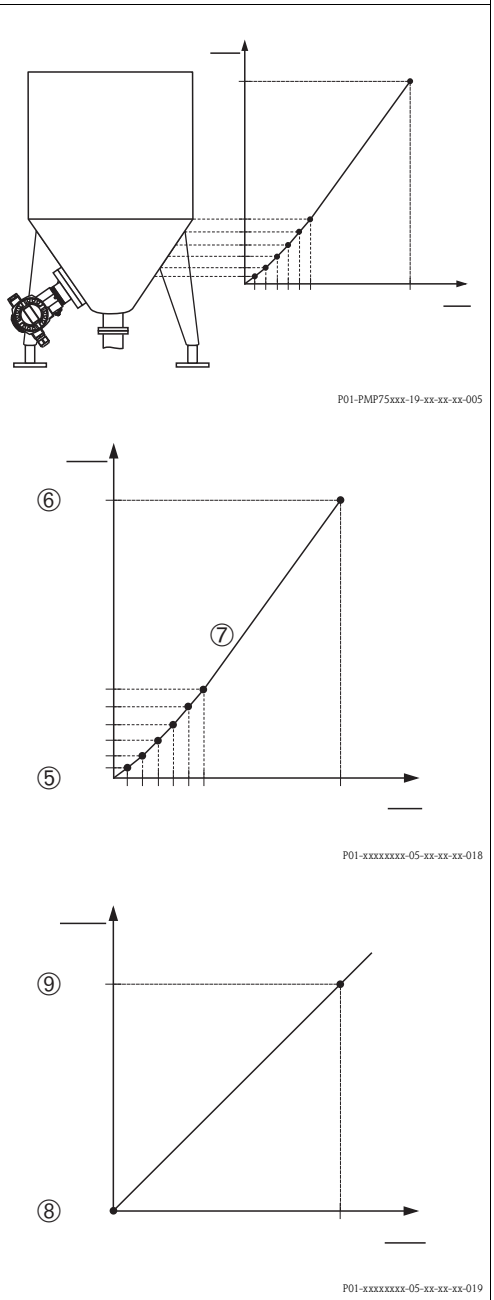


Fig. 18: Calibrating the 2nd measured variable

5 See table, step 18.
6 See table, step 19.
7 See table, steps 20 – 24.
8 See the following note, point 4.
9 See the following note, point 4.

Note!

1. For this level type, the measured variables "Height + %", "Height + Volume", "Height + Mass", "%-Height + %", "%-Height + Volume" and "%-Height + Mass" are available. → See Page 79 ff.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 83), UNIT VOLUME (→ Page 84) and MASS UNIT (→ Page 85).
3. Once you have selected the "Pressure Linearized" level type, the warning message "W710 Set span too small. Not allowed." can appear. At this stage the linearisation table already consists of two points as standard. It could be the case that the 2nd value, and thus the highest X-VAL. of the linearisation table, is smaller than the minimum span permitted (→ MINIMUM SPAN, Page 119). The message goes out as soon as the highest X-VAL. is larger than the minimum span.
4. A level value is assigned to both the lower and upper current value with the SET LRV (→ Page 98) and SET URV (→ Page 98) parameters.
   You can use the ASSIGN CURRENT parameter (→ Page 113) to specify whether the current output should depict the 1st or 2nd measured variable. Depending on the setting of the ASSIGN CURRENT parameter, enter the following values for SET LRV and SET URV:
   – ASSIGN CURRENT = tank content (factory setting) ⇒ %-value, volume value or mass value
   – ASSIGNMENT = height ⇒ level value

   The following applies for the setting ASSIGN CURRENT "Tank content":
   If you enter values for TANK CONTENT MIN (→ Page 101 or 104) and TANK CONTENT MAX (→ Page 101 or 105), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for TANK CONTENT MIN and TANK CONTENT MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

   The following applies for the setting ASSIGN CURRENT "Height":
   If you enter values for LEVEL MIN (→ Page 86) and LEVEL MAX (→ Page 86), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for LEVEL MIN and LEVEL MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

5. You can use the MENU DESCRIPTOR parameter (→ Page 110) to specify which measured value should be displayed on the on-site display.

5.6.2 Dry calibration and manual entry of the linearisation table

Example:
In this example, the height and the volume should be measured at the same time.

Prerequisite:
- This is a theoretical calibration, i.e. the points for the linearisation table are known.
- A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.

Note!
- See also Operating Instructions for Deltabar S (BA00270P) or Cerabar S (BA00271P), Section 6.5 "Level measurement" or Deltapilot S (BA00332P), Section 6.4 "Level measurement".
- For a description of the parameters mentioned, see
  – Page 45, Table 2: MEASURING MODE
  – Page 67, Table 10: BASIC SETUP
  – Page 83, Table 12: BASIC SETUP – "Height Linearized" level type
  – Page 100, Table 18: LINEARISATION – on-site operation
  – Page 104, Table 19: LINEARISATION – Digital communication.
- For a description of further parameters, see
  – Page 96, Table 16: EXTENDED SETUP
  – Page 122, Table 28: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description	
	Perform calibration for the 1st measured variable:	1	Perform calibration as per Section 5.4.1, steps 3 to 12.	
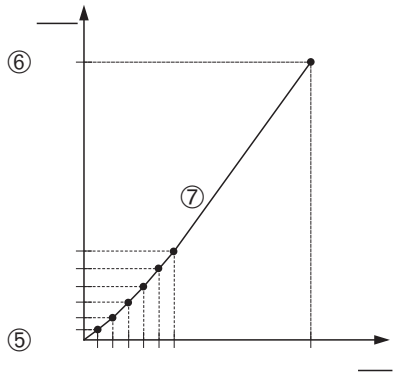
2	Select the "Dry" option via the CALIBRATION MODE parameter (calibration mode for the 1st measured variable).	
3	Enter the density of the fluid via the ADJUST DENSITY parameter, here 1 kg/dm^3 for example.	
4	If necessary, enter a level offset via the ZERO POSITION parameter, here 0 m for example.	
5	Result: The calibration for the 1st measured variable is carried out.	

	Description
	Perform linearisation (calibration for the 2nd measured variable)
6	Change the function group. Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION
7	Select TANK CONTENT MIN parameter.
	Specify the minimum tank contents to be expected, here 0 m^3 for example.
8	Select TANK CONTENT MAX parameter.
	Specify the maximum tank contents to be expected, here 5 m^3 for example.
9	On-site display: Select the "Editor table" option by means of the TABLE SELECTION parameter.
10	Select the "Manual" option by means of the LIN. EDIT MODE parameter.
11	Select the "New table" option by means of the EDITOR TABLE parameter.
12	Enter linearisation table (min. 2 points, max. 32 points).
	LINE-NUMB: confirm value displayed.
	X-VAL.: enter the height value and confirm.
	Y-VAL.: enter the volume value, here 0 m^3 for example, and confirm.
13	On-site display If you want to enter another point for the linearisation table, select the "Next point" option and enter the point as described in step 12. If you want to finish entering the values and activate the linearisation table, select the "Accept input table" option. Digital communication: You can enter further points for the linearisation table as explained in step 12. Once all the points have been entered, the table must be activated by means of the TAB. ACTIVATE parameter.
14	Result: – The linearisation table has been entered. – The measured value display and the TANK CONTENT parameter display the 2nd measured value (here the volume). – The LEVEL BEFORE LIN parameter displays the 1st measured value (here the height). See also the following note, point 5.



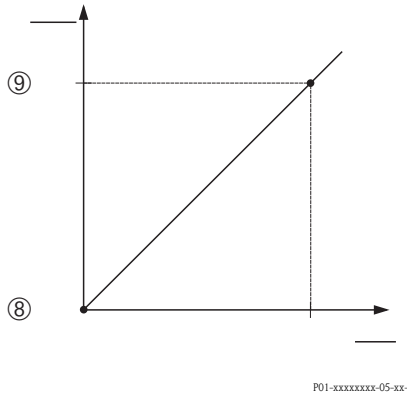


Fig. 19: Calibrating the 2nd measured variable

5 See table, step 7.
6 See table, step 8.
7 See table, steps 9 – 13.
8 See the following note, point 4.
9 See the following note, point 4.

Note!

1. For this level type, the measured variables "Height + %", "Height + Volume", "Height + Mass", "%-Height + %", "%-Height + Volume" and "%-Height + Mass" are available. → See Page 79 ff.
2. You can also specify customer-specific units. See parameter description for PRESS. ENG. UNIT (→ Page 67), HEIGHT UNIT (→ Page 83), UNIT VOLUME (→ Page 84) and MASS UNIT (→ Page 85).
3. Once you have selected the "Pressure Linearized" level type, the warning message "W710 Set span too small. Not allowed." can appear. At this stage the linearisation table already consists of two points as standard. It could be the case that the 2nd value, and thus the highest X-VAL. of the linearisation table, is smaller than the minimum span permitted (→ MINIMUM SPAN, Page 119). The message goes out as soon as the highest X-VAL. is larger than the minimum span.

4. A level value is assigned to both the lower and upper current value with the SET LRV (→ Page 98) and SET URV (→ Page 98) parameters.
   You can use the ASSIGN CURRENT parameter (→ Page 113) to specify whether the current output should depict the 1st or 2nd measured variable. Depending on the setting of the ASSIGN CURRENT parameter, enter the following values for SET LRV and SET URV:
   – ASSIGN CURRENT = tank content (factory setting) ⇒ %- value, volume value or mass value
   – ASSIGNMENT = height ⇒ level value

   The following applies for the setting ASSIGN CURRENT "Tank content":
   If you enter values for TANK CONTENT MIN (→ Page 101 or 104) and TANK CONTENT MAX (→ Page 101 or 105), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for TANK CONTENT MIN and TANK CONTENT MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

   The following applies for the setting ASSIGN CURRENT "Height":
   If you enter values for LEVEL MIN (→ Page 86) and LEVEL MAX (→ Page 86), the SET LRV and SET URV parameters are also changed. If you want to assign values other than those for LEVEL MIN and LEVEL MAX to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

5. You can use the MENU DESCRIPTOR parameter (→ Page 110) to specify which measured value should be displayed on the on-site display.

6 Flow measurement

6.1 Calibration

Example:
In this example, a volume flow should be measured in m^3/s.

Note!
- The "Flow measurement" measuring mode is only available for the Deltabar S differential pressure transmitter.
- See also Operating Instructions BA00270P Deltabar S, Section 6.4 "Flow measurement".
- For a description of the parameters mentioned, see
  - Page 45, Table 2: MEASURING MODE
  - Page 53, Table 6: POSITION ADJUSTMENT
  - Page 91 ff, Table 12: BASIC SETUP
  - Page 98 ff, Table 15: EXTENDED SETUP.
- For a description of further parameters, see
  - Page 98, Table 15: EXTENDED SETUP
  - Page 123, Table 29: PROCESS VALUES.

Warning!
If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured.

	Description
1	Before configuring the device for your application, the pressure piping must be cleaned and the device filled with fluid. See Operating Instructions BA00270P, Section 6.4.1.
2	Carry out position adjustment if necessary. See Page 53, Table 6: POSITION ADJUSTMENT.
3	If necessary, select the "Flow" measuring mode via the MEASURING MODE parameter. On-site display: Menu path: GROUP SELECTION → MEASURING MODE Digital communication: Menu path: OPERATING MENU → SETTINGS → BASIC SETUP → MEASURING MODE
4	On-site display: Select BASIC SETUP function group. Menu path: GROUP SELECTION → OPERATING MENU → SETTINGS → BASIC SETUP
5	Select a pressure unit via the PRESS. ENG. UNIT parameter, here mbar for example.
6	Select the "Volume p. cond." option by means of the FLOW-MEAS. TYPE parameter.
7	Select a flow unit via the UNIT FLOW parameter, here m^3/h for example.
8	Select MAX. FLOW parameter.
	Enter the maximum flow value of the primary element, here 6000 m^3/h for example. See also layout sheet of primary element.
9	Select MAX PRESS. FLOW parameter.
	Enter the maximum pressure, here 400 mbar (6 psi) for example. See also layout sheet of primary element.
10	Result: The device is configured for flow measurement.

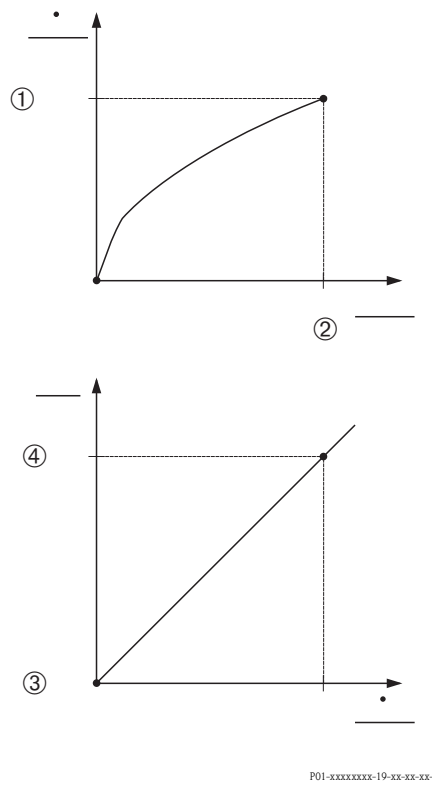

Fig. 20: Flow measurement calibration

1 See table, step 8.
2 See table, step 9.
3 See the following note, point 4.
4 See the following note, point 4.

Note!

1. You can also perform calibration by means of the QUICK SETUP menu. → See Page 52 ff, Table 5: QUICK SETUP menu.
2. Using the FLOW-MEAS. TYPE parameter, you can choose between the following flow types:
   – Volume p. cond. (volume under operating conditions)
   – Gas norm. cond. (norm volume under norm conditions in Europe: 1013.25 mbar and 273.15 K (0°C))
   – Gas std. cond. (standard volume under standard conditions in USA: 1013.25 mbar (14.7 psi) and 288. 15 K (15°C/59°F))
   – Mass
3. Depending on the flow type selected, you can choose between various units. You can also specify a customer-specific unit.
   See parameter description for PRESS. ENG. UNIT (→ Page 92), UNIT FLOW (→ Page 93), NORM FLOW UNIT (→ Page 93), STD. FLOW UNIT (→ Page 94) and MASS FLOW UNIT (→ Page 94).
4. A flow value or a pressure value is assigned to both the lower and upper current value with the SET LRV (→ Page 99) and SET URV (→ Page 100) parameters.

You can use the LINEAR/SQROOT parameter (→ Page 113) to specify whether the current output should depict the linear pressure signal or the Flow (square root) flow signal. Depending on the setting of the LINEAR/SQROOT parameter, enter the following values for SET LRV and SET URV:
– LINEAR/SQROOT = Flow (square root) (factory setting) ⇒ flow value
– LINEAR/SQROOT = Differential pres. ⇒ pressure value

The following applies for the setting LINEAR/SQROOT "Flow (square root)":
As per the factory settings, the lower current value is set to equal zero and the upper current value is set to the MAX. FLOW value. If you enter a value for MAX. FLOW, the SET URV parameter is also changed. If you want to assign values other than zero and MAX. FLOW to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

The following applies for the setting LINEAR/SQROOT "Differential pres.":
As per the factory settings, the lower current value is set to equal zero and the upper current value is set to the MAX. PRESS. FLOW value. If you enter a value for MAX PRESS. FLOW, the SET URV parameter is also changed. If you want to assign values other than zero and MAX PRESS. FLOW to the lower and upper current values, the desired values must be entered for SET LRV and SET URV.

5. In the lower measuring range, small flow quantities (creepages) can lead to large measured value fluctuations. You can activate low flow cut-off via the LOW FLOW CUT-OFF parameter (→ Page 99).

6.2 Totalizers

Example:
In this example, the volume flow should be totalised and displayed in the unit m^3E^3. Negative flows should be added to the flow rate.

Note!
- For a description of the parameters mentioned, see
  – Page 107 ff, Table 18: TOTALIZER SETUP
  – Page 123 ff, Table 29: PROCESS VALUES
- Totalizer 1 can be reset. Totalizer 2 cannot be reset.

	Description
1	Calibrate the device as per Section 6.1.
2	Change the function group: (GROUP SELECTION →) OPERATING MENU → SETTINGS → TOTALIZER SETUP
3	Select a flow unit via the TOTALIZER 1 UNIT parameter, here m^3 E^3 for example.
4	Use the NEG. FLOW TOT. 1 parameter to specify the totalising mode for negative flows, here the "Positive" option for example.
5	Reset totalizer 1 to zero via the RESET TOTALIZER parameter.
6	Result: The TOTALIZER 1 and TOTAL. 1 OVERFLOW parameters display the totalised volume flow.

Note!
- You can also specify a customer-specific unit. → See parameter description for TOTALIZER 1 UNIT (→ Page 108) and TOTALIZER 2 UNIT (→ Page 109).
- The TOTALIZER 1 and TOTAL. 1 OVERFLOW parameters display the totalised flow value of the first totalizer. The TOTALIZER 2 and TOTAL. 2 OVERFLOW parameters display the totalised flow value of the second totalizer. → See Page 123 ff, PROCESS VALUES function group.
- You can use the MENU DESCRIPTOR parameter (→ Page 110) to specify which measured value should be displayed on the on-site display.

7 Description of parameters

Note!
- The following tables list all the parameters as per the menu structure. Each table corresponds to a function group in the menu tree. The overall menu structure is illustrated in Section 9.1.
- The menu structure for on-site operation and the digital communication are slightly different. The differences mainly affect the MEASURING MODE and LANGUAGE parameters and the LINEARISATION function group.
- In the operating program or HART handheld terminal, additional parameters are displayed. These parameters are marked accordingly.
- The menu path is indicated in the header of each table. You can use this path to get to the parameters in question.
- The menu has a different structure depending on the measuring mode selected. This means that some function groups are only displayed for one measuring mode, e.g. the "LINEARISATION" function group for the "Level" measuring mode. If certain requirements have to be met for a function group, these are listed in the first row of the table.
- Some parameters are only displayed if other parameters are appropriately configured. For example, the EMPTY CALIB. parameter is not displayed in the Quick Setup menu ("Level" measuring mode) unless the "Linear" option was selected for the LEVEL MODE parameter and the "Wet" option was selected for the CALIBRATION MODE parameter. There is a comment in the parameter description here stating: Note: prerequisite: LEVEL MODE = Linear and CALIBRATION MODE = Wet.
- Parameter names are written in upper case in the text.
- In the "Parameter name" column, the unique identification number (ID) of the parameter is indicated in brackets. This ID only appears on the on-site display.

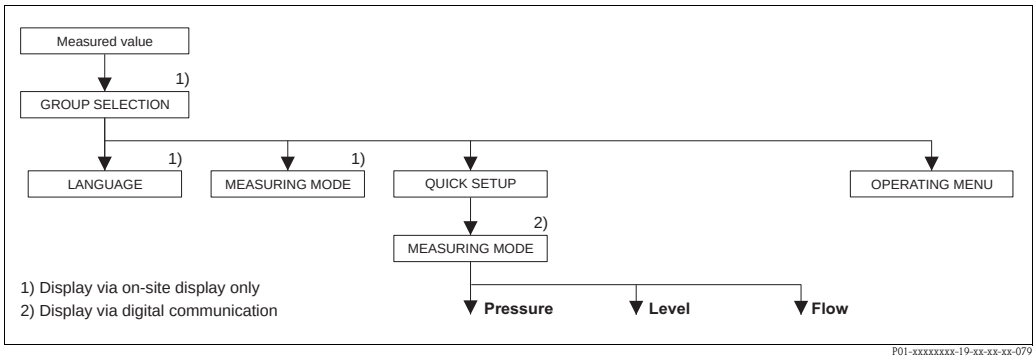

Fig. 21: 1st selection level in menu, LANGUAGE (→ see Page 44, Table 1) and MEASURING MODE (→ see Page 45, Table 2)

Table 1: GROUP SELECTION → LANGUAGE – on-site operation	
Parameter name	**Description**
LANGUAGE (079) Selection	Select the menu language for the on-site display. Note! ■ In the operating program and in the HART handheld terminal, the LANGUAGE parameter is arranged in the DISPLAY function group. ■ Select the menu language for FieldCare via the "Options" menu → "Settings" → "Language" tab → "Tool language" field. **Factory setting:** English

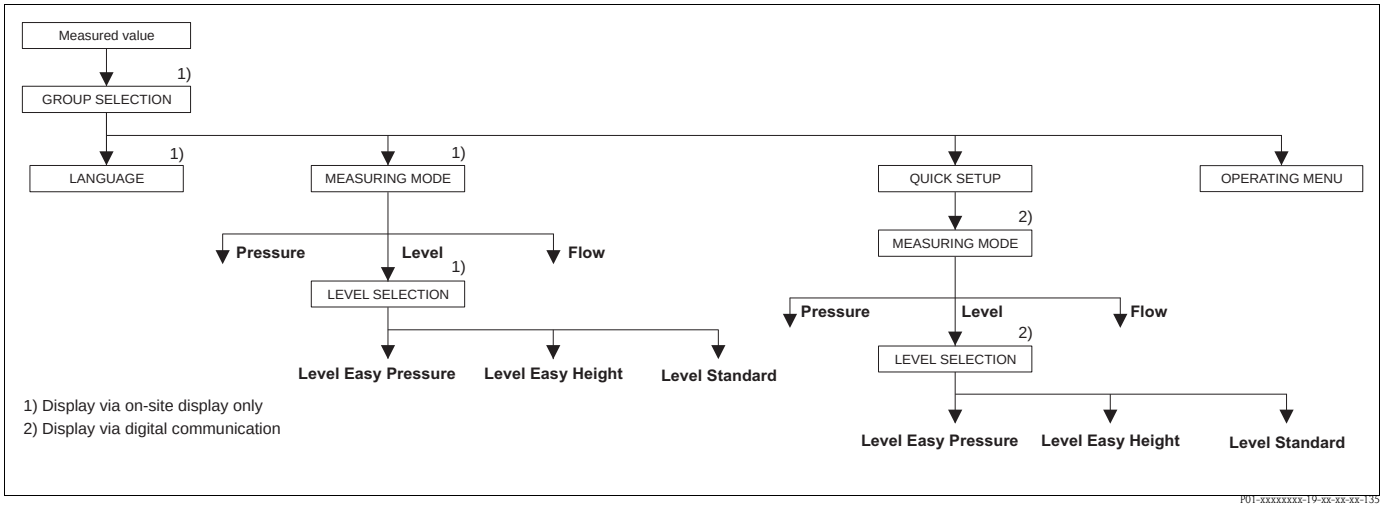

Fig. 22: "Level" measuring mode, LEVEL SELECTION parameter

Table 2: GROUP SELECTION → MEASURING MODE – on-site operation	
Parameter name	**Description**
MEASURING MODE (389) Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ✎ Note! ■ The MEASURING MODE parameter is displayed in the operating program and in the HART handheld terminal in the QUICK SETUP menus and in the BASIC SETUP function group (OPERATING MENU → SETTINGS → BASIC SETUP). ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Options:** ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level

Table 2: GROUP SELECTION → MEASURING MODE – on-site operation	
Parameter name	**Description**
LEVEL SELECTION (020) Options	Select level mode. **Prerequisite:** ■ MEASURING MODE = Level ✎ Note! ■ In the "Level Easy Pressure" and "Level Easy Height" level modes, the values entered are not tested as extensively as in the "Level Standard" level mode. The values entered for EMPTY CALIB./FULL CALIB., EMPTY PRESSURE/FULL PRESSURE, EMPTY HEIGHT/FULL HEIGHT and SET LRV/SET URV must have a minimum interval of 1% for the "Level Easy Pressure" and "Level Easy Height" level modes. The value will be rejected with a warning message if the values are too close together. Further limit values are not checked; i.e. the values entered must be appropriate for the sensor and the measuring task so that the measuring device can measure correctly. → For an overview of the different level modes and types, see Page 14, Section 5.1 "Overview of level measurement". ■ The "Level Easy Pressure" and "Level Easy Height" level modes encompass fewer parameters than the "Level Standard" mode and are used for quick and easy configuration of a level application. ■ Customer-specific units of fill level, volume and mass or a linearization table may only be entered in the "Level Standard" level mode. ■ Where the device is intended for use as a subsystem in a safety function (SIL), a "Device configuration with enhanced parameter security" (SAFETY CONFIRM.) is only possible for the "Level" operating mode in the "Level Easy Pressure" level mode. All parameters previously entered are checked after a password is entered. Once the "Level Easy Height" or "Level Standard" has been selected, the configuration will first have to be reset to the ex-works setting using the RESET parameter (menu path: (GROUP SELECTION →) OPERATING MENU → OPERATION) using the reset code "7864". → For additional information, see the Safety Manual for Deltabar S (SD00189), Cerabar S (SD00190) or Deltapilot S (SD00213P). **Options:** ■ Level Easy Pressure Specify two pressure-level value pairs for this level mode. The pressure measured value is converted directly to the unit which is selected via the OUTPUT UNIT parameter (→ Page 60). Two calibration modes, "Wet" and "Dry", are available. – Wet calibration takes place by filling and emptying the container. In the case of two different levels, the level, volume, mass or percentage value entered is assigned to the pressure measured at this point in time. – Dry calibration is a theoretical calibration. For this calibration, specify two pressure-level value pairs via the EMPTY CALIB., EMPTY PRESSURE, FULL CALIB. and FULL PRESSURE parameters. → Parameter descriptions see Page 61 ff. ■ Level Easy Height For this level mode, specify a height unit, density and two height-level value pairs. The pressure measured value is converted to a height value using the density entered and the height unit. Two calibration modes, "Wet" and "Dry", are available. – Wet calibration takes place by filling and emptying the container. In the case of two different levels, the level, volume, mass or percentage value entered is assigned to the converted height value. – Dry calibration is a theoretical calibration. For this calibration, specify two height-level value pairs via the EMPTY CALIB., EMPTY HEIGHT, FULL CALIB. and FULL HEIGHT parameters. → Parameter descriptions see Page 65 ff. ■ Level standard Once you have selected this level mode, you can use the LEVEL MODE parameter (→ Page 68) to choose between "Linear", "Pressure Linearized" and "Height Linearized". **Factory setting:** Level Easy Pressure
→ For LEVEL SELECTION = "Level Easy Pressure" see Page 58, Table 8. → For LEVEL SELECTION = "Level Easy Height" see Page 62, Table 9. → For LEVEL SELECTION = "Level standard" see Page 67, Table 10.	

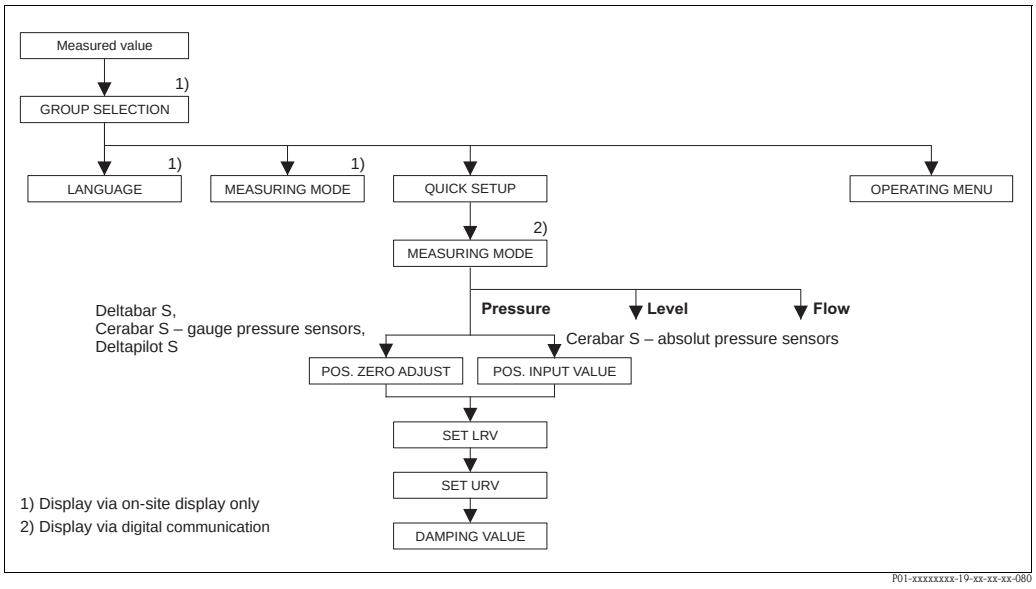

Fig. 23: Quick Setup menu for the "Pressure" measuring mode

Table 3: (GROUP SELECTION →) QUICK SETUP "Pressure"	
Parameter name	**Description**
This menu displays the most important parameters for the "Pressure" measuring mode. **Prerequisite:** ■ MEASURING MODE = Pressure (→ see also Page 45). **Note:** See also – Page 55 ff, Table 7: BASIC SETUP – Page 96, Table 15: EXTENDED SETUP – Page 121 ff, Table 27: PROCESS VALUES – Page 11 ff, Section 4 "Pressure measurement".	
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisite:** ■ Digital communication **Options:** ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level

Table 3: (GROUP SELECTION →) QUICK SETUP "Pressure"	
Parameter name	**Description**
POS. ZERO ADJUST (685) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. Due to the orientation of the device, there may be a shift in the measured value, i.e. for example, when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. **Example:** – MEASURED VALUE = 2.2 mbar (0.033 psi) – Correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present. – MEASURED VALUE (after pos. zero adjust) = 0.0 mbar – The current value is also corrected. The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. **Prerequisite:** ■ This parameter is displayed for Deltabar S, Cerabar S with gauge pressure sensor and Deltapilot S. **Options:** ■ Abort ■ Confirm **Factory setting:** 0.0
POS. INPUT VALUE (563) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. To correct the pressure difference, you need a reference measurement value (e. g. from a reference device). Due to the orientation of the device, there may be a shift in the measured value, i.e. for example, when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero or the desired value. **Example:** – MEASURED VALUE = 0.5 mbar (0.0075 psi) – For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE, e.g. 2 mbar. (MEASURED VALUE$_{new}$ = POS. INPUT VALUE) – MEASURED VALUE (after entry for POS. INPUT VALUE) = 2.0 mbar (0.03 psi) – The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. CALIB. OFFSET = MEASURED VALUE $_{old}$ – POS. INPUT VALUE, here: CALIB. OFFSET = 0.5 mbar (0.0075 psi) – 2.0 mbar (0.03 psi) = – 1.5 mbar (0.0225 psi)) – The current value is also corrected. **Prerequisite:** ■ This parameter is displayed for Cerabar S with absolute pressure sensors. **Factory setting:** 0.0
SET LRV (245) Entry	Set lower range value – without reference pressure. Enter pressure value for the lower current value (4 mA). **Factory setting:** 0.0 or as per order specifications
SET URV (246) Entry	Set upper range value – without reference pressure. Enter pressure value for the upper current value (20 mA). **Factory setting:** High sensor limit (→ see PRESS. SENS HILIM, Page 119) or as per order specifications
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

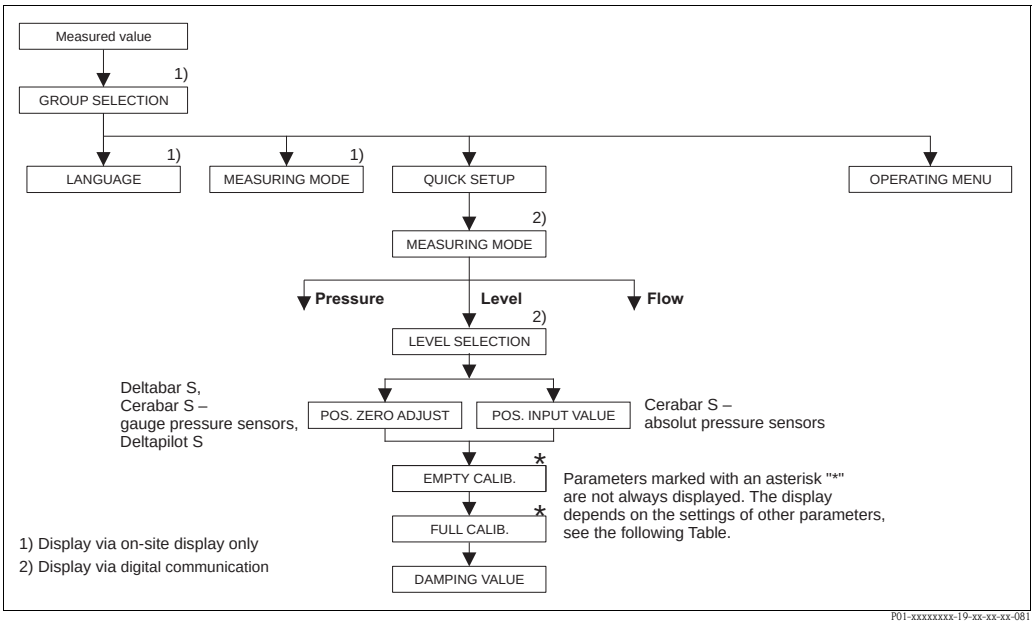

Fig. 24: Quick Setup menu for the "Level" measuring mode

Table 4: (GROUP SELECTION →) QUICK SETUP "Level"	
Parameter name	**Description**
This menu displays the most important parameters for the "Level" measuring mode. **Prerequisite**: ■ MEASURING MODE = Level (→ see also Page 45). **Note:** See also – Page 67 ff, Tables 10 to 13: BASIC SETUP – Page 96 ff, Table 16: EXTENDED SETUP – Page 100 ff, Table 18: LINEARISATION – on-site operation – Page 104 ff, Table 19: LINEARISATION – Digital communication – Page 122 ff, Table 28: PROCESS VALUES – Page 14 ff, Section 5 "Level measurement".	
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisite:** ■ Digital communication **Options**: ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level
LEVEL SELECTION (020) Options	Select level mode. → Parameter description, see Page 46. **Factory setting:** Level Easy Pressure

Table 4: (GROUP SELECTION →) QUICK SETUP "Level"	
Parameter name	**Description**
POS. ZERO ADJUST (685) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. **Example:** – MEASURED VALUE = 2.2 mbar (0.033 psi) – Correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present. – MEASURED VALUE (after pos. zero adjust) = 0.0 mbar – The current value is also corrected. The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. **Prerequisite:** ■ This parameter is displayed for Deltabar S, Cerabar S with gauge pressure sensor and Deltapilot S. **Options:** ■ Abort ■ Confirm **Factory setting:** 0.0
POS. INPUT VALUE (563) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. To correct the pressure difference, you need a reference measurement value (e. g. from a reference device). Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero or the desired value. **Example:** – MEASURED VALUE = 0.5 mbar (0.0075 psi) – For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE, e.g. 2.0 mbar (0.03 psi). (MEASURED VALUE $_{new}$ = POS. INPUT VALUE) – MEASURED VALUE (after entry for POS. INPUT VALUE) = 2.0 mbar (0.03 psi) – The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. CALIB. OFFSET = MEASURED VALUE$_{old}$ – POS. INPUT VALUE, here: CALIB. OFFSET = 0.5 mbar (0.0075 psi) – 2.0 mbar (0.03 psi) = – 1.5 mbar (0.0225 psi)) – The current value is also corrected. **Prerequisite:** ■ This parameter is displayed for Cerabar S with absolute pressure sensors. **Factory setting:** 0.0
EMPTY CALIB. (314)/(010) Entry	Enter level value for the lower calibration point (container empty). The container is either empty or part full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. **Prerequisite:** ■ LEVEL SELECTION = Level Easy Pressure (→ see also Page 46), CALIBRATION MODE = Wet (→ see also Page 60) ■ LEVEL SELECTION = Level Standard (→ see also Page), LEVEL MODE = Linear (→ see also Page 68), CALIBRATION MODE = Wet (→ see also Page 73) ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 0.0

Table 4: (GROUP SELECTION →) QUICK SETUP "Level"	
Parameter name	**Description**
FULL CALIB. (315)/(004) Entry	Enter level value for the upper calibration point (container full). The container is either completely or almost full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. **Prerequisite:** ■ LEVEL SELECTION = Level Easy Pressure (→ see also Page 46), CALIBRATION MODE = Wet (→ see also Page 60) ■ LEVEL SELECTION = Level Standard, LEVEL MODE = Linear (→ see also Page 68), CALIBRATION MODE = Wet (→ see also Page 73) ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 100.0
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

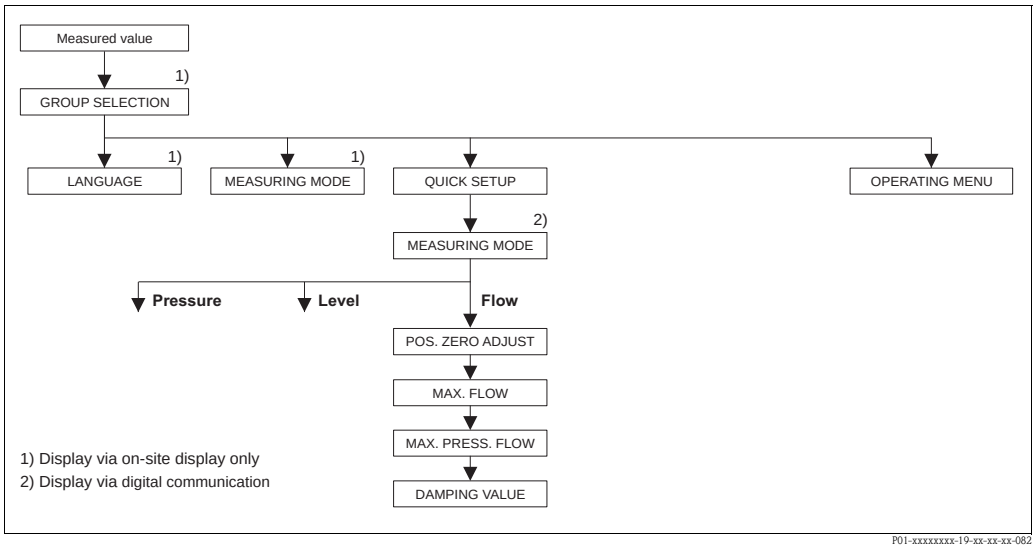

Fig. 25: Quick Setup menu, "Flow" measuring mode

Table 5: (GROUP SELECTION →) QUICK SETUP "Flow"	
Parameter name	**Description**
This menu displays the most important parameters for the "Flow" measuring mode. **Prerequisite**: ■ Deltabar S differential pressure transmitter ■ MEASURING MODE = Flow (→ see also Page 45). **Note:** See also – Page 91, Table 14: BASIC SETUP – Page 98, Table 17: EXTENDED SETUP – Page 107, Table 20: TOTALIZER SETUP – Page 40 ff, Section 6 "Flow measurement".	
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisites:** ■ Digital communication **Options**: ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level
POS. ZERO ADJUST (685) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. (A reference pressure is present at the device.) Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the MEASURED VALUE parameter does not display zero. **Example:** – MEASURED VALUE = 2.2 mbar (0,033 psi) – Correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present. – MEASURED VALUE (after pos. zero adjust) = 0.0 mbar – The current value is also corrected. The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. **Selection:** ■ Abort ■ Confirm **Factory setting:** 0.0
MAX. FLOW (311) Entry	Enter maximum flow of primary element. See also layout sheet of primary element. The maximum flow is assigned to the maximum pressure which you enter via MAX PRESS. FLOW. ✎ Note! Use the LINEAR/SQROOT parameter (→ Page 113) to specify the current signal for the "Flow" measuring mode. The following applies for the "Flow (square root)" setting: If you enter a new value for MAX. FLOW, the value for SET URV is also changed. Use SET URV to assign a flow to the upper current value. If you want to assign the upper current value a value other than that for MAX. FLOW, you must enter the desired value for SET URV. (→ SET URV, Page 100). **Factory setting:** 1.0

Table 5: (GROUP SELECTION →) QUICK SETUP "Flow"	
Parameter name	**Description**
MAX PRESS. FLOW (634) Entry	Enter maximum pressure of primary element. → See layout sheet of primary element. This value is assigned to the maximum flow value (→ see MAX. FLOW). ✎ Note! Use the LINEAR/SQROOT parameter (→ Page 113) to specify the current signal for the "Flow" measuring mode. The following applies for the "Differential pres." setting: If you enter a new value for MAX PRESS. FLOW, the value for SET URV is also changed. Use SET URV to assign a pressure value to the upper current value. If you want to assign the upper current value a value other than that for MAX PRESS. FLOW, you must enter the desired value for SET URV. (→ SET URV, Page 100). **Factory setting:** High sensor limit (→ See PRESS. SENS HILIM, Page 119)
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

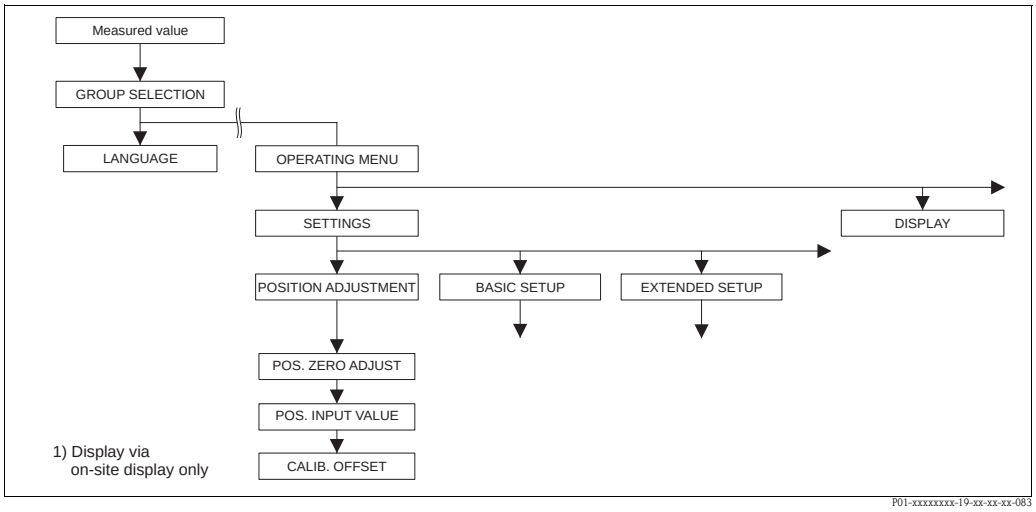

Fig. 26: POSITION ADJUSTMENT function group

Table 6: (GROUP SELECTION →) OPERATING MENU → SETTINGS → POSITION ADJUSTMENT	
Parameter name	**Description**
Due to the orientation of the device, there may be a shift in the measured value, i.e. when the container is empty or partly filled, the measured value does not display zero. Deltabar S and Cerabar S offer three different ways of performing a position adjustment. Recommendation: ■ The pressure difference between zero (set point) and the measured pressure need not be known. – POS. ZERO ADJUST: Deltabar S or Cerabar S with gauge pressure sensor or Deltapilot S. – POS. INPUT VALUE: Cerabar S with absolute pressure sensor. ■ The pressure difference between zero (set point) and the measured pressure is known. – CALIB. OFFSET: Deltabar S, Cerabar S with gauge pressure sensor, Cerabar S with absolute pressure sensor or Deltapilot S.	

Table 6: (GROUP SELECTION →) OPERATING MENU → SETTINGS → POSITION ADJUSTMENT	
Parameter name	**Description**
POS. ZERO ADJUST (685) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. **Example:** – MEASURED VALUE = 2.2 mbar (0.033 psi) – Correct the MEASURED VALUE via the POS. ZERO ADJUST parameter with the "Confirm" option. This means that you are assigning the value 0.0 to the pressure present. – MEASURED VALUE (after pos. zero adjust) = 0.0 mbar – The current value is also corrected. The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. **Selection:** ■ Abort ■ Confirm **Factory setting:** 0.0
POS. INPUT VALUE (563) Entry	Position adjustment – the pressure difference between zero (set point) and the measured pressure need not be known. To correct the pressure difference, you need a reference measurement value (e. g. from a reference device). **Example:** – MEASURED VALUE = 0.5 mbar (0.0075 psi) – For the POS. INPUT VALUE parameter, specify the desired set point for the MEASURED VALUE, e.g. 2.0 mbar (0.03 psi). (MEASURED VALUE$_{new}$ = POS. INPUT VALUE) – MEASURED VALUE (after entry for POS. INPUT VALUE) = 2.0 mbar (0.03 psi) – The CALIB. OFFSET parameter displays the resulting pressure difference (offset) by which the MEASURED VALUE was corrected. CALIB. OFFSET = MEASURED VALUE$_{old}$ – POS. INPUT VALUE, here: CALIB. OFFSET = 0.5 mbar (0.0075 psi) – 2.0 mbar (0.03 psi) = – 1.5 mbar (0.0225 psi)) – The current value is also corrected. **Factory setting:** 0.0
CALIB. OFFSET (319) Entry	Position adjustment - the pressure difference between zero (set point) and the measured pressure is known. **Example:** – MEASURED VALUE = 2.2 mbar (0.033 psi) – Via the CALIB. OFFSET parameter, enter the value by which the MEASURED VALUE should be corrected. To correct the MEASURED VALUE to 0.0 mbar, you must enter the value 2.2 here. (MEASURED VALUE$_{new}$ = MEASURED VALUE$_{old}$ – CALIB. OFFSET) – MEASURED VALUE (after entry for calib. offset) = 0.0 mbar – The current value is also corrected. **Factory setting:** 0.0

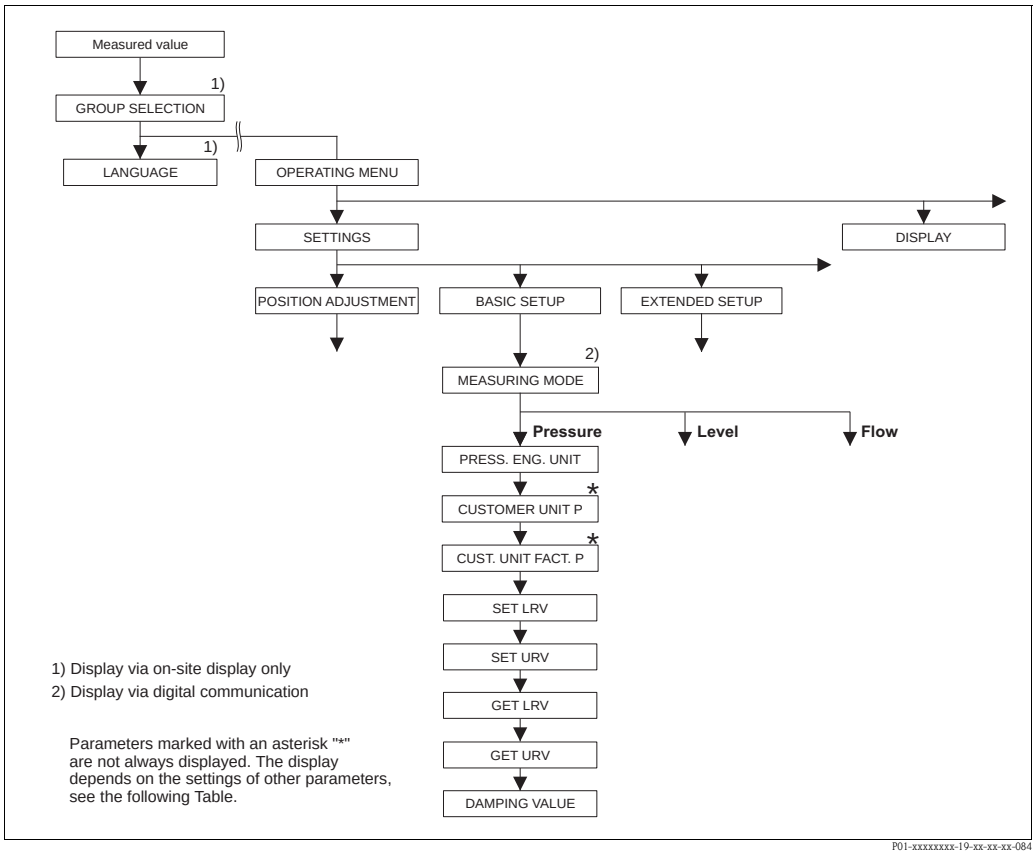

Fig. 27: BASIC SETUP function group for the "Pressure" measuring mode

Table 7: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Pressure"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Pressure (→ see also Page 45). **Note:** See also – Page 47, Table 3: QUICK SETUP – Page 96, Table 15: EXTENDED SETUP – Page 121 ff, Table 27: PROCESS VALUES – Page 11 ff, Section 4 "Pressure measurement".	
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisite:** ■ Digital communication **Options:** ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level

Table 7: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Pressure"	
Parameter name	**Description**
PRESS. ENG. UNIT (060) Selection	Select pressure unit. If a new pressure unit is selected, all pressure-specific parameters are converted and displayed with the new unit. **Options:** ■ mbar, bar ■ mmH2O, mH2O, inH2O, ftH2O [1)] ■ Pa, hPa, kPa, MPa ■ psi ■ mmHg, inHg [2)] ■ Torr ■ g/cm^2, kg/cm^2 ■ lb/ft^2 ■ atm ■ gf/cm^2, kgf/cm^2 ■ User unit, → See also the following parameter description for CUSTOMER UNIT P and CUST. UNIT FACT. P. 1) The conversion factor of the pressure units refers to a reference temperature of 4 °C (39.2 °F). 2) The conversion factor of the pressure units refers to a reference temperature of 0 °C (32 °F). **Factory setting:** Depends on the sensor nominal measuring range mbar or bar or as per order specifications
CUSTOMER UNIT P (075) Entry	Enter text (unit) for customer-specific pressure unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT P parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –
CUST. UNIT FACT. P (317) Entry	Enter conversion factor for a customer-specific pressure unit. The conversion factor must be entered in relation to the SI unit "Pa". → See also CUSTOMER UNIT P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE =10000 Pa ≙ 1 PU – Entry CUSTOMER UNIT P: PU – Entry CUST. UNIT FACT. P: 0.0001 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
SET LRV (245) Entry	Set lower range value – without reference pressure. Enter pressure value for the lower current value (4 mA). **Factory setting:** 0.0 or as per order specifications

Table 7: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Pressure"	
Parameter name	**Description**
SET URV (246) Entry	Set upper range value – without reference pressure. Enter pressure value for the upper current value (20 mA). **Factory setting:** High sensor limit (→ See PRESS. SENS HILIM, Page 119)
GET LRV (309) Entry	Set lower range value – reference pressure is present at device. The pressure for the lower current value (4 mA) is present at device. With the "Confirm" option, you assign the lower current value to the pressure value present. On-site display: the pressure value present is displayed in the bottom line. **Options:** ■ Abort ■ Confirm
GET URV (310) Entry	Set upper range value – reference pressure is present at device. The pressure for the upper current value (20 mA) is present at device. With the "Confirm" option, you assign the upper current value to the pressure value present. On-site display: the pressure value present is displayed in the bottom line. **Options:** ■ Abort ■ Confirm
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

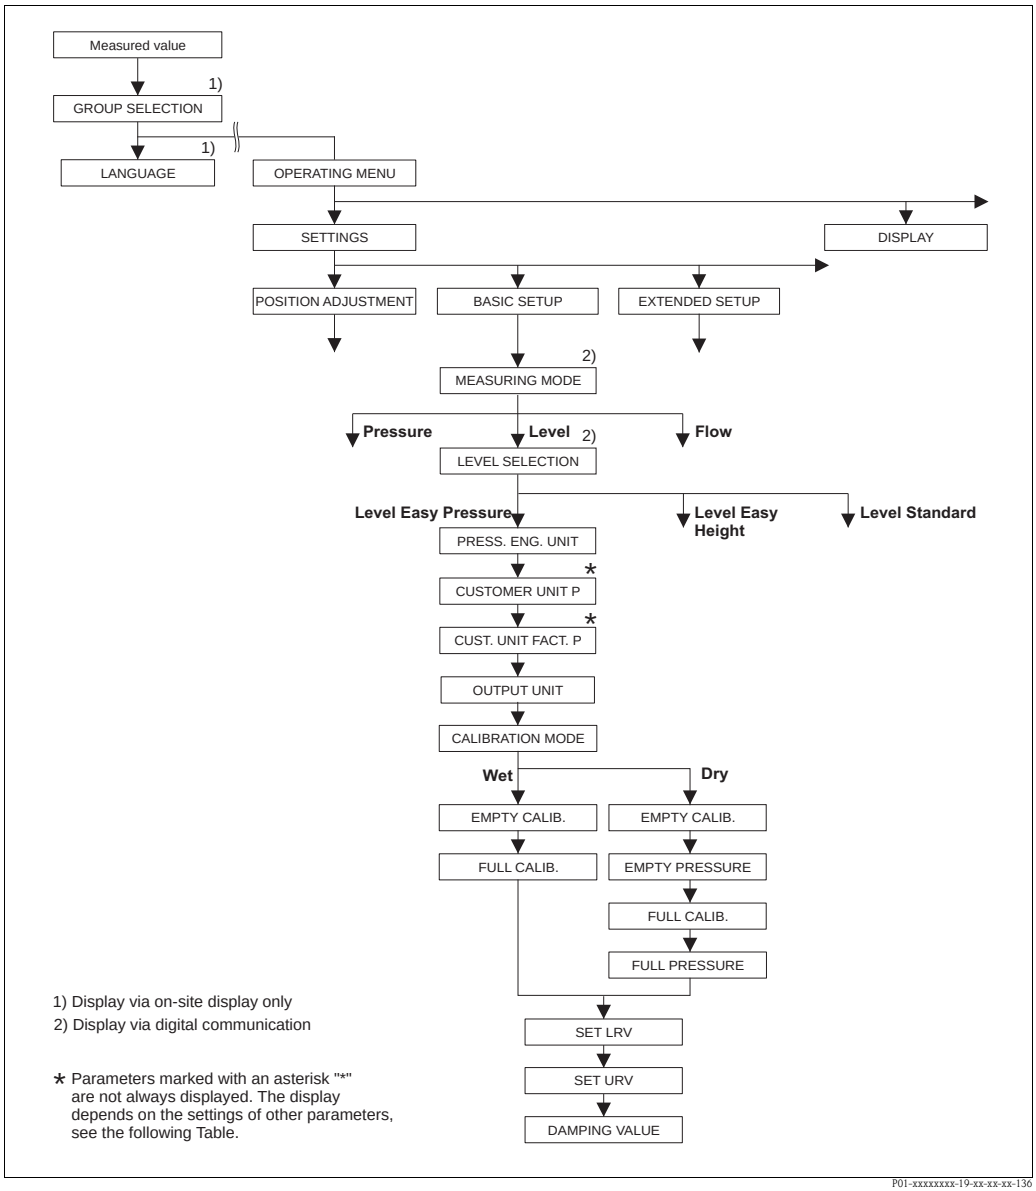

Fig. 28: BASIC SETUP function group for the "Level" measuring mode and "Level Easy Pressure" level selection

Table 8: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Pressure"

The following parameters are displayed if you have selected the "Level Easy Pressure" option for the LEVEL SELECTION parameter. Specify two pressure-level value pairs for this level mode. Two calibration modes, "Wet" and "Dry", are available.

Prerequisite:

- MEASURING MODE = Level (→ see also Page 45.)
- LEVEL SELECTION = Level Easy Pressure (→ See also Page 46.)

Table 8: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Pressure"	
PRESS. ENG. UNIT (060) Selection	Select pressure unit. If a new pressure unit is selected, all pressure-specific parameters are converted and displayed with the new unit. **Options:** ■ mbar, bar ■ mmH2O, mH2O, inH2O, ftH2O [1)] ■ Pa, hPa, kPa, MPa ■ psi ■ mmHg, inHg [2)] ■ Torr ■ g/cm^2, kg/cm^2 ■ lb/ft^2 ■ atm ■ gf/cm^2, kgf/cm^2 ■ User unit, → See also the following parameter description for CUSTOMER UNIT P and CUST. UNIT FACT. P. 1) The conversion factor of the pressure units refers to a reference temperature of 4 °C (39.2 °F). 2) The conversion factor of the pressure units refers to a reference temperature of 0 °C (32 °F). **Factory setting:** Depends on the sensor nominal measuring range mbar or bar or as per order specifications
CUSTOMER UNIT P (075) Entry	Enter text (unit) for customer-specific pressure unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT P parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –
CUST. UNIT FACT. P (317) Entry	Enter conversion factor for a customer-specific pressure unit. The conversion factor must be entered in relation to the SI unit "Pa". → See also CUSTOMER UNIT P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE =10000 Pa ≙ 1 PU – Entry CUSTOMER UNIT P: PU – Entry CUST. UNIT FACT. P: 0.0001 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0

Table 8: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Pressure"	
OUTPUT UNIT (023) Selection	Select unit for measured value display and MEASURED VALUE parameter (→ Page 122). ✎ Note! The selected unit is used only to describe the measured value. This means that when selecting a new output unit, the measured value is not converted. Example: ■ current measured value: 0.3 ft ■ new output unit: m ■ new measured value: 0.3 m (9.8 ft) **Options** ■ % ■ mm, cm, dm, m ■ ft, inch ■ cm^3, dm^3, m^3,m^3 E^3 ■ l, hl ■ ft^3, ft^3 E^3 ■ gal, bbl, Igal ■ g, kg, t ■ lb, ton, oz **Factory setting:** %
CALIBRATION MODE (008) Selection	Select calibration mode. **Options:** ■ Wet Wet calibration takes place by filling and emptying the container. In the case of two different levels, the level, volume, mass or percentage value entered is assigned to the pressure measured at this point in time. (→ See also this table, parameter descriptions for EMPTY CALIB. and FULL CALIB.) ■ Dry Dry calibration is a theoretical calibration. For this calibration, specify two pressure-level value pairs via the following parameters: EMPTY CALIB., EMPTY PRESSURE, FULL CALIB. and FULL PRESSURE. **Factory setting:** Wet
EMPTY CALIB. (010) Entry	Enter level, volume, mass or percentage value for the lower calibration point (container empty). The container is either empty or part full. By entering a value for this parameter, you assign a level, volume, mass or percentage value to the pressure present at the device. The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 0.0
FULL CALIB. (004) Entry	Enter height, volume or mass value for the upper calibration point (container full). The container is either completely or almost full. By entering a value for this parameter, you assign a height, volume or mass value to the pressure present at the device. The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 100.0

Table 8: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Pressure"	
EMPTY CALIB. (010) Entry	Enter level, volume, mass or percentage value for the lower calibration point (container empty). The values entered for the EMPTY CALIB. and EMPTY PRESSURE parameters form the pressure-level value pair for the lower calibration point. The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 0.0
EMPTY PRESSURE (011) Entry	Enter pressure value for the lower calibration point (container empty). → See also EMPTY CALIB. **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 0.0
FULL CALIB. (004) Entry	Enter height, volume, mass or percentage value for the upper calibration point (container full). The values entered for the FULL CALIB. and FULL PRESSURE parameters form the pressure-level value pair for the upper calibration point. The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 100.0
FULL PRESSURE (005) Entry	Enter pressure value for the upper calibration point (container full). → See also FULL CALIB. **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 100.0
SET LRV (013) Entry	Enter value for the lower current value (4 mA). The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Factory setting:** 0.0
SET URV (012) Entry	Enter value for the upper current value (20 mA). The unit is selected via the OUTPUT UNIT parameter (→ Page 60). **Factory setting:** 100.0
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0 to 999.0 s **Factory setting:** 2.0 s or as per order specifications

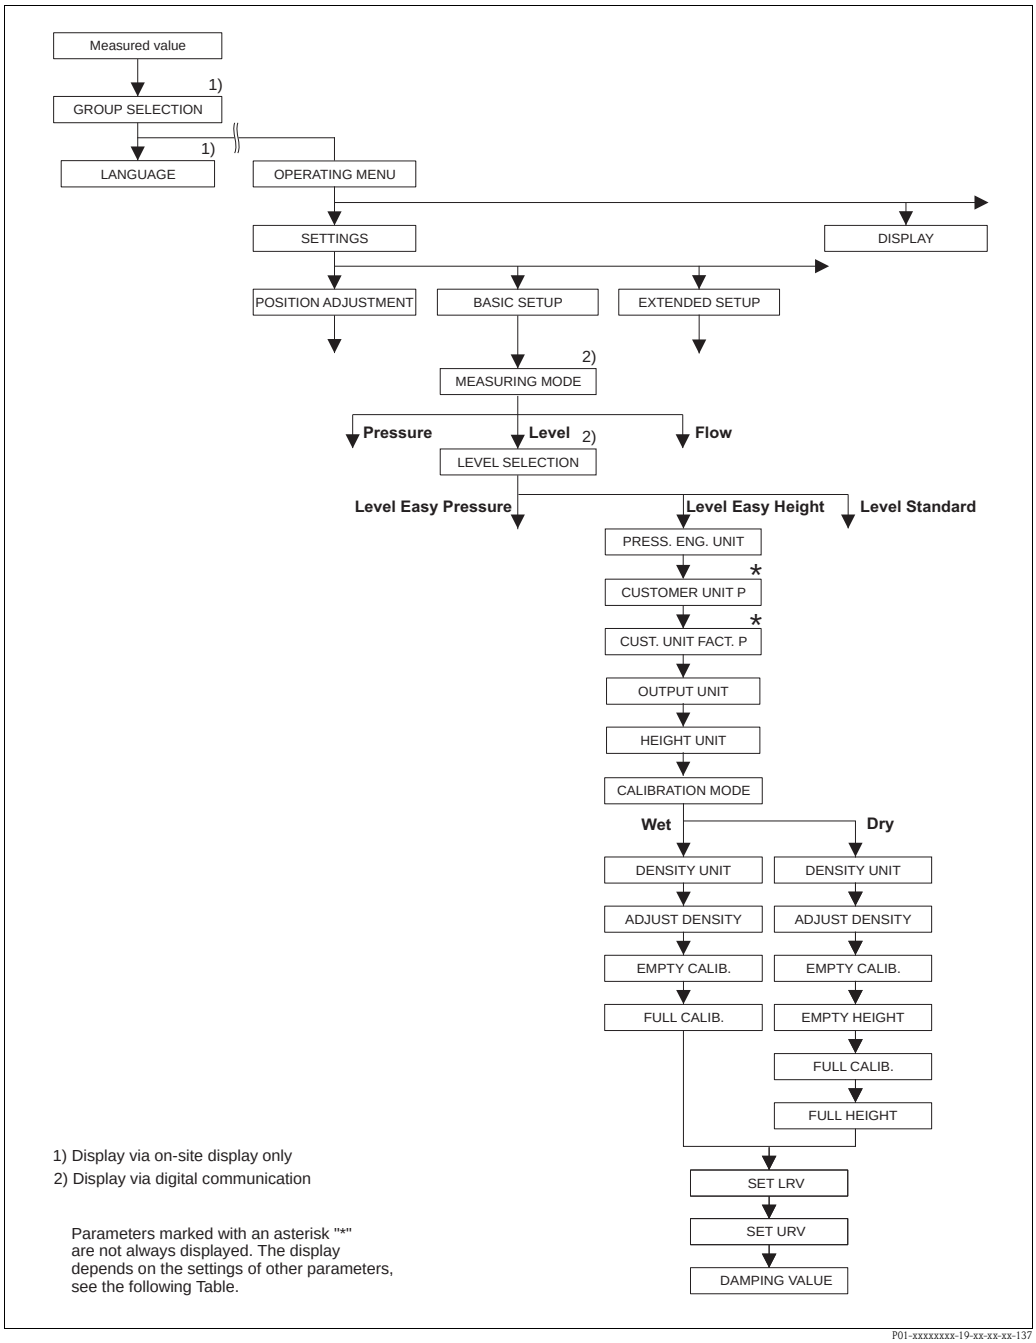

Fig. 29: BASIC SETUP function group for "Level" measuring mode and "Level Easy Height" level selection

Table 9: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Height"

The following parameters are displayed if you have selected the "Level Easy Height" option for the LEVEL SELECTION parameter. For this level mode, specify a height unit, density and two height-level value pairs. The pressure measured value is converted to a height value using the density entered and the height. Two calibration modes, "Wet" and "Dry", are available.

Prerequisite:

- MEASURING MODE = Level (→ see also Page 45.)
- LEVEL SELECTION = Level Easy Height (→ See also Page 46.)

Table 9: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Height"	
PRESS. ENG. UNIT (060) Options	Select pressure unit. If a new pressure unit is selected, all pressure-specific parameters are converted and displayed with the new unit. **Options:** ■ mbar, bar ■ mmH2O, mH2O, inH2O, ftH2O [1)] ■ Pa, hPa, kPa, MPa ■ psi ■ mmHg, inHg [2)] ■ Torr ■ g/cm^2, kg/cm^2 ■ lb/ft^2 ■ atm ■ gf/cm^2, kgf/cm^2 ■ User unit, → See also the following parameter description for CUSTOMER UNIT P and CUST. UNIT FACT. P. 1) The conversion factor of the pressure units refers to a reference temperature of 4 °C (39.2 °F). 2) The conversion factor of the pressure units refers to a reference temperature of 0 °C (32 °F). **Factory setting:** Depends on the sensor nominal measuring range mbar or bar or as per order specifications
CUSTOMER UNIT P (075) Entry	Enter text (unit) for customised pressure unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customised unit is displayed only in the CUSTOMER UNIT P parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –
CUST. UNIT FACT. P (317) Entry	Enter conversion factor for a customer-specific pressure unit. The conversion factor must be entered in relation to the SI unit "Pa". → See also CUSTOMER UNIT P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE =10000 Pa ≙ 1 PU – Entry CUSTOMER UNIT P: PU – Entry CUST. UNIT FACT. P: 0.0001 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0

Table 9: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Height"	
OUTPUT UNIT (023) Options	Select unit for measured value display and MEASURED VALUE parameter (→ Page 122). ✎ Note! The selected unit is used only to describe the measured value. This means that when selecting a new output unit, the measured value is not converted. Example: ■ current measured value: 0.3 ft ■ new output unit: m ■ new measured value: 0.3 m (9.8 ft) **Options:** ■ % ■ mm, cm, dm, m ■ ft, inch ■ cm^3, dm^3, m^3,m^3 E^3 ■ l, hl ■ ft^3, ft^3 E^3 ■ gal, bbl, Igal ■ g, kg, t ■ lb, ton, oz **Factory setting:** %
HEIGHT UNIT (003) Options	Select height unit. The measured pressure is converted to the chosen height unit using the DENSITY UNIT and ADJUST DENSITY parameters. **Options:** ■ mm ■ cm ■ dm ■ m ■ inch ■ ft **Factory setting:** m
CALIBRATION MODE (008) Options	Select calibration mode. **Options:** ■ Wet Wet calibration takes place by filling and emptying the container. The measured pressure is converted to the chosen height unit using the HEIGHT UNIT, DENSITY UNIT and ADJUST DENSITY parameters. In the case of two different levels, the level, volume, mass or percentage value entered is assigned to the converted height value. ■ Dry Dry calibration is a theoretical calibration. For this calibration, specify two height-level value pairs via the EMPTY CALIB., EMPTY HEIGHT, FULL CALIB. and FULL HEIGHT parameters. **Factory setting:** Dry
DENSITY UNIT (001) Options	Select density unit. The measured pressure is converted to a height using the HEIGHT UNIT, DENSITY UNIT and ADJUST DENSITY parameters. **Options:** ■ g/cm^3 ■ kg/dm^3 ■ kg/m^3 ■ US lb/in^3 ■ US lb/ft^3 **Factory setting:** kg/dm^3
ADJUST DENSITY (007) Entry	Enter density of fluid. The measured pressure is converted to a height using the HEIGHT UNIT, DENSITY UNIT and ADJUST DENSITY parameters. **Factory setting:** 1.0

Table 9: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Height"	
EMPTY CALIB. (010) Entry	Enter level, volume, mass or percentage value for the lower calibration point (container empty). The container is either empty or part full. The measured pressure is converted to a height value using the HEIGHT UNIT, DENSITY UNIT and ADJUST DENSITY parameters and displayed. Using the parameter EMPTY CALIB., you assign a level, volume, mass or percentage value to the height value. The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 0.0
FULL CALIB. (004) Entry	Enter level, volume, mass or percentage value for the upper calibration point (container full). The container is either completely or almost full. Using the parameters HEIGHT UNIT, DENSITY UNIT and ADJUST DENSITY, the measured pressure is converted to a height value and displayed. Using the parameter FULL CALIB., you assign a level, volume, mass or percentage value to the height value. The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 100.0
EMPTY CALIB. (010) Entry	Enter level, volume, mass or percentage value for the lower calibration point (container empty). The values entered for the EMPTY CALIB. and EMPTY HEIGHT parameters form the height-level value pair for the lower calibration point. The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 0.0
EMPTY HEIGHT (009) Entry	Height value for the lower calibration point (container empty). The unit is selected via the HEIGHT UNIT parameter (→ Page 64). → See also EMPTY CALIB. **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** Upper range limit (URL) coverted to an height unit
FULL CALIB. (004) Entry	Enter level, volume, mass or percentage value for the upper calibration point (container full). The values entered for the FULL CALIB. and FULL HEIGHT parameters form the height-level value pair for the upper calibration point. The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 100.0

Table 9: (GROUP SELECTION→) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL SELECTION "Level Easy Height"	
FULL HEIGHT (006) Entry	Enter height value for the upper calibration point (container full). The unit is selected via the HEIGHT UNIT parameter (→ Page 64). → See also FULL CALIB. **Prerequisite:** ■ CALIBRATION MODE = Dry **Factory setting:** 0.0
SET LRV (013) Entry	Enter level, volume, mass or percentage value for the lower current value (4 mA). The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Factory setting:** 0.0
SET URV (012) Entry	Enter level, volume, mass or percentage value for the upper current value (20 mA). The unit is selected via the OUTPUT UNIT parameter (→ Page 64). **Factory setting:** 100.0
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0 to 999.0 s **Factory setting:** 2.0 s or as per order specifications

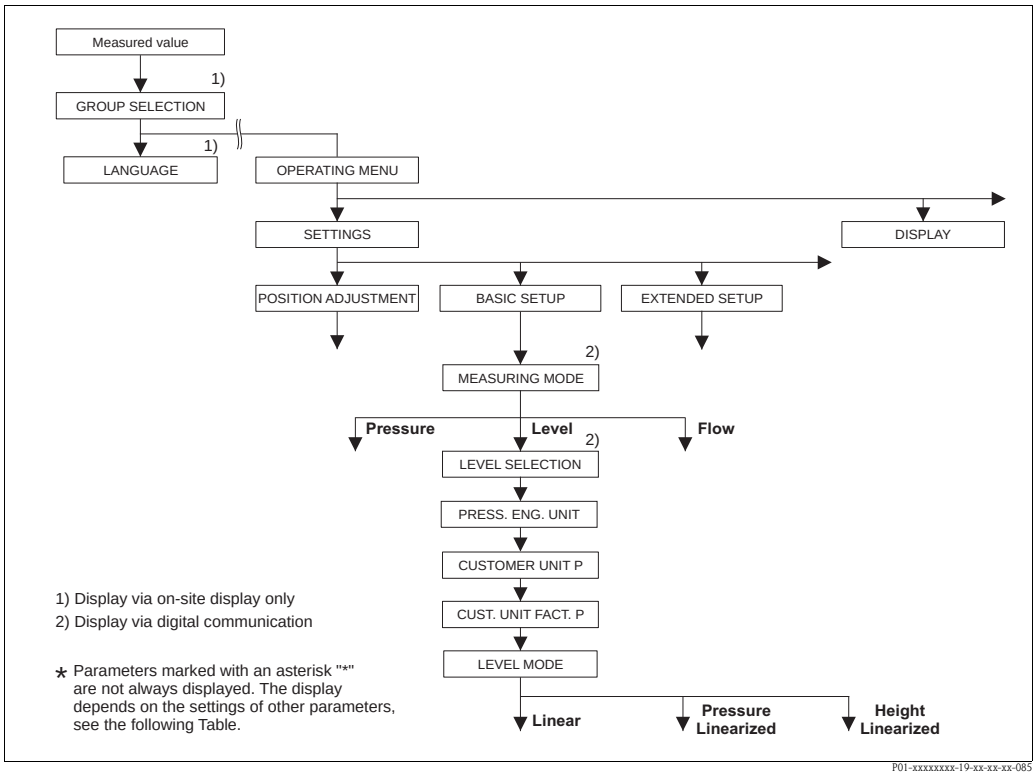

Fig. 30: BASIC SETUP function group for the "Level" measuring mode, depending on the setting for the LEVEL MODE parameter
→ See Page 69, Fig. 31 for LEVEL MODE = Linear,
→ See Page 78, Fig. 33 for LEVEL MODE = Pressure Linearized,
→ See Page 82, Fig. 34 for LEVEL MODE = Height Linearized

Table 10: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = level (→ see also Page 45). **Note:** See also – Page 70 ff, Tables 11 to 13: BASIC SETUP – contd. – Page 96 ff, Table 16: EXTENDED SETUP – Page 100 ff, Table 18: LINEARISATION – on-site operation – Page 104 ff, Table 19: LINEARISATION – Digital communication – Page 122 ff, Table 28: PROCESS VALUES – Page 14 ff, Section 5 "Level measurement".	
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisite:** ■ Digital communication **Options**: ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** Pressure
PRESS. ENG. UNIT (060) Selection	Select pressure unit. If a new pressure unit is selected, all pressure-specific parameters are converted and displayed with the new unit. **Options:** ■ mbar, bar ■ mmH2O, mH2O, inH2O, ftH2O [1)] ■ Pa, hPa, kPa, MPa ■ psi ■ mmHg, inHg [2)] ■ Torr ■ g/cm^2, kg/cm^2 ■ lb/ft^2 ■ atm ■ gf/cm^2, kgf/cm^2 ■ User unit, → See also the following parameter description for CUSTOMER UNIT P and CUST. UNIT FACT. P. 1) The conversion factor of the pressure units refers to a reference temperature of 4 °C (39.2 °F). 2) The conversion factor of the pressure units refers to a reference temperature of 0 °C (32 °F). **Factory setting:** Depends on the sensor nominal measuring range mbar or bar or as per order specifications

Table 10: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level"	
Parameter name	**Description**
CUSTOMER UNIT P (075) Entry	Enter text (unit) for customer-specific pressure unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT P parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –
CUST. UNIT FACT. P (317) Entry	Enter conversion factor for a customer-specific pressure unit. The conversion factor must be entered in relation to the SI unit "Pa". → See also CUSTOMER UNIT P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE =10000 Pa ≙ 1 PU – Entry CUSTOMER UNIT P: PU – Entry CUST. UNIT FACT. P: 0.0001 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
LEVEL MODE (718) Selection	Select level type. **Options:** ■ Linear: the measured variable (level, volume, mass or %) is in direct proportion to the measured pressure. → See also Page 70 ff, Table 9. ■ Pressure Linearized: the measured variable (volume, mass or %) is not in direct proportion to the measured pressure such as in the case of containers with a conical outlet. For the calibration, enter a linearisation table with at least 2 and not more than 32 points. → See also Page 78 ff, Table 10. ■ Height Linearized: select this level type if you require two measured variables or if the container shape is given with value pairs, e.g. height and volume. The following combinations are possible: – Height + Volume – Height + Mass – Height + % – %-Height + Volume – %-Height + Mass – %-Height + % Perform two calibrations for this level type. First for the measured variable height or %-height like for the "Linear" option and then for the measured variable volume, mass or % like for the "Pressure Linearized" option. → See also Page 83 ff, Table 11. **Factory setting:** Linear
→ For LEVEL MODE = Linear, see Page 70, Table 9. → For LEVEL MODE = Pressure Linearized, see Page 78, Table 10. → For LEVEL MODE = Height Linearized, see Page 83, Table 11.	

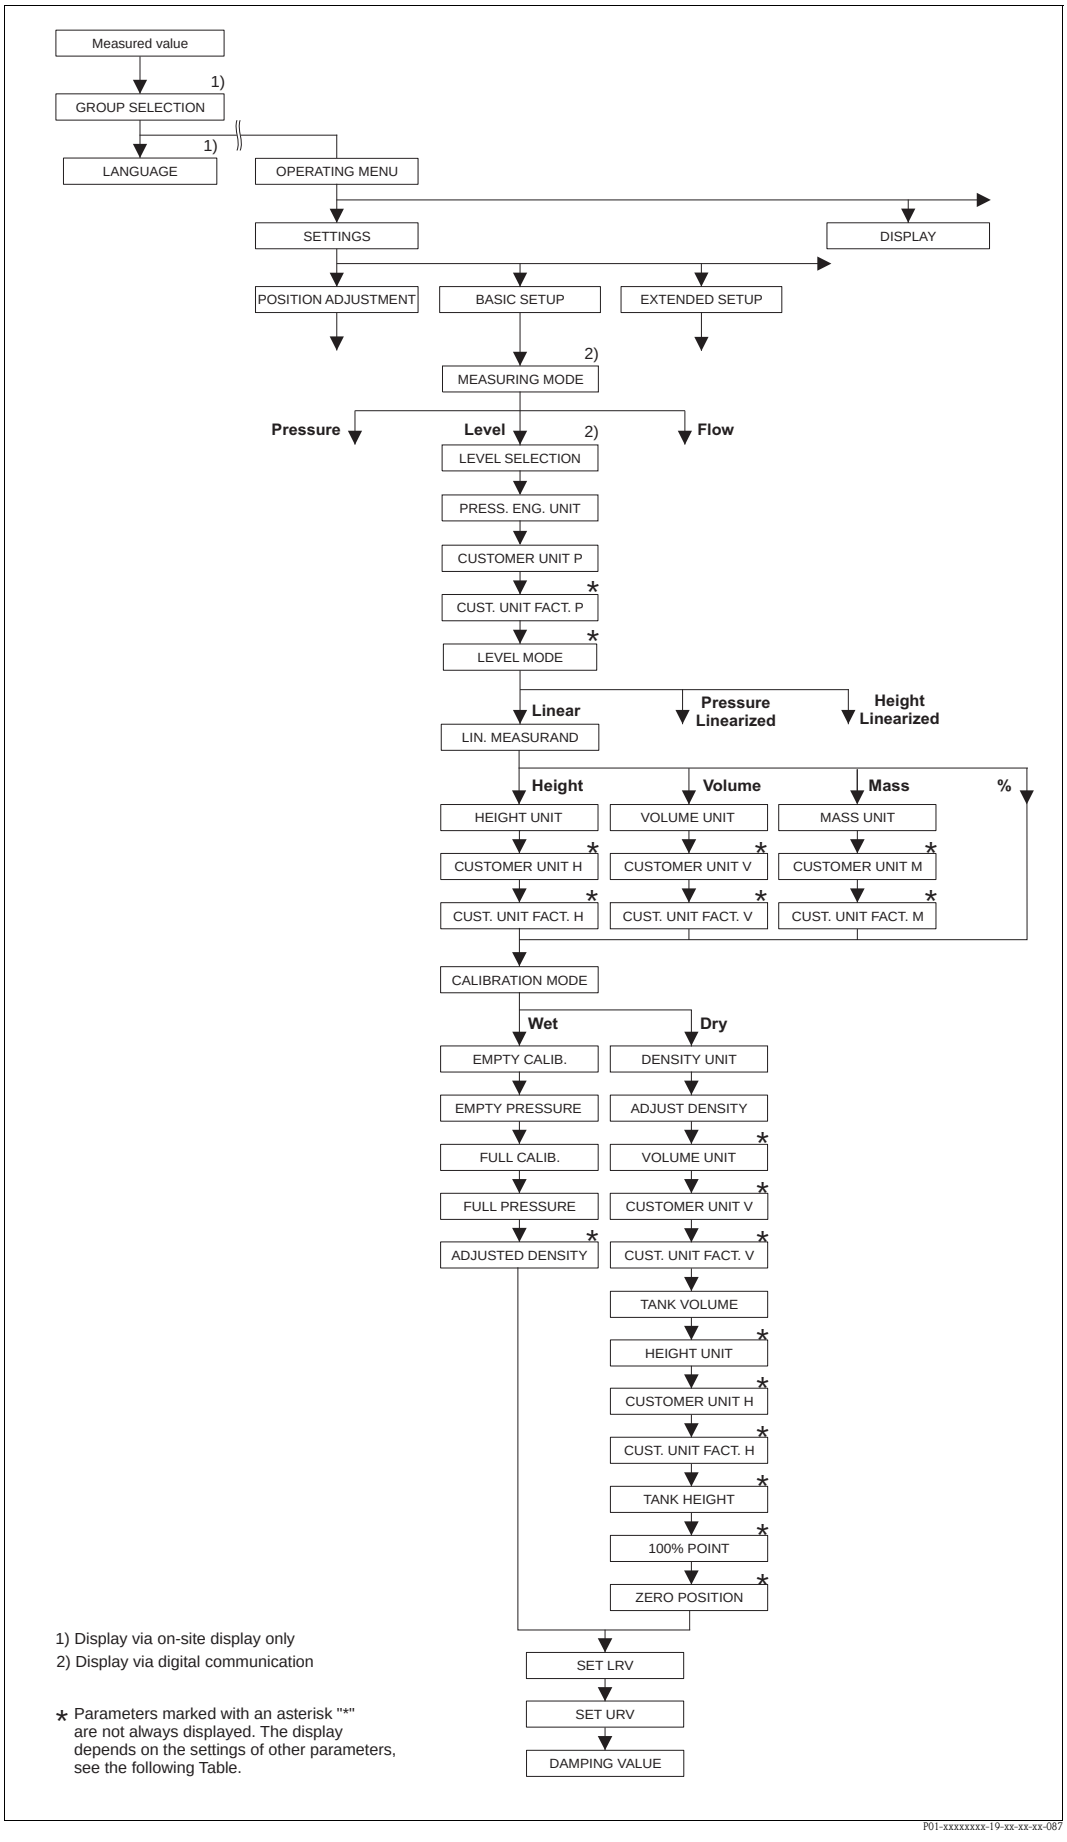

Fig. 31: BASIC SETUP function group for the "Level" measuring mode and "Linear" level type

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
The following parameters are displayed if you selected the "Linear" option for the LEVEL MODE parameter. For this level type, the measured variable (level, volume, mass or %) is in direct proportion to the measured pressure. **Prerequisite**: ■ MEASURING MODE = Level (→ see also Page 45). ■ LEVEL SELECTION = Level Standard (→ see also Page 46). ■ LEVEL MODE = Linear (→ see also Page 68). **Note:** See also – Page 67 ff, Table 10: BASIC SETUP – general – Page 96 ff, Table 16: EXTENDED SETUP – Page 122 ff, Table 28: PROCESS VALUES – Page 14 ff, Section 5 "Level measurement".	
LIN. MEASURAND (804) Selection	Select measured variable. **Options:** ■ Level ■ Volume ■ Mass ■ % (Level) **Factory setting:** % (Level)
HEIGHT UNIT (708) Selection	Select level unit. **Prerequisite:** ■ LIN. MEASURAND = Level **Options:** ■ mm ■ cm ■ dm ■ m ■ inch ■ ft ■ User unit, → see also the following parameter description for CUSTOMER UNIT H and CUST. UNIT FACT. H. **Factory setting:** m
CUSTOMER UNIT H (706) Entry	Enter text (unit) for customer-specific level unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. H. **Prerequisite:** ■ LIN. MEASURAND = Level, HEIGHT UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT H parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
CUST. UNIT FACT. H (705) Entry	Enter conversion factor for a customer-specific level unit. The conversion factor must be entered in relation to the SI unit "m". → See also CUSTOMER UNIT H. **Prerequisite:** ■ LIN. MEASURAND = Level, HEIGHT UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE = 0.5 m (1.6 ft) ≙ 1 PU – Entry CUSTOMER UNIT H: PU – Entry CUST. UNIT FACT. H: 2 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
UNIT VOLUME (313) Selection	Select volume unit. **Prerequisite:** ■ LIN. MEASURAND = Volume **Options:** ■ l ■ hl ■ cm^3 ■ dm^3 ■ m^3 ■ m^3 E^3 ■ ft ■ ft^3 E^3 ■ gal ■ Igal ■ bbl ■ User unit, → see also the following parameter description for CUSTOMER UNIT V and CUST. UNIT FACT. V. **Factory setting:** m^3
CUSTOMER UNIT V (608) Entry	Enter text (unit) for customer-specific volume unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. V **Prerequisite:** ■ LIN. MEASURAND = Volume, UNIT VOLUME = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT H parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
CUST. UNIT FACT. V (607) Entry	Enter conversion factor for a customer-specific volume unit. The conversion factor must be entered in relation to the SI unit "m^3". → See also CUSTOMER UNIT V. **Prerequisite:** ■ LIN. MEASURAND = Volume, UNIT VOLUME = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 0.01 m3 ≙ 1 bucket – Entry CUSTOMER UNIT V: bucket – Entry CUST. UNIT FACT. V: 100 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
MASS UNIT (709) Selection	Select mass unit. **Prerequisite:** ■ LIN. MEASURAND = Mass **Options:** ■ g ■ kg ■ t ■ oz ■ lb ■ ton ■ User unit, → see also the following parameter description for CUSTOMER UNIT M and CUST. UNIT FACT. M. **Factory setting:** kg
CUSTOMER UNIT M (704) Entry	Enter text (unit) for customer-specific mass unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. M. **Prerequisite:** ■ LIN. MEASURAND = Mass, MASS UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT M parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
CUST. UNIT FACT. M (703) Entry	Enter conversion factor for a customer-specific mass unit. The conversion factor must be entered in relation to the SI unit "kg". → See also CUSTOMER UNIT M. **Prerequisite:** ■ LIN. MEASURAND = Mass, MASS UNIT = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 10 kg ≙ 1 bucket – Entry CUSTOMER UNIT M: bucket – Entry CUST. UNIT FACT. M: 0.1 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
CALIBRATION MODE (392) Selection	Select calibration mode. **Options:** ■ Wet Wet calibration takes place by filling and emptying the container. This calibration mode requires two pressure-level value pairs to be entered. In the case of two different levels, the level value is entered and the pressure measured at this moment is assigned to the level value. → See also the following parameter description for EMPTY CALIB., EMPTY PRESSURE, FULL CALIB. and FULL PRESSURE. ■ Dry Dry calibration is a theoretical calibration which you can carry out even if the device is not mounted or the container is empty. – For the "Level" measured variable, the density of the fluid (→ see Page 74, ADJUST DENSITY) must be entered. – For the "Volume" measured variable, the density of the fluid and the tank volume and tank height must be entered (→ see Page 74, ADJUST DENSITY, TANK VOLUME and TANK HEIGHT). – For the "Mass" measured variable, the tank volume and the tank height must be entered (→ see Page 75, TANK VOLUME and TANK HEIGHT). The density must also be entered in the case of a zero point shift (level offset) (→ see Page 74, ADJUST DENSITY). – For the "%" measured variable, the density of the fluid must be entered and a level assigned to the 100 % point (→ see Page 74 and 77, ADJUST DENSITY and 100% POINT). If the measurement should not start at the mounting location of the device, a level offset must be entered (→ see Page 77, ZERO POSITION). ✎ Note! LIN. MEASURAND: "% (Level)", "Mass" and "Volume": If the change to dry calibration is made after a wet calibration, the density must be entered correctly using the ADJUST DENSITY and DENSITY PROCESS parameter before changing the calibration mode. → See also Page 97. **Factory setting:** Wet
EMPTY CALIB. (314) Entry	Enter level value for the lower calibration point (container empty). The container is either empty or part full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. → See also EMPTY PRESSURE. **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 0.0

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
EMPTY PRESSURE (710) Display	Displays the pressure value for the lower calibration point (container empty). → See also EMPTY CALIB. **Prerequisite:** ■ CALIBRATION MODE = Wet **Factory setting:** 0.0
FULL CALIB. (315) Entry	Enter level value for the upper calibration point (container full). The container is either completely or almost full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. → See also FULL PRESSURE. **Prerequisite:** ■ CALIBRATION MODE = Wet ✎ Note! For this parameter, the on-site display shows the level value to be entered and the pressure present at the device. In order for the level value to be saved together with the pressure present at the device, the entry field for the level value must first be activated using the "+"- or "–" key before confirming with the "E" key. This applies also if the level value is to remain unchanged. **Factory setting:** 100.0
FULL PRESSURE (711) Display	Displays the pressure value for the upper calibration point (container full). → See also FULL CALIB. **Prerequisite:** ■ CALIBRATION MODE = Wet **Factory setting:** High sensor limit (→ see PRESS. SENS HILIM, Page 119)
ADJUSTED DENSITY (810) Display	Displays the density calculated from the upper and lower level point. **Prerequisite:** ■ CALIBRATION MODE = Wet, LIN. MEASURAND = Level
DENSITY UNIT (812) Selection	Select density unit. **Prerequisite:** ■ LIN. MEASURAND = Level, CALIBRATION MODE = Dry ■ LIN. MEASURAND = % (Level), CALIBRATION MODE = Dry ■ LIN. MEASURAND = Volume, CALIBRATION MODE = Dry ■ LIN. MEASURAND = Mass, CALIBRATION MODE = Dry **Options:** ■ g/cm^3 ■ kg/dm^3 ■ kg/m^3 ■ US lb/in^3 ■ US lb/ft^3 **Factory setting:** kg/dm^3
ADJUST DENSITY (316) Entry	Enter density of fluid. **Prerequisite:** ■ LIN. MEASURAND = Level, CALIBRATION MODE = Dry ■ LIN. MEASURAND = % (Level), CALIBRATION MODE = Dry ■ LIN. MEASURAND = Volume, CALIBRATION MODE = Dry ■ LIN. MEASURAND = Mass, CALIBRATION MODE = Dry **Factory setting:** 1000.0

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
UNIT VOLUME (313) Selection	Select volume unit. **Prerequisite:** ■ LIN. MEASURAND = Volume **Options:** ■ l ■ hl ■ cm^3 ■ dm^3 ■ m^3 ■ m^3 E^3 ■ ft ■ ft^3 E^3 ■ gal ■ Igal ■ bbl ■ User unit, → see also the following parameter description for CUSTOMER UNIT V and CUST. UNIT FACT. V. **Factory setting:** m^3
CUSTOMER UNIT V (608) Entry	Enter text (unit) for customer-specific volume unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. V **Prerequisite:** ■ LIN. MEASURAND = Volume, UNIT VOLUME = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT H parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. V (607) Entry	Enter conversion factor for a customer-specific volume unit. The conversion factor must be entered in relation to the SI unit "m^3". → See also CUSTOMER UNIT V. **Prerequisite:** ■ LIN. MEASURAND = Volume, UNIT VOLUME = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 0.01 m3 ≙ 1 bucket – Entry CUSTOMER UNIT V: bucket – Entry CUST. UNIT FACT. V: 100 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
TANK VOLUME (858) Entry	Enter tank volume. **Prerequisite:** ■ LIN. MEASURAND = Volume, CALIBRATION MODE = Dry ■ LIN. MEASURAND = Mass, CALIBRATION MODE = Dry **Factory setting:** 1.0 m^3

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"

The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. H (705) Entry	Enter conversion factor for a customer-specific level unit. The conversion factor must be entered in relation to the SI unit "m". → See also CUSTOMER UNIT H. **Prerequisite:** ■ LIN. MEASURAND = % (Level), CALIBRATION MODE = Dry, HEIGHT UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE = 0.5 m (1.6 ft) ≙ 1 PU – Entry CUSTOMER UNIT H: PU – Entry CUST. UNIT FACT. H: 2 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
TANK HEIGHT (859) Entry	Enter tank height. **Prerequisite:** ■ LIN. MEASURAND = Volume, CALIBRATION MODE = Dry ■ LIN. MEASURAND = Mass, CALIBRATION MODE = Dry **Factory setting:** 1.0 m

Table 11: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Linear"	
Parameter name	**Description**
100% POINT (813) Entry	Enter level value for 100% point. **Prerequisite:** ▪ LIN. MEASURAND = % (Level), CALIBRATION MODE = Dry **Example:** – The 100 %-point should correspond to 4 m (13 ft). – Select the "m" unit via the HEIGHT UNIT parameter. – Enter the value "4" for this parameter (100% POINT). **Factory setting:** 1.0
ZERO POSITION (814) Entry	Enter value for level offset. If the measurement should not start at the mounting location of the device, e.g. for containers with a sump, carry out zero point shift (level offset). **Prerequisite:** ▪ CALIBRATION MODE = Dry **Factory setting:** 0.0  P01-PMP75xxx-19-xx-xx-xx-001 *Fig. 32: Zero point shift* *1 Device is mounted above the level lower range value: a positive value has to be entered for ZERO POSITION.* *2 Device is mounted below the level lower range value: a negative value has to be entered for ZERO POSITION.*
SET LRV (719) Entry	Enter level value for the lower current value (4 mA). **Factory setting:** 0.0
SET URV (720) Entry	Enter level value for the upper current value (20 mA). **Factory setting:** 100.0
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

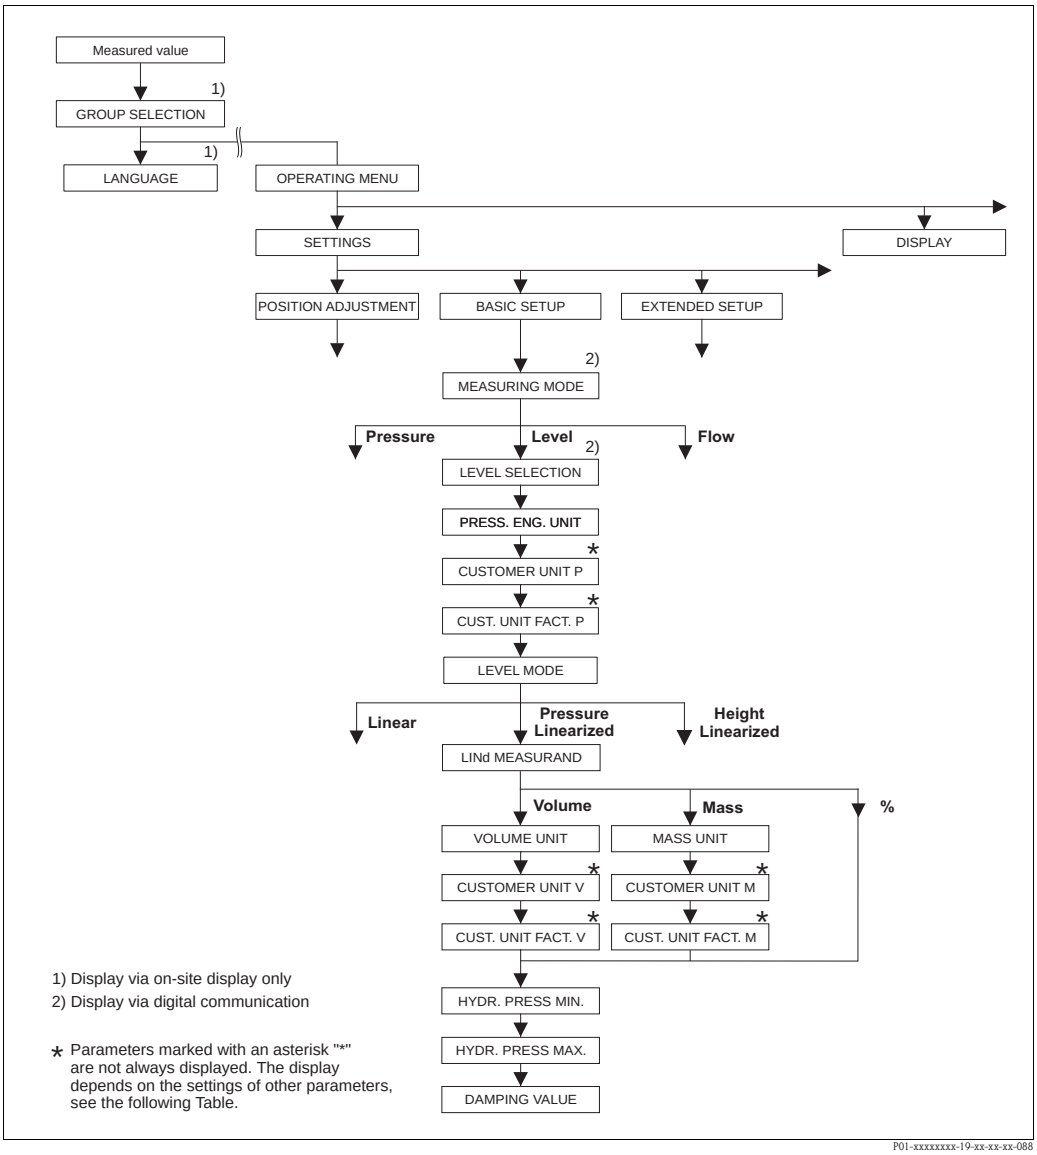

Fig. 33: BASIC SETUP function group for the "Level" measuring mode and the "Pressure Linearized" level type, continue calibration with LINEARISATION function group
→ See Page 100 ff for on-site operation and Page 104 ff for operation with digital communication.

Table 12: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Pressure Linearized"

Parameter name	Description

The following parameters are displayed if you selected the "Pressure Linearized" option for the LEVEL MODE parameter. For this level type, the measured variable (volume, mass or %) is not in direct proportion to the measured pressure. For the calibration, enter a linearisation table with at least 2 and not more than 32 points.

Prerequisite:
- MEASURING MODE = Level (→ see also Page 45).
- LEVEL SELECTION = Level Standard (→ see also Page 46).
- LEVEL MODE = Pressure Linearized (→ see also Page 68).

Note:

Table 12: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Pressure Linearized"	
Parameter name	**Description**
LINd. MEASURAND (805) Selection	Select measured variable. **Options:** ■ Pressure and Volume ■ Pressure and Mass ■ Pressure and % **Factory setting:** Pressure and %
UNIT VOLUME (313) Selection	Select volume unit. **Prerequisite:** ■ LINd. MEASURAND = Pressure and Volume **Options:** ■ l ■ hl ■ cm^3 ■ dm^3 ■ m^3 ■ m^3 E^3 ■ ft ■ ft^3 E^3 ■ gal ■ Igal ■ bbl ■ User unit, → see also the following parameter description for CUSTOMER UNIT V and CUST. UNIT FACT. V. **Factory setting:** m^3
CUSTOMER UNIT V (608) Entry	Enter text (unit) for customer-specific volume unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. V **Prerequisite:** ■ LINd. MEASURAND = Pressure and Volume, UNIT VOLUME = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT V parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –
CUST. UNIT FACT. V (607) Entry	Enter conversion factor for a customer-specific volume unit. The conversion factor must be entered in relation to the SI unit "m^3". → See also CUSTOMER UNIT V. **Prerequisite:** ■ LINd. MEASURAND = Pressure and Volume, UNIT VOLUME = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 0.01 m3 ≙ 1 bucket – Entry CUSTOMER UNIT V: bucket – Entry CUST. UNIT FACT. V: 100 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0

Table 12: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Pressure Linearized"	
Parameter name	**Description**
MASS UNIT (709) Selection	Select mass unit. **Prerequisite:** ■ LINd. MEASURAND = Pressure and Mass **Options:** ■ g ■ kg ■ t ■ oz ■ lb ■ ton ■ User unit, → see also the following parameter description for CUSTOMER UNIT M and CUST. UNIT FACT. M. **Factory setting:** kg
CUSTOMER UNIT M (704) Entry	Enter text (unit) for customer-specific mass unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. M. **Prerequisite:** ■ LINd. MEASURAND = Pressure and Mass, MASS UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT M parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. M (703) Entry	Enter conversion factor for a customer-specific mass unit. The conversion factor must be entered in relation to the SI unit "kg". → See also CUSTOMER UNIT M. **Prerequisite:** ■ LINd. MEASURAND = Pressure and Mass, MASS UNIT = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 10 kg ≙ 1 bucket – Entry CUSTOMER UNIT M: bucket – Entry CUST. UNIT FACT. M: 0.1 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
HYDR. PRESS MIN. (775) Entry	Enter the minimum hydrostatic pressure to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the minimum hydrostatic pressure to be expected, the more accurate the measurement result. **Factory setting:** 0.0

Table 12: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Pressure Linearized"	
Parameter name	**Description**
HYDR. PRESS MAX. (761) Entry	Enter the maximum hydrostatic pressure to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the maximum hydrostatic pressure to be expected, the more accurate the measurement result. **Factory setting:** High sensor limit (→ See PRESS. SENS HILIM, Page 119)
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

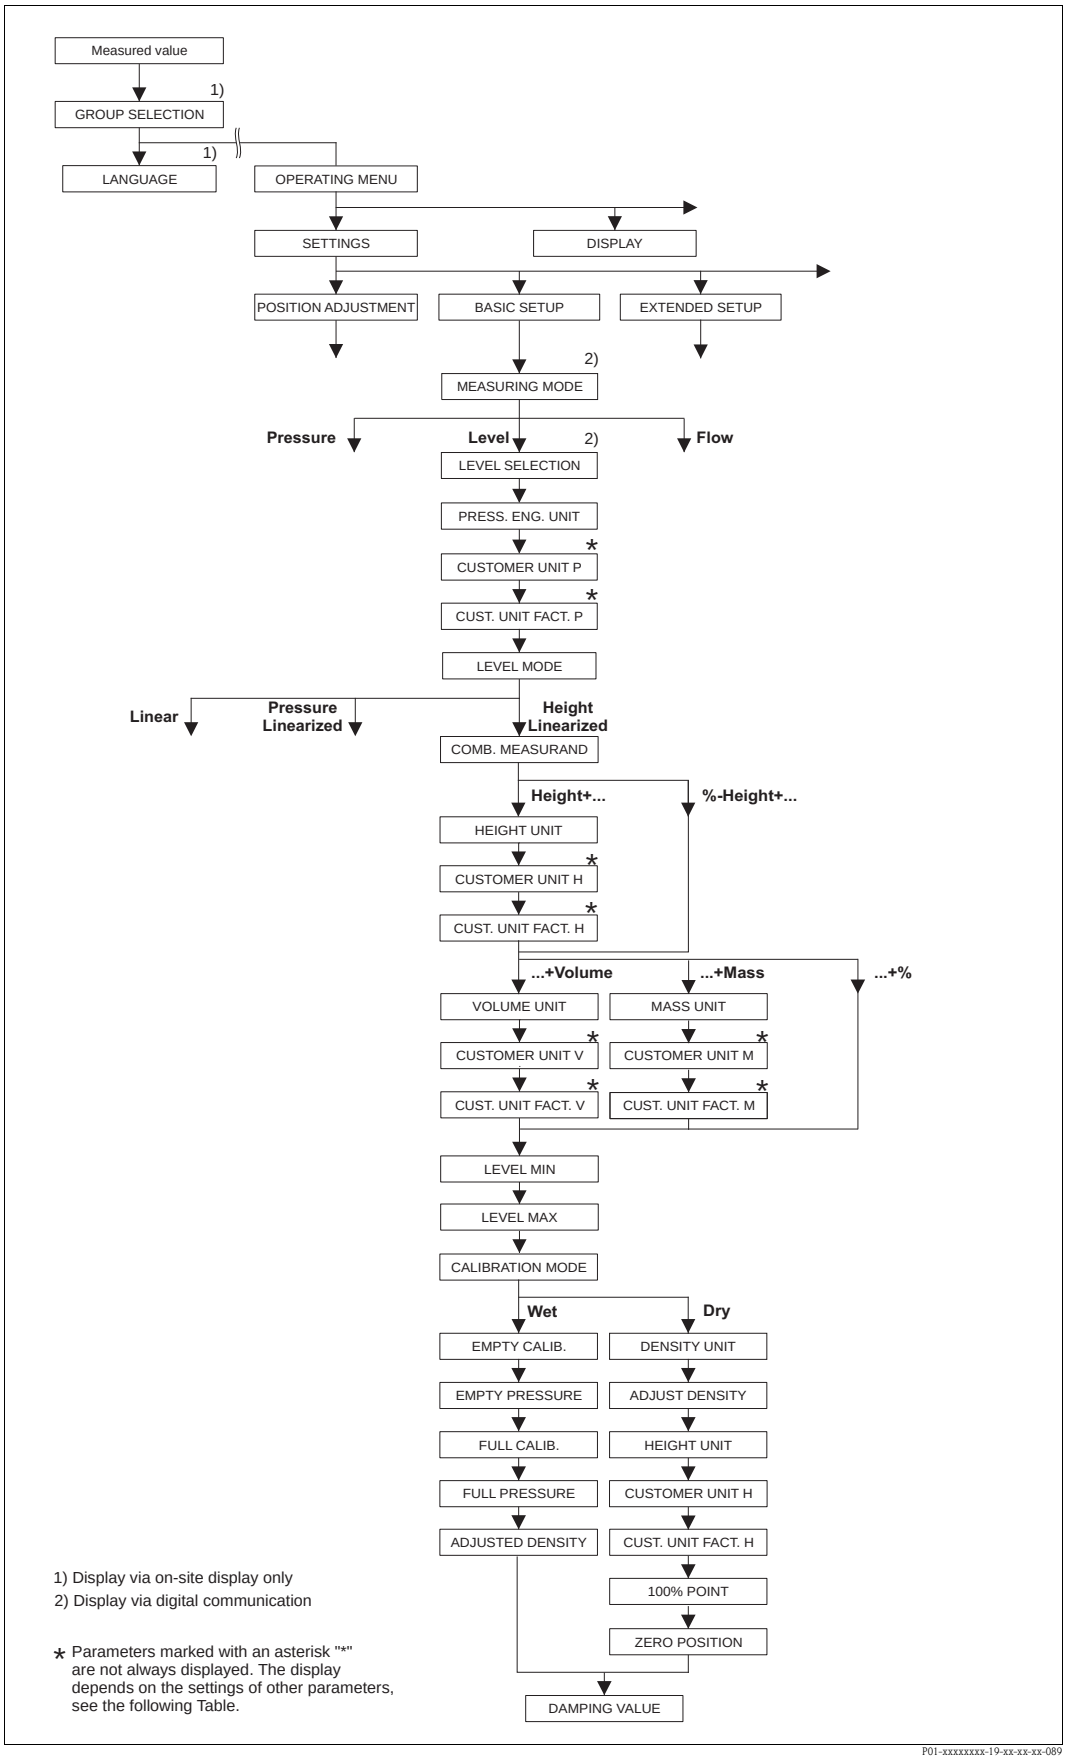

Fig. 34: BASIC SETUP function group for the "Level" measuring mode and the "Height Linearized" level type, continue calibration with LINEARISATION function group → See Page 100 ff for on-site operation and Page 104 ff for operation with digital communication.

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
The following parameters are displayed if you selected the "Height Linearized" option for the LEVEL MODE parameter. Select this level type if you require two measured variables or if the container shape is given with value pairs, e.g. height and volume. The following combinations are possible: ■ Height + Volume ■ Height + Mass ■ Height + % ■ %-Height + Volume ■ %-Height + Mass ■ %-Height + % The 1st measured variable (%-Height or Height) must be in direct proportion to the measured pressure. The 2nd measured variable (Volume, Mass or %) must not be in direct proportion. A linearisation table must be entered for the 2nd measured variable. The 2nd measured variable is assigned to the 1st measured variable by means of this table. **Prerequisite**: ■ MEASURING MODE = Level (→ see also Page 45). ■ LEVEL SELECTION = Level Standard (→ see also Page 46). ■ LEVEL MODE = Height Linearized (→ see also Page 68). **Note:** See also – Page 67 ff, Table 10: BASIC SETUP – general – Page 96 ff, Table 16: EXTENDED SETUP – Page 100 ff, Table 18: LINEARISATION – on-site operation – Page 104 ff, Table 19: LINEARISATION – Digital communication – Page 122 ff, Table 28: PROCESS VALUES – Page 14 ff, Section 5 "Level measurement".	
COMB. MEASURAND (806) Selection	Select measured variable. **Options:** ■ Height and Volume ■ Height and Mass ■ Height and % ■ %-Height and Volume ■ %-Height and Mass ■ %-Height and % **Factory setting:** %-Height and %
HEIGHT UNIT (708) Selection	Select level unit for the 1st measured variable. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, Height and Mass or Height and % **Options:** ■ mm ■ dm ■ cm ■ m ■ inch ■ ft ■ User unit, → see also the following parameter description for CUSTOMER UNIT H and CUST. UNIT FACT. H. **Factory setting:** m

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
CUSTOMER UNIT H (706) Entry	Enter text (unit) for customer-specific level unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. H. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, HEIGHT UNIT = User unit ■ COMB. MEASURAND = Height and Mass, HEIGHT UNIT = User unit ■ COMB. MEASURAND = Height and %, HEIGHT UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT H parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. H (705) Entry	Enter conversion factor for a customer-specific level unit. The conversion factor must be entered in relation to the SI unit "m". → See also CUSTOMER UNIT H. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, HEIGHT UNIT = User unit ■ COMB. MEASURAND = Height and Mass, HEIGHT UNIT = User unit ■ COMB. MEASURAND = Height and %, HEIGHT UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE = 0.5 m (1,6 ft) ≙ 1 PU – Entry CUSTOMER UNIT H: PU – Entry CUST. UNIT FACT. H: 2 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
UNIT VOLUME (313) Selection	Select the volume unit for the 2nd measured value. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume or %-Height and Volume **Options:** ■ l ■ hl ■ cm^3 ■ dm^3 ■ m^3 ■ m^3 E^3 ■ ft ■ ft^3 E^3 ■ gal ■ Igal ■ bbl ■ User unit, → see also the following parameter description for CUSTOMER UNIT V and CUST. UNIT FACT. V. **Factory setting:** m^3

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
CUSTOMER UNIT V (608) Entry	Enter text (unit) for customer-specific volume unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. V **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and Volume, HEIGHT UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT V parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. V (607) Entry	Enter conversion factor for a customer-specific volume unit. The conversion factor must be entered in relation to the SI unit "m^3". → See also CUSTOMER UNIT V. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and Volume, HEIGHT UNIT = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 0.01 m3 ≙ 1 bucket – Entry CUSTOMER UNIT V: bucket – Entry CUST. UNIT FACT. V: 100 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
MASS UNIT (709) Selection	Select the mass unit for the 2nd measured value. **Prerequisite:** ■ COMB. MEASURAND = Height and Mass or %-Height and Mass **Options:** ■ g ■ kg ■ t ■ oz ■ lb ■ ton ■ User unit, → see also the following parameter description for CUSTOMER UNIT M and CUST. UNIT FACT. M. **Factory setting:** kg

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
CUSTOMER UNIT M (704) Entry	Enter text (unit) for customer-specific mass unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. M. **Prerequisite:** ■ COMB. MEASURAND = Height and Mass, MASS UNIT = User unit ■ COMB. MEASURAND = %-Height and Mass, MASS UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT M parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. M (703) Entry	Enter conversion factor for a customer-specific mass unit. The conversion factor must be entered in relation to the SI unit "kg". → See also CUSTOMER UNIT M. **Prerequisite:** ■ COMB. MEASURAND = Height and Mass, MASS UNIT = User unit ■ COMB. MEASURAND = %-Height and Mass, MASS UNIT = User unit **Example:** – You want the measured value to be displayed in "buckets". – MEASURED VALUE = 10 kg ≙ 1 bucket – Entry CUSTOMER UNIT M: bucket – Entry CUST. UNIT FACT. M: 0.1 – Result: MEASURED VALUE = 1 bucket **Factory setting:** 1.0
LEVEL MIN (755) Entry	Enter the minimum level to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the minimum level to be expected, the more accurate the measurement result. ✎ Note! ■ The following applies for the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear": If you enter a new value for LEVEL MIN, the value for SET LRV is also changed. Use SET LRV to assign a height to the lower current value. If you want to assign the lower current value a value other than that for LEVEL MIN, you must enter the desired value for SET LRV. (→ SET LRV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 0.0
LEVEL MAX (712) Entry	Enter the maximum level to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the maximum level to be expected, the more accurate the measurement result. ✎ Note! ■ The following applies for the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear": If you enter a new value for LEVEL MAX, the value for SET URV is also changed. Use SET URV to assign a height to the upper current value. If you want to assign the upper current value a value other than that for LEVEL MAX, you must enter the desired value for SET URV. (→ SET URV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 100.0

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
CALIBRATION MODE (392) Selection	Select the calibration mode for the calibration of the 1st measured variable. **Options:** ■ Wet Wet calibration takes place by filling the container. This calibration mode requires two pressure-level value pairs to be entered. In the case of two different levels, the level value is entered and the pressure measured at this moment is assigned to the level value. → See also the following parameter description for EMPTY CALIB., EMPTY PRESSURE, FULL CALIB. and FULL PRESSURE. ■ Dry Dry calibration is a theoretical calibration which you can carry out even if the device is not mounted or the container is empty. – For the "Level" measured variable, the density of the fluid (→ see Page 88, ADJUST DENSITY) must be entered. – For the "%" measured variable, the density of the fluid must be entered and a level assigned to the 100 % point (→ see Page 88, ADJUST DENSITY and 100% POINT). If the measurement should not start at the mounting location of the device, a level offset must be entered (→ see Page 90, ZERO POSITION). ✎ Note! If the change to dry calibration is made after a wet calibration, the density must be entered correctly using the ADJUST DENSITY and DENSITY PROCESS parameter before changing the calibration mode. → See also Page 97. **Factory setting:** Wet
EMPTY CALIB. (314) Entry	Enter level value for the lower calibration point (container empty). The container is either empty or part full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. → See also EMPTY PRESSURE. **Prerequisite:** ■ CALIBRATION MODE = Wet **Factory setting:** 0.0
EMPTY PRESSURE (710) Display	Displays the pressure value for the lower calibration point (container empty). → See also EMPTY CALIB. **Prerequisite:** ■ CALIBRATION MODE = Wet
FULL CALIB. (315) Entry	Enter level value for the upper calibration point (container full). The container is either completely or almost full. By entering a value for this parameter, you are assigning a level value to the pressure present at the device. → See also FULL PRESSURE. **Prerequisite:** ■ CALIBRATION MODE = Wet **Factory setting:** 100.0
FULL PRESSURE (711) Display	Displays the pressure value for the upper calibration point (container full). → See also FULL CALIB. **Prerequisite:** ■ CALIBRATION MODE = Wet **Factory setting:** High sensor limit (→ see PRESS. SENS HILIM, Page 119)
ADJUSTED DENSITY (810) Display	Displays the density calculated from the upper and lower level point. **Prerequisite:** ■ COMB. MEASURAND = Height and Volume, CALIBRATION MODE = Wet ■ COMB. MEASURAND = Height and Mass, CALIBRATION MODE = Wet ■ COMB. MEASURAND = Height and %, CALIBRATION MODE = Wet

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
DENSITY UNIT (812) Selection	Select density unit. **Prerequisite:** ■ COMB. MEASURAND = %-Height and %, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and %, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and Mass, CALIBRATION MODE = Dry **Options:** ■ g/cm^3 ■ kg/dm^3 ■ kg/m^3 ■ US lb/in^3 ■ US lb/ft^3 **Factory setting:** kg/dm^3
ADJUST DENSITY (316) Entry	Enter density of fluid. **Prerequisite:** ■ COMB. MEASURAND = %-Height and %, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and %, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = Height and Mass, CALIBRATION MODE = Dry **Factory setting:** 1.0
HEIGHT UNIT (708) Selection	Select level unit. **Prerequisite:** ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height + %, CALIBRATION MODE = Dry **Options:** ■ mm ■ dm ■ cm ■ m ■ inch ■ ft ■ User unit, → see also the following parameter description for CUSTOMER UNIT H and CUST. UNIT FACT. H. **Factory setting:** m

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
CUSTOMER UNIT H (706) Entry	Enter text (unit) for customer-specific level unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. H. **Prerequisite:** ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and %, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT H parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
CUST. UNIT FACT. H (705) Entry	Enter conversion factor for a customer-specific level unit. The conversion factor must be entered in relation to the SI unit "m". → See also CUSTOMER UNIT H. **Prerequisite:** ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit ■ COMB. MEASURAND = %-Height and %, CALIBRATION MODE = Dry, HEIGHT UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE = 0.5 m (1.6 ft) ≙ 1 PU – Entry CUSTOMER UNIT H: PU – Entry CUST. UNIT FACT. H: 2 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
100% POINT (813) Entry	Enter level value for 100% point. **Prerequisite:** ■ COMB. MEASURAND = %-Height and Volume, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height and Mass, CALIBRATION MODE = Dry ■ COMB. MEASURAND = %-Height + %, CALIBRATION MODE = Dry **Example:** – The 100 %-point should correspond to 4 m (13 ft). – Select the "m" unit via the HEIGHT UNIT parameter. – Enter the value "4" for this parameter (100% POINT). **Factory setting:** 1.0

Table 13: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Level", LEVEL MODE "Height Linearized"	
Parameter name	**Description**
ZERO POSITION (814) Entry	Enter value for level offset. If the measurement should not start at the mounting location of the device, e.g. for containers with a sump, carry out zero point shift (level offset). **Prerequisite:** ■ CALIBRATION MODE = Dry  P01-PMP75xxx-19-xx-xx-xx-001 *Fig. 35: Zero point shift* *1 Device is mounted above the level lower range value: a positive value has to be entered for ZERO POSITION.* *2 Device is mounted below the level lower range value: a negative value has to be entered for ZERO POSITION.* **Factory setting:** 0.0
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

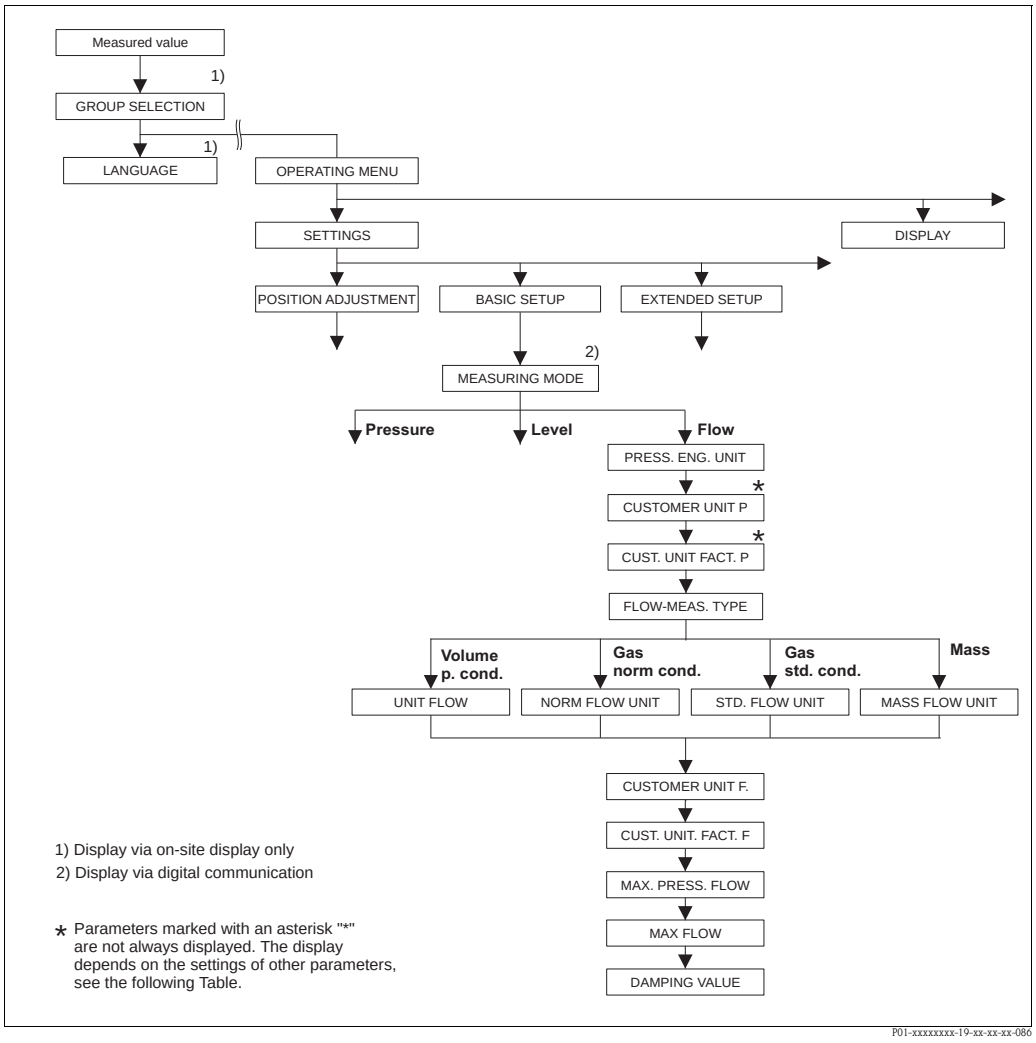

Fig. 36: BASIC SETUP function group for the "Flow" measuring mode

Table 14: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Flow"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Flow (→ see also Page 45). **Note:** See also – Page 52, Table 5: QUICK SETUP – Page 98, Table 15: EXTENDED SETUP – Page 107, Table 18: TOTALIZER SETUP – Page 123, Table 27: PROCESS VALUES. – Page 40 ff, Section 6 "Flow measurement".	

Table 14: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Flow"	
Parameter name	**Description**
MEASURING MODE Selection	Select the measuring mode. The operating menu is structured according to the selected measuring mode. ⚠ Warning! If the measuring mode is changed, the span setting (URV) must be verified in the "Calibration" → "Basic Setup" operating menu and, if necessary, reconfigured. **Prerequisite:** ■ Digital communication **Options:** ■ Pressure ■ Level ■ Deltabar S: Flow **Factory setting:** ■ Cerabar S and Deltabar S: Pressure ■ Deltapilot S: Level
PRESS. ENG. UNIT (060) Selection	Select pressure unit. If a new pressure unit is selected, all pressure-specific parameters are converted and displayed with the new unit. **Options:** ■ mbar, bar ■ mmH2O, mH2O, inH2O, ftH2O [1)] ■ Pa, hPa, kPa, MPa ■ psi ■ mmHg, inHg [2)] ■ Torr ■ g/cm^2, kg/cm^2 ■ lb/ft^2 ■ atm ■ gf/cm^2, kgf/cm^2 ■ User unit, → See also the following parameter description for CUSTOMER UNIT P and CUST. UNIT FACT. P. 1) The conversion factor of the pressure units refers to a reference temperature of 4 °C (39.2 °F). 2) The conversion factor of the pressure units refers to a reference temperature of 0 °C (32 °F). **Factory setting:** Depends on the sensor nominal measuring range mbar or bar or as per order specifications
CUSTOMER UNIT P (075) Entry	Enter text (unit) for customer-specific pressure unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT P parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** – – – – – – – –

Table 14: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Flow"	
Parameter name	**Description**
CUST. UNIT FACT. P (317) Entry	Enter conversion factor for a customer-specific pressure unit. The conversion factor must be entered in relation to the SI unit "Pa". → See also CUSTOMER UNIT P. **Prerequisite:** ■ PRESS. ENG. UNIT = User unit **Example:** – You want the measured value to be displayed in "PU" (PU: packing unit). – MEASURED VALUE =10000 Pa ≙ 1 PU – Entry CUSTOMER UNIT P: PU – Entry CUST. UNIT FACT. P: 0.0001 – Result: MEASURED VALUE = 1 PU **Factory setting:** 1.0
FLOW-MEAS. TYPE (640) Selection	Select the flow type. **Options:** ■ Volume p. cond. (volume under operating conditions) ■ Gas norm. cond. (norm volume under norm conditions in Europe: 1013.25 mbar and 273.15 K (0°C)) ■ Gas std. cond. (standard volume under standard conditions in USA: 1013.25 mbar (14.7 psi) and 288.15 K (15°C/59°F)) ■ Mass (mass under operating conditions) **Factory setting:** Volume p. cond.
UNIT FLOW (391) Selection	Select volume flow unit. When a new flow unit is selected, all flow-specific parameters are converted and displayed with the new unit within a flow mode (FLOW-MEAS. TYPE). When the flow mode is changed, conversion is not possible. **Prerequisite:** ■ FLOW-MEAS. TYPE = Volume p. cond. **Options:** ■ m3/s, m3/min, m3/h, m3/day ■ l/s, l/min, l/h ■ hl/s, hl/min, hl/day ■ ft3/s, ft3/min, ft3/h, ft3/day ■ ACFS, ACFM, ACFH, ACFD ■ ozf/s, ozf/min ■ US Gal/s, US Gal/min, US Gal/h, US Gal/day ■ Imp. Gal/s, Imp. Gal/min, Imp. Gal/h ■ bbl/s, bbl/min, bbl/h, bbl/day ■ User unit, → see also this table, parameter description for CUSTOMER UNIT F and CUST. UNIT FACT. F **Factory setting:** m^3/s
NORM FLOW UNIT (661) Selection	Select norm volume flow unit. When a new flow unit is selected, all flow-specific parameters are converted and displayed with the new unit within a flow mode (FLOW-MEAS. TYPE). When the flow mode is changed, conversion is not possible. **Prerequisite:** ■ FLOW-MEAS. TYPE = Gas norm conditions **Options:** ■ Nm3/s, Nm3/min, Nm3/h, Nm3/day ■ User unit, → see also this table, parameter description for CUSTOMER UNIT F and CUST. UNIT FACT. F **Factory setting:** Nm^3/s

Table 14: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Flow"	
Parameter name	**Description**
STD. FLOW UNIT (660) Selection	Select standard volume flow unit. When a new flow unit is selected, all flow-specific parameters are converted and displayed with the new unit within a flow mode (FLOW-MEAS. TYPE). When the flow mode is changed, conversion is not possible. **Prerequisite:** ■ FLOW-MEAS. TYPE = Gas std. conditions **Options:** ■ Sm3/s, Sm3/min, Sm3/h, Sm3/day ■ SCFS, SCFM, SCFH, SCFD ■ User unit, → see also this table, parameter description for CUSTOMER UNIT F and CUST. UNIT FACT. F **Factory setting:** Sm^3/s
MASS FLOW UNIT (571) Selection	Select mass flow unit. When a new flow unit is selected, all flow-specific parameters are converted and displayed with the new unit within a flow mode (FLOW-MEAS. TYPE). When the flow mode is changed, conversion is not possible. **Prerequisite:** ■ FLOW-MEAS. TYPE = Mass **Options:** ■ g/s, kg/s, kg/min, kg/min, kg/h ■ t/s, t/min, t/h, t/day ■ oz/s, oz/min ■ lb/s, lb/min, lb/h ■ ton/s, ton/min, ton/h, ton/day ■ User unit, → see also the following parameter description for CUSTOMER UNIT F and CUST. UNIT FACT. F **Factory setting:** kg/s
CUSTOMER UNIT F (610) Entry	Enter text (unit) for customer-specific flow unit. You can enter a maximum of eight alphanumeric characters here. → See also CUST. UNIT FACT. F. **Prerequisite:** ■ UNIT FLOW = User unit ■ NORM FLOW UNIT = User unit ■ STD. FLOW UNIT = User unit ■ MASS FLOW UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the CUSTOMER UNIT F parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _

Table 14: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP "Flow"	
Parameter name	**Description**
CUST. UNIT FACT. F (609) Entry	Enter conversion factor for a customer-specific flow unit. The conversion factor must be entered in relation to an appropriate SI unit, e.g. m^3/s for the "Volume p. cond." flow mode. → See also CUSTOMER UNIT F. **Prerequisite:** ■ UNIT FLOW = User unit ■ NORM FLOW UNIT = User unit ■ STD. FLOW UNIT = User unit ■ MASS FLOW UNIT = User unit **Example:** – You want the measured value to be displayed in "bucket/h". – MEASURED VALUE =0.01 m3/s ≙ 3600 bucket/h – Entry CUSTOMER UNIT F: bucket/h – Entry CUST. UNIT FACT. F: 360000 – Result: MEASURED VALUE = 3600 bucket/h **Factory setting:** 1.0
MAX. FLOW (311) Entry	Enter maximum flow of primary element. → See also layout sheet of primary element. The maximum flow is assigned to the maximum pressure which you enter via MAX PRESS. FLOW. ✎ Note! Use the LINEAR/SQROOT parameter (→ Page 113) to specify the current signal for the "Flow" measuring mode. The following applies for the "Flow (square root)" setting: If you enter a new value for MAX. FLOW, the value for SET URV is also changed. Use SET URV to assign a flow to the upper current value. If you want to assign the upper current value a value other than that for MAX. FLOW, you must enter the desired value for SET URV. (→ SET URV, Page 100). **Factory setting:** 1.0
MAX PRESS. FLOW (634) Entry	Enter maximum pressure of primary element. → See layout sheet of primary element. This value is assigned to the maximum flow value (→ see MAX. FLOW). ✎ Note! Use the LINEAR/SQROOT parameter (→ Page 113) to specify the current signal for the "Flow" measuring mode. The following applies for the "Differential pres." setting: If you enter a new value for MAX PRESS. FLOW, the value for SET URV is also changed. Use SET URV to assign a pressure value to the upper current value. If you want to assign the upper current value a value other than that for MAX PRESS. FLOW, you must enter the desired value for SET URV. (→ SET URV, Page 100). **Factory setting:** High sensor limit (→ see PRESS. SENS HILIM, Page 119)
DAMPING VALUE (247) Entry	Enter damping time (time constant τ). The damping affects the speed at which all subsequent elements, such as the on-site display, measured value and current output react to a change in the pressure. **Input range:** 0.0...999.0 s **Factory setting:** 2.0 s or as per order specifications

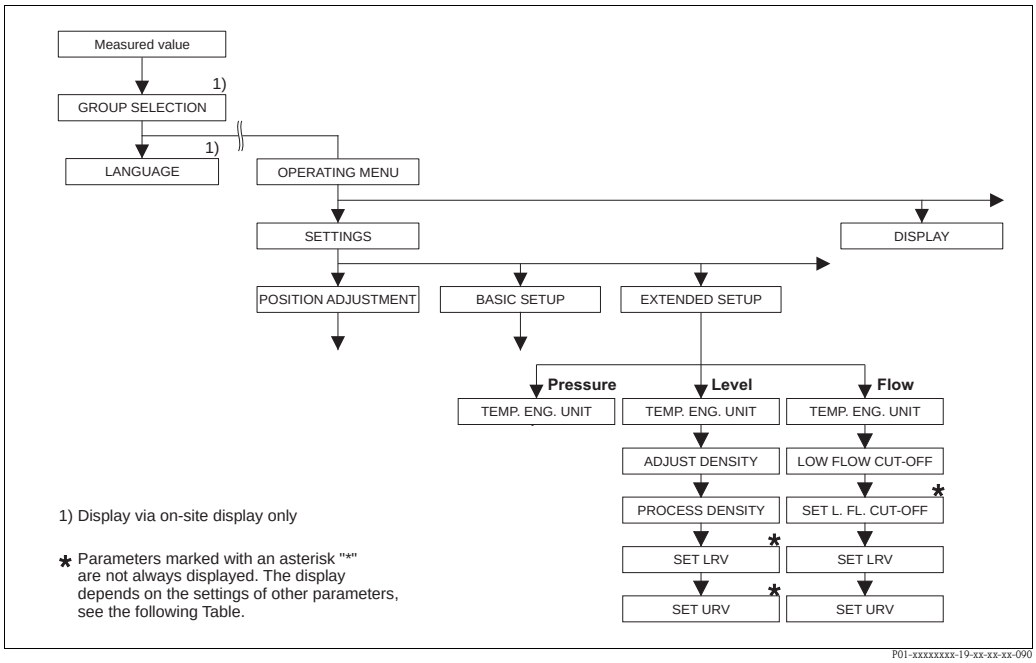

Fig. 37: EXTENDED SETUP function group
→ For the "Pressure" measuring mode, see Page 96, Table 15
→ For the "Level" measuring mode, see Page 96, Table 16
→ For the "Flow" measuring mode, see Page 98, Table 17

Table 15: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Pressure"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Pressure (→ see also Page 45). **Note:** ■ See also Page 11 ff, Section 4 "Pressure measurement".	
TEMP. ENG. UNIT (318) Selection	Select the unit for the temperature measured values. → See also PCB TEMPERATURE (Page 117) and SENSOR TEMP. (Page 122). **Options:** ■ °C ■ °F ■ K ■ R **Factory setting:** °C

Table 16: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Level"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Level (→ see also Page 45). **Note:** ■ See also Page 14 ff, Section 5 "Level measurement".	

Table 16: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Level"	
Parameter name	**Description**
TEMP. ENG. UNIT (318) Selection	Select the unit for the temperature measured values. → See also PCB TEMPERATURE (Page 117) and SENSOR TEMP. (Page 122). **Options:** ■ °C ■ °F ■ K ■ R **Factory setting:** °C
DENSITY UNIT (001)/(812) Options	Select density unit. **Options:** ■ g/cm^3 ■ kg/dm^3 ■ kg/m^3 ■ US lb/in^3 ■ US lb/ft^3 **Factory setting:** kg/dm^3
ADJUST DENSITY (007)/(316) Entry	Enter density of fluid. ✎ Note! LIN. MEASURAND: "% (Level)", "Mass" and "Volume" and MEASUAND KOMB.: If a change to dry calibration is made after a wet calibration using the CALIBRATION MODE parameter (→ Page 73 or 87), the density for this parameter must be entered correctly before changing the calibration mode. In the event that the pressure falls with increasing levels (LIN. MEASURED: Volume), such as in the case of a residual volume measurement, a negative value shall be entered for this parameter. **Factory setting:** 1.0
PROCESS DENSITY (025)/(811) Entry	Enter a new density value for density correction. The calibration was carried out with the medium water, for example. Now the container is to be used for another fluid with another density. The calibration is corrected appropriately by entering the new density value in the PROCESS DENSITY parameter. ✎ Note! LIN. MEASURAND: "% (Level)", "Mass" and "Volume" and MEASUAND KOMB.: If a change to dry calibration is made after a wet calibration using the CALIBRATION MODE parameter (→ Page 73 or 87), the density for this parameter must be entered correctly before changing the calibration mode. In the event that the pressure falls with increasing levels (LIN. MEASURED: Volume), such as in the case of a residual volume measurement, a negative value shall be entered for this parameter. **Factory setting:** 1.0

Table 16: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Level"	
Parameter name	**Description**
SET LRV (762) Entry	Enter value for the lower current value (4 mA). **Prerequisite:** ■ LEVEL MODE = Pressure Linearized or Height Linearized ✎ Note! ■ For the LEVEL MODE "Height Linearized", you can use the ASSIGN CURRENT parameter (→ Page 113) to specify whether the current output should depict the 1st or 2nd measured variable (height or tank content). Depending on the setting of the ASSIGN CURRENT parameter, enter the following value for SET LRV: – ASSIGN CURRENT = tank content (factory setting) ⇒ %- value, volume value or mass value – ASSIGN CURRENT = height ⇒ level value The following applies for the LEVEL MODE "Pressure Linearized" or LEVEL MODE "Height Linearized" + ASSIGN CURRENT "Tank content": ■ If you enter a new value for TANK CONTENT MIN, the value for SET LRV is also changed. If you want to assign the lower current value a value other than that for TANK CONTENT MIN, you must enter the desired value for SET LRV. (→ TANK CONTENT MIN, Page 101 or 104.) The following applies for the LEVEL MODE "Height Linearized" + ASSIGN CURRENT "Height": ■ If you enter a new value for LEVEL MIN, the value for SET LRV is also changed. If you want to assign the lower current value a value other than that for LEVEL MIN, you must enter the desired value for SET LRV. (→ LEVEL MIN, Page 86.) **Factory setting:** 0.0
SET URV (763) Entry	Enter value for the upper current value (20 mA). **Prerequisite:** ■ LEVEL MODE = Pressure Linearized or Height Linearized ✎ Note! ■ For the LEVEL MODE "Height Linearized", you can use the ASSIGN CURRENT parameter (→ Page 113) to specify whether the current output should depict the 1st or 2nd measured variable (height or tank content). Depending on the setting of the ASSIGN CURRENT parameter, enter the following value for SET URV: – ASSIGN CURRENT = tank content (factory setting) ⇒ %- value, volume value or mass value – ASSIGN CURRENT = height ⇒ level value The following applies for the LEVEL MODE "Pressure Linearized" or LEVEL MODE "Height Linearized" + ASSIGN CURRENT "Tank content": ■ If you enter a new value for TANK CONTENT MAX, the value for SET URV is also changed. If you want to assign the upper current value a value other than that for TANK CONTENT MAX, you must enter the desired value for SET URV. (→ TANK CONTENT MAX, Page 101 or 105.) The following applies for the LEVEL MODE "Height Linearized" + ASSIGN CURRENT "Height": ■ If you enter a new value for LEVEL MAX, the value for SET URV is also changed. If you want to assign the lower current value a value other than that for LEVEL MAX, you must enter the desired value for SET URV. (→ LEVEL MAX, Page 86.) **Factory setting:** 100.0

Table 17: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Flow"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Flow (→ see also Page 45). **Note:** ■ See also Page 40 ff, Section 6 "Flow measurement".	

Table 17: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Flow"	
Parameter name	**Description**
TEMP. ENG. UNIT (318) Selection	Select the unit for the temperature measured value. → See also PCB TEMPERATURE (Page 117) and SENSOR TEMP. (Page 123). **Options:** ■ °C ■ °F ■ K ■ R **Factory setting:** °C
LOW FLOW CUT-OFF (442) Selection	Switches "low flow cut-off" function on and off. In the lower measuring range, small flow quantities (creepages) can lead to large measured value fluctuations. Switching on this function stops these flow quantities from being recorded. → See also SET. L. FL. CUT-OFF. **Options:** ■ Off ■ On **Factory setting:** Off
SET. L. FL. CUT-OFF (323) Entry	Enter switch-off point of low flow cut-off. The hysteresis between the switch-on point and the switch-off point is always 1 % of the end flow value. → See also LOW FLOW CUT-OFF. **Prerequisite:** ■ LOW FLOW CUT-OFF = on **Input range:** Switch-off point: 0...50 % of end flow value (→ MAX. FLOW).  **Factory setting:** 5 % (of end flow value)
SET LRV (637) Entry	Depending on the setting in the LINEAR/SQROOT parameter (→ Page 113), enter a flow value or a pressure value for the lower current value (4 mA) here. ■ LINEAR/SQROOT = Flow (square root) (factory setting) ⇒ flow value ■ LINEAR/SQROOT = Differential pres. ⇒ pressure value **Factory setting:** 0

Table 17: (GROUP SELECTION →) OPERATING MENU → SETTINGS → EXTENDED SETUP "Flow"	
Parameter name	**Description**
SET URV (638) Entry	Depending on the setting in the LINEAR/SQROOT parameter (→ Page 113), enter a flow value or a pressure value for the upper current value (20 mA) here. ■ LINEAR/SQROOT = Flow (square root) (factory setting) ⇒ flow value ■ LINEAR/SQROOT = Differential pres. ⇒ pressure value The following applies for the setting LINEAR/SQROOT "Flow (square root)": ■ If you enter a new value for MAX. FLOW, the value for SET URV is also changed. If you want to assign the upper current value a value other than that for MAX. FLOW, you must enter the desired value for SET URV. (→ MAX. FLOW, Page 95). The following applies for the setting LINEAR/SQROOT "Differential pres.": ■ If you enter a new value for MAX PRESS. FLOW, the SET URV value is also changed. If you want to assign the upper current value a value other than that for MAX PRESS. FLOW, you must enter the desired value for SET URV. (→ MAX PRESS. FLOW, Page 95). **Factory setting:** MAX. FLOW

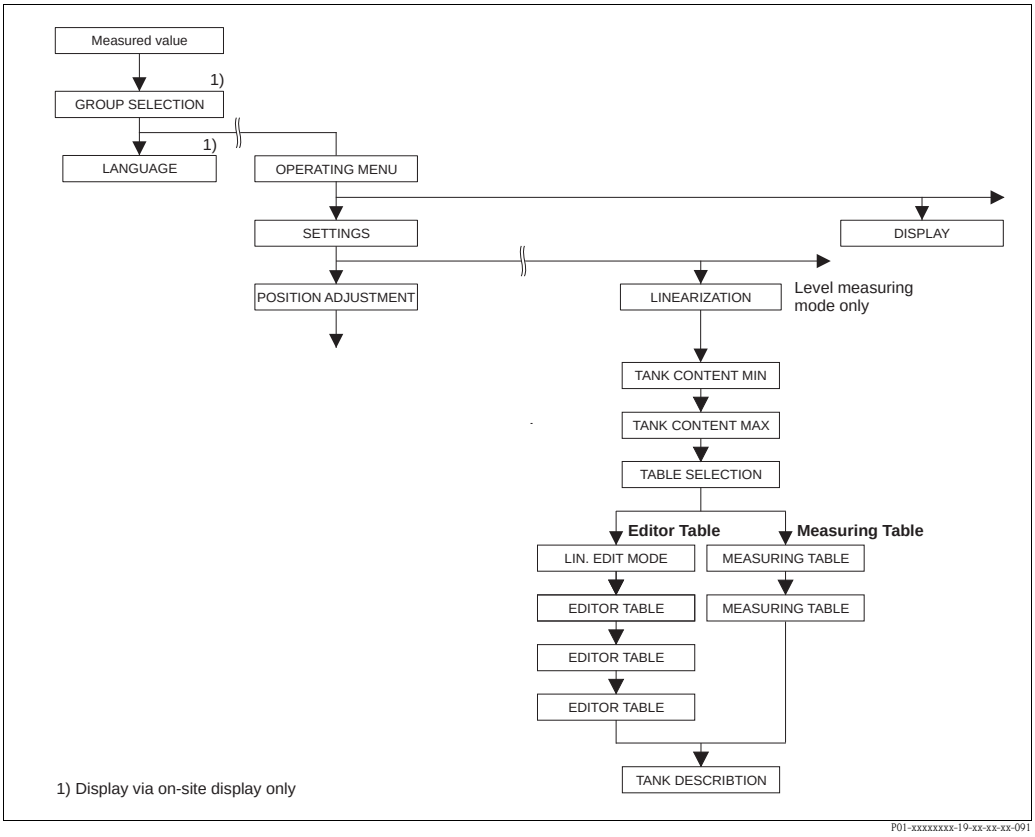

Fig. 38: LINEARISATION function group for on-site operation

Table 18: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – on-site operation	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Level (→ see also Page 45). ■ LEVEL MODE = Pressure Linearized or Height Linearized (→ see also Page 68). **Note:** – See also Page 14 ff, Section 5 "Level measurement".	

Table 18: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – on-site operation	
Parameter name	**Description**
TANK CONTENT MIN (759) Entry	Enter the minimum tank contents to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the minimum tank content to be expected, the more accurate the measurement result. ✎ Note! ■ If you enter a new value for TANK CONTENT MIN, the value for SET LRV is also changed. Use SET LRV to assign a %-value, volume value or mass value to the lower current value. If you want to assign the lower current value a value other than that for TANK CONTENT MIN, you must enter the desired value for SET LRV. (→ SET LRV, Page 98). ■ For the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear", the TANK CONTENT MIN parameter does not affect the SET LRV parameter. (→ SET LRV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 0.0
TANK CONTENT MAX (713) Entry	Enter the maximum tank contents to be expected. The input limits for the subsequent calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the maximum tank content to be expected, the more accurate the measurement result. ✎ Note! ■ If you enter a new value for TANK CONTENT MAX, the value for SET URV is also changed. Use SET URV to assign a %-value, volume value or mass value to the upper current value. If you want to assign the upper current value a value other than that for TANK CONTENT MAX, you must enter the desired value for SET URV. (→ SET URV, Page 98.) ■ For the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear", the TANK CONTENT MAX parameter does not affect the SET URV parameter. (→ SET URV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 100.0
TABLE SELECTION (808) Selection	Select table. The device works with a measuring and an editor table. The measuring table is used to calculate the measured value. To make sure measuring also runs properly when entering a new table, there is another table, the editor table, for entering new values. **Options:** ■ View meas. table ■ Editor table **Factory setting:** View meas. table
LIN. EDIT MODE (397) Selection	Select the entry mode for the linearisation table. **Prerequisite:** ■ TABLE SELECTION = Editor table **Options:** ■ Manual: the container neither has to be filled nor emptied for this entry mode. Enter the value pairs for the linearisation table. ■ Semiautomatic: the container is filled or emptied in stages in this entry mode. The device automatically records the hydrostatic pressure. The associated volume, mass or %-value is entered. **Factory setting:** Manual

Table 18: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – on-site operation	
Parameter name	**Description**
EDITOR TABLE (809) Selection	Select table. **Prerequisite:** ■ TABLE SELECTION = editor table **Options:** ■ New table: enter new linearisation table. ■ Edit measure table: The measuring table is loaded as an editor table so that changes can be made. → See also TAB. SELECTION ■ Continue edit: Edit an editor table that already exists. → See also TABLE EDITOR (770) **Factory setting:** New table
EDITOR TABLE Entry ("Semiautomatic" edit mode) – LINE-NUMB (549) – Y-VAL. (551)	Enter table in the "Semiautomatic" editing mode. A linearisation table must have at least 2 points and may not have more than 32 points. A point consists of LINE-NUMB, X-VAL. and Y-VAL. For this editing mode, the container is filled or emptied in stages. **Example:** Enter point for LEVEL MODE = Pressure Linearized – LINE-NUMB: confirm value displayed. – Y-VAL.: depending on the setting in the LINd. MEASURAND parameter, enter the volume, mass or % value. – X-VAL.: the hydrostatic pressure present is displayed and saved by confirming the Y-value. **Example:** Enter point for LEVEL MODE = Height Linearized – LINE-NUMB: confirm value displayed. – Y-VAL.: depending on the setting in the COMB. MEASURAND parameter, enter the volume, mass or % value. – X-VAL.: the hydrostatic pressure present is measured. Depending on the setting in the COMB. MEASURAND parameter, the measured pressure is converted to a level unit or a % and displayed. The value is saved by confirming the Y-value. **Factory setting:** LINE-NUMB = 1, X-VAL. = 0.0, Y-VAL. = 0.0
EDITOR TABLE Entry ("manual" edit mode) – LINE-NUMB (549) – Y-VAL. (551) – X-VAL. (550)	Enter table in the "manual" editing mode. A linearisation table must have at least 2 points and may not have more than 32 points. A point consists of a line number, X-value and Y-value. The container neither has to be filled nor emptied for this editing mode. **Example:** Enter point for LEVEL MODE = Pressure Linearized – LINE-NUMB: confirm value displayed. – X-VAL.: enter pressure value. – Y-VAL.: depending on the setting in the LINd. MEASURAND parameter, enter the related volume, mass or % value. **Example:** Enter point for LEVEL MODE = Height Linearized – LINE-NUMB: confirm value displayed. – X-VAL.: the hydrostatic pressure present is measured. Depending on the setting in the COMB. MEASURAND parameter, enter a level value or % value. – Y-VAL.: depending on the setting in the COMB. MEASURAND parameter, enter the related volume, mass or % value. **Factory setting:** LINE-NUMB = 1, X-VAL. = 0.0, Y-VAL. = 0.0

Table 18: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – on-site operation	
Parameter name	**Description**
EDITOR TABLE (770) Options	Select the function for the editor table. **Options:** ■ Next point: enter next point. ■ Last input point: jump back to previous point to correct a mistake for example. ■ Accept input table: save editor table as measuring table. This overwrites the old measuring table. ■ Abort: save values entered up to this point for the editor table and display next parameter. The editor table is not activated as a measuring table. ■ Insert point: see example below. ■ Delete point: the current point is deleted. See example below. **Example:** Add point, in this case between the 4th and 5th point for example – Select point 5 via the EDITOR TABLE/LINE NUMB parameter. – Confirm current X and Y values with Enter. – Using the TABLE EDITOR (770) parameter, select the option "Insert point". – Point 5 is displayed for the TABLE EDITOR/LINE NUMB parameter. New values for the X-VAL and Y-VAL parameters. **Example:** delete point, in this case the 5th point for example – Select point 5 via the EDITOR TABLE/LINE NUMB parameter. – Using the TABLE EDITOR (770) parameter, select the option "Delete point". – The 5th point is deleted. All of the following points are pushed up one number i.e. following deletion, the 6th point becomes Point 5. **Factory setting:** Next point
MEASURING TABLE (549) Display	A point of the linearisation table saved (measuring table) appears on the display The parameter first displays the first point of the linearisation table. By entering a line number, you can directly display the corresponding point in the linearisation table.
MEASURING TABLE (717) Selection	Select the function for the measuring table. **Options:** ■ Next point: view next point of the measuring table. ■ Last input point: view previous point of the measuring table. ■ Abort: cancel measuring table display. Display next parameter. **Factory setting:** Next point
TANK DESCRIPTION (815) Entry	Enter tank description. (max. 32 alphanumeric characters) **Factory setting:** _

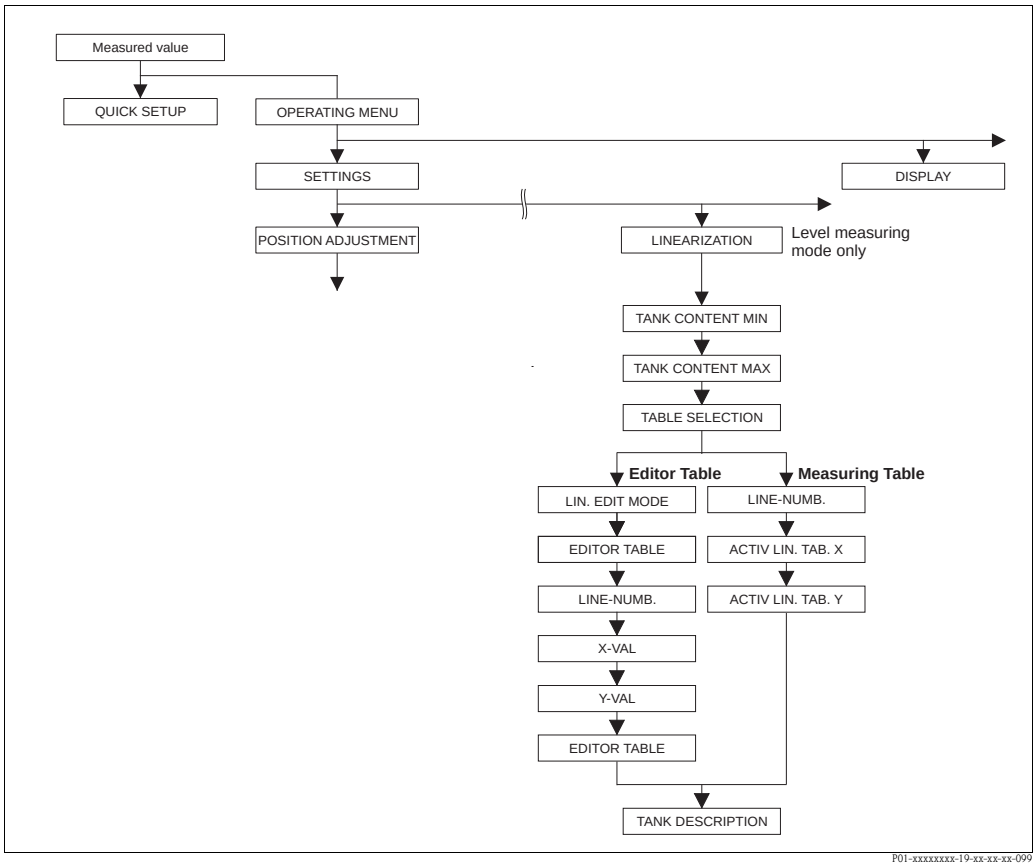

Fig. 39: LINEARISATION function group for digital communication

Table 19: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – Digital communication	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Level (→ see also Page 45). ■ LEVEL MODE = Pressure Linearized or Height Linearized (→ see also Page 68). **Note:** – See also Page 14 ff, Section 5 "Level measurement".	
TANK CONTENT MIN Entry	Enter the minimum tank contents to be expected. The input limits for the calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the minimum tank content to be expected, the more accurate the measurement result. Note! ■ If you enter a new value for TANK CONTENT MIN, the value for SET LRV is also changed. Use SET LRV to assign a %-value, volume value or mass value to the lower current value. If you want to assign the lower current value a value other than that for TANK CONTENT MIN, you must enter the desired value for SET LRV. (→ SET LRV, Page 98). ■ For the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear", the TANK CONTENT MIN parameter does not affect the SET LRV parameter. (→ SET LRV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 0.0

Table 19: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – Digital communication	
Parameter name	**Description**
TANK CONTENT MAX Entry	Enter the maximum tank contents to be expected. The input limits for the subsequent calibration (editing limits) are derived from the value entered. The closer the value entered corresponds to the maximum tank content to be expected, the more accurate the measurement result. ✎ Note! ■ If you enter a new value for TANK CONTENT MAX, the value for SET URV is also changed. Use SET URV to assign a %-value, volume value or mass value to the upper current value. If you want to assign the upper current value a value other than that for TANK CONTENT MAX, you must enter the desired value for SET URV. (→ SET URV, Page 98.) ■ For the setting LEVEL MODE "Height Linearized" and ASSIGN CURRENT "Linear", the TANK CONTENT MAX parameter does not affect the SET URV parameter. (→ SET URV, Page 98 and ASSIGN CURRENT, Page 113) **Factory setting:** 100.0
TABLE SELECTION Selection	Select table. The device works with a measuring and an editor table. The measuring table is used to calculate the measured value. To make sure measuring also runs properly when entering a new table, there is another table, the editor table, for entering new values. **Options:** ■ View meas. table ■ Editor table **Factory setting:** View meas. table
LIN. EDIT MODE Selection	Select the entry mode for the linearisation table. **Prerequisite:** ■ TABLE SELECTION = Editor table **Options:** ■ Manual: The container neither has to be filled nor emptied for this entry mode. Enter the value pairs for the linearisation table. ■ Semiautomatic: the container is filled or emptied in stages in this entry mode. The device automatically records the hydrostatic pressure. The associated volume, mass or %-value is entered. **Factory setting:** Manual
EDITOR TABLE Selection	Select table. **Prerequisite:** ■ TABLE SELECTION = Editor table **Options:** ■ New table: Enter new linearisation table. ■ View meas. table: View saved linearisation table and change points if necessary. ■ Continue edit: Edit a linearisation table that already exists. ✎ Note! Operating program: ■ If you select the "View meas. table" option, the saved measuring table is loaded in the operating priogram. Use the "Lin.-Tab." window to view the entire table, change values if necessary and write the modified table to the device. ■ If you change a value via the X-VAL. or Y-VAL. parameters, the table in the "Lin.-Tab." window is not updated. To view the table saved in the device, this table must first be read out of the device. **Factory setting:** New table

Table 19: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – Digital communication	
Parameter name	**Description**
LINE-NUMB Entry	Enter the line number for the linearisation table. A linearisation table must have at least 2 points and may not have more than 32 points. ■ TABLE SELECTION = View meas. table Via this parameter you can select the point of the linearisation table which should be displayed. ■ TABLE SELECTION = Editor table Enter a point via the LINE-NUMB, X-VAL. and Y-VAL. parameters. → See also this table, parameter description for LIN. EDIT MODE, X-VAL. ("Manual" entry mode), X-VAL. ("Semiautomatic" entry mode) and Y-VAL. ✎ Note! In the operating program, you can enter a complete linearisation table in one go via the "Lin.-Tab." window.
X-VAL. ("Manual" entry mode) Entry	Enter the pressure value for the linearisation table. → See also LIN. EDIT MODE, LINE-NUMB and Y-VAL. **Prerequisite:** ■ TABLE SELECTION = Editor table
X-VAL. ("Semiautomatic" entry mode) Display	In the "Semiautomatic" entry mode, the container is filled or emptied in stages. The X-VAL. displays the measured hydrostatic pressure. **Prerequisite:** ■ TABLE SELECTION = Editor table **Operating program** The X-VAL. is saved by confirming the Y-value. **HART Handheld** Confirm X-VAL. displayed. → See also LIN. EDIT MODE, LINE-NUMB and Y-VAL.
Y-VAL. Entry	Enter the volume, mass or %-value belonging to the X-VAL. for the linearisation table. **Prerequisite:** ■ TABLE SELECTION = Editor table Depending on the setting in the LINd. MEASURAND or COMB. MEASURAND parameters, enter a volume, mass or %-value here. → See also this table, parameter description for LIN. EDIT MODE, LINE-NUMB, X-VAL. ("Manual" entry mode), X-VAL. ("Semiautomatic" entry mode).
EDITOR TABLE Options	Select the function for the editor table. **Prerequisite:** ■ TABLE SELECTION = Editor table **Options:** ■ Next point: without function ■ Last input point: without function ■ Accept input table: save editor table as measuring table. This overwrites the old measuring table. ■ Abort: save values entered up to this point for the editor table and display next parameter. The editor table is not activated as a measuring table. ■ Insert point: see example below. ■ Delete point: the current point is deleted. See example below. **Example:** Add point, in this case between the 4th and 5th point for example – Select point 5 via the LINE NUMB parameter. – Using the TABLE EDITOR parameter, select the option "Insert point". – Point 5 is displayed for the LINE NUMB parameter. New values for the X-VAL and Y-VAL parameters. **Example:** delete point, in this case the 5th point for example – Select point 5 via the LINE NUMB parameter. – Using the TABLE EDITOR parameter, select the option "Delete point". – The 5th point is deleted. All of the following points are pushed up one number i.e. following deletion, the 6th point becomes Point 5. **Factory setting:** Next point

Table 19: (GROUP SELECTION →) OPERATING MENU → SETTINGS → LINEARISATION – Digital communication	
Parameter name	**Description**
ACTIV LIN. TAB. X Display	An X-value of the linearisation table already saved appears on the display You can select a point of the linearisation table via the LINE-NUMB parameter. **Prerequisite:** ■ TABLE SELECTION = View meas. table ✎ Note! In the operating program, you can view the entire saved table in the "Tables" window.
ACTIV LIN. TAB. Y Display	A Y-value of the linearisation table already saved appears on the display You can select a point of the linearisation table via the LINE-NUMB parameter. **Prerequisite:** ■ TABLE SELECTION = View meas. table ✎ Note! In the operating program, you can view the entire saved table in the "Tables" window.
TANK DESCRIPTION Entry	Enter tank description. (max. 32 alphanumeric characters) **Factory setting:** _

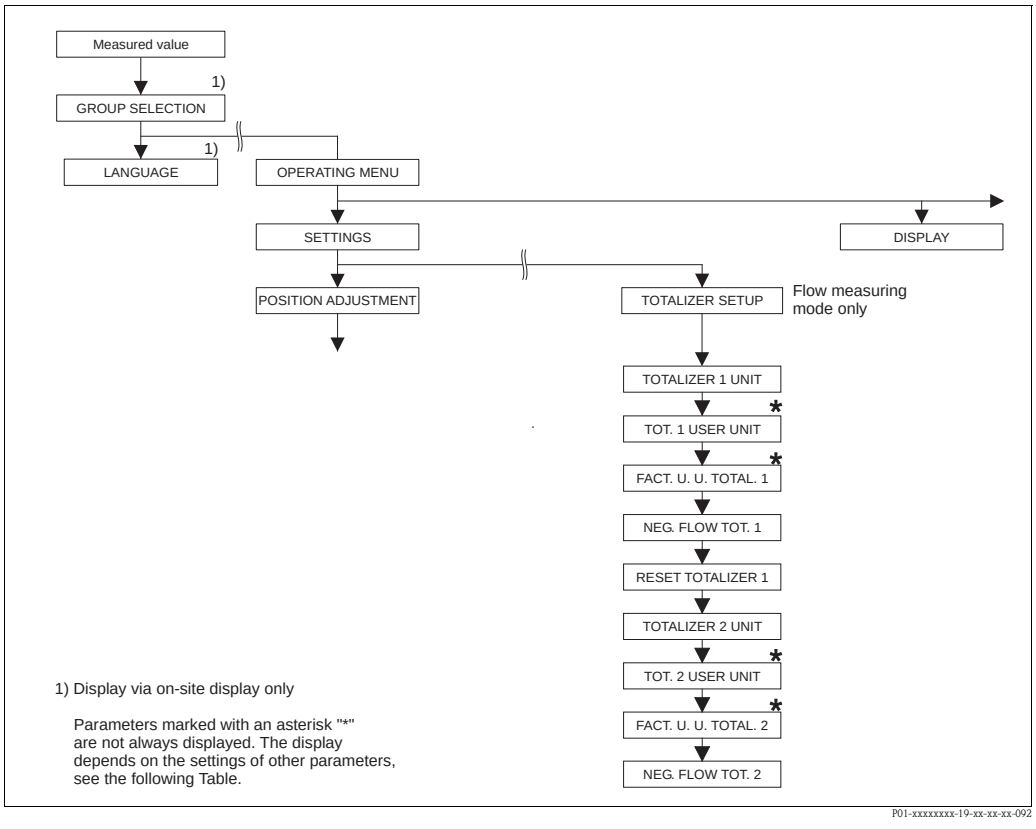

Fig. 40: TOTALIZER SETUP function group

Table 20: (GROUP SELECTION →) OPERATING MENU → SETTINGS → TOTALIZER SETUP	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Flow (→ see also Page 45). **Note:** ■ See also Page 40 ff, Section 6 "Flow measurement".	

Table 20: (GROUP SELECTION →) OPERATING MENU → SETTINGS → TOTALIZER SETUP	
Parameter name	**Description**
TOTALIZER 1 UNIT (398), (666), (664), (662) Selection	Select unit for totalizer 1. Depending on the setting in the FLOW-MEAS. TYPE parameter (→ Page 93) this parameter offers a list of volume, norm volume, standard volume and mass units. When a new volume or mass unit is selected, totalizer-specific parameters are converted and displayed with the new unit within a unit group. When the flow mode is changed, the totalizer value is not converted. The 3-digit ID number on the on-site display depends on the FLOW-MEAS. TYPE selected: – (398): FLOW-MEAS. TYPE "Volume p. cond." – (662): FLOW-MEAS. TYPE "Mass" – (664): FLOW-MEAS. TYPE "Gas. std. cond." – (666): FLOW-MEAS. TYPE "Gas. norm conditions" **Factory setting:** m^3
TOT. 1 USER UNIT (627) Entry	Enter text (unit) for customer-specific unit for totalizer 1. You can enter a maximum of eight alphanumeric characters here. → See also FACT. U. U. TOTAL. 1. **Prerequisite:** ■ TOTALIZER 1 UNIT = User unit ✎ Note! Only the first five characters are shown on the on-site display. For example, if "crates" is specified as the customer-specific unit, "crate" is displayed. If the unit contains a slash, up to eight characters can be shown on the on-site display. The maximum number of characters in the counter is again limited to five. For example, if "crates/m2" is specified as the customer-specific unit, "crate/m2" is displayed. In the FieldCare, all eight characters are displayed. In the HART handheld terminal, the customer-specific unit is only displayed in the TOT. 1 USER UNIT parameter. The measured value is displayed with the additional text "User Unit". **Factory setting:** _ _ _ _ _ _ _ _
FACT. U. U. TOTAL. 1 (329) Entry	Enter conversion factor for a customer-specific unit for totalizer 1. The conversion factor must be entered in relation to an appropriate SI unit, e.g. m^3 for the "Volume p. cond." FLOW-MEAS. TYPE. → See also TOT. 1 USER UNIT. **Prerequisite:** ■ TOTALIZER 1 UNIT = User unit **Example:** You want the measured value to be displayed in "buckets". – MEASURED VALUE =1 m3 ≙ 100 buckets – Entry TOT. 1 USER UNIT: bucket – Entry FACT. U. U. TOTAL. 1: 100 – Result: MEASURED VALUE = 100 buckets **Factory setting:** 1.0
NEG. FLOW TOT. 1 (400) Selection	Specify way of counting negative flows for totalizer 1.  **Factory setting:** Inc. on neg. flow

Table 20: (GROUP SELECTION →) OPERATING MENU → SETTINGS → TOTALIZER SETUP	
Parameter name	**Description**
RESET TOTALIZER1 (331) Selection	You reset totalizer 1 to zero with this parameter. **Options:** ■ Abort (do not reset) ■ Reset **Factory setting:** Abort
TOTALIZER 2 UNIT (399), (663), (665), (667) Selection	Select unit for totalizer 2. → See also TOTAL 1. ENG. UNIT. The 3-digit ID number on the on-site display depends on the FLOW-MEAS. TYPE selected: – (399): FLOW-MEAS. TYPE "Volume p. cond." – (663): FLOW-MEAS. TYPE "Mass" – (665): FLOW-MEAS. TYPE "Gas. std. cond." – (667): FLOW-MEAS. TYPE "Gas. norm conditions" **Factory setting:** m^3
TOT. 2 USER UNIT (628) Entry	Enter text (unit) for customer-specific unit for totalizer 2. → See also TOT. 1 USER UNIT. **Prerequisite:** ■ TOTALIZER 2 UNIT = User unit **Factory setting:** _ _ _ _ _ _ _ _
FACT. U. U. TOTAL. 2 (330) Selection	Enter conversion factor for a customer-specific unit for totalizer 2. → See also FACT. U. U. TOTAL. 1. **Prerequisite:** ■ TOTALIZER 2 UNIT = User unit **Factory setting:** 1.0
NEG. FLOW TOT. 2 (416) Selection	Specify way of counting negative flows for totalizer 2. → See NEG. FLOW TOT. 1. **Factory setting:** Positive

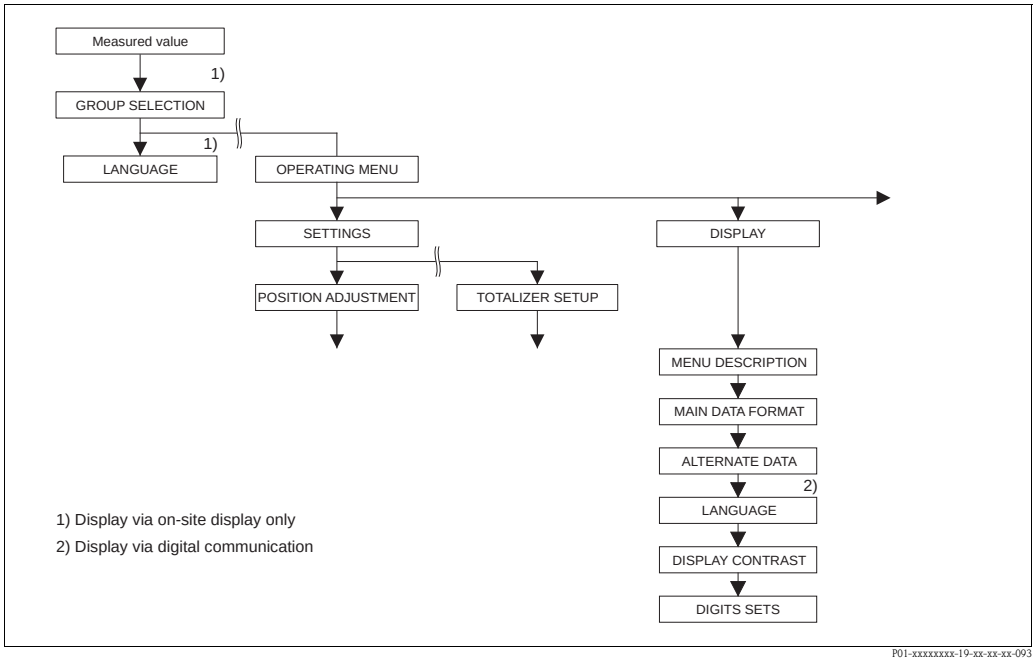

Fig. 41: DISPLAY group

Table 21: (GROUP SELECTION →) OPERATING MENU → DISPLAY	
Parameter name	**Description**
MENU DESCRIPTOR (419) Selection	Specify contents for the main line of the on-site display in the measuring mode. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.1 "On-site display". **Options:** ■ Main measured value (PV) ■ Main measured value (%) ■ Pressure ■ Flow ■ Level ■ Tank content ■ Current ■ Temperature ■ Error number ■ Totalizer 1 ■ Totalizer 2 The selection depends on the measuring mode chosen. **Factory setting:** Main measured value (PV)
MAIN DATA FORMAT (688) Selection	Specifies the number of places after the decimal point for the value displayed in the main line. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or (BA00332P) Deltapilot S, Section 5.1 "On-site display". **Options:** ■ Auto ■ x.x ■ x.xx ■ x.xxx ■ x.xxxx ■ x.xxxxx **Factory setting:** Auto
ALTERNATE DATA (423) Selection	Switch on "Alternating display" mode. In this display mode, the on-site display alternates between the following measured values depending on the measuring mode selected. – Pressure: Main measured value (PV), Pressure, Temperature and Current – Level Standard: Main measured value (PV), Pressure, Level, Tank content, Temperature and Current – Level Easy: Main measured value (PV), Pressure, Temperature and Current – Flow: Main measured value (PV), Pressure, Flow, Temperature, Current, Totalizer 1 and Totalizer 2 **Options:** ■ Off ■ On **Factory setting:** Off
LANGUAGE Selection	Select the menu language for the on-site display. ✎ Note! ■ For on-site operation, the LANGUAGE parameter is arranged directly under GROUP SELECTION (menu path: GROUP SELECTION → LANGUAGE, see also Page 44). ■ Select the menu language for FieldCare via the "Options" menu → "Settings" → "Language" tab → "Tool language" field. **Factory setting**: English

Table 21: (GROUP SELECTION →) OPERATING MENU → DISPLAY	
Parameter name	**Description**
DISPLAY CONTRAST (339) Entry	Adjust contrast of on-site display. You specify the contrast of the display with a number. Changes are only accepted as single steps, i.e. to change the value from "8" to "4", you need to save four times. You can also adjust the contrast of the display by means of the keys on the electronic insert or at the device. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.2.3 "Function of operating keys". **Input range:** 4...13, 4: contrast weaker (brighter), 13: contrast stronger (darker). **Factory setting:** 8
DIGITS SETS (840) Display	This parameter is used to check the correct display of characters and digits on the user interface. If the characters and digits are displayed correctly, this parameter displays the string "0123456789.-".

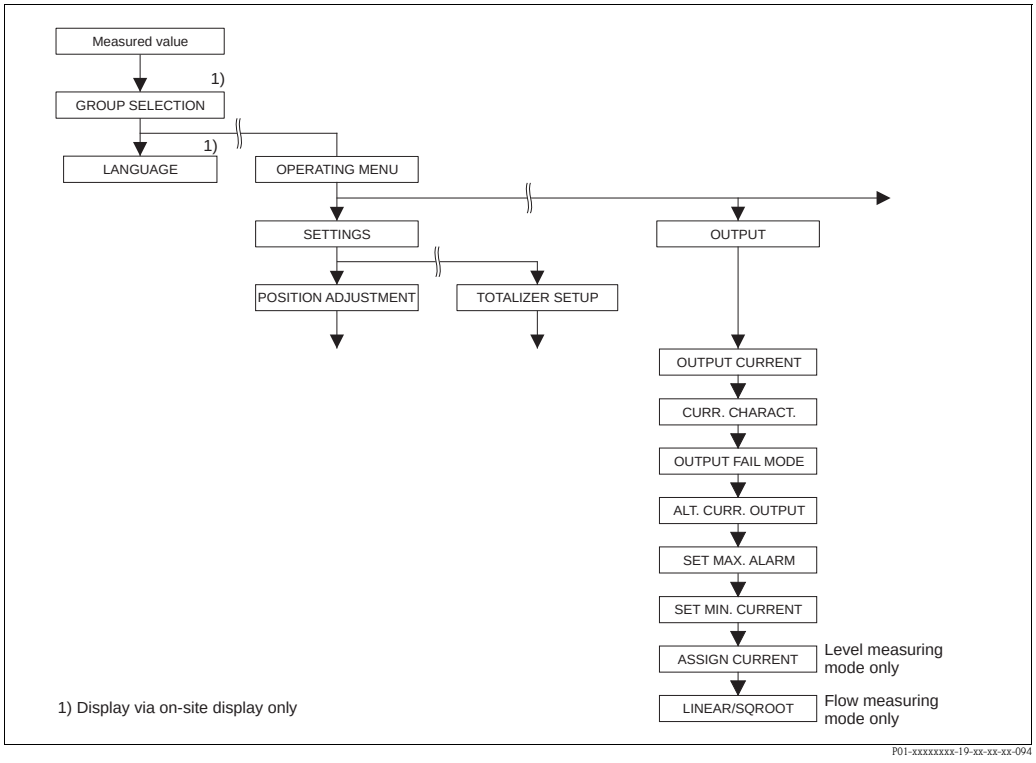

Fig. 42: OUTPUT group

Table 22: (GROUP SELECTION →) OPERATING MENU → OUTPUT	
Parameter name	**Description**
OUTPUT CURRENT (254) Display	Displays the current current value.

Table 22: (GROUP SELECTION →) OPERATING MENU → OUTPUT	
Parameter name	**Description**
CURR. CHARACT. (694), (695), (696), (764) Selection	Select curve of current output. **Options:**  *Fig. 43: Illustration of current output curves* *1 Linear: lower range value = 4 mA, upper range value = 20 mA* *2 Bi-linear: lower range value = 4 mA, centre or zero = 20 mA, upper range value = 4 mA* *3 Linear inverse: lower range value = 20 mA, upper range value = 4 mA* *4 Bi-linear inverse: lower range value = 20 mA, centre or zero = 4 mA, upper range value = 20 mA* *LRV Lower range value* *URV Upper range value* *I Current* *X Measured value (Pressure/Level/Flow)* *The "CURR. CHARACT." function refers to the operating mode previously selected.* The 3-digit ID number on the on-site display depends on the MEASURING MODE selected: – (694): MEASURING MODE "Pressure" or MEASURING MODE "Flow" with the setting for LINEAR/SQROOT "Differential pres. – (695): MEASURING MODE "Flow" with the setting LINEAR/SQROOT "Flow (square root)" – (696): MEASURING MODE "Level", LEVEL MODE "Linear" or "Pressure Linearized" and LEVEL MODE "Height Linearized" with the setting for ASSIGN CURRENT "Level" – (764): MEASURING MODE "Level", LEVEL MODE "Height Linearized" with the setting for ASSIGN CURRENT "Tank content" **Factory setting:** Linear
OUTPUT FAIL MODE (388) Entry	Select the current value in the event of an alarm. In the event of an alarm, the current and the bargraph assume the current value specified with this parameter. **Options:** ■ Max. alarm (110%): can be set between 21...23 mA ■ Hold meas. value: last measured value is kept. ■ Min. alarm (–10%): 3.6 mA → See also this table SET MAX. ALARM and Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 8.2.1. "Setting current output for alarm". **Factory setting:** Max. alarm 110% (22 mA)

Table 22: (GROUP SELECTION →) OPERATING MENU → OUTPUT	
Parameter name	**Description**
ALT. CURR. OUTPUT (597) Selection	Set current output if sensor limits undershot or overshot. **Options:** ■ Normal: the current output assumes the value set via the OUTPUT FAIL MODE and SET MAX. ALARM parameters. ■ Special: – Lower sensor limit undershot (E120): Current output = 3.6 mA – Upper sensor limit overshot (E115): current output assumes the value set via the SET MAX. ALARM parameter. Attention : when using the case "special", the behavior is limited to an over/ underpressure in a range LRL -10%, URL +10%. **Factory setting:** Normal
SET MAX. ALARM (342) Entry	Enter current value for maximum alarm current. → See also OUTPUT FAIL MODE. **Input range:** 21...23 mA **Factory setting:** 22 mA
SET MIN. CURRENT (343) Entry	Enter lower current limit. Some switching units sometimes do not accept currents less than 4.0 mA. **Options:** ■ 3.8 mA ■ 4.0 mA **Factory setting:** 3.8 mA
ASSIGN CURRENT (760) Selection	Specify current signal for the "Level" measuring mode. See also SET LRV (→ Page 98) and SET URV (→ Page 98). **Prerequisite:** ■ MEASURING MODE = Level, LEVEL MODE = Height Linearized **Options:** ■ Height ■ Tank content **Factory setting:** Tank content
LINEAR/SQROOT (390) Selection	Specify current signal for the "Flow" measuring mode. See also SET LRV (→ Page 99) and SET URV (→ Page 100). **Prerequisite:** ■ MEASURING MODE = Flow **Options:** ■ Differential pres.: the linear pressure signal is used for the current output. ■ Flow (square root): the root flow signal is used for the current output. The "Flow (square root)" current signal is indicated on the on-site display with a root symbol. **Factory setting:** Flow (square root)

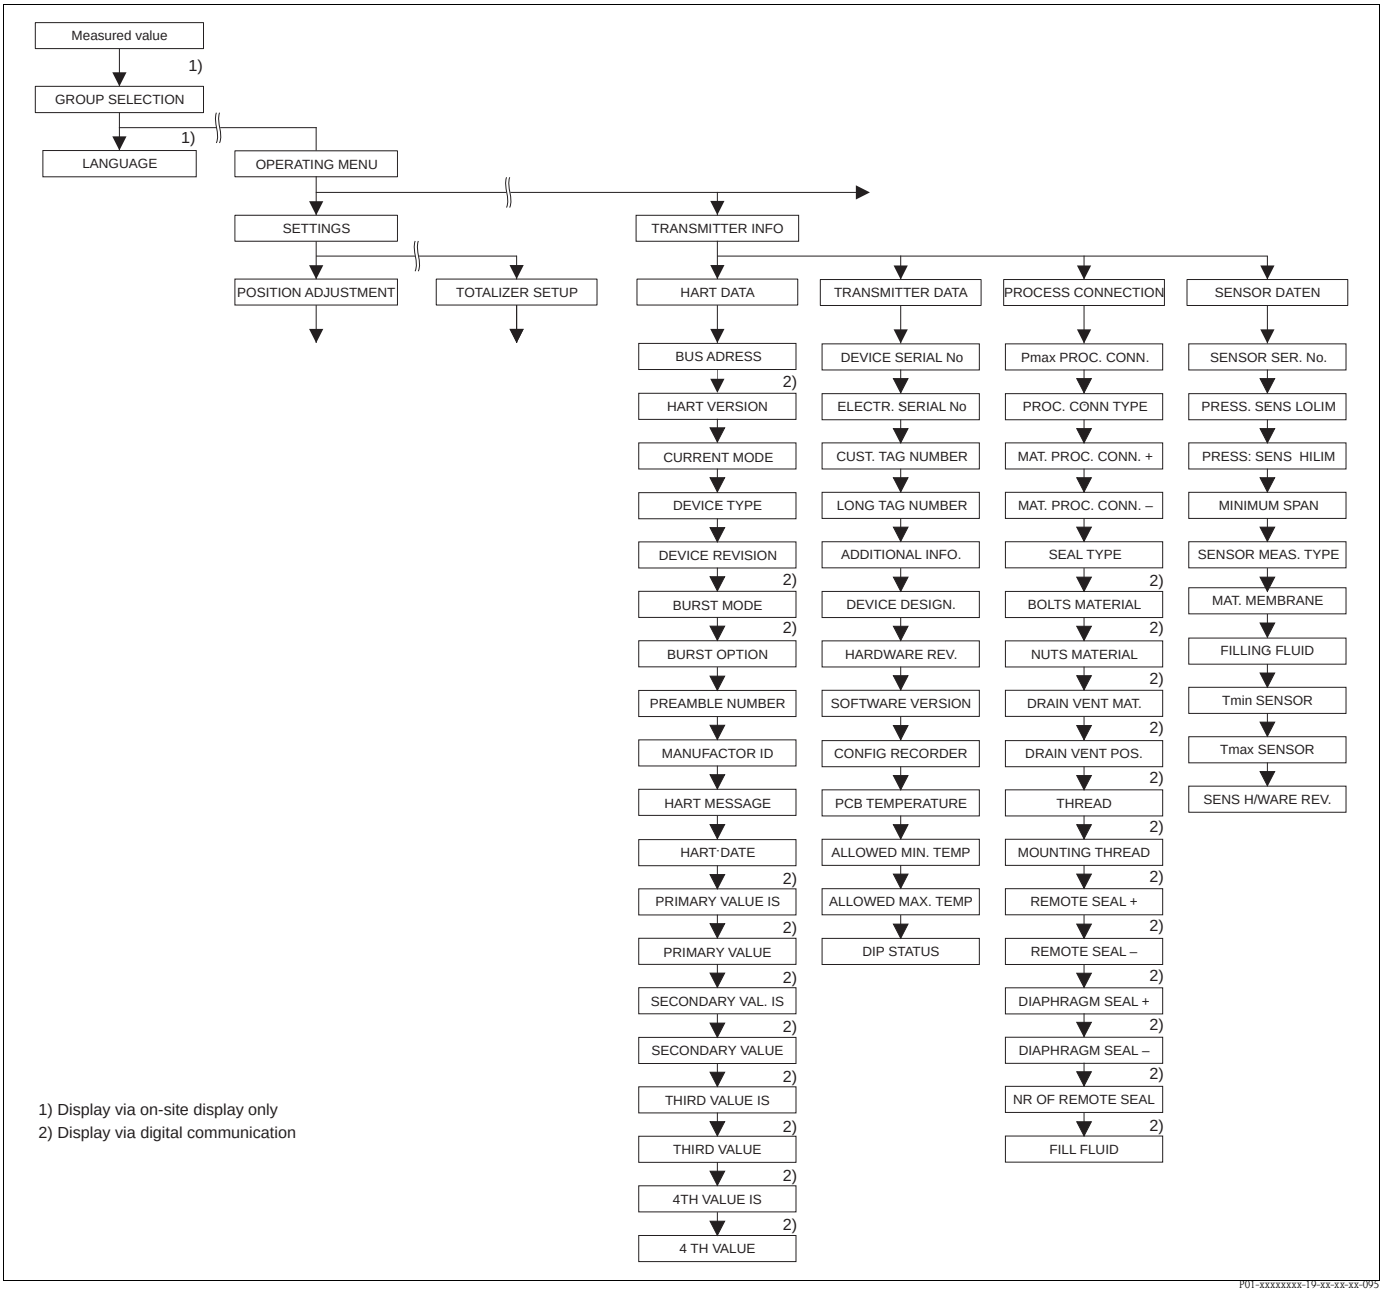

Fig. 44: TRANSMITTER INFO group
→ For the HART DATA function group, see Page 114, Table 23
→ For the TRANSMITTER DATA function group, see Page 117, Table 24
→ For the PROCESS CONNECTION function group, see Page 117, Table 25
→ For the SENSOR DATA function group, see Page 119, Table 26

Table 23: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → HART DATA	
Parameter name	**Description**
HART VERSION (585) Display	Displays the HART Version.

Table 23: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → HART DATA	
Parameter name	**Description**
CURRENT MODE (052) Selection	Set the current mode for HART communication. **Selection via on-site display and FieldCare:** ■ Signaling Measured value transmission by the current value ■ Fixed Fixed current 4.0 mA (multidrop mode) (Measured value transmission only via HART digital communication) **Factory setting:** Signaling **Selection via HART Handheld Terminal:** ■ enabled Measured value transmission by the current value ■ disabled Fixed current 4.0 mA (multidrop mode) (Measured value transmission only via HART digital communication) **Factory setting:** enabled
BUS ADDRESS (345) Entry	Enter the address for the exchange of data with the HART protocol. (HART 5.0: range 0 to 15, wherein if the address = 0 this produces the "Signaling" setting; HART 6.0/7.0: range 0 to 63) **Factory setting:** 0
DEVICE TYPE (351) Display	Displays the device type in decimal numerical format, here Deltabar S: 23 The extended device type is a composition of the manufacturer number (17) and the device type (23). **Prerequisite:** ■ Deltabar S differential pressure transmitter
DEVICE TYPE (802) Display	Displays the device type in decimal numerical format, here Cerabar S: 24 The extended device type is a composition of the manufacturer number (17) and the device type (24). **Prerequisite:** ■ Pressure transmitter Cerabar S
DEVICE TYPE (002) Display	Displays the device type in decimal numerical format, here Deltapilot S: 26 The extended device type is a composition of the manufacturer number (17) and the device type (26). **Prerequisite:** ■ Pressure transmitter Deltapilot S
DEVICE REVISION (699) Display	Displays the device revision
BURST MODE Selection	Switches "Burst Mode" function on and off. **Selection:** ■ On ■ Off **Prerequisite:** ■ Digital communication
BURST OPTION Entry	Use this parameter to specify which command is sent to the master. **Voraussetzung:** ■ Digital communication **Factory setting:** 3 (HART commando 3)
PREAMBLE NUMBER (036) Entry	Enter the number of preambles in the HART protocol. (Synchronisation of the modem modules along a transmission path, each modem module could "swallow" a byte – at least 2 bytes must arrive.) **Input range:** 2...20 **Factory setting:** 5

Table 23: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → HART DATA	
Parameter name	**Description**
MANUFACTOR ID (432) Display	Displays the manufacturer number in a decimal numerical format. Here: 17 Endress+Hauser
HART MESSAGE (271) Entry	Enter message (max. 32 alphanumeric characters). On command from the master, this message is sent via the HART protocol. **Factory setting:** _ or as per order specifications
HART DATE (481) Entry	Enter the date of the last configuration change. **Factory setting:** DD.MM.YY (date of final test)
PRIMARY VALUE IS Display	This parameter displays the following measured value depending on the measuring mode selected: – Measuring mode "Pressure": PRESSURE – "Level" measuring mode, "Linear" or "Pressure Linearized" level type: LEVEL BEFORE LIN – Measuring mode "Level", level type "Height Linearized": TANK CONTENT – Measuring mode "Flow": SUPPRESSED FLOW → See also PRIMARY VALUE. **Prerequisite:** ■ Digital communication
PRIMARY VALUE Display	Displays the primary value. → See also PRIMARY VALUE IS. **Prerequisite:** ■ Digital communication
SECONDARY VAL. IS	Select second process value. You can choose between the following process values depending on the measuring mode selected: – PRESSURE – CORRECTED PRESS. – SENSOR PRESSURE – SENSOR TEMP. – PCB TEMPERATURE – SUPPRESSED FLOW – TOTALIZER 1 – TOTALIZER 2 – LEVEL BEFORE LIN – TANK CONTENT **Prerequisite:** ■ Digital communication
SECONDARY VALUE	Display second process value. → See also SECONDARY VAL. IS. **Prerequisite:** ■ Digital communication
THIRD VALUE IS	Select third process value. → See also SECONDARY VAL. IS. **Prerequisite:** ■ Digital communication
THIRD VALUE	Display third process value. → See also SECONDARY VAL. IS. **Prerequisite:** ■ Digital communication
4TH VALUE IS	Select fourth process value. → See also SECONDARY VAL. IS. **Prerequisite:** ■ Digital communication
4TH VALUE	Display fourth process value. → See also SECONDARY VAL. IS. **Prerequisite:** ■ Digital communication

Table 24: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → TRANSMITTER DATA	
Parameter name	**Description**
DEVICE SERIAL No (354) Display	Displays the serial number of the device (11 alphanumeric characters).
ELECTR. SERIAL No (386) Display	Displays the serial number of the main electronics (11 alphanumeric characters).
CUST. TAG NUMBER (055) Entry	Enter TAG number (max. 8 alphanumeric characters). **Factory setting:** _ _ _ _ _ _ _ _ or as per order specifications
LONG TAG NUMBER (305) Entry	Enter TAG number (max. 32 alphanumeric characters). **Factory setting:** _ or as per order specifications
ADDITIONAL INFO. (272) Entry	Enter tag description (max. 16 alphanumeric characters). **Factory setting:** _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ or as per order specifications
DEVICE DESIGN. (350) Display	Displays the device designation and order code.
HARDWARE REV. (266) Display	Displays the revision number of the main electronics e.g.: V02.00
SOFTWARE VERSION (264) Display	Displays the software version e.g.: V02.10
CONFIG RECORDER (352) Display	Displays the configuration counter. This counter is increased by one with each change to a parameter or group. The counter counts to 65535 and then starts again at zero. Changes in the parameters of the DISPLAY function group do not increase the counter.
PCB TEMPERATURE (357) Display	Displays the measured temperature of the main electronics.
ALLOWED MIN. TEMP (358) Display	Displays the lower temperature limit of the main electronics.
ALLOWED MAX. TEMP (359) Display	Displays the upper temperature limit of the main electronics.
DIP STATUS (363) Display	Displays the status of DIP switch 1 on the electronic insert. You can lock or unlock parameters relevant to the measured value with DIP switch 1. If operation is locked by means of the INSERT PIN No. parameter, you can only unlock operation again by means of this parameter. (→ INSERT PIN NO, see Page 126.) → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.9 "Locking/unlocking operation". **Display:** ■ On (locking switched on) ■ Off (locking switched off) **Factory setting:** Off (locking switched off)

Table 25: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → PROCESS CONNECTION	
Parameter name	**Description**
Pmax PROC. CONN. (570) Entry	For entering and displaying the maximum permitted pressure of the process connection. **Factory setting:** In accordance with nameplate data (→ see also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 2.1.1 nameplate)

Table 25: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → PROCESS CONNECTION	
Parameter name	**Description**
PROC. CONN. TYPE (482) Selection	For selecting and displaying the process connection type. **Options:** ■ Not used ■ Unknown ■ Special ■ Oval flange ■ Thread female ■ Thread male ■ Flange ■ Remote seal
MAT. PROC. CONN. + (360) Selection	For selecting and displaying the material of the process connection (P+). → See also parameter description for MAT. PROC. CONN. - **Options:** ■ Not used ■ Unknown ■ Special ■ Steel ■ 304 st. steel ■ 316 st. steel ■ Alloy C ■ Monel ■ Tantalum ■ Titanium ■ PTFE (Teflon) ■ 316L st. steel ■ PVC ■ Inconel ■ PVDF ■ ECTFE **Factory setting:** As per order specifications
MAT. PROC. CONN. - (361) Selection	For selecting and displaying the material of the process connection (P–). → See also parameter description for MAT. PROC. CONN. + **Prerequisite:** ■ Deltabar S differential pressure transmitter
SEAL TYPE (362) Selection	For selecting and displaying the material of the process seal. **Options:** ■ Not used ■ Unknown ■ Special ■ FKM Viton ■ NBR ■ EPDM ■ Urethane ■ IIR ■ Kalrez ■ FKM Viton oxyg ■ CR ■ MVQ ■ PTFE glass ■ PTFE graphite ■ PTFE oxygen ■ Copper ■ Copper f. oxygen **Factory setting:** As per order specifications
BOLTS MATERIAL	For selecting and displaying the material of the bolts. **Prerequisite:** ■ Digital communication

Table 25: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → PROCESS CONNECTION	
Parameter name	**Description**
NUTS MATERIAL	For selecting and displaying the material of the nuts. **Prerequisite:** ■ Digital communication
DRAIN VENT MAT.	For selecting and displaying the material of the vent valves. **Prerequisite:** ■ Digital communication
DRAIN VENT POS.	For selecting and displaying the position of the vent valves. **Prerequisite:** ■ Digital communication
THREAD	For selecting and displaying the process connection thread. **Prerequisite:** ■ Digital communication
MOUNTING THREAD	For selecting and displaying the ways of securing the device. **Prerequisite:** ■ Digital communication
REMOTE SEAL +	For selecting and displaying the diaphragm seal type on the positive side. **Prerequisite:** ■ Digital communication
REMOTE SEAL –	For selecting and displaying the diaphragm seal type on the negative side. **Prerequisite:** ■ Digital communication
DIAPHRAG. MAT. +	For selecting and displaying the material of the process isolating diaphragm on the positive side. **Prerequisite:** ■ Digital communication
DIAPHRAG. MAT. –	For selecting and displaying the material of the process isolating diaphragm on the negative side. **Prerequisite:** ■ Digital communication
NR OF REMOTE SEAL	For selecting and displaying the number of diaphragm seals. **Prerequisite:** ■ Digital communication
FILL FLUID	For selecting and displaying the diaphragm seal fill fluid. **Prerequisite:** ■ Digital communication

Table 26: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → SENSOR DATA (all measuring modes)	
Parameter name	**Description**
SENSOR SER. No. (250) Display	Displays the serial number of the sensor (11 alphanumeric characters).
PRESS. SENS LOLIM (484) Display	Displays the lower measuring limit of the sensor.
PRESS. SENS HILIM (485) Display	Displays the upper measuring limit of the sensor.
MINIMUM SPAN (591) Display	Displays the smallest possible span.

Table 26: (GROUP SELECTION →) OPERATING MENU → TRANSMITTER INFO → SENSOR DATA (all measuring modes)	
Parameter name	**Description**
SENSOR MEAS.TYPE (581) Display	Displays the sensor type. ■ Deltabar S = differential ■ Cerabar S with gauge pressure sensor = relative ■ Cerabar S with absolute pressure sensor = absolute ■ Deltapilot S = relative
Pmin SENS. DAMAGE (251) Display	Displays the minimum permissible absolute pressure of the sensor (vacuum-proofing).
Pmax SENS. DAMAGE (252) Display	Displays the maximum permissible absolute pressure of the sensor (overpressure-proofing).
MAT. MEMBRANE (365) Display	Displays the material of the process isolating diaphragm. **Factory setting:** As per version in the order code → For Deltabar S, see Technical Information TI00382P, for Cerabar S, see Technical Information TI00383P or for Deltapilot S, see Technical Information TI00416P, "Ordering information" section.
FILLING FLUID (366) Display	Displays the filling fluid.
Tmin SENSOR (368) Display	Displays the lower nominal temperature limit of the sensor.
Tmax SENSOR (369) Display	Displays the upper nominal temperature limit of the sensor.
SENS H/WARE REV (487) Display	Displays the revision number of the sensor hardware. e.g.: 1

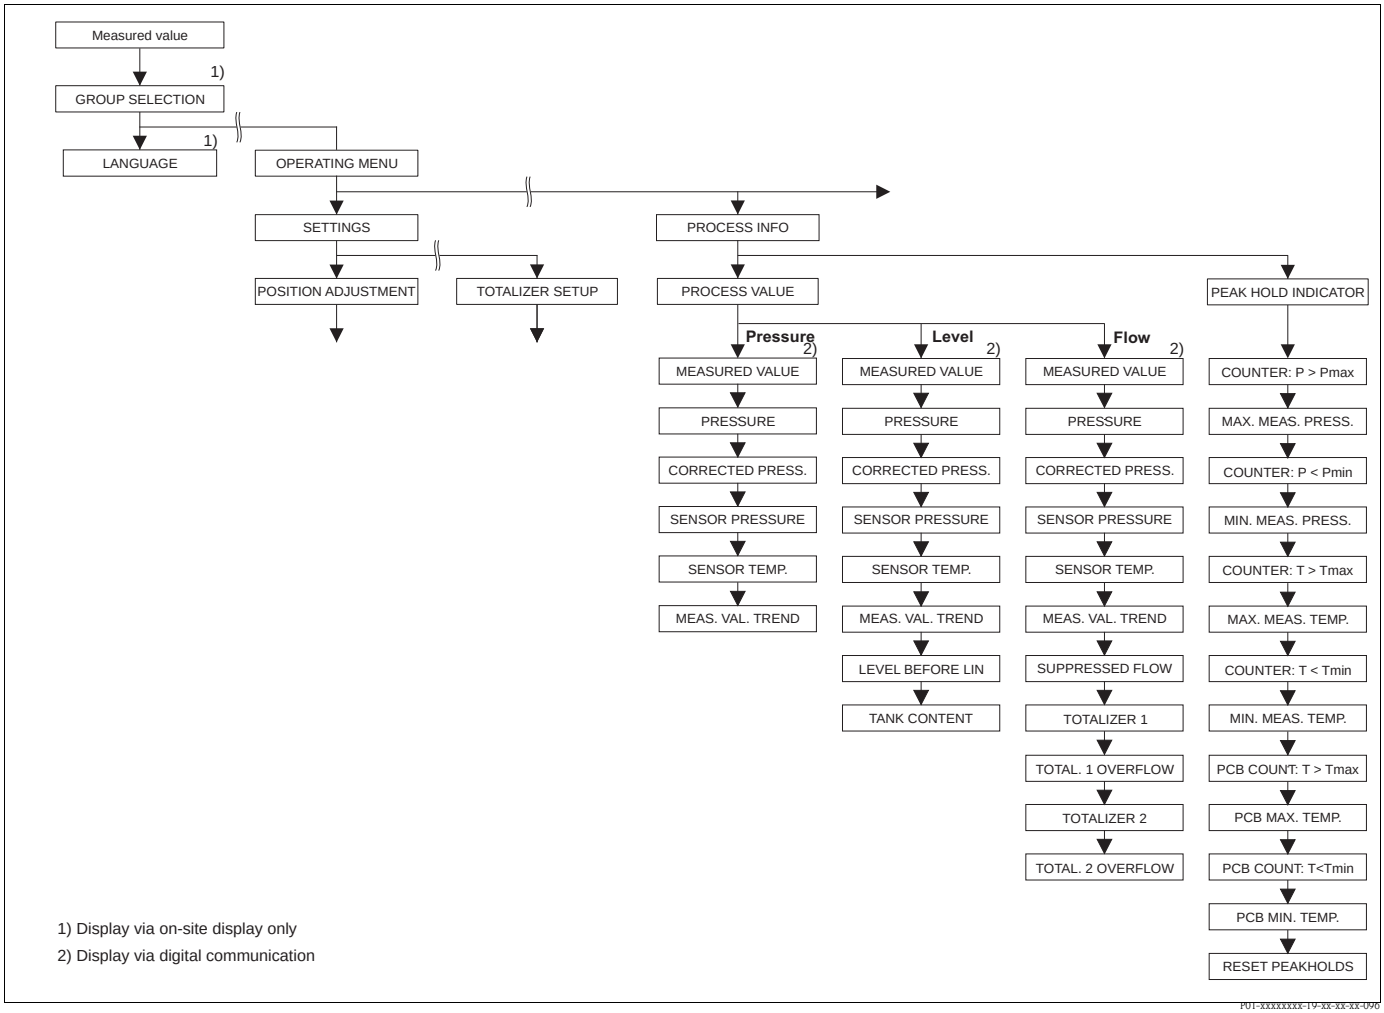

Fig. 45: PROCESSINFO group
→ For the PROCESS VALUES function group, "Pressure" measuring mode, see Page 121, Table 27
→ For the PROCESS VALUES function group, "Level" measuring mode, see Page 122, Table 28
→ For the PROCESS VALUES function group, "Flow" measuring mode, see Page 123, Table 29
→ For the PEAK HOLD INDICATOR function group, see Page 124, Table 30

Table 27: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Pressure"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = pressure (→ see also Page 45).	
MEASURED VALUE (679)	Displays the measured value In the "Pressure" measuring mode, this value corresponds to the PRESSURE parameter. **Prerequisite:** ■ Digital communication **On-site operation:** ■ For on-site operation, the MEASURED VALUE parameter is displayed on the 1st level.

Table 27: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Pressure"	
Parameter name	**Description**
PRESSURE (301) Display	Displays the measured pressure after sensor recalibration, position adjustment and damping. This value corresponds to the MEASURED VALUE parameter in the "Pressure" measuring mode. CORRECTED PRESS. (434) Display	Displays the measured pressure after sensor trim and position adjustment and before damping. → See also PRESSURE diagram.
SENSOR PRESSURE (584) Display	Displays the measured pressure before sensor trim, position adjustment and damping. → See also PRESSURE diagram.
SENSOR TEMP. (367) Display	Displays the temperature currently measured in the sensor. This temperature can deviate from the process temperature.
MEAS. VAL. TREND (378) Display	Displays the trend of the pressure measured value. Possibilities: increasing, decreasing, constant

Table 28: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Level"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Level (→ see also Page 45).	
MEASURED VALUE (679)	Displays the measured value In the "Level" measuring mode with "Linear" or "Pressure Linearized" level type, this value corresponds to the LEVEL BEFORE LIN parameter In the "Level" measuring mode with "Height Linearized" level type, this value corresponds to the TANK CONTENT parameter. **Prerequisite:** ■ Digital communication **On-site operation:** ■ For on-site operation, the MEASURED VALUE parameter is displayed on the 1st level.
PRESSURE (301) Display	Displays the measured pressure after sensor recalibration, position adjustment and damping. This value corresponds to the MEASURED VALUE parameter in the "Pressure" measuring mode. CORRECTED PRESS. (434) Display	Displays the measured pressure after sensor trim and position adjustment and before damping. → See also PRESSURE diagram.
SENSOR PRESSURE (584) Display	Displays the measured pressure before sensor trim, position adjustment and damping. → See also PRESSURE diagram.
SENSOR TEMP. (367) Display	Displays the temperature currently measured in the sensor. This temperature can deviate from the process temperature.

Table 28: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Level"	
Parameter name	**Description**
MEAS. VAL. TREND (378) Display	Displays the trend of the pressure measured value. Possibilities: increasing, decreasing, constant
LEVEL BEFORE LIN (050) Display	Displays the level value prior to linearisation. **Prerequisite:** ■ LEVEL MODE = Linear or Height Linearized Depending on the setting for the LIN. MEASURAND or COMB. MEASURAND parameter, this parameter displays the current level in % or in a unit of level.
TANK CONTENT (370) Display	Displays the level value after linearisation. **Prerequisite:** ■ LEVEL MODE = Pressure Linearized or Height Linearized Depending on the settings for the LINd. MEASURAND or COMB. MEASURAND parameter, the current tank content is displayed in % or in a unit of volume or mass. This value corresponds to the MEASURED VALUE.

Table 29: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Flow"	
Parameter name	**Description**
Prerequisite: ■ MEASURING MODE = Flow (→ see also Page 45).	
MEASURED VALUE (679)	Displays the measured value In the "Flow" measuring mode, this value corresponds to the SUPPRESSED FLOW parameter. **Prerequisite:** ■ Digital communication **On-site operation:** ■ For on-site operation, the MEASURED VALUE parameter is displayed on the 1st level.
PRESSURE (301) Display	Displays the measured pressure after sensor recalibration, position adjustment and damping. This value corresponds to the MEASURED VALUE parameter in the "Pressure" measuring mode. CORRECTED PRESS. (434) Display	Displays the measured pressure after sensor trim and position adjustment and before damping. → See also PRESSURE diagram.
SENSOR PRESSURE (584) Display	Displays the measured pressure before sensor trim, position adjustment and damping. → See also PRESSURE diagram.
SENSOR TEMP. (367) Display	Displays the temperature currently measured in the sensor. This temperature can deviate from the process temperature.
MEAS. VAL. TREND (378) Display	Displays the trend of the pressure measured value. Possibilities: increasing, decreasing, constant
SUPPRESSED FLOW (375) Display	Displays the current flow. Depending on the flow mode selected (→ FLOW-MEAS. TYPE), a volume flow, mass flow, standard volume flow or corrected volume flow is displayed.

Table 29: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PROCESS VALUES "Flow"	
Parameter name	**Description**
TOTALIZER 1 (652) Display	Displays the total flow value of totalizer 1. You can reset the value with the RESET TOTALIZER 1 parameter. The TOTAL. 1 OVERFLOW parameter displays the overflow. **Example:** The value 123456789 m^3 is displayed as follows: – TOTALIZER 1: 3456789 m^3 – TOTAL. 1 OVERFLOW: 12 E7
TOTAL. 1 OVERFLOW (655) Display	Displays the overflow value of totalizer 1. → See also TOTALIZER 1.
TOTALIZER 2 (657) Display	Displays the total flow value of totalizer 2. You cannot reset totalizer 2. The TOTAL. 2 OVERFLOW parameter displays the overflow. → See also example for TOTALIZER 1.
TOTAL. 2 OVERFLOW (658) Display	Displays the overflow value of totalizer 2. → See also TOTALIZER 2 and example for TOTALIZER 1.

Table 30: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PEAK HOLD INDICATOR	
Parameter name	**Description**
COUNTER:P > Pmax (380) Display	Displays the overpressure counter of the sensor The limit value is: upper nominal pressure limit of sensor + 10 % of upper nominal pressure limit of sensor. You can reset this counter by means of the RESET PEAKHOLD parameter.
MAX. MEAS. PRESS. (383) Display	Displays the largest measured pressure value (peak hold indicator). You can reset this indicator by means of the RESET PEAKHOLD parameter.
COUNTER P < Pmin (467) Display	Displays the vacuum pressure counter of the sensor The limit value is: lower nominal pressure limit of sensor – 10 % of upper nominal pressure limit of sensor. You can reset this counter by means of the RESET PEAKHOLD parameter.
MIN. MEAS. PRESS. (469) Display	Displays the smallest measured pressure value (peak hold indicator). You can reset this indicator by means of the RESET PEAKHOLD parameter.
COUNTER:T > Tmax (404) Display	Displays the number of times the specified temperature range of the sensor has been overshot. You can reset this counter by means of the RESET PEAKHOLD parameter.
MAX. MEAS. TEMP. (471) Display	Displays the largest measured temperature in the sensor (peak hold indicator). You can reset this indicator by means of the RESET PEAKHOLD parameter.
COUNTER:T < Tmin (472) Display	Displays the number of times the specified temperature range of the sensor has been undershot. You can reset this counter by means of the RESET PEAKHOLD parameter.
MIN. MEAS. TEMP. (474) Display	Displays the smallest measured temperature in the sensor (peak hold indicator). You can reset this indicator by means of the RESET PEAKHOLD parameter.
PCB COUNT:T > Tmax (488) Display	Displays the number of times the specified temperature range of the electronics has been overshot.
PCB MAX. TEMP. (490) Display	Displays the largest electronics temperature measured.
PCB COUNT:T < Tmin (492) Display	Displays the number of times the specified temperature range of the electronics has been undershot.
PCB MIN. TEMP. (494) Display	Displays the smallest electronics temperature measured.

Table 30: (GROUP SELECTION →) OPERATING MENU → PROCESSINFO → PEAK HOLD INDICATOR	
Parameter name	**Description**
RESET PEAKHOLD (382) Selection	This parameter lists all the peak hold indicator parameters that can be reset. You can select the peak hold indicators you want to reset. **Options:** ■ None ■ Max. pressure ■ Min. pressure ■ Pmax history ■ Pmin history ■ Max. temp. ■ Min. temp. ■ Tmax history ■ Tmin history ■ Reset all **Factory setting:** None

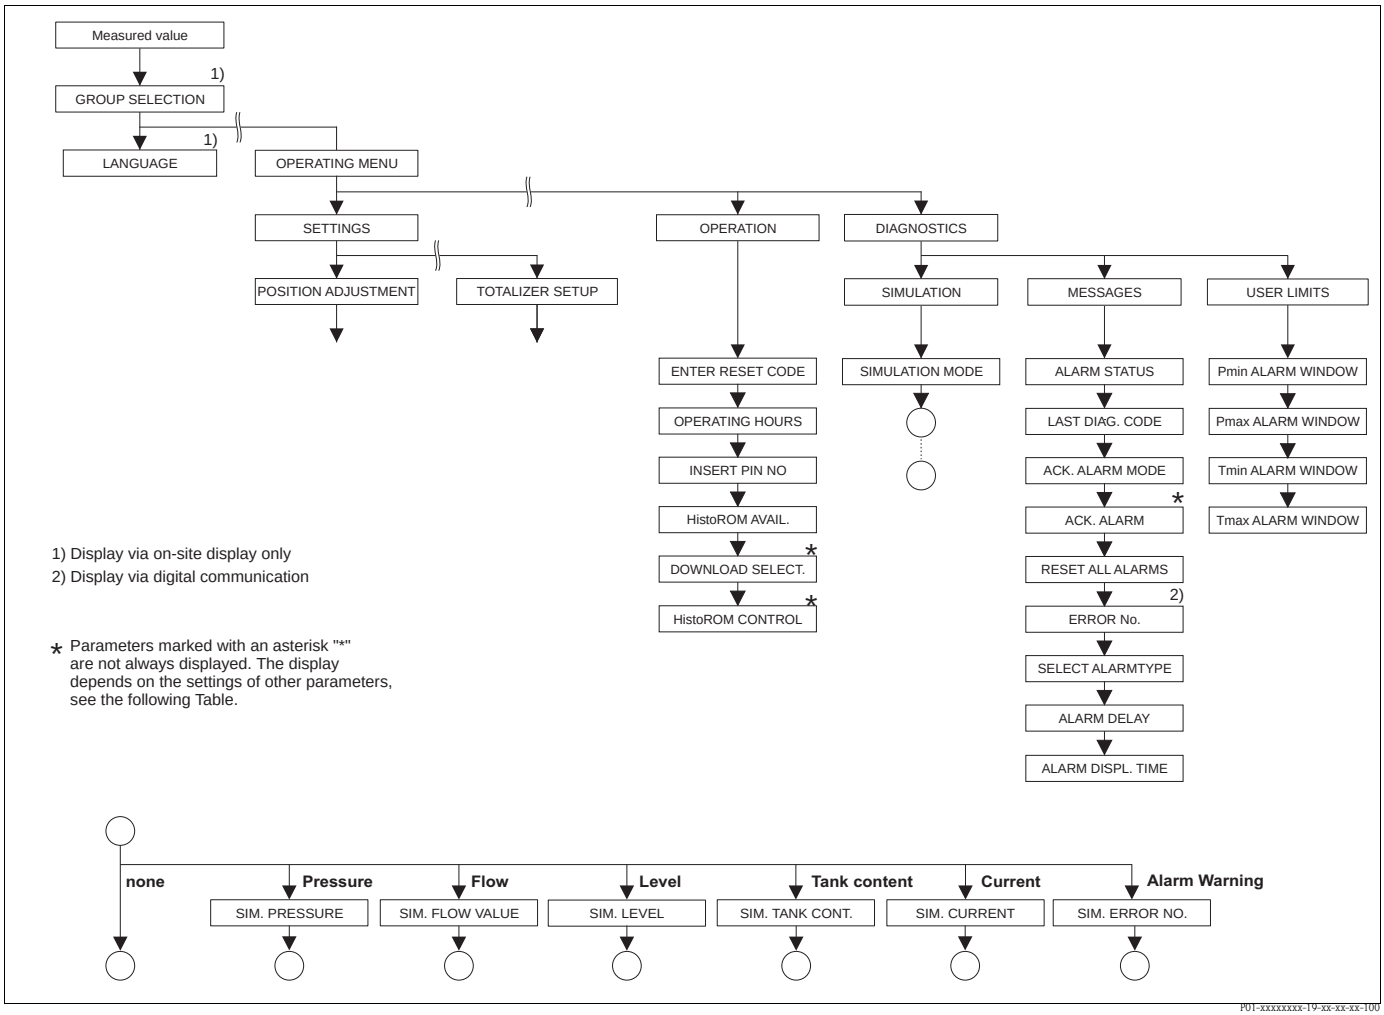

Fig. 46: OPERATING and DIAGNOSTICS group
→ For the OPERATING group, see Page 126, Table 31
→ For the SIMULATION function group, see Page 127, Table 32
→ For the MESSAGES function group, see Page 128, Table 33
→ For the USER LIMITS function group, see Page 130, Table 34

Table 31: (GROUP SELECTION →) OPERATING MENU → OPERATING	
Parameter name	**Description**
ENTER RESET CODE (047) Entry	Reset parameters completely or partially to factory values or delivery status. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.10 "Factory setting" (reset). **Factory setting:** 0
OPERATING HOURS (409) Display	Displays the hours of operation. This parameter cannot be reset.
INSERT PIN NO (048) Entry	For entering a code to lock or unlock operation. Note! ■ The -symbol on the on-site display indicates that operation is locked. Parameters which refer to how the display appears, e.g. LANGUAGE and DISPLAY CONTRAST can still be altered. ■ If operation is locked by means of the DIP-switch, you can only unlock operation again by means of the DIP-switch. If operation is locked by means of the on-site display or remote operation e.g. FieldCare, you can unlock operation again by means of the on-site display or using remote operation. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.9 "Locking/unlocking operation". **Options:** ■ Lock: enter a number between 0...9999 which is ≠100. ■ Unlock: enter the number 100. **Factory setting:** 100
HistoROM AVAIL. (831) Display	Indicates whether the optional HistoROM®/M-DAT memory module is connected to the electronic insert. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.5 "HistoROM®/M-DAT (optional)". **Options:** ■ Yes (HistoROM®/M-DAT is attached to the electronic insert) ■ No (HistoROM®/M-DAT is not attached to the electronic insert)
DOWNLOAD SELECT (014) Options	Select download function from HistoROM to device. The selection has no effect on an upload from the device to the HistoROM. **Prerequisite:** ■ A HistoROM®/M-DAT is attached to the electronic insert (HistoROM AVAIL. = yes) **Options:** ■ Configuration copy: For this option, all parameters apart from the DEVICE SERIAL No, DEVICE DESIGN., CUST. TAG NUMBER, LONG TAG NUMBER, ADDITIONAL INFO., BUS ADDRESS, CURRENT MODE and the parameters of the POSITION ADJUSTMENT and PROCESS CONNECTION group are overwritten. ■ Device replacement: With this option, all parameters except for DEVICE SERIAL No, DEVICE DESIGN. and the parameters of the POSITION ADJUSTMENT and PROCESS CONNECTION group are overwritten. ■ Electronics replace: With this option, all parameters except for the parameters of the POSITION ADJUSTMENT group are overwritten. **Factory setting:** Copy config. (if HistoROM®/M-DAT is attached to the electronic insert)

Table 31: (GROUP SELECTION →) OPERATING MENU → OPERATING	
Parameter name	**Description**
HistoROM CONTROL (832) Selection	For selecting the direction for copying the data. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.5. "HistoROM®/M-DAT (optional)". **Prerequisite:** ■ A HistoROM®/M-DAT is attached to the electronic insert (HistoROM AVAIL. = yes) **Options:** ■ Abort ■ HistoROM → Device ■ Device → HistoROM **Factory setting:** Abort (if HistoROM®/M-DAT is connected to the electronic insert)

Table 32: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → SIMULATION	
Parameter name	**Description**
SIMULATION MODE (413) Selection	Switch on simulation and select simulation type. Any simulation running is switched off if the measuring mode or level type is changed. **Options**: ■ None ■ Pressure, → see also this table parameter description for SIM. PRESSURE ■ Flow (only differential pressure transmitter), → see also this table parameter description for SIM. FLOW VALUE ■ Level, → see also this table parameter description for SIM. LEVEL ■ Tank content, → see also this table parameter description for SIM. TANK CONT. ■ Current, → see also this table parameter description for SIM. CURRENT Note: The "Flow" measuring mode has to be selected in the LINEAR/SQROOT parameter to ensure the current output corresponds to the simulated flow value. ■ Alarm/warning, , → see also this table parameter description for SIM. ERROR NO.  **Factory setting:** None
SIM. PRESSURE (414) Entry	Enter simulation value. → See also SIMULATION MODE. **Prerequisite:** ■ SIMULATION MODE = Pressure **Factory setting:** Current pressure measured value
SIM. FLOW VALUE (639) Entry	Enter simulation value. → See also SIMULATION MODE. **Prerequisite:** ■ MEASURING MODE = Pressure and SIMULATION MODE = Flow ■ MEASURING MODE = Flow and SIMULATION MODE = Flow

Table 32: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → SIMULATION	
Parameter name	**Description**
SIM. LEVEL (714) Entry	Enter simulation value. → See also SIMULATION MODE. **Prerequisite:** ■ MEASURING MODE = Level and SIMULATION MODE = Level
SIM. TANK CONT. (715) Entry	Enter simulation value. → See also SIMULATION MODE. **Prerequisites:** ■ MEASURING MODE = Level, LEVEL MODE = Pressure Linearized and SIMULATION MODE = Tank content ■ MEASURING MODE = Level, LEVEL MODE = Height Linearized and SIMULATION MODE = Tank content
SIM. CURRENT (270) Entry	Enter simulation value. → See also SIMULATION MODE. **Prerequisite:** ■ SIMULATION MODE = Current value **Factory setting:** Current current value
SIM. ERROR NO. (476) Entry	⚠ Warning! The SIMULATION parameter overwrites fault states (alarm/warning) that are actually present. When the simulation is ended, the fault states (alarm/warning) still persist but are no longer displayed! When the device is restarted it returns to its fault state. Enter message number. → See also SIMULATION MODE. → See also these Operating Instructions, Section 8.1 "Messages", "Code" table column. **Prerequisite:** ■ SIMULATION MODE = Alarm/Warning **Factory setting:** 613 (simulation active)

Table 33: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → MESSAGES	
Parameter name	**Description**
ALARM STATUS (046) Display	Displays the current messages present. → See also these Operating Instructions, Section 8.1. "Messages" and Section 8.3 "Confirming messages". **On-site display** ■ The measured value display shows the message with the highest priority. ■ The ALARM STATUS parameter shows all the messages in descending order of priority. You can scroll through all the messages present with the ⊞ or ⊟ key. **Operating program** ■ The "Status" field and the ALARM STATUS parameter show the message with the highest priority.
LAST DIAG. CODE (564) Display	Displays the last messages that occurred and were eliminated. ✎ Note! ■ On-site display: you can scroll through the last 15 messages with the ⊞ or ⊟ key. ■ Digital communication: the last message appears on the display. ■ Use the RESET ALL ALARMS parameter to delete the messages listed in the LAST DIAG. CODE parameter.
ACK. ALARM MODE (401) Selection	Switch on acknowledge alarm mode. → See also ACK. ALARM. **Options:** ■ On ■ Off **Factory setting:** Off

Table 33: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → MESSAGES	
Parameter name	**Description**
ACK. ALARM (500) Selection	Acknowledge alarm. **Prerequisite:** ■ ACK. ALARM MODE = on **Options:** ■ Abort ■ Confirm The cause of the alarm must be eliminated, the message must be acknowledged via the ACK. ALARM parameter and, where applicable, the ALARM DISPL. TIME (→ Page 129) has to have elapsed before the device starts measuring again following an alarm. → See also these Operating Instructions, Section 8.3 "Confirming messages". **Factory setting:** Abort
RESET ALL ALARMS (603) Selection	Use this parameter to reset all the messages of the LAST DIAG. CODE parameter. **Options:** ■ Abort ■ Confirm **Factory setting:** Abort
ERROR No. Entry	For "Error"-type messages, you can decide whether the device should behave as in the event of an alarm (A) or as in the event of a warning (W). Enter the corresponding message number for this parameter. → See also SELECT ALARMTYPE. → See also these Operating Instructions, Section 8.1 "Messages" and Section 8.2 "Response of outputs to errors". **Prerequisite:** ■ Digital communication
SELECT ALARMTYPE (595) – Entry (600) – Selection	For "Error"-type messages, you can decide whether the device should behave as in the event of an alarm (A) or as in the event of a warning (W). → See also ERROR No. → See also these Operating Instructions, Section 8.2 "Response of outputs to errors". **Options**: ■ Alarm (A): output current assumes a defined value. ■ Warning (W): device continues measuring **On-site operation:** 1. Enter the corresponding message number for ERROR No. field. 2. Select "Alarm" or "Warning" option. **Digital communication:** 1. Enter the corresponding message number via the ERROR No. parameter. 2. Use the SELECT ALARMTYPE parameter to select the "Alarm" or "Warning" option.
ALARM DELAY (336) Entry	Enter alarm response time for all "Error" messages. ✎ Note! There is no alarm if the cause of the error is eliminated within the alarm delay time. **Input range:** 0...100 s **Factory setting:** 0.0 s
ALARM DISPL. TIME (480) Entry	Enter alarm display time for all "Error" messages. Once the cause of the error is rectified, the alarm display time starts running. ✎ Note! The following applies if the setting for ACK. ALARM MODE = on: If an alarm appears and the alarm display time elapses before the alarm has been acknowledged, the message will be cleared once it has been acknowledged. → See also these Operating Instructions, Section 8.3 "Confirming messages". **Input range:** 0...999.9 s **Factory setting:** 0.0 s

Table 34: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → USER LIMITS	
Parameter name	**Description**
Pmin ALARM WINDOW (332) Entry	Customer-specific process monitoring – enter lower pressure limit. You can use the SELECT ALARMTYPE parameter to enter how the device responds if the operating pressure undershoots the specified value. → See also these Operating Instructions, Section 8.1 "Messages", table, Code E730 and Section 8.2. "Response of outputs to errors". **Factory setting:** Low sensor limit ■1.1 (→ For the low sensor limit, see PRESS. SENS LOLIM.)
Pmax ALARM WINDOW (333) Entry	Customer-specific process monitoring – enter upper pressure limit. You can use the SELECT ALARMTYPE parameter to enter how the device responds if the operating pressure undershoots the specified value. → See also these Operating Instructions, Section 8.1 "Messages", table, Code E731 and Section 8.2. "Response of outputs to errors". **Factory setting:** High sensor limit ■1.1 (→ For the high sensor limit, see PRESS. SENS HILIM.)
Tmin ALARM WINDOW (334) Entry	Customer-specific process monitoring – enter lower temperature limit. You can use the SELECT ALARMTYPE parameter to enter how the device responds if the operating pressure undershoots the specified value. → See also these Operating Instructions, Section 8.1 "Messages", table, Code E732 and Section 8.2. "Response of outputs to errors". **Factory setting:** Lower sensor temperature application limit – 10 K (→ For the lower temperature application limit, see Tmin SENSOR)
Tmax ALARM WINDOW (335) Entry	Customer-specific process monitoring – enter upper temperature limit. You can use the SELECT ALARMTYPE parameter to enter how the device responds if the operating pressure undershoots the specified value. → See also these Operating Instructions, Section 8.1 "Messages", table, Code E733 and Section 8.2. "Response of outputs to errors". **Factory setting:** Upper sensor temperature application limit +10 K (→ For the upper temperature application limit, see Tmax SENSOR)

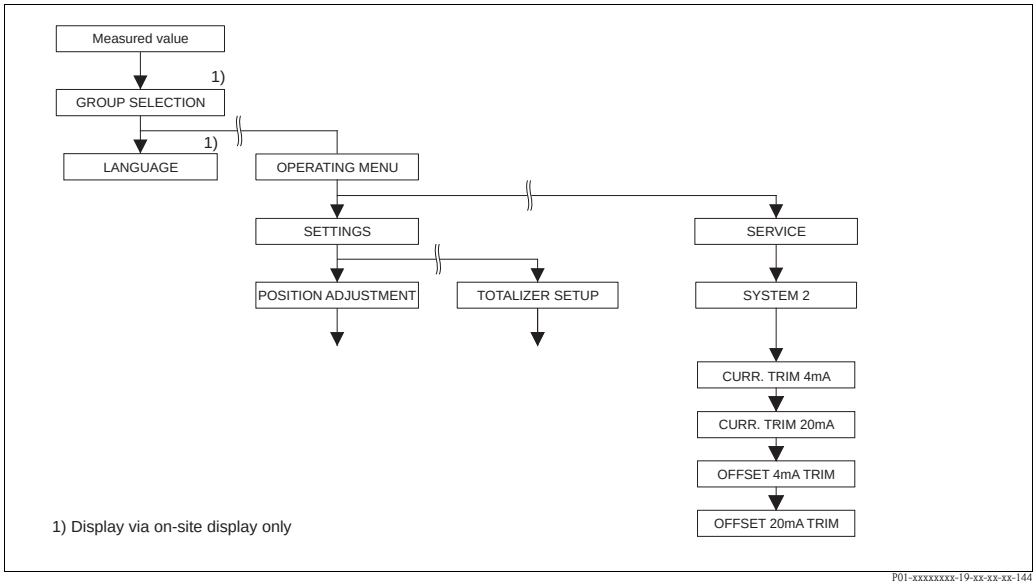

Fig. 47: SYSTEM 2 group

Table 35: (GROUP SELECTION →) OPERATING MENU → SERVICE → SYSTEM 2	
Parametername	**Beschreibung**
CURR. TRIM 4mA (045) Entry	Enter current value for the lower point (4 mA) of the current output trim line. You can adapt the current output to the transmission conditions with this parameter and CURR. TRIM 20mA. Perform current trim for the lower point as follows: 1. Select SIMULATION group. (Menu path: (GROUP SELECTION) → OPERATING MENU → DIAGNOSTICS → SIMULATION) 2. Select option "Current" via SIMULATION parameter. 3. Enter "4 mA" for SIM. CURRENT parameter. 4. Select SYSTEM 2 group. (Menu path: (GROUP SELECTION) → OPERATING MENU → SERVICE) 5. Enter the current value measured with the switching unit for the CURR. TRIM 4mA parameter. **Input range:** Measured current ±0.2 mA **Factory setting:** 4 mA
CURR. TRIM 20mA (042) Entry	Enter current value for the upper point (20 mA) of the current output trim line. You can adapt the current output to the transmission conditions with this parameter and CURR. TRIM 4mA. Perform current trim for the upper point as follows: 1. Select SIMULATION group. (Menu path: (GROUP SELECTION) → OPERATING MENU → DIAGNOSTICS → SIMULATION) 2. Select option "Current" via SIMULATION parameter. 3. Enter "20 mA" for SIM. CURRENT parameter. 4. Select SYSTEM 2 group. (Menu path: (GROUP SELECTION) → OPERATING MENU → SERVICE) 5. Enter the current value measured with the switching unit for the CURR. TRIM 20mA parameter. **Input range:** Measured current ±0.2 mA **Factory setting:** 20 mA
OFFSET 4mA TRIM (043) Display	Displays the difference between 4 mA and the value entered for the CURRENT TRIM 4mA parameter. **Factory setting:** 0
OFFSET 20mA TRIM (044) Display	Displays the difference between 20 mA and the value entered for the CURRENT TRIM 20mA parameter. **Factory setting:** 0

8 Trouble-shooting

8.1 Messages

The following table lists all the possible messages that can occur.
The device differentiates between the error types "Alarm", "Warning" and "Error". You may specify whether the instrument should react as if for an "Alarm" or "Warning" for "Error" messages.
→ See "Error type/NA 64" column and parameter descriptions for ERROR No. and SELECT ALARMTYPE (→ Page 129).

In addition, the "Error type/NA 64" column classifies the messages in accordance with NAMUR Recommendation NA 64:
- Break down: indicated with "B"
- Maintenance need: indicated with "C" (check request)
- Function check: indicated with "I" (in service)

Error message display on the on-site display:
- The measured value display shows the message with the highest priority. → See "Priority" column.
- The ALARM STATUS (→ Page 128) parameter shows all the messages present in descending order of priority. You can scroll through all the messages present with the ⊟-key or ⊞-key.

Message display via the digital communication:
- The ALARM STATUS (→ Page 128) parameter shows the message with the highest priority. → See "Priority" column.

Note!
- If the device detects a defect in the on-site display during initialization, special error messages are generated. → For the error messages, see Page 139, Section 8.1.1 "On-site display error messages".
- For support and further information, please contact Endress+Hauser Service.
- → See also Section 8.4, 8.5 and 8.6.

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
101 (A101)	Alarm B	Failure (F)	B>Sensor electronic EEPROM error	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). This message normally only appears briefly. – Sensor defect.	– Wait a few minutes. – Restart the device. Perform reset (Code 62). – Block off electromagnetic effects or eliminate source of disturbance. – Replace sensor.	17
102 (W102)	Warning C	Maintenance request (M)	C>Checksum error in EEPROM: peakhold segment	– Main electronics defect. Correct measurement can continue as long as you do not need the peak hold indicator function.	– Replace main electronics.	53
106 (W106)	Warning C	Funktion check (C)	C>Downloading - please wait	– Downloading.	– Wait for download to complete.	52

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
110 (A110)	Alarm B	Failure (F)	B>Checksum error in EEPROM: configuration segment	– The supply voltage is disconnected when writing. – Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Main electronics defect.	– Reestablish supply voltage. Perform reset (Code 7864) if necessary. Carry out calibration again. – Block off electromagnetic effects or eliminate sources of disturbance. – Replace main electronics.	6
113 (A113)	Alarm B	Failure (F)	B>ROM failure in transmitter electronic	– Main electronics defect.	– Replace main electronics.	1
115 (E115)	Error B factory setting: Warning C	Out of specification (S)	B>Sensor overpressure	– Overpressure present. – Sensor defect.	– Reduce pressure until message disappears. – Replace sensor.	29
116 (W116)	Warning C	Maintenance request (M)	C>Download error, repeat download	– The file is defect. – During the download, the data are not correctly transmitted to the processor, e.g. because of open cable connections, spikes (ripple) on the supply voltage or electromagnetic effects.	– Use another file. – Check cable connection PC – transmitter. – Block off electromagnetic effects or eliminate sources of disturbance. – Perform reset (Code 7864) and carry out calibration again. – Repeat download.	36
120 (E120)	Error B factory setting: Warning C	Out of specification (S)	B>Sensor low pressure	– Pressure too low. – Sensor defect.	– Increase pressure until message disappears. – Replace sensor.	30
121 (A121)	Alarm B	Failure (F)	B>Checksum error in factory segment of EEPROM	– Main electronics defect.	– Replace main electronics.	5
122 (A122)	Alarm B	Failure (F)	B>Sensor not connected	– Cable connection sensor –main electronics disconnected. – Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Main electronics defect. – Sensor defect.	– Check cable connection and repair if necessary. – Block off electromagnetic effects or eliminate source of disturbance. – Replace main electronics. – Replace sensor.	13
130 (A130)	Alarm B	Failure (F)	B>EEPROM is defect.	– Main electronics defect.	– Replace main electronics.	10
131 (A131)	Alarm B	Failure (F)	B>Checksum error in EEPROM: min/max segment	– Main electronics defect.	– Replace main electronics.	9
132 (A132)	Alarm B	Failure (F)	B>Checksum error in totalizer EEPROM	– Main electronics defect.	– Replace main electronics.	7
133 (A133)	Alarm B	Failure (F)	B>Checksum error in History EEPROM	– An error occurred when writing. – Main electronics defect.	– Perform reset (Code 7864) and carry out calibration again. – Replace electronics.	8
602 (W602)	Warning C	Funktion check (C)	C>Linearisation curve not monotone	– The linearisation table is not monotonic increasing or decreasing.	– Add to linearisation table or perform linearisation again.	57

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
604 (W604)	Warning C	Funktion check (C)	C>Linearisation table not valid. Less than 2 points or points too close	✎ Note! From software version "02.10.xx" onwards, there is no min. span for the Y-points.		
				– The linearisation table consists of less than 2 points.	– Add to linearisation table. If necessary, perform linearisation again.	58
				– At least 2 points in the linearisation table are too close together. A minimum gap of 0.5 % of the distance between two points must be maintained. Spans for the "Pressure linearized" option: HYDR. PRESS MAX. – HYDR. PRESS MIN.; TANK CONTENT MAX. – TANK CONTENT MIN. Spans for the "Height linearized" option: LEVEL MAX – LEVEL MIN; TANK CONTENT MAX. – TANK CONTENT MIN.	– Correct linearisation table and accept again.	
613 (W613)	Warning I	Funktion check (C)	I>Simulation is active	– Simulation is switched on, i.e. the device is not measuring at present.	– Switch off simulation.	60
620 (E620)	Error C Factory setting: Warning C	Out of specification (S)	C>Current output out of range	The current is outside the permitted range 3.8 to 20.5 mA. – The pressure applied is outside the set measuring range (but within the sensor range).	– Check pressure applied, reconfigure measuring range if necessary (→ See also these Operating Instructions, chapter 4 to 6.) – Perform reset (Code 7864) and carry out calibration again.	49
				– Loose connection at sensor cable	– Wait a short period of time and tighten the connection, or avoid loose connection.	
700 (W700)	Warning C	Maintenance request (M)	C>Last configuration not stored	– An error occurred when writing or reading configuration data or the power supply was disconnected.	– Perform reset (Code 7864) and carry out calibration again.	54
				– Main electronics defect.	– Replace main electronics.	
701 (W701)	Warning C	Funktion check (C)	C>Measuring chain config. exceeds sensor range	– The calibration carried out would result in the sensor nominal operating range being undershot or overshot.	– Carry out calibration again.	50
702 (W702)	Warning C	Maintenance request (M)	C>HistoROM data not consistent.	– Data were not written correctly to the HistoROM, e.g. if the HistoROM was detached during the writing process.	– Repeat upload. – Perform reset (Code 7864) and carry out calibration again.	55
				– HistoROM does not have any data.	– Copy suitable data to the HistoROM. (→ See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S) or BA00332P (Deltapilot S), Section 5.5.1 "Copying configuration data".)	
703 (A703)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics.	– Briefly disconnect device from the power supply.	22
				– Main electronics defect.	– Replace main electronics.	

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
704 (A704)	Alarm B	Funktion check (C)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	12
705 (A705)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	21
706 (W706)	Warning C	Maintenance request (M)	C>Configuration in HistoROM and device not identical	– Configuration (parameters) in the HistoROM and in the device is not identical.	– Copy data from the device to the HistoROM. – Copy data from the HistoROM to the device. The message remains if the HistoROM and the device have different software versions. The message goes out if you copy the data from the device to the HistoROM. – Device reset codes such as 7864 do not have any effect on the HistoROM. That means that if you do a reset, the configurations in the HistoROM and in the device may not be the same. → See also Operating Instructions BA00270P (Deltabar S), BA00271P (Cerabar S), BA00332P (Deltapilot S) Section 5.5.1 "Copying configuration data".	59
707 (A707)	Alarm B	Funktion check (C)	B>X-VAL. of lin. table out of edit limits.	– At least one X-VALUE in the linearisation table is either below the value for HYDR. PRESS MIN. or MIN. LEVEL or above the value for HYDR. PRESS. MAX. or LEVEL MAX.	– Carry out calibration again. (→ See also these Operating Instructions, chapter 5.)	38
710 (W710)	Warning C	Funktion check (C)	B>Set span too small. Not allowed.	– Values for calibration (e.g. lower range value and upper range value) are too close together. – The sensor was replaced and the customer-specific configuration does not suit the sensor. – Unsuitable download carried out.	– Adjust calibration to suit sensor. (→ See also Page 119, parameter description MINIMUM SPAN.) – Adjust calibration to suit sensor. – Replace sensor with a suitable sensor. – Check configuration and perform download again.	51
711 (A711)	Alarm B	Funktion check (C)	B>LRV or URV out of edit limits	– Lower range value and/or upper range value undershoot or overshoot the sensor range limits. – The sensor was replaced and the customer-specific configuration does not suit the sensor. – Unsuitable download carried out.	– Reconfigure lower range value and/or upper range value to suit the sensor. Pay attention to position factor. – Reconfigure lower range value and/or upper range value to suit the sensor. Pay attention to position factor. – Replace sensor with a suitable sensor. – Check configuration and perform download again.	37
713 (A713)	Alarm B	Funktion check (C)	B>100% POINT level out of edit limits	– The sensor was replaced.	– Carry out calibration again.	39

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
715 (E715)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor over temperature	– The temperature measured in the sensor is greater than the upper nominal temperature of the sensor. (→ See also Page 120, parameter description Tmax SENSOR.) – Unsuitable download carried out.	– Reduce process temperature/ ambient temperature. – Check configuration and perform download again.	32
716 (E716)	Error B Factory setting: Alarm B	Failure (F)	B>Process isolating diaphragm broken	– Sensor defect.	– Replace sensor. – Reduce pressure.	24
717 (E717)	Error C Factory setting: Warning C	Out of specification (S)	C>Transmitter over temperature	– The temperature measured in the electronics is greater than the upper nominal temperature of the electronics (+88 °C). – Unsuitable download carried out.	– Reduce ambient temperature. – Check configuration and perform download again.	34
718 (E718)	Error C Factory setting: Warning C	Out of specification (S)	C>Transmitter under temperature	– The temperature measured in the electronics is smaller than the lower nominal temperature of the electronics (–43 °C). – Unsuitable download carried out.	– Increase ambient temperature. Insulate device if necessary. – Check configuration and perform download again.	35
719 (A719)	Alarm B	Funktion check (C)	B>Y-VAL of lin. table out of edit limits	– At least on Y-VALUE in the linearisation table is below the MIN. TANK CONTANT or above the MAX. TANK CONTENT.	– Carry out calibration again. (→ See also Operating Instructions BA00274P, chapter 5 or these Operating Instructions, Page 2.)	40
720 (E720)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor under temperature	– The temperature measured in the sensor is smaller than the lower nominal temperature of the sensor. (→ See also Page 120, parameter description Tmin SENSOR.) – Unsuitable download carried out. – Loose connection at sensor cable	– Increase process temperature/ ambient temperature. – Check configuration and perform download again. – Wait a short period of time and tighten the connection, or avoid loose connection.	33
721 (A721)	Alarm B	Funktion check (C)	B>ZERO POSITION level out of edit limits	– LEVEL MIN or LEVEL MAX has been changed.	– Perform reset (Code 2710) and carry out calibration again.	41
722 (A722)	Alarm B	Funktion check (C)	B>EMPTY CALIB. or FULL CALIB. out of edit limits	– LEVEL MIN or LEVEL MAX has been changed.	– Perform reset (Code 2710) and carry out calibration again.	42
723 (A723)	Alarm B	Funktion check (C)	B>MAX. FLOW out of edit limits	– FLOW-MEAS. TYPE has been changed.	– Carry out calibration again.	43

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Priority
725 (A725)	Alarm B	Failure (F)	B>Sensor connection error, cycle disturbance	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Setscrew loose. – Sensor or main electronics defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Retighten setscrew with 1 Nm (0,74 lbf ft) (see chapter "Rotating the housing" in BA00270P (Deltabar S), BA00271P (Cerabar S), BA00332P (Deltapilot S). – Replace sensor or main electronics.	25
726 (E726)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor temperature error - overrange	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Process temperature is outside permitted range. – Sensor defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Check temperature present, reduce or increase if necessary. – If the process temperature is within the permitted range, replace sensor.	31
727 (E727)	Error C Factory setting: Warning C	Out of specification (S)	C>Sensor pressure error - overrange	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Pressure is outside permitted range. – Sensor defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Check pressure present, reduce or increase if necessary. – If the pressure is within the permitted range, replace sensor.	28
728 (A728)	Alarm B	Failure (F)	B>RAM error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	2
729 (A729)	Alarm B	Failure (F)	B>RAM error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	3
730 (E730)	Error C Factory setting: Warning C	Out of specification (S)	C>LRV user limits exceeded	– Pressure measured value has undershot the value specified for the Pmin ALARM WINDOW parameter. – Loose connection at sensor cable	– Check system/pressure measured value. – Change value for Pmin ALARM WINDOW if necessary. (→ See also Page 130, parameter description Pmin ALARM WINDOW.) – Wait a short period of time and tighten the connection, or avoid loose connection.	46

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Prio rity
731 (E731)	Error C Factory setting: Warning C	Out of specification (S)	C>URV user limits exceeded	– Pressure measured value has overshot the value specified for the Pmax ALARM WINDOW parameter.	– Check system/pressure measured value. – Change value for Pmax ALARM WINDOW if necessary. (→ See also Page 130, parameter description Pmax ALARM WINDOW.)	45
		Out of specification (S)		– Loose connection at sensor cable	– Wait a short period of time and tighten the connection, or avoid loose connection.	
732 (E732)	Error C Factory setting: Warning C		C>LRV Temp. User limits exceeded	– Temperature measured value has undershot the value specified for the Tmin ALARM WINDOW parameter.	– Check system/temperature measured value. – Change value for Tmin ALARM WINDOW if necessary. (→ See also Page 130, parameter description Tmin ALARM WINDOW.)	48
733 (E733)	Error C Factory setting: Warning C	Out of specification (S)	C>URV Temp. User limits exceeded	– Temperature measured value has overshot the value specified for the Tmax ALARM WINDOW parameter.	– Check system/temperature measured value. – Change value for Tmax ALARM WINDOW if necessary. (→ See also Page 130, parameter description Tmax ALARM WINDOW.)	47
736 (A736)	Alarm B	Failure (F)	B>RAM error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	4
737 (A737)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	20
738 (A738)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	19
739 (A739)	Alarm B	Failure (F)	B>Measurement error	– Fault in the main electronics. – Main electronics defect.	– Briefly disconnect device from the power supply. – Replace main electronics.	23
740 (E740)	Error C Factory setting: Warning C	Maintenance request (M)	C>Calculation overflow, bad configuration	– Level measuring mode: the measured pressure has undershot the value for HYDR. PRESS. MIN. or overshot the value for HYDR. PRESS MAX. – Level measuring mode: The measured level did not reach the LEVEL MIN value or exceeded the LEVEL MAX value. – Flow measuring mode: the measured pressure has undershot the value for MAX. PRESS FLOW.	– Check configuration and carry out calibration again if necessary. – Select a device with a suitable measuring range. – Check configuration and carry out calibration again if necessary. (→ See also parameter description LEVEL MIN., Page 86.) – Check configuration and carry out calibration again if necessary. – Select a device with a suitable measuring range.	27
741 (A741)	Alarm B	Funktion check (C)	B>TANK HEIGHT out of edit limits	– LEVEL MIN or LEVEL MAX has been changed.	– Perform reset (Code 2710) and carry out calibration again.	44

Code	Error type/ NA 64	Corresponds NE 107	Message/description	Cause	Measure	Prio rity
742 (A742)	Alarm B	Failure (F)	B>Sensor connection error (upload)	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). This message normally only appears briefly. – Cable connection sensor – main electronics disconnected. – Sensor defect.	– Wait a few minutes. – Perform reset (Code 7864) and carry out calibration again. – Check cable connection and repair if necessary. – Replace sensor.	18
743 (E743)	Alarm B	Failure (F)	B>Electronic PCB error during initialisation	– This message normally only appears briefly. – Main electronics defect.	– Wait a few minutes. – Restart the device. Perform reset (Code 62). – Replace main electronics.	14
744 (A744)	Alarm B	Failure (F)	B>Main electronic PCB error	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Main electronics defect.	– Restart the device. Perform reset (Code 62). – Block off electromagnetic effects or eliminate source of disturbance. – Replace main electronics.	11
745 (W745)	Warning C	Maintenance request (M)	C>Sensor data unknown	– Sensor does not suit the device (electronic sensor nameplate). Device continues measuring.	– Replace sensor with a suitable sensor.	56
746 (W746)	Warning C	Funktion check (C)	C>Sensor connection error - initialising	– Electromagnetic effects are greater than specifications in the technical data. This message normally only appears briefly. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Overpressure or low pressure present.	– Wait a few minutes. – Restart the device. Perform reset (Code 7864). – Block off electromagnetic effects or eliminate source of disturbance. – Reduce or increase pressure.	26
747 (A747)	Alarm B	Failure (F)	B>Sensor software not compatible to electronics	– Sensor does not suit the device (electronic sensor nameplate).	– Replace sensor with a suitable sensor.	16
748 (A748)	Alarm B	Failure (F)	B>Memory failure in signal processor	– Electromagnetic effects are greater than specifications in the technical data. → See Technical Information TI00382P (Deltabar S), TI00383P (Cerabar S) or TI00416P (Deltapilot S). – Main electronics defect.	– Block off electromagnetic effects or eliminate source of disturbance. – Replace main electronics.	15

8.1.1 On-site display error messages

If the device detects a defect in the on-site display during initialization, the following error messages can be displayed:

Message	Measure
Initialization, VU Electr. Defect A110	Exchange on-site display.
Initialization, VU Electr. Defect A114	
Initialization, VU Electr. Defect A281	
Initialization, VU Checksum Err. A110	
Initialization, VU Checksum Err. A112	
Initialization, VU Checksum Err. A171	

8.2 Response of outputs to errors

The device differentiates between the error types Alarm, Warning and Error.
→ See also Section 8.1 "Messages" und Page 111 ff, Table 20: OUTPUT and Page 111 ff, Table 31: MESSAGES the following table and Page 132, Section 8.1 "Messages".

Output	**A (Alarm)**	**W (Warning)**	**E (Error: Alarm/Warning)**
Current output	Assumes the value specified via the OUTPUT FAIL MODE[1)], ALT. CURR. OUTPUT[1] and SET MAX. ALARM[1] parameter. → See also the following section "Configuring current output for an alarm".	Device continues measuring.	For this error, you can enter whether the device should react as in the event of an alarm or as in the event of a warning. See corresponding "Alarm" or "Warning" column. (→ See also these Operating Instructions, parameter description SELECT ALARM TYPE.)
Bargraph (on-site display)	The bargraph adopts the value defined by the OUTPUT FAIL MODE [1] parameter.	The bargraph adopts the value which corresponds to the current value.	→ See this table, column "Alarm" or "Warning".
On-site display	– The measured value and message are displayed alternately – Measured value display: ↯ -symbol is permanently displayed. Message display – 3-digit number such as A122 and description	– The measured value and message are displayed alternately – Measured value display: ↯ -symbol flashes. Message display: – 3-digit number such as W613 and description	– The measured value and message are displayed alternately – Measured value display: see corresponding "Alarm" or "Warning" column Message display: – 3-digit number such as E731 and description
Remote operation (Digital communication)	In the case of an alarm, the ALARM STATUS[2)] parameter displays a 3-digit number such as 122 for "Sensor not connected".	In the case of a warning, the ALARM STATUS[2] parameter displays a 3-digit number such as 613 for "Simulation is active".	In the case of an error, the ALARM STATUS[2] parameter displays a 3-digit number such as 731 for "URV user limits exceeded".

1) Menu path: (GROUP SELECTION →) OPERATING MENU → OUTPUT

2) Menu path: (GROUP SELECTION →) OPERATING MENU → MESSAGES

8.3 Confirming messages

Depending on the settings for the ALARM DISPL. TIME (→ Page 129) and ACK. ALARM MODE (→ Page 128) parameters, the following measures should be taken to clear a message:

Settings [1]	Measures
– ALARM DISPL. TIME = 0 s – ACK. ALARM MODE = off	– Rectify cause of the message (see also Section 8.1).
– ALARM DISPL. TIME > 0 s – ACK. ALARM MODE = off	– Rectify cause of the message (see also Section 8.1). – Wait for the alarm display time to elapse.
– ALARM DISPL. TIME = 0 s – ACK. ALARM MODE = on	– Rectify cause of the message (see also Section 8.1). – Confirm message using ACK. ALARM parameter.
– ALARM DISPL. TIME > 0 s – ACK. ALARM MODE = on	– Rectify cause of the message (see also Section 8.1). – Confirm message using ACK. ALARM parameter. – Wait for the alarm display time to elapse. If a message appears and the alarm display time elapses before the message has been acknowledged, the message will be cleared once it has been acknowledged.

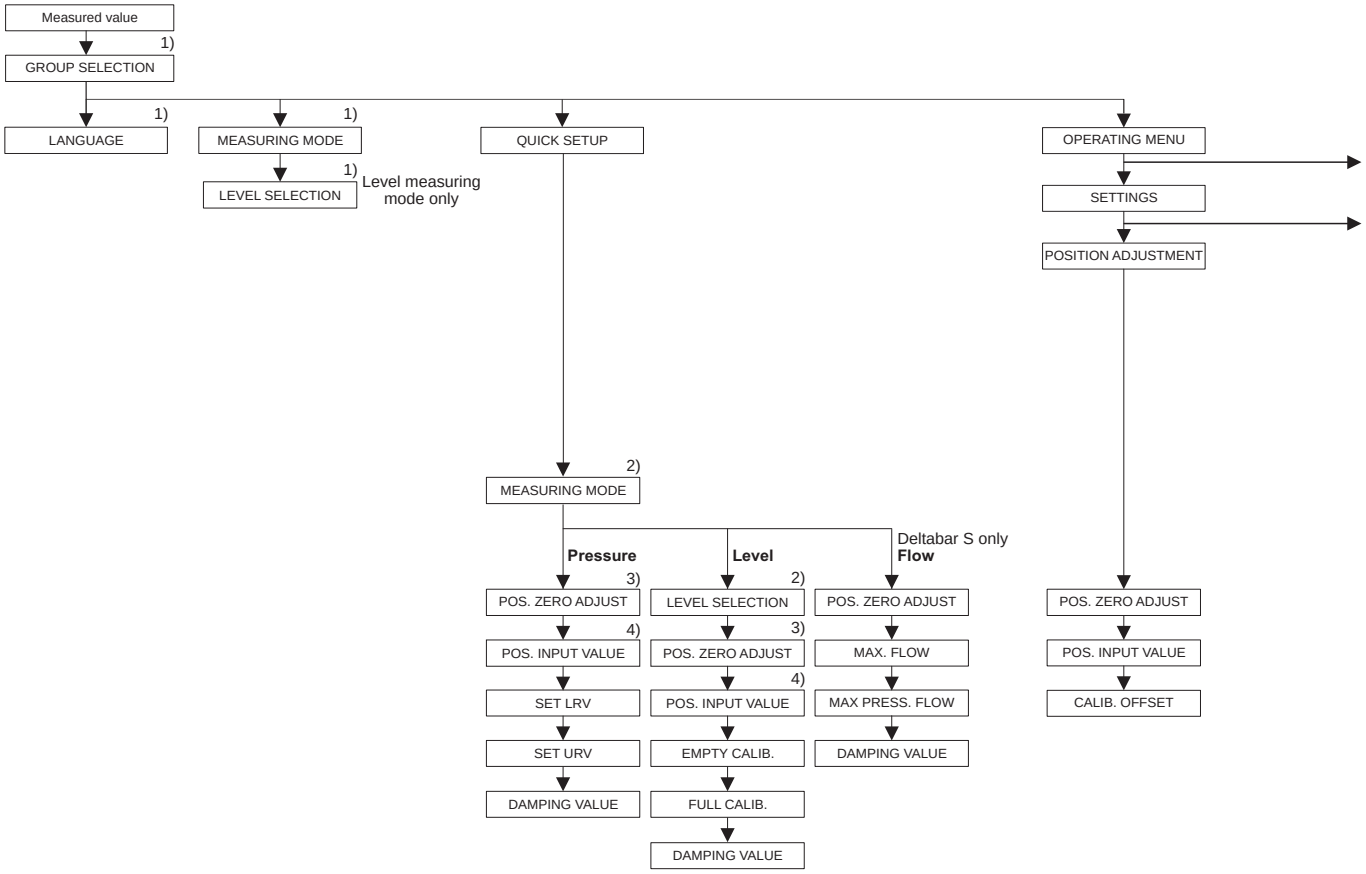
1) Menu path for ALARM DISPL. TIME and ACK. ALARM MODE: (GROUP SELECTION →) OPERATING MENU → DIAGNOSTICS → MESSAGES

If the on-site display displays a message, you can delete it with the E-key.
If there are several messages, the on-site display shows the message which has the highest priority (see also Section 8.1). Once you have deleted this message using the E-key, the message with the next highest priority is displayed. You can use the E-key to delete each message, one after the other. The ALARM STATUS parameter continues to display all the messages present.

9 Appendix

9.1 Operating menu for on-site display, Digital communication

Note!
- The entire menu is depicted on the following pages.
- The menu has a different structure depending on the measuring mode selected. This means that some function groups are only displayed for one measuring mode, e.g. "LINEARISATION" function group for the Level measuring mode (Menu path: (GROUP SELECTION →) OPERATING MENU → SETTINGS → BASIC SETUP).
- In addition, there are also parameters that are only displayed if other parameters are appropriately configured. For example the Customer Unit P parameter is only displayed if the "User unit" option was selected for the PRESS. ENG. UNIT parameter. These parameters are indicated with a "*".
- For a description of the parameters, please refer to chapter 7 "Description of parameters". The exact dependency of individual parameters on one another is explained here.



1) Display via on-site display only

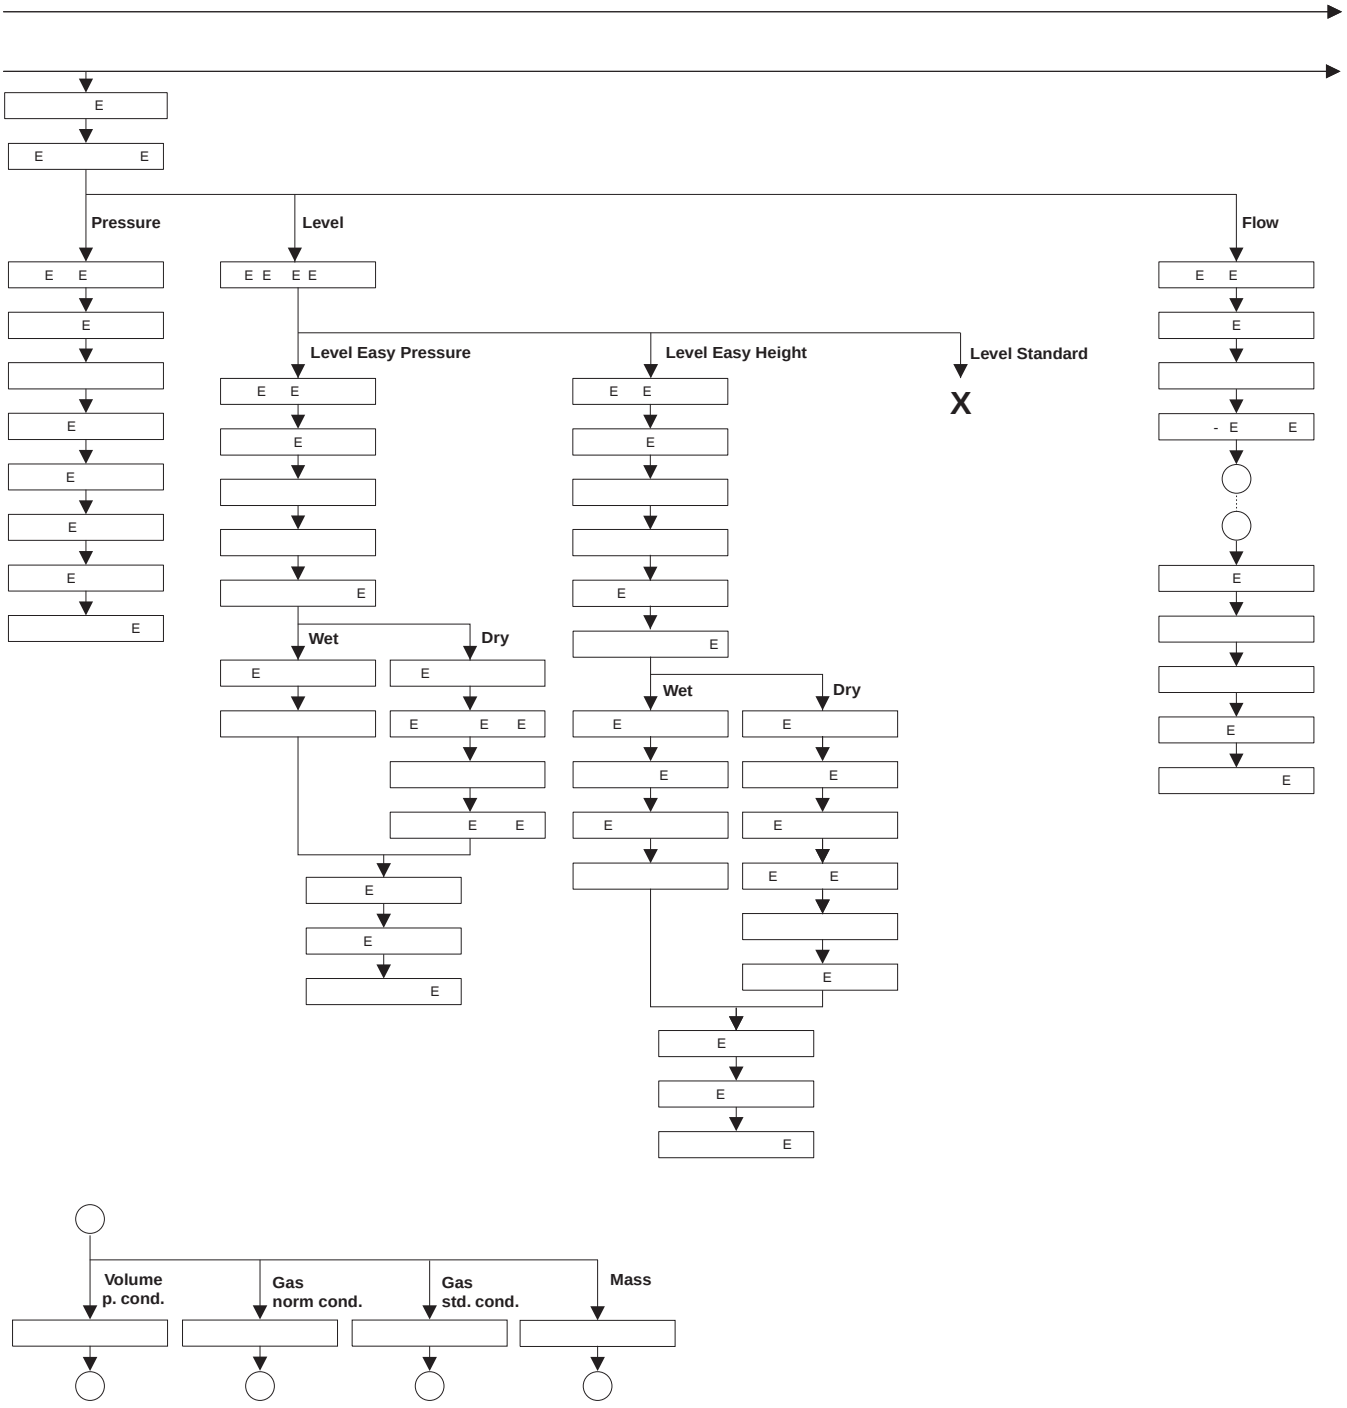
2) Display via digital communication

3) Cerabar S with gauge pressure sensor, Deltabar S or Deltapilot S

4) Cerabar S with absolut pressure sensor

There are parameters that are only displayed if other parameters are appropriately configured.
For example the CUSTOMER UNIT P parameter is only displayed if the "User unit" option was selected for the PRESS. ENG. UNIT parameter.
These parameters are indicated with a "*".

P01-xxxxxxxx-19-xx-xx-xx-138

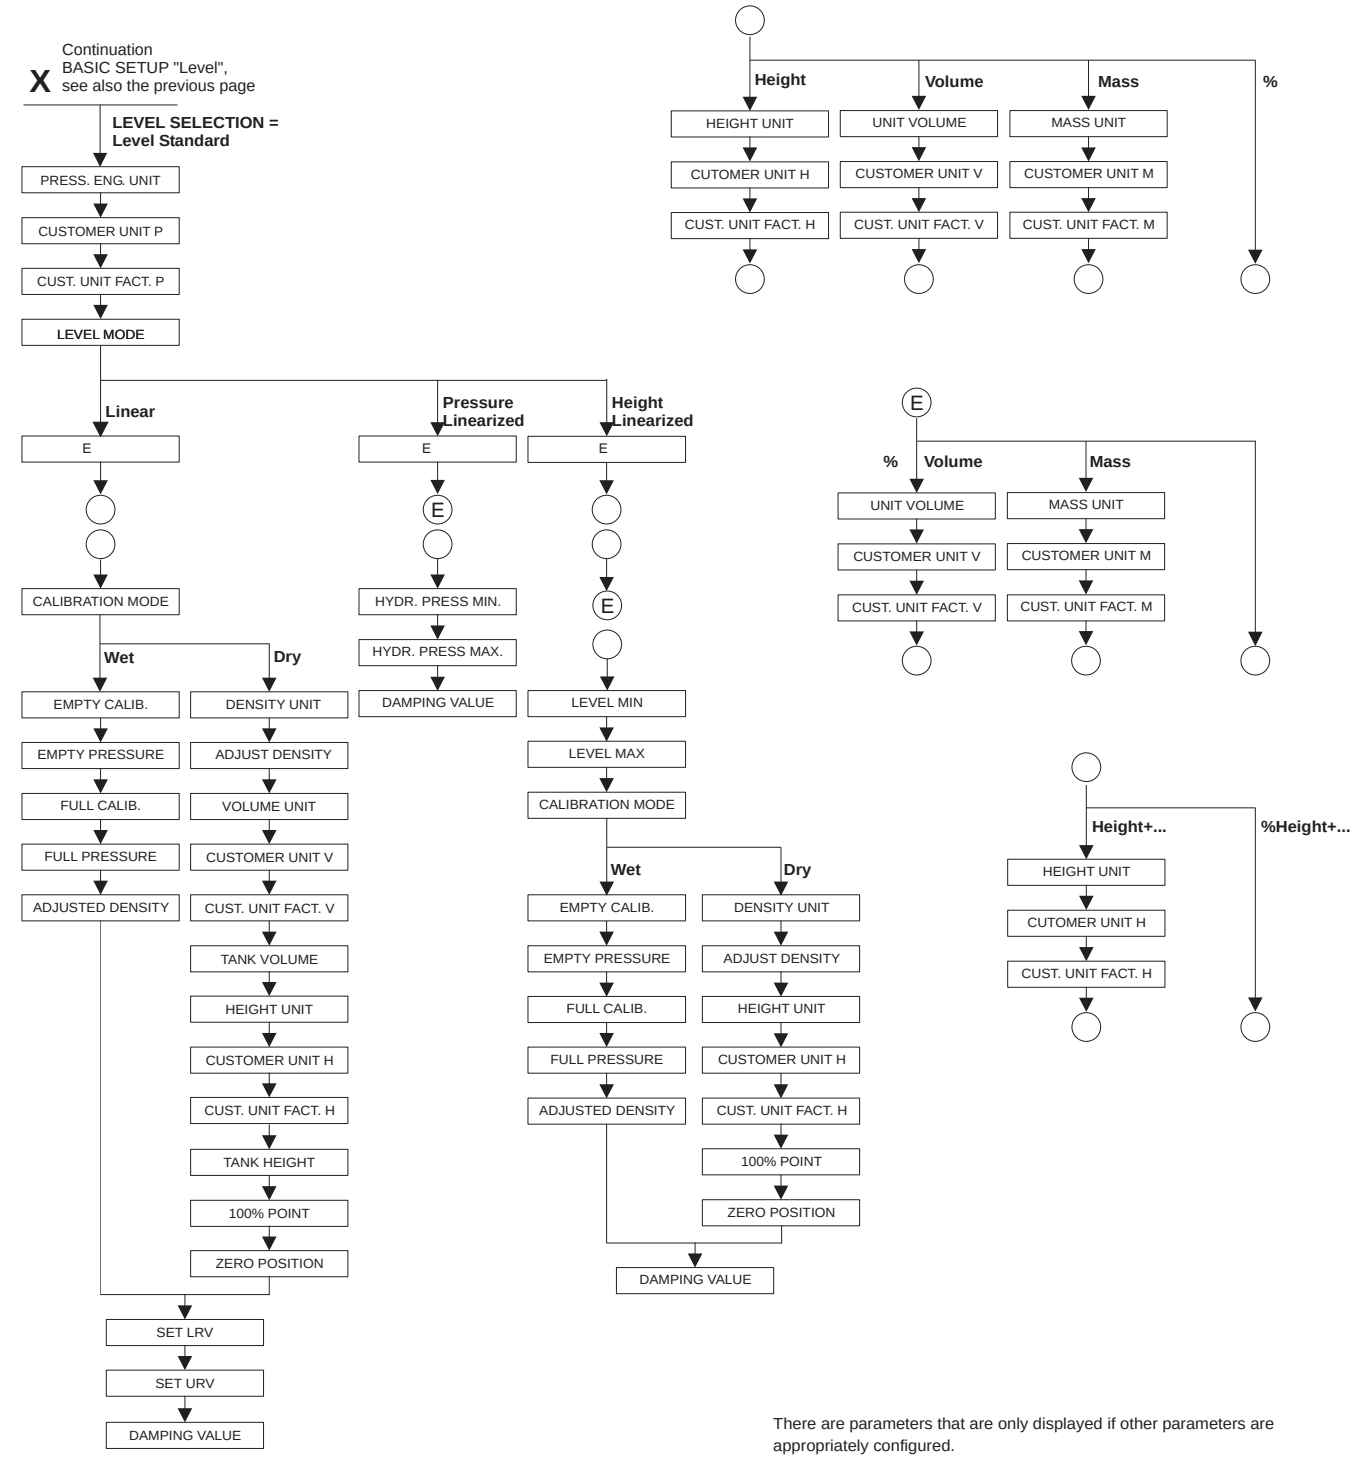


digital communication

E

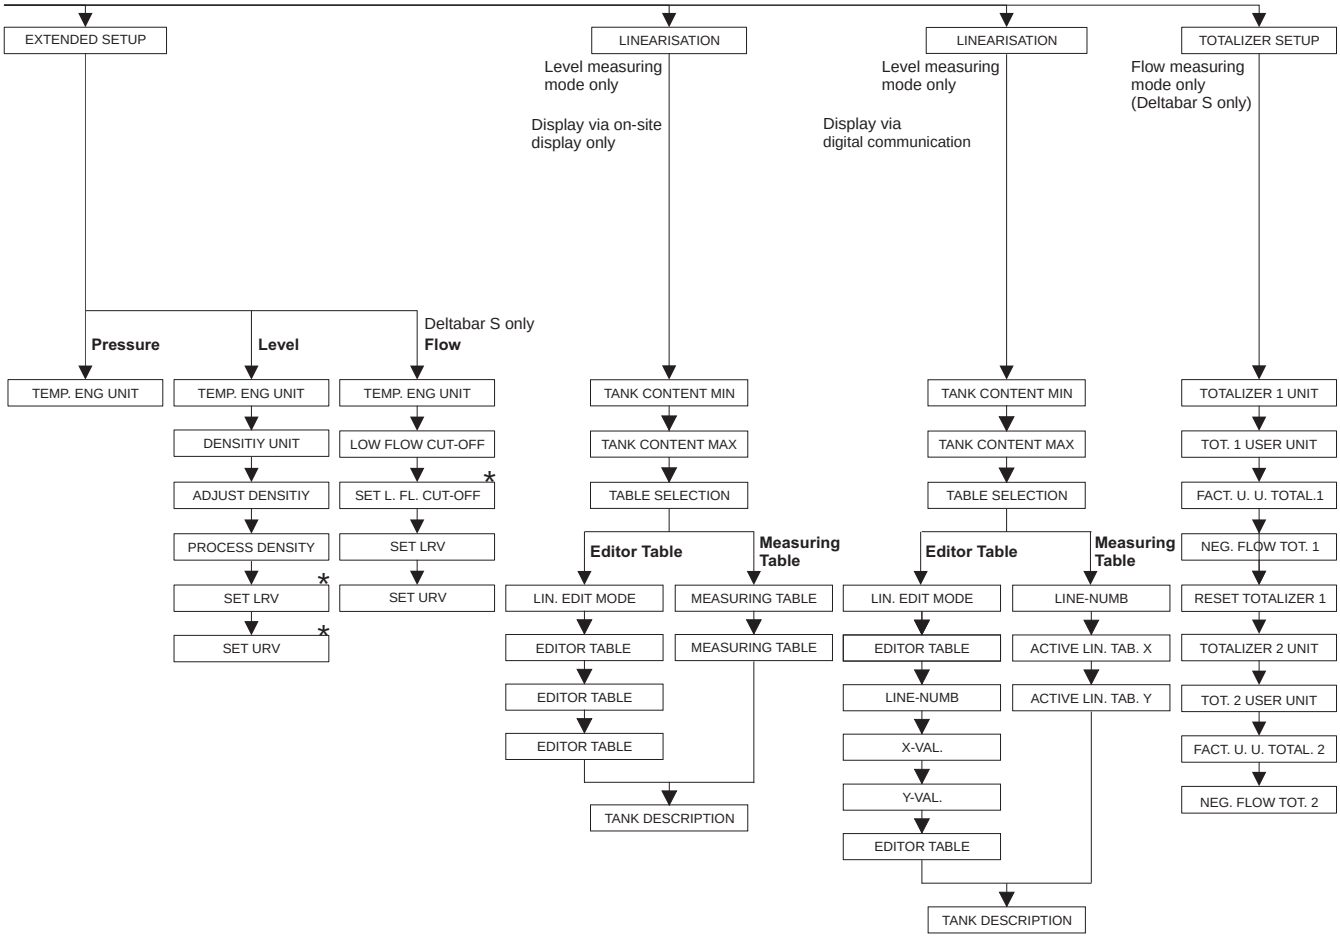
E E

P01-xxxxxxxx-19-xx-xx-xx-139



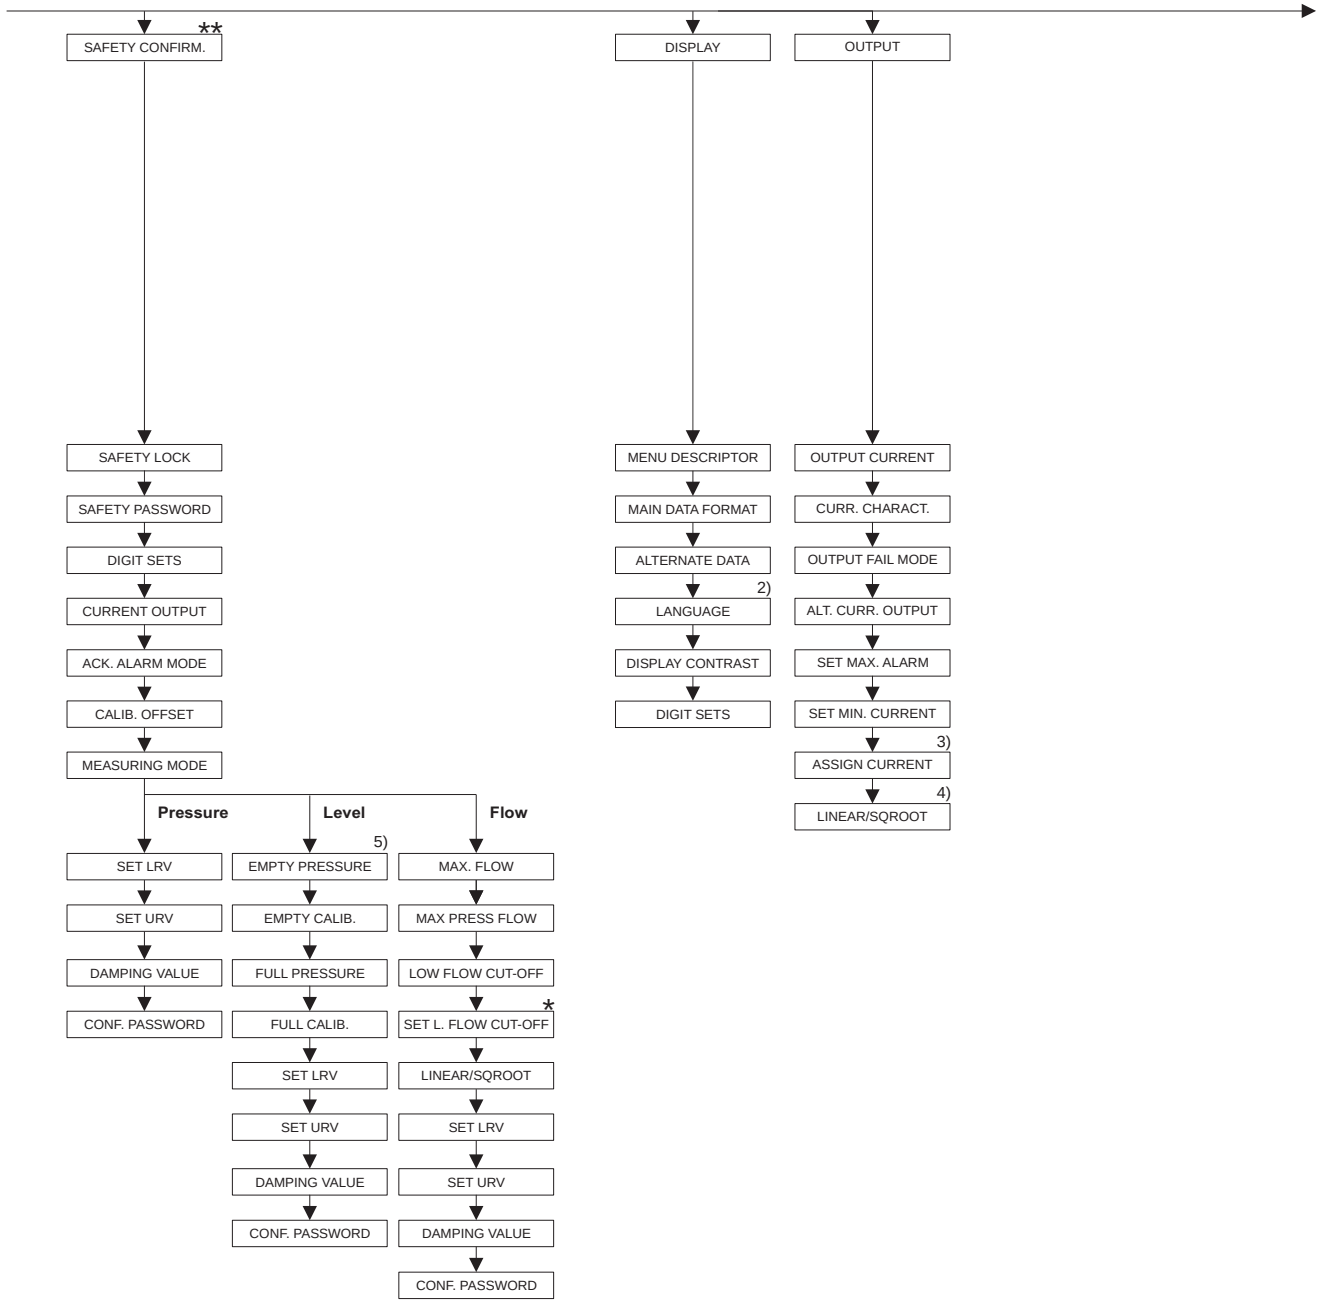
There are parameters that are only displayed if other parameters are appropriately configured.
For example the CUST. UNIT FACT. H parameter is only displayed if the "User unit" option was selected for the HEIGHT UNIT parameter.
These parameters are indicated with a "*".

P01-xxxxxxxx-19-xx-xx-xx-140



There are parameters that are only displayed if other parameters are appropriately configured.
For example the TOT. 1 USER UNIT parameter is only displayed if the "User unit" option was selected for the TOTALIZER 1 UNIT parameter.
These parameters are indicated with a "*".

P01-xxxxxxxx-19-xx-xx-xx-101



2) Display via digital communication

3) Level measuring mode only

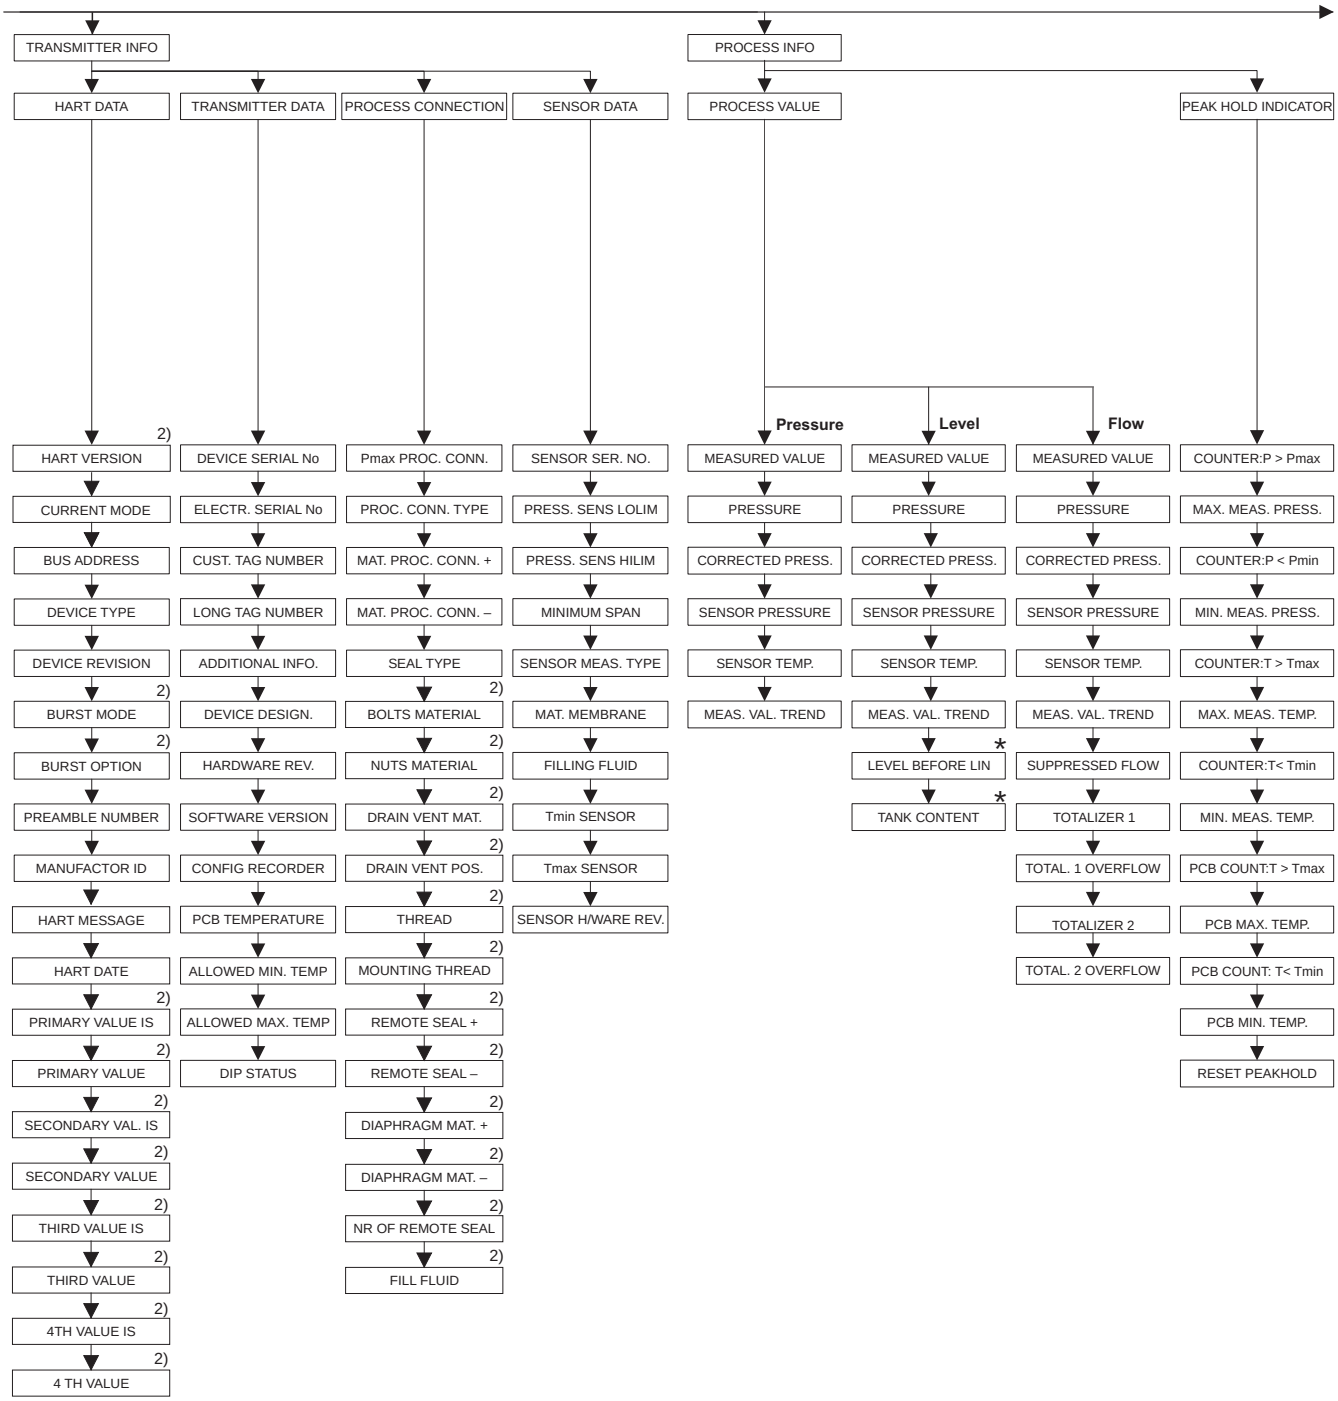
4) Flow measuring mode only

5) only LEVEL SELECTION = Level Easy Pressure

There are parameters that are only displayed if other parameters are appropriately configured.
These parameters are indicated with a "*".

** See Safety Manual SD190P for Cerabar S, SD189P for Deltabar S or SD213P for Deltapilot S.

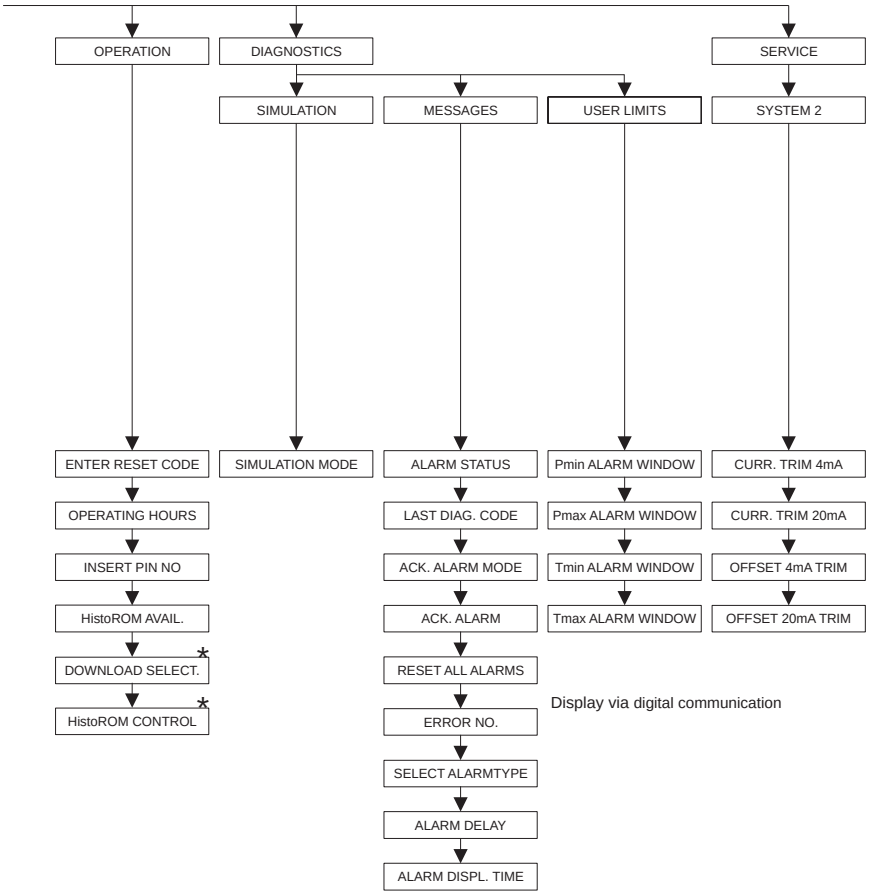
P01-xxxxxxxx-19-xx-xx-xx-141

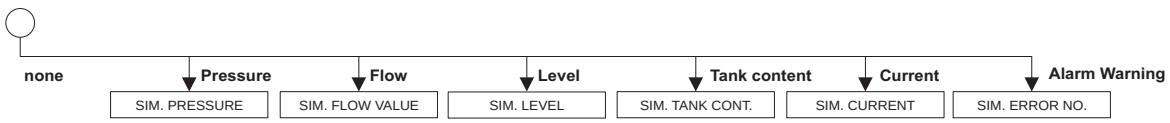


2) Display via digital communication

* There are parameters that are only displayed if other parameters are appropriately configured.
These parameters are indicated with a "*".

P01-xxxxxxxx-19-xx-xx-xx-142





* There are parameters that are only displayed if other parameters are appropriately configured.
These parameters are indicated with a "*".

P01-xxxxxxxx-19-xx-xx-xx-143

INSTALLATION & OPERATION MANUAL
MIX-TECH MIXERS

S E C T I O N 1 - INSPECTION

- Make sure that all mixer parts have been removed from the crate(s) before discarding.
- Each mixer should be carefully checked for any possible shipping damage. Any shipping damage should be reported to the TRANSPORT COMPANY immediately.
- Check the paint and make any necessary touch-ups.

S E C T I O N 2 - INSTALLATION

- Most mixer problems can be avoided by following proper installation and operation instructions. The following is a list of hints to help insure proper installation and therefore satisfactory mixer service.
- Please read all appropriate instruction manuals prior to proceeding with the installation of the mixers.

C AU T I O N

- Lock-out the motor starter if any person is in the tank.
- Remove wick from the breather vent plug.
- DO NOT Paint breather / vent plug

MOST COMMON PROBLEMS: Mixer Shaft(s) not vertical; Impeller going through liquid level

- Make sure the impeller blades have been installed onto the hubs in the proper position with regards Rotation and Direction of flow. Please also note that the impellers blades are installed with the hubs ears always backing the blade into the flow. Also be sure that the leading edge and not the trailing edge is presented into the flow and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15° rather than to 75°.

C A U T I O N

- If the angle of attack (at the impeller tip is closer to 75°, either an incorrect hub in combination with the correct impeller blade (OR VICE VERSA) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should be, Please refer to the mixer nameplate that will have the Rotation and direction of thrust written. Once you know the combination, refer to the pictorial guide of impeller / hub installation positions A, B, C or D.

- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attach at the impeller is closer to 75°, the HP drawn will be 2 to 3 times greater than what it should be. This could result in overloading the motor and damaging the mixer.

- Make sure that the impeller blades are installed in the correct position for the required rotation. e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the impeller blades to suit.

C A U T I O N

POTENTIALLY DAMAGING SITUATIONS FOR MIXERS

- Prolonged operation of the mixer (impeller) at the liquid interface causes increased stress on the shaft & impeller for which the system was not designed to accommodate. Damage could result.
- Installations where there is a large hydraulic flow (or Velocity) in the mixer reservoir. : Make sure that if should such a flow is present, that the flow is baffled or dispersed over a larger area (as opposed to directed flow via a pipe), or that the flow be re-directed away form the impeller/shaft assembly, or is introduced evenly e.g via a weir. If this cannot be done, this external hydraulic flow will exert additional un-designed for stress loads and deflection on the mixer shaft and impeller which could result in component failure.

C A U T I O N

- Before permanently wiring the motor, check for the correct rotation of the low speed shaft. Normal is Clock-wise looking down from the top of the tank, although the reverse may also be required. Please check mixer nameplate for other instructions. (e.g. Letters A, B, C or D)

- Read and follow the instructions of all tags and nameplates before operating.
- Check the mixer full load motor amperage and voltage before operating any mixer.
- It is recommended that the mixer impeller be rotated by hand in order to check for smooth operation. **N.B**: For crown & worm drives, remove the fan cover and rotate the fan manually.
- Always operate the mixer in a fluid which had a specific gravity and viscosity less than or equal to the design specific gravity and viscosity.
- Do not dump the contents of large bags of chemicals directly onto the rotating mixer impeller(s); but add the contents into the reservoir gradually. This will also promote better mixing.
- Before starting the mixer, make sure the impeller is not buried in solids or a "set-up" fluid Note: If solids have settled-out, then dilute or jog the mixer clockwise then counterclockwise
- Please check that there is no directed flow from an external source at the impeller or shaft unless the mixer was specifically designed to accommodate these additional stress loads, as mixers could be damaged.
- During START-UP, please listen for unusual noises and check for excessive vibration.
- Check the temperature of the motor and gear reducer. The temperature should not exceed 180º F. (82ºC) If they are too hot, please stop the operation of the mixer and contact MIX-TECH immediately.
- Measure the motor amperage. The measured amperage must be less than the nameplate rating nameplate value. If the amps are over, please check the rotational speed of the gear reducer/mixer output shaft. Place a piece of tape onto the shaft (or use an RPM counter if available, and count the number of revolutions for a period of e.g. 10 seconds using your watch second hand. Multiply the result by (6) for 60 Hz operation and this will provide you with the rotational speed of the mixer. Check Rotation, & impeller blade installation to be sure they are correct. If the power draw remains high, please check with MIX-TECH

Note: - Record the full load motor amperage (FLA) and measure them every (3) months.
- Some motor amperage readings are poor indicators at low loads

C A U T I O N:

- **DO NOT STAY IN THE TANK DURING MIXER ROTATION**
- Never use the mixer impeller as a foot stand or support for body weight - as such actions could damage the mixer as well as result in serious bodily injury.

- As with any rotating equipment, in order to avoid injury, extreme care should be taken to avoid contacting the rotating parts including not connecting the motors to the electrical power source until the mixer is completely assembled. Then, vacate the tank prior to operating the mixer.

- Before making field changes of motor horsepower, mixer speed, shaft length, impeller diameter or width, etc. be sure to consult with ENVIREQUIP, MIX TECH DIVISION.

- After any plant electrical work has been done, check that the mixer(s) rotation(s) are correct as power lines may have been reversed**.**

S E C T I O N 3 - MIXER ASSEMBLY: - Closed tanks are Flange Mounted

- Open tank models usually are mounted on a steel structure. Level the drive as closely as possible. This assures that the shaft will turn in a true vertical position. Incorrect mounting is often a cause of mechanical difficulty with a mixer. Unless specified on the mixer assembly drawing, the mixer extension shaft is designed to run in a true vertical position. Never angle or side mount the mixers.

- While operating, there is random fluid motion in the vessel that exerts great forces on the extension shaft of the mixer. The mixer accommodates these forces since they are transmitted directly to the support mounting(s). Therefore, the mounting system must be rigid. It must support the static mixer weight as well as live mixer reactions that result from Torque and Bending Moment. It is not enough to design the support system for acceptable levels of stress. It must be rigid enough to take care of Start-up torque load (2.5 times the Torque), and preclude large deflections that may result in mixer vibration.

- When designing the support structure to accommodate bending moments, be sure that the structure is sufficiently rigid so that the mixer extension shaft will not move more than 1/32" per (10) feet (0.8 m per 3.05 meters) of shaft length due to deflection of the support structure.

- After the gear drive (with the motor already flange mounted onto the drive) has been properly installed, the mixer extension shaft should be installed into the gear drive's hollow output shaft (quill shaft) and fastened in the quill shaft with the thrust plate and secured in position with the threaded bolt provided - use Locktite Blue (or equivalent), or in the case of an output shaft coupling, bolt the mating flanges together.

- Mixer blades over 20" in diameter are generally bolted to a welded hub. Check the welds on the hub on your yearly overall inspection.

- These mixers are supplied with the finest electric motors available. They are manufactured by a nationally known manufacturer, (e.g. NORD, WEG, Brook etc). Under normal operating conditions, within specified temperatures, proper installation and maintenance, these motors are guaranteed to deliver rated output.

- In order to get top performance from any electric motor, be sure that there is plenty of air circulation and a minimum of obstructions. On fan cooled motors, be sure not to choke off the suction inlets, also be sure to check the allowable temperature that's indicated on the motor nameplate. Don't decrease the service life of a motor by operating it at excessively high ambient temperature.

- In order to avoid damage to the motor during temporary overloads, jams, etc. be sure that correctly sized overload protection is provided. Starter overload heater elements can be sized from the full load current of the motor as shown on the motor nameplate. It is advisable to consult a supplier of motor control equipment when selecting thermal overload heaters.

- Before the motor is permanently wired, check to be sure that the output shaft rotation is correct (Normally clockwise looking down from the mixer drive, but sometimes counterclockwise depending on the process requirements)

C A U T I O N:

- Make sure to check rotation of the mixer before it is operated. To reverse the rotation of standard 3 phrase electric motors, simply switch any two power leads.

M O T O R S P E C I F I C A T I O N S: 1800 RPM - (4) pole

- NORD motors carry the CE mark in accordance with the Low Voltage Directive
- NORD motors are designed to operate at elevations up to 1000 m (3300 ft) above sea level

Altitude: up to 1000 m	= 100% output	Ambient Temp = 40º C
Above 1000 up to 2000 m	= 92% output	Ambient Temp.= 32º C
Above 2000 up to 3000 m	= 83% output	Ambient Temp = 24º C
Above 3000 up to 4000 m	= 74% output	Ambient Temp = 16º C

- NORD motors are designed to operate with a maximum ambient temperature of 40º C (104ºF) - for higher temperatures, motors have to be de-rated or an upgraded insulation used.

Ambient Temperature:	(104^0F)	40º C = 100%
		45º C = 95%
		50º C = 89%
		55º C = 83%
		60º C = 67%
		70º C = 64%

EXAMPLE: A motor designed for an output of 100 HP to operate in the mining area of Bolivia (altitude 4000 m above sea level). **NOTE**: 1000 meters = 3281 Feet
Output reduction: the maximum allowable output of the motor would be 74% (74 HP)

Ambient temperature limit: the motor may operate at its rated output of 100 HP provided that the ambient temperature does not exceed 16° C

Note: You can operate over 3300 feet, but you have to de-rate the motor

– Voltages: Canada 575/3/60,TEFC; USA 460/3/60, TEFC; Europe 400/3/50, IP55 ; Australia 415/3/50

– **Tolerances Voltage & Frequency**: ± 10% based on rated voltage; Line frequency tolerance ± 5%. Combined **MAXIMUM** variation in voltage and frequency ± 10%

-- MG1 Part 31 suitable for inverter service

– Insulation Class is Class F (non organic)

-- High-efficiency design for motors 1 HP and up

– Service Factor 1.15

– The Standard Nord motor fan is a non-sparking

– Each Nord motor uses a terminal block

– Integral Nord motor (unless Nema motor with "C" flange)

S E C T I O N 5 - Pedestals: Shaft & Gearbox Removal - EVG SERIES

• Series EVG standard design of the dry-well pedestal and shaft catcher is one where the flinger (for the dry well) and the shaft catcher are one-in-the-same part serving both purposes.

SHAFT REMOVAL AND / OR TO REMOVE THE GEAR REDUCER:- **See assembly dwg**

i) Lock-out electrical power to the electric motor.

ii) If the electrical wiring is not long enough to allow removal of the gear reducer, dis-connect the motor wiring.

iii) Remove the safety cover located on top of the gear reducer exposing the bolt (# 3) and top plate (# 4) which holds the shaft (# 12).

iv) Slowly remove the top bolt.(# 3).

v) As the bolt is loosened, the shaft and impeller assembly will be lowered a distance of about 0.125" (3.175 mm).

vi) After the bolt has been loosened sufficiently, the flinger (# 8) will come into contact with the Pedestal to the inner support pipe (# 11) and stop there.

vii) Remove the bolts holding together the Adaptor plate Reducer to Pedestal top plate (# 7).

viii) Lift-off the complete gear reducer unit the gearbox clears the shaft.

ix) Inside of the Pedestal (# 10), you can now see the flinger (#8) which rests on the Collar / Clamp (2) Bolts / Shaft catcher (# 9).

x) Prior to un-doing the set screws on the collar / Clamp, make preparation to handle the shaft which will now fall through the dry well (# 11) and into the tank.

xi) Once the shaft is secured loosen the set screws on the Flinger assembly or Clamp bolts (# 9).

xii) **To Reinstall the shaft** (et al) follow the above procedure in Reverse.

Note: In older designs, the flinger was welded-onto the shaft. In that case, the shaft can only be removed vertically through the top of the Pedestal.

C A U T I O N:

- Prior to loosening the (3) set screws on the flinger/shaft-catcher, please ensure that there is some means of holding the shaft in-place (if no Clamp supplied, use (2) pieces of wood 4" x 4" or 6" x 6" with tightening bolts to hold the shaft in place via friction) IF NOT, THE SHAFT WILL DROP INTO THE TANK possible causing damage to the equipment or vessel and bodily injury. Shafts are often of sufficient weight to cause serious bodily injury or even death were it not properly secured.

- You may want to install a plastic hose in the pedestal so that you can monitor if the gear reducer is losing oil and collecting in the dry-well pedestal.

A Split Collar is used to prevent the shaft from accidentally falling from the gear reducer:

NOTE: On older Series EVG, there may not be a Split Ring but rather a flinger that rests on the dry well seal to hold the shaft in-place

– (i) Insert eye-bolt in top centre of the impeller shaft.
(ii) Slowly lift up the complete impeller shaft assembly a distance of 6 mm (0.25").
(iii) Remove the split collar that rests against the top of the quill shaft of the gearbox.
(iv) Slowly lower the complete shaft/impeller assembly a distance of 10 to 12 mm (0.375"to 0.50".
(v) At this point, the flinger/clamp ass'y will come into contact with the pedestal top inner support pipe/Dry-well
(vi) Remove bolts.
(vii) Lift off the complete gear reducer until the gearbox clears the shaft and eye-bolt.
(viii) The reinstall the gear drive, follow the above procedure in reverse

---

S E C T I O N 5 - SHAFTS, IMPELLERS & FLANGED COUPLINGS

SHAFT - STRAIGHTNESS:

- When shipped, the mixer extension shaft was straight to within 0.003" per foot (0.25 mm per meter) of shaft length for mixers equipped with centre-less ground shafts (Special Order/ uncommonly used). If the shaft does not appear to be damaged, but the run-out is greater than the above standard, the shafting supplied may have been "smooth-turn" (more commonly used), which might not be dimensionally
the same over the entire length of the shaft. This is probably still acceptable. In such cases, or where it might be difficult to obtain an accurate shaft run-out value, we may apply another rule: 0.25 to 0.50% of the impeller diameter = the maximum shaft run-out at the bottom of the shaft. e.g:

50" diameter impeller	0.14 to 0.28"
100" diameter impeller	0.26 to 0.53"
150"diameter impeller	0.40 to 0.67"

S E C T I O N 5 - SHAFTS, IMPELLERS & FLANGED COUPLINGS

- Flanges are used as shaft couplings when shaft extensions exceed approx 12'-0" (3.65 m) Ensure that the bolts are tightened and that a product like Never Seize (or equivalent) is used. Refer to the table (in this manual) for torque tightening values

  Recheck bolt tightness after 1500 hours (or (3 months)

These couplings are welded onto the shafts with (4 to 6) gussets and are not removable.

C A U T I O N:

- Handle the shaft carefully to be sure that it is not bent.

- After the shaft has been installed, check it for straightness. Storage and handling may have resulted in a bend. To check it, an indicator is placed at the end of the shaft, and the high speed shaft is then rotated by hand. Runout of the total shaft should not be greater than the above \references values. If the runout is greater than the above values, the shaft can be re-straightened in the field. To re-straighten the shaft, follow this procedure:

- Where the maximum, positive readout is found, place the indicator on that side of the shaft.

- Heat the shaft at a point of 180° from the indicator, (and just below the first in-tank coupling if applicable), apply heat just below the mounting nozzle.

- The shaft will grow toward the indicator as heat is applied to it. However, DO NOT permit the surface temperature to go over 500° F (260° C). Use Tempilstics or equivalent

- The shaft will straighten since it will draw more than it grows.

- After each heating process, rotate the shaft and recheck until the straightness is within tolerance to meet the allowable tolerance

- To install any impeller, simply slide the impeller hub onto the extension shaft above the shaft keyway. Install Hook type (Gib) key into the keyway making sure that the pin is inserted into the

  correct hole for proper impeller location. Lower the hub (with or without blades bolted-on) down onto the key. Tighten set screw. Bolt -on blades if not already done.

NOTE: All MIX-TECH Portable mixers operate at least 35% below the 1st Critical speed or harmonic frequency - There is no danger of "hitting-on" or approaching the 1st Critical speed - (Unless specifically mentioned otherwise)

- Please refer to the specific manufacturer's installation and operating manual.
- Correct lubrication practices are essential to long life and satisfactory performance of a gear drive. Be sure to use the right lubricants as recommended. With proper lubrication

maintenance, the gear drive will carry its rated design load and provide years of satisfactory operation.

SECTION 6 - SHAFTS, IMPELLERS & COUPLINGS

IMPELLERS

- Make sure that the impeller blades have been installed onto the hubs in the proper position with regard Rotation and Direction of flow. Please also note that the impellers blades are installed with the hubs ears always backing the blade into the flow. Also be sure that the leading edge and not the trailing edge is presented into the flow and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15° rather than to 75°.

C A U T I O N

- If the angle of attack (at the impeller tip is closer to 75°, either an incorrect hub in combination with the correct impeller blade (OR VICE VERSA) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should be, please refer to the mixer nameplate that will have the Rotation and direction of thrust written. Once you know the combination, refer to the pictorial guide of impeller / hub installation positions A, B, C or D.

- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attach at the impeller is closer to 75°, the HP drawn will be 2 to 3 times greater than what it should be. This could result in overloading the motor and damaging the mixer.

- Make sure that the impeller blades are installed in the correct position for the required rotation. e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the blades to suit.

SECTION 7 - GEAR DRIVE MAINTENANCE

C A U T I O N:

- By following instructions, many premature gear and bearing failures can be avoided.

- Keeping a maintenance log is highly recommended.

- Lubricant used in the gear case must be free of dirt, metal particles and other contaminants. Use only new oil. Strain the oil if there is any possibility that it contains contaminants.

- To equalize pressure inside and outside the gear case, a breather vrnt is installed on top of the unit. This breather normally requires no maintenance, and must not be blocked. Check hole for free breathing.

PORTABLE MIXERS:

Lubrication For PORTABLE MIXERS (**Series "EHG"**), the Crown & worm gear reducers are filled for life (20,000 hours or (4) years) with synthetic oil

C A U T I O N:

- For shipment, the gear-case is drained of oil (EXCEPT FOR NORD drives) - Be sure to fill the gear case with the proper lubricant to the proper level. Install breather. DO NOT OVERFILL - N.B: if the reducer is already filled, (as is the case with NORD drives), Do not forget to install the breather(s) or the seals may fail.

- **RECOMMENDED LUBRICANTS FOR NORD HELICAL GEARING**:
  These Nord Gear reducers are factory-filled with Shell Omala 220 mineral oil or with Chevron ISO FM 220 food grade oil (if required), or equivalent:
  or with Shell Omala 220 regular mineral oil fill when the mixer is provided with a dry well seal unless otherwise specified:

  N.B: A reducer previously filled with Shell Omala 220 mineral can be drained (as much as practical to achieve), and Chevron ISO FM 220 substituted without any harmful chemical reactions or reduction to the lubricating quality of the new (or old) oil.

- Please note that the gear reducers for MIX-TECH'S "EVG" series are Nord Parallel shaft drives. The top output bearing is grease packed although there is not grease nipple. Please remove the seal and re-pack the bearing with grease. (please refer to NORD instruction attached)

- The output shaft seals are "Quadrilip" having (2) discrete grease filled pockets

---

S E C T I O N 7 - GEAR DRIVE MAINTENANCE FOR SERIES EVG & EVGX parallel Shaft design gear reducers:

- **RECOMMENDED OIL CHANGE INTERVALS IN NORD IOM: -**
  Synthetic lubricants should be changed every 20,000 service hours or (4) years;
  Mineral oils should be changed every 10,000 service hours or after (2) years. See gear reducer service manual (IOM).

C A U T I O N:

Units should be checked out periodically for increased noise, surface temperature, vibration, shaft

movement, and amperage draw. Units with inspection covers should not be operated with the inspection covers removed.

PROCEDURE FOR RE-GREASING THE UPPER OUTPUT BEARING equipped with Tapered roller bearing option:

- Remove upper output shaft seal(s).
- Inspect bearing cavity for presence of grease. The bearing cavity should be packed to approximately 1/3 full with grease.
- If required, inject grease into the taper roller bearing until the cavity is filled to 1/3. A Needle Nozzle is generally required on the grease gun, because the shim(s) partially cover the access to the bearing cavity**.**
- Install new upper output seals**.**

Note: The other bearings in these gearboxes are open and are submerged in oil.

The recommended interval for changing the gearbox oil is every 10,000 hours of operation.

- The standard ambient temperature selected is 15 to 125° F (9 to 52° C) for the gear reducer**.**
- Some Gear reducers are equipped with bulls-eye oil level indicators**, others have a plug.**

S E C T I O N 8 - BOLTS

- Impeller blades & other in-tank fasteners are supplied as standard with lock-washers.

C A U T I O N:

- Extreme care should be taken to see that locking devices are properly installed and to be sure that the bolts/studs are properly tightened and lubricated.

It is recommended that all in-tank fasteners (and all other bolts), be rechecked for tightness after the first 1500 hours of operation and subsequently, at each scheduled shut-down and that a suitable lubricant be used e.g. Never seize or equivalent.

RECOMMENDED BOLT TORQUE VALUES:

BOLT SIZE	TIGHTENING TORQUE (Foot Pounds)		
½" - 13	50	1.25" - 7	580
5/8" - 11	100	7/8" - 9	190
3/4" - 10	190	1.50" - 6	1000
1" - 8	290		

NOTE: Tighten all bolts as specified. Lubricate all fasteners with an anti-seize product. If no lubrication is used when tightening the bolts as specified, multiply the table values by 1.3

GEAR REDUCER & MOUNTING PLATE BOLTS:

These bolts are also subject to high loads and should be properly torqued to prevent bolt stretch and/or reducer wobble. For situations with large reducers or long shafts with large reducers, use additional care to make sure that these bolts are installed and torqued properly

This "Turn of the nut Method" can be summed up in one sentence: "Turn the Nut ½ to 2/3 turns beyond the snug tight position, "this applies to any bolt of any size. However, fasteners should be clean, rust free and lightly oiled.

In cases where the nut is not accessible, the bolt may be turned ½ to 3/4 turn beyond snug tight.

LEVER ARM SYSTEM	Bolt size	Lever Arm
	1/4 - 3/8"	6" handle
	7/16" - 5/8"	12" handle
	3/4" - 1.125"	24" handle
	1.25" and over	36" handle

Note: This lever arm system should be used with or without lock-washers. If lock-washers show sign of splitting or fatigue, they must be replaced

S E C T I O N 9 - OPERATION

- The mixers that you have purchased have been designed to accommodate all the loads that will be encountered in the normal course of operation.

C A U T I O N:

- Care must be taken to avoid prolonged operation of the mixer impeller(s) at liquid interface. These mixers were not designed to operate under those severe conditions and could become damaged.

S E C T I O N 10 - MOTOR REMOVAL & INSTALLATION OF MOTORS:

- For Nema "C " Flanged motors (not integral motors)
  The motors supplied have been installed onto the reducers. In the event of motor maintenance, remove the bolts which hold the gear reducer's Nema "C" flange adaptor to the motor's "C" face. Remove the coupling half and service the standard NEMA motor as required. INSTALLATION: reverse the procedure. Please refer to **"COUPLING ENCLOSED"** cross sectional drawing which shows the mounting distance 1 13/16" (46.03 mm). Note that the coupling is keyed onto the motor shaft (key provided).

- In the case of NORD integral motors, remove the bolts. The motor can then be removed exposing the high speed pinion gear mounted on the motor shaft. The motor can then be serviced as required.

S E C T I O N 11 - TROUBLE-SHOOTING / MIXER PERFORMANCE

- **PERFORMANCE**: If you find that the mixer is not performing according to your expectations, one of the things that directly affects mixer performance is Baffles (or lack thereof)

Note: Also check that the impeller blades are in the correct configuration A, B, C or D, that the correct blades are matched to the correct hubs and that the rotation is correct.(Please refer to Section 6 Pages 7, 8 & 9 for more information.

N.B: Baffles always help any mixer application by providing the means to convert rotational motion into to top-to-bottom- pumping/mixing.

- If the viscosity of the fluid is over 25,000 cp, then baffles are not necessary.

- If the vessel is rectangular in shape, baffles may not be necessary.

- In circular or square vessels, the use of baffles is mandatory.

- OTHER METHODS of achieving top-to-bottom motion without using baffles:
  - Off-centering the mixer by 20% (uses the vessel as a baffle)
  - Angle mounting (into a quadrant)- often seen on Portable mixers. If you want to angle-mount a larger mixer, please check to be sure that the shaft was designed to accept these additional stress loads.

- **OIL LEAK(S)** problems with Nord Gear reducers: In order to be able to address the

- **OIL LEAK(S)** For Series EVG supplied with a flinger / shaft Catcher & dry well seal:

NOTE: For Series **EVGX**, There is an oil overflow plastic pipe indicating oil leak>

- If one of the (2) output oil seals were to fail (very rare), then the oil would migrate down the output shaft, and be pumped by the flinger into the moat surrounding the dry well pipe. Any such leak would be contained by our sealed pedestal. (access to it is by a plug). Any other oil leak will be visible on the outside of the gear reducer

SYMPTOM	REASON(S)	SOLUTION
Oil leak on the reducer	Vent plug not installed Vent plug painted over Vent plug failure	Clean up oil and remove the vent plug If this stops the leak, change the vent plug
Oil leak on top of the reducer	Motor and/or top bolts not tightened	Use Teflon tape and tighten bolts
Oil leak on top of reducer	Too much oil in the reducer will be forced out of the vent	Check oil level and adjust to site glass
Oil leak on end plate	Bolts loose	Tighten bolts
Oil leak on top of the reducer	Gasket between motor and the reducer failed	Replace gasket and silicone dealant
Sign of oil on the reducer	Drain pipe & valve damaged	Use Teflon tape /sealant to try to reseal
Oil leaking on reducers with "C" flanged motor(s)	if the vent was not installed, plugged or faulty, the oil presure in the reducer might have exceeded 2 psi causing the input oil seal to "blow-out"	Change the input oil seal

- **NOISE**: Under normal circumstances, Mix-Tech mixers operate quietly and without vibration. If there is a metal-on-metal noise, check to see if the top bolt # 3 is properly tightened to the shaft. If the bolt is not, the shaft will lower than it should be and the flinger/shaft catcher may be touching the dry well pipe

- **HEAT**: Check the temperature of the Reducer and motor. If hot, check the oil level.

NOTE: On Series EVG & EVGX, an oil expansion chamber is supplied to minimize problems with over-filling of oil into the gearcase

- These mixers should provide long and satisfactory service. Only the finest materials were employed in their manufacture. However, if any defects in materials or workmanship occur, the defective part(s) must be returned to ENVIREQUIP (div 6335772 Canada Inc), **MIX TECH Division**, freight prepaid. ENVIREQUIP reserves the right to repair or replace, at its discretion, any part that proves to have been defective in materials or workmanship.

- ENVIREQUIP is not responsible for the warranties on components purchased, e.g. motors, but will endeavour to help to obtain resolution of any problem(s) with any of our sub-supplier(s) as regards their warranties.

- ENVIREQUIP specifically excludes any liability as to loss of production, improper use of the equipment, abuse, any other liability expressed or implied that exceed the limited warranty given as applies to the equipment being free of defects in materials and/or workmanship.

- ENVIREQUIP's warranty is for (2) years against defects in materials or workmanship and also includes a process warranty.

- This Process warranty only applies to the actual conditions that were specified at the time of bidding.

- Please refer to the terms and conditions as well as to the warranty for complete details.

1 GENERAL

1.1 General safety instructions for PV & PVE valves

In this manual, the following symbols are used to highlight the parts requiring particular attention:

SYMBOL	DESCRIPTION
	Risk to personal safety: Neglecting the safety measures can cause serious personal injury or death.
	Electrical safety: Neglecting the safety measures can cause serious personal injury or death.
	Machinery or environmental risk: Incorrect maintenance or operation of the product can harm the environment or the product.
	**Read the operation and maintenance instructions:** Read and understand the operation and maintenance instructions before using the product.

2 INTRODUCTION TO DEVICE

2.1 Intended use

Open type PV.
The open body is available in diameters starting from 80mm.
The open body construction is designed for applications with:

- Low pressures
- Low temperatures
- Non-hazardous media

The open body construction is light and simple, which makes it easy to access for service. The open body also tolerates misalignment and vibration.

Enclosed type PVE.
The valve sleeve is covered by the body housing and thus protected from the environmental impacts and sunlight.

- Body construction prevents leakage of flowing media to the environment
- The valve body can be equipped with a gauge indicating pressure changes inside the body

2.2 Construction of device

Flowrox valves are made of three main components:

- flanged valve sleeve
- valve body, either open PV or enclosed PVE
- actuator and actuator control components, if applicable

The valve sleeve is the only part of the valve which is in contact with the medium flowing in the pipeline.
All valve bodies are flange ended. The standard flange drillings can be made to meet all standards (e.g. DIN, ANSI, BS, AS, JIS).
The face to face dimensions of Flowrox valves are according to ANSI/ISA 75.10.02:

- 165 mm for valves DN25…DN65
- 2 ½ times the nominal diameter for valves DN80 and bigger

2.2.1 Open body valve PV

In the open body model the body and the actuator are connected only to one of the end flanges (Fig. 1.). The construction allows a slight deviation in the pipe angle and the valve can act as a vibration absorber.

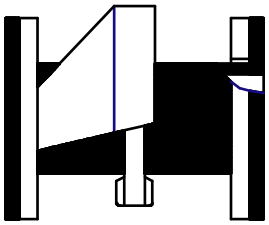

Fig. 1.

	Note that in case of a sleeve breakage, the flowing liquid will leak to the environment.

2.2.2 Enclosed body valve PVE

The body of the enclosed model prevents leakage of flowing media to the environment (Fig. 2.). The lower part of the body has a plug, which can be opened to check for sleeve failure.

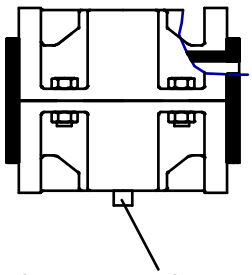

Fig. 2. plug

	In case of a sleeve failure, slight leakage will occur through the bushings. If you open the plug for checking, be careful as the medium may flow out.

	Changing the sleeve at appropriate intervals prevents leakages.

2.3 Valve function

DANGER	When the valve closes the actuator moves. Do not put tools or parts of your body between the moving valve parts. Note the injury risks (see drawings 3A and 3B).

Note the dangerous places (see drawings 3A and 3B)! When the pinch valve closes, two pinch bars, moved by the actuator, squeeze the sleeve, closing on the center line. As the valve is fully closed, the actuator has raised one half of the valve diameter. The actuator raises in both models (PV and PVE) 0.5 x valve nominal diameter (measure X). In the open model the space between the pinch bars, the space between the upper pinch bar and fixing plate of the actuator and the space below the lower pinch bar.		Fig. 3A - PV open model
In the enclosed model the space between the valve body and the fixing plate of the actuator and the ends of the guide bars of lower pinch bar below the valve body.		Fig. 3B - PVE enclosed model

Regarding the actuators, follow the instructions of the manufacturer.

NOTE	Note the possible remote control of automatic valves and turn it off before starting maintenance.

3 TRANSPORTATION, STORAGE AND LIFTING

3.1 Receiving

Check the condition of the valve package on arrival. If it shows signs of transport damage, check the operation of the valve carefully. Normally, a visual inspection of the valve is sufficient. However, if valve has been damaged during transport, contact your nearest Flowrox sales office immediately.

3.2 Storage

The sleeves must be stored as follows:

- The storing temperature should not exceed +25°C, preferably below +15°C but not under +5 °C. Keep the storage temperature as constant as possible.
- Store the sleeves in a dry place. Prevent water from condensing on sleeve surfaces.
- Avoid ultraviolet light. Protect the sleeves against straight sunlight. Use warehouse instead of storing outside.
- Remove all equipment generating ozone from the room where sleeves are stored. Minimize the store room ventilation.
- Store sleeves so that they are free from tension. Sleeves should be stored in vertical position on smooth support. Do not store sleeves one on top of another.
- Keep the sleeves off the chemical effect of solutions, semi-solids, impurities and solvent vapours during storing.
- Try to keep the storing time of sleeves as short as possible. Always use first the material which has been longest in stock.

3.3 Lifting

When lifting the valve, fasten the ropes to the valve body or around it. Note the center of gravity and support the valve to avoid it turning around. In some models the center of gravity is located towards the actuator.

4 INSTALLATION

4.1 Open body model (PV)

The sleeve has not been designed to withstand axial forces. The pipes must therefore be supported properly so that neither tension nor compression is caused. Use cross-tightening for flange bolts. Do not overtighten bolts.

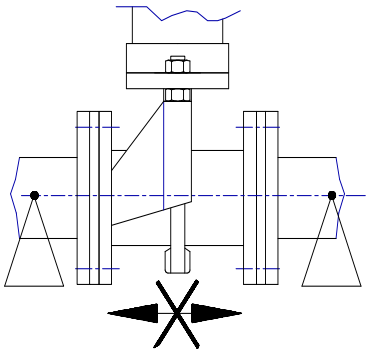

Fig. 4.

Make sure that no inappropriate items get between the pinch bars and the sleeve.

If possible, protect the sleeve from direct sunlight. Direct sunlight and UV light deteriorate certain rubber qualities; this must also be considered during normal use.

A lengthwise angle deviation of max. 5º in the pipe is allowed (Fig. 5).

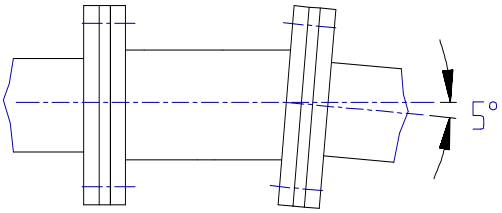

Fig. 5.

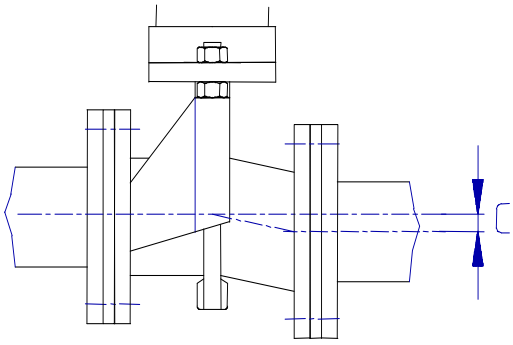

Fig. 6.

Deviation in the center line of the pipe (C), (Fig. 6):

PV 80…100	max. 5 mm
PV 125…250	max.10 mm
PV 300…500	max. 15 mm
PV 550…1000	max. 20 mm

4.2 Enclosed body model (PVE)

Make sure that no inappropriate items get between the valve body and the actuator.

4.3 Both models (PV and PVE)

The valve nominal size means the inner diameter of the sleeve. The pipe inner diameter should match this diameter as closely as possible. Whenever possible, install the actuator in a vertical position. Valve can be assembled either way in terms of flow direction.

If you have to install the actuator horizontally, it has to be supported to ensure the operation, especially if the actuator is heavy. Install a sliding surface under the actuator (Fig 7).

The support can be fixed on the wall (1), on the floor (2) or the pipeline (3).

The valve can be installed in either way depending on the flow direction.

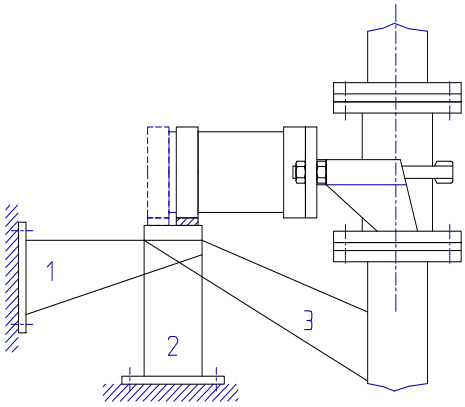

Fig. 7.

When installing the valve to the pipeline, it has to be in the open position. Tighten the flange bolts smoothly crosswise

	Do not fasten actuator or any part of it to the support.

5 OPERATION

5.1 First use

Flowrox valves are normally delivered fully assembled and ready to use. Check the condition of the valve visually.
After installation to the pipeline, check that all connections are leak-proof.

5.2 During operation

During the operation the valve does not normally require any maintenance. The sleeve change is described in 6.2.

To ensure smooth operation, it is recommended to change the valve sleeve regularly.

Regarding the actuators, follow the instructions of the manufacturer.

	Note the valve functions, see 2.3.

6 MAINTENANCE

6.1 Schedule

The sleeve is the only part of the valve which is in contact with the medium flowing in the pipeline. With regular sleeve changing, the likelihood of malfunctions in the process decreases. Wear resistance of the sleeve depends on the circumstances of the process and may vary a lot.
If there is a flow through closed valve or leakage through bushings (PVE) or through damaged sleeve (PV), change the sleeve immediately.

	PVE: In case of a sleeve failure, slight leakage can occur through bushings. PV: In case of a sleeve breakage, the flowing liquid will leak into the environment.

6.2 Changing the valve sleeve

	Control the valve functions (see 2.3) and follow the instructions for adjusting of valve (6.3) to prevent accidents and to ensure the correct operation of the valve.

6.2.1 Changing the valve sleeve in open model valve (PV)

See appendix A. Open the valve and detach it from the pipeline. If the valve is equipped with opening tags, loosen the fixing screws (8 pcs) at the pinch bars and pull out the opening tags (Fig. 8).

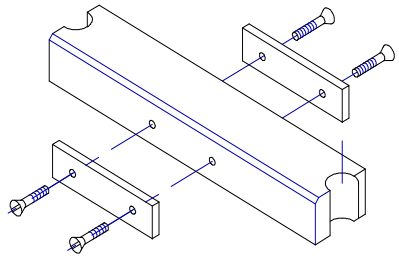

Fig. 8.

Remove the broken sleeve by bending the rubber flange of the sleeve and by wrenching it e.g. with a pry bar / bending iron.

Put in the new sleeve by pressing the rubber flange on the opposite sides together, pushing its edge as far as possible through the steel flange and wrenching the rest of the sleeve through the flange e.g. with a pry bar / bending iron (see Fig. 9).

NOTE	The rubber flange of the sleeve allows bending. Do not damage the sleeve with a sharp tool.

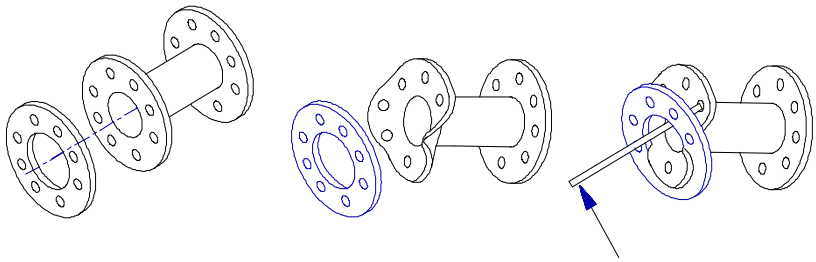

Fig. 9.

After putting in the new sleeve, fix the opening tags to the pinch bars. The excessive length of the tags can be cut away. Adjust the pinch bars before installing to the pipeline.

NOTE	At sleeve change, it is always important to check and adjust the position of the pinch bars. See 6.3.

6.2.2 Changing valve sleeve with enclosed model valve PVE

See appendix B. (Part numbers refer to drawing number 410006 in appendix A). Open the valve and detach it from the pipeline. Open the bolts (6.) between the valve body halves and detach the lower part of the body. If the valve has opening tags, detach them (16.) from upper (2.) and lower pinch bars (3.), 8 pcs screws (Fig.8). Take out the damaged sleeve and put in a new one. If the sleeve is stiff, detach the lower pinch bar. Remember to fix the opening tags if applicable. Check the body sealing (15.) between the body halves and the condition of the bushings (4.). A worn sealing and/or worn bushings may cause leakage to the environment in the event of a sleeve breakage. Assemble the valve and adjust the pinch bars before installing the valve to the pipeline.

NOTE	At sleeve change, it is always important to check and adjust the position of the pinch bars. See 6.3.

6.3 Adjusting the valve

After every sleeve change, the closing of the valve has to be checked and adjusted. A wrong adjustment may shorten the lifetime of the sleeve and cause leakage from the valve when the actuator is in the closed position.

	Control the valve functions (see 2.3). Do not put tools or parts of your body between the moving valve parts.

Before reinstallation of the valve into the pipeline:

- Close the valve by using the actuator. Adjust the pinch bars parallel to each other with the nuts, which are on both sides of actuator fixing plate (Fig.10, nuts 1 and 2), so that from one end of the sleeve an even, narrow light strip (appr. 0.5 mm) is shown on the whole squeezed point of the sleeve or symmetrically on both sides (Fig. 10.1).
- Tighten both nuts (1) equally so, that the strip of light disappears.
- Unscrew the lower nuts (Fig. 10.2, nut 2) X mm from the attachment plate (see the dimension X in the table, Fig. 11).
- When the nuts (Fig. 10.3, nut 1) on the upper side of the attachment plate are tightened, the lower pinch bar rises and causes a sufficient squeeze on the sleeve to close the flow against the pressure in the pipeline. After this has been done, open the valve and it is ready to be installed to the pipeline.

If the valve is hand wheel operated, it is enough to check that the pinch bars are parallel and the light slit is shown (Fig. 10.1). A sufficient squeeze is achieved by turning the hand wheel 1/3...3/4 rounds after the valve feels tight: if the pressure in the pipeline is 1 bar - appr. 1/3 of a hand wheel rotation; PN 10 bar - appr. 1/2 of a hand wheel rotation; PN 25 bar - appr. 3/4 of a hand wheel rotation. If the valve is supplied with a reduction gear, the number of rotations is multiplied by the gear ratio.

6.4 Troubleshooting

PROBLEM	POSSIBLE REASON	ACTION
Valve leaks into the environment.	1. Sleeve breakage. 2. End flanges loosely tightened.	1. Change and make adjustment of sleeve 2. Tighten the flange end screws
Leakage or flow through the valve when valve should be closed.	Sleeve breakage.	(models PVE, PVS): check by the plug - change and make adjustment of sleeve
	Sleeve is not closed with sufficient squeeze.	Manual valves - turn the hand wheel more tight. Pneum. and hydr. actuators - check the supply pressure for cylinder; if the pressure is too low, the sufficient squeeze for the sleeve cannot be reached. Check the compactness of the cylinder seals.
	Wrong adjustment of the sleeve.	Make the adjustment
Shorter lifetime of the sleeve than before.	Sleeve is not closed with sufficient squeeze.	Manual valves - turn the hand wheel more tight. Pneum. and hydr. actuators - check the supply pressure for cylinder; if the pressure is too low, the sufficient squeeze for the sleeve cannot be reached. Check the compactness of the cylinder sealings.
	Wrong adjustment of the sleeve.	Make the adjustment.
	1. Pneum. valves: wrong adjustment of the end cushioning in front end-block of cylinder. 2. Wrong adjustment of the pneum. spring.	1. End cushioning in front end-block of cylinder should be fully open. 2. Check adjustment of pneumatic spring .
	Changes in customer process e.g. * composition of medium / temperature * flow capacity	Check the best rubber qualityl with FLOWROX. Select another valve size with FLOWROX (particularly valves with positioners).
Sleeve is flapping and/or flow capacity is not sufficient.	Vacuum or pressure shocks in pipeline, rubber has hardened and does not open totally.	Check that the opening tags are fixed.

In case you cannot find the solution to your problem in the above table, please turn to the nearest Flowrox representative. The serial number and type identification of the valve in question will help getting the prompt answer.

7.1.3 Sleeve materials for Flowrox valves

STANDARD SLEEVE MATERIALS FOR FLOWROX VALVES

RUBBER QUALITY	APPLICATION EXAMPLES	TEMPERATURE RANGE	TYPICAL MEDIA
SBRT Styrene Butadiene, Flowrox Blend	Heavy wearing High cycle frequency	-40°C - +110°C	Abrasive materials Diluted acid, alkali and chemical applications
EPDM Ethylene Propylene	Chemical applications • Applicable to 75% of all industrial chemical applications	-40°C - +120°C	Concentrated and oxidizing chemicals

OTHER SLEEVE MATERIAL OPTIONS

RUBBER QUALITY	APPLICATION EXAMPLES	TEMPERATURE RANGE	TYPICAL MEDIA
NBR Nitrile Rubber	Applications involving oils, fats and hydrocarbons	-30°C - +100°C	Oils, Fats, Fuels Hydrocarbon, Lubricants
NR Natural Rubber	High wear applications	-40°C - +75°C	Abrasive materials Diluted acids, alkali and chemicals
HNBR Hydrogenated Nitrile	High temperature Applications	-30°C - +160°C	Oils, Fats, Fuels Hydrocarbon, Lubricants
NRF Natural Rubber Foodstuff Quality White inner lining	Foodstuff applications Fulfils FDA (Food and Drug Administration) requirements	-40°C - +75°C	Media used in food and other CIP (clean-in-place) processes Alcohols
NBRF Nitrile Rubber White inner lining	Applications involving fatty foodstuff Fulfils FDA (Food and Drug Administration) requirements	-30°C - +100°C	Vegetable and animal oils and fats
EPDM/B Ethylene Propylene, Flowrox Blend	Pulp and paper industry's green liquor applications	-40°C - +100°C	Green liquor Alkaline and extraneous matter in green liquor processes
CR Chloroprene Rubber	Special-purpose chemical applications • Resilient to ozone and averse weather	-40°C - +100°C	Chemicals, Acids Several solvents Aliphatic oils Fats, Lubricants
FPM Fluorine Rubber (Viton®)	Special-purpose chemical applications • Resilient to ozone and averse weather	-20°C +120°C	Chemicals Aliphatic oils Aromatic and halogenated hydrocarbon
CSM Chloro-sulphone-ethylene (Hypalon®)	Special-purpose chemical applications • Resilient to ozone and averse weather	-40°C - +100°C	Chemicals, Acids Several solvents Aliphatic oils Fats, Lubricants
IIR Butyl	Special-purpose chemical applications • Impermeable to gas	-40°C - +100°C	Concentrated and acidic chemicals Vegetable oils
PU Polyurethane • With PU lining or solid PU	Abrasive media applications	-10°C - +80°C	Abrasive materials Diluted chemicals Hydrocarbons Oils, Lubricants

FLSMIDTH KREBS
URETHANE IOM

GENERAL

FLSmidth Krebs Cyclones are the result of an intensive research and development program initiated in 1950. Each unit represents a product of advanced design, careful engineering, quality materials and the finest workmanship.

The information in the following pages is directed toward a better understanding of cyclone principles and operation, so that the potential for every FLSmidth Krebs Cyclone is realized.

FLSmidth Krebs engineers cyclone installations by studying the operating data and customer objectives. The cyclone selections are based on the large amount of operating data accumulated by our staff of engineers and our continuing research. When data is not available or is incomplete, studies in our laboratory and pilot plant are recommended. The pilot plant is equipped for complete, full-scale cyclone classification studies. Predictable performances resulting from these studies have been proven in numerous subsequent field installations. An important part of this service is the analysis of the test results by our staff of metallurgical and chemical engineers as related to the overall plant operation.

You are invited to avail yourself of these facilities and services for the study of your classification problems.

Cyclone Identification

FLSmidth Krebs cyclones are designated by Model Numbers, Serial Numbers, size and style. This information is stamped on an identification plate.

Permanent records for this cyclone are kept by the serial number; therefore, the serial number must be used with all correspondence and spare parts orders.

Receiving Instructions

Smaller FLSmidth Krebs Urethane Cyclones are crated and shipped completely assembled. Larger units are generally shipped dismantled as two pieces in order to reduce the size of the shipping crate. When removing the cyclone from the shipping crate, care should be taken to account for all of the parts. This can be checked against the packing slip.

Storage Requirements

FLSmidth Krebs Cyclones, any items with elastomer or polymer components, and auxiliary equipment such as valves, should always be stored:

- out of direct sunlight;
- away from heat and;
- protected from extreme weather conditions.

The preferred storage area will be a cool, well-ventilated building.

If outside storage is mandatory, the equipment should be totally covered over with heavy, opaque, plastic weather covering. It is essential that the plastic be opaque so as to cut out direct sunlight. In addition, a light color opaque material is desirable, to avoid heat build-up under the covering.

The covering should be spread over the equipment with allowance for underside ventilation to avoid excessive heat build-up and moisture condensation. Elevating the equipment a minimum of 2 inches above ground level should ensure adequate ventilation and prevention of moisture condensation.

The polyurethane employed in the manufacture of the cyclones is adversely affected by heat. However, if stored exactly as described above, ambient temperatures of less than 120°F (preferably less than 100°F) can be maintained.

The equipment will not be damaged by freezing conditions as long as it is kept dry. If below freezing conditions are involved, care should be taken when handling to avoid damage to urethane components as they become brittle at very low temperatures.

Installation

Cyclone Mounting

Each cyclone should be securely mounted on a soundly constructed frame so that stresses on the overflow/underflow piping are minimized.

During assembly, care must be taken such that the urethane flanges are not stressed. Assemble the inlet flange to its mating piping without over torqueing to the point of urethane deformation. Follow the same procedure for the overflow connection and lastly the cyclone mounting plate. Do not force the urethane cyclone into an unnatural position.

Sump

Correct design of the pump sump is probably the most important factor in establishing an efficient cyclone operation.

Conversion of flow and velocity to kinetic energy in a cyclone is derived from the energy supplied from the pump. Each adjustment of the cyclone variables will influence the pumping to some degree. This will be discussed in the section entitled “Operation”. A constant volume to the cyclone is important. Momentary fluctuations are generally the result of entrained air in the slurry.

A constant level in the sump is critical, but by no means an indication that the cyclone is receiving a constant and uniform volume of feed. If the needle of the cyclone inlet pressure gauge fluctuates rapidly, it is a definite indication that there is entrained air in the pump discharge slurry. To correct this problem, the entering stream should be prevented from carrying entrapped air to the suction of the pump. This can be done by mounting a sloping plate in the sump, well below the normal level of the slurry. An annular opening between the plate and the edges of the sump of about one inch around its entire periphery will generally be sufficient to allow the total volume of slurry to pass from the upper compartment to the lower section.

It is permissible to return part or the entire overflow product to the sump to maintain a constant level. It should be noted that the greater the slime content of the feed slurry to a cyclone, the more difficult it becomes to make a given separation. The use of recycled overflow product should be handled with caution, as there is always a danger of recirculating an excess quantity and consequently increasing the slime content of the feed slurry.

Where water is available and the overflow product is an important consideration, fresh water should

be added to the feed as a means of volume control.

The overflow product should discharge to atmosphere as close to the cyclone as possible. If the overflow pipe is carried directly to an elevation below the inlet of the cyclone, a siphoning action can be created. This will cause coarser particles to be carried to the cyclone overflow product.

The underflow discharge should be open for visual inspection, as it is important to be able to observe the characteristics of this flow. The underflow should be maintained with a 20-30 degree spray discharge. A “rope” discharge is an indication that there is excess crowding of solids at the apex orifice. This will cause coarse oversize solids to be carried into the overflow product.

Both the overflow and underflow should be available for sampling.

Pumping

Pumping to a cyclone, or battery of cyclones, must be carefully engineered to the job both as to size and type of the pump, and to size and length of the pipe line. Wear results in a much higher pump maintenance cost than cyclone maintenance cost.

Wear on a pump varies approximately proportionately to the cube of the velocity. In order to minimize the pump speed and pump maintenance, the cyclone should be as near to the pump as possible. A certain inlet pressure at the cyclone will be required, so there is also a power saving by having the static and friction head as low as possible.

If adequate pressure is available in the cyclone feed line, a pump may not be required.

Piping

When designing cyclone piping, the most important consideration is to establish a velocity that will prevent particle segregation in the pipe line, and at the same time hold the velocity to a minimum to reduce wear, which increases rapidly with increase in velocity.

With a large majority of installations for pumping slurries, the velocity range falls between a low of 5 ft/s and a high of 15 ft/s.

Major factors in determining the optimum velocity in a pipeline are:

- particle size
- angularity of the coarser fractions
- specific gravity of solids
- slimes content
- pulp density
- viscosity

Multiple Installations

FLSmidth Krebs has the ability to design and fabricate cyclone manifolds as per the project

requirements, with various styles including: radial, “spider”, and inline.

A radial manifold system assures an even feed distribution to each cyclone. The take-offs should be equally spaced around the perimeter of the central distribution pot. The overflow and underflow launders must be properly sized to allow for collection and distribution of the streams.

An inline manifold system can be used if the feed is very dilute and not subject to segregating in the system. An inline system is generally easier to design and build than a radial system and consequently is less expensive. However, an inline system does not assure equal feed to each cyclone.

Operation

The FLSmidth Krebs Urethane Cyclones are chemical resistant in some cases. The maximum recommended operating temperature is 140 °F. Available sizes include: ½" up to 15" diameter.

The primary consideration in selecting the proper size and design of cyclone is the classification objective, not the capacity. The proper relationship between the inlet orifice size, the vortex finder diameter, and the apex diameter is engineered by the staff of FLSmidth Krebs for each specific classification objective.

There is seldom any necessity for changing the size of these orifices unless the classification objectives or plant operating conditions are altered.

Numerous factors influence the operation of a cyclone. Following is a brief discussion of some factors influencing cyclone operation (which the operator is normally able to control while the cyclone is operating).

Feed Dilution

Feed dilution is the most effective control available. The use of additional dilution water will always result in a finer and sharper separation. The dilution water can also be adjusted to maintain a constant level in the sump, although the operator must be aware of the potential change in the separation. For very dilute feeds, the change in the separation will be minimal.

Pressure Management

Pressure drop across the cyclone is the pressure differential between the cyclone inlet and overflow. When the cyclone discharges to atmosphere, a condition we usually recommend, the inlet pressure (gauge reading) is equal to the pressure drop.

The pressure drop is merely an indication of the energy required to force a given volume through the cyclone fitted with a certain combination of orifices. It is not an indication of a developed force-pattern or throughput, except as related to that one particular set of operating conditions. Excessive pressure results in high pump operating and maintenance costs and should be avoided. We generally do not recommend pressure drops above 40 psi.

In general, the higher the pressure drop, the greater the throughput capacity of the cyclone. A higher pressure drop will also produce a finer separation.

Cyclone Orifices

The following describes the effect the various orifices have on the cyclone performance. Changing

the orifice requires shutting down the system.

Inlet Orifice

The main function of the inlet orifice is to provide a smooth flow pattern at the point of entry into the cyclone. All FLSmidth Krebs Cyclones are designed with an involute entry that pre-orients the solids prior to reaching the tangential point of contact with the cylinder wall. This minimizes turbulence and allows FLSmidth Krebs Cyclones to produce finer and sharper separations.

An increase in the inlet area will increase the capacity of the cyclone. It will also coarsen the separation slightly. All of FLSmidth Krebs Urethane Cyclones, four inches and smaller in diameter, have fixed inlet areas. For larger diameter urethane cyclones, various inlet head sizes are available for each size cyclone. If a different inlet area is required, the complete inlet head can be replaced as the inlet area is integral to the part.

Vortex Finder

The vortex finder has the greatest impact on the operating results of all the orifices. The vortex finder size has a major effect on the cyclone capacity at a fixed pressure drop and also affects the cyclone separation significantly.

The larger the vortex finder diameter, the greater the cyclone capacity at a given pressure drop. A larger diameter vortex finder will also coarsen the cyclone separation and send a larger proportion of solids to the overflow. Various vortex finder sizes are available and the entire part can be replaced.

Apex Orifice

The main function of the apex orifice is to discharge the coarse solids in such a manner that the maximum underflow density and smoothness of discharge are obtained. The apex should be large enough to produce a 20-30 degree conical-shaped discharge, but should not be used to control the cyclone separation. The apex should never be so small that a “rope” discharge exists. A “rope” discharge is an indication that the apex is not allowing all of the coarse solids to exit out the underflow and consequently some are being forced out the cyclone overflow.

Both fixed and manually adjustable apexes are available on FLSmidth Krebs Urethane Cyclones, although fixed apexes are more common. Various apex sizes are available and the entire part can be easily replaced to optimize the underflow solids.

Maintenance

It is important to maintain smooth surfaces on the interior of the cyclone. If possible, the cyclones should be inspected on a regular basis. When the interior surfaces become worn or uneven, the part should be replaced. After experience has been gained in operating the cyclones under given conditions, a regular maintenance schedule can be determined.

Once the apex opens more than 10% of its original size, it should be replaced. Once worn, these urethane parts are 'disposable'.

Please note that for urethane cyclones, the entire part (i.e. cone section, vortex finder, and apex) can be replaced. This is opposed to the replaceable elastomer or ceramic liners used by standard cyclones with steel housing.

The FLSmidth Krebs Urethane cyclones are very lightweight which makes maintenance easier. For cyclone sizes 6" and smaller, the cone sections are generally connected by SS clamps for ease of connection by operators.

FLSmidth Krebs Urethane Cyclones are available in various materials of construction which include:

- Urethane (RU)
- Food-grade Urethane (RT90)
- High-Temp. Urethane (RI)
- Ultrane (RW)*
- Royal Cast (RC)*
- Natural Gum Rubber (apex liner and adjustable apex only)

*Multi-component urethane used for gMAX cyclone sizes 10" and larger

**Other urethane materials are available upon special request

Common Problems and Solutions

Problem 1:

There are very coarse solids in the cyclone overflow.

Solution:

This is normally an indication that the apex is too small and coarse solids are being forced to the cyclone overflow. The apex diameter should be increased until a constant 30 degree cone angle is obtained on the discharge. Certain styles of the urethane fixed apexes can be cut to increase the diameter. An adjustable apex will have to be replaced with a larger one if it is in the full open position.

Another possible solution is to reduce the pressure drop by reducing the flow to the cyclone or by operating additional cyclones (for multiple installations).

Problem 2:

The cyclone pressure drop fluctuates wildly.

Solution:

This is an indication that a constant level in the sump is not being maintained or that air is entrained in the slurry. If the pump is pumping more feed volume than is going to the slump, the sump level will go down. Eventually the pump will cavitate and the pressure drop across the cyclone will be very erratic. Slowing the pump down or increasing the dilution water to the sump will maintain a constant sump level.

Air usually enters the pump suction because the feed to the sump is pointing directly down into the pump suction. Change the feed so that it angles against a side wall of the sump or install a baffle plate as described in the installation section.

Problem 3:

The separation is not fine enough.

Solution:

Increase the dilution water to the feed. If the feed is already dilute or if diluting the feed is not possible, increase the cyclone pressure drop. This will require speeding up the pump and installing a smaller diameter vortex finder. If the separation is still not fine enough, smaller diameter cyclones will probably be required.

Problem 4:

The underflow is too dilute.

Solution:

This is an indication that the apex is too large. Decrease the apex diameter until a 30 degree cone discharge is obtained. Do not decrease the apex diameter to the point of “roping” the discharge. The adjustable apexes can be decreased by tightening the worm

driven clamp. The fixed apexes will have to be replaced with a smaller size.

If smaller apexes are not readily available, another option is to increase the pressure drop by increasing the flow to the cyclone or by operating fewer cyclones (for multiple installations).

Calculations

TONNAGE:

1) Solids: $TPH = GPM\ SLURRY \times S.G\ SLURRY \times \%\ SOLIDS$

Slurry: $\frac{TPH\ SOLIDS}{\%\ SOLIDS}$

2) PULP SPECIFIC GRAVITY:

S.G. PULP =

$$\frac{100 \times S.G.\ SOLIDS \times S.G.\ LIQUID}{100 \times S.G.\ SOLIDS - \%\ SOLIDS\ (S.G.\ SOLIDS - S.G.\ LIQUID)}$$

3) PERCENT SOLIDS IN PULP

$$\% = \frac{TPH\ SOLIDS}{TPH\ SLURRY} \times 100$$

4) GALLONS PER MINUTE:

$$GPM\ SLURRY = \frac{TPH\ SOLIDS \times 4}{S.G.\ SLURRY \times \%\ SOLIDS}$$

5) $$\%\ SOLIDS\ BY\ VOLUME = \frac{\%\ SOLIDS\ BY\ WEIGHT \times S.G.\ PULP}{S.G.\ SOLIDS}$$

6) $$\frac{GPM}{ONE\ TPH\ SOLIDS} = \frac{4}{\%\ SOLIDS \times S.G.\ PULP}$$

Introduction and Safety

Introduction

CAUTION:

- Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.
- Observe accident prevention regulations in force.
- Save this manual for future reference, and keep it readily available at the location of the unit.

Purpose of this manual

The purpose of this manual is to provide the necessary information for:

- Installation
- Operation
- Maintenance

Safety

Precautions

WARNING:

- The operator must be aware of safety precautions to prevent physical injury.
- You must observe the instructions contained in this manual. Failure to do so could result in physical injury, damage, or delays.
- Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.[R]
- A certified electrician must supervise all electrical work. Comply with all local codes and regulations. [R]

Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product
- Product malfunction

Hazard levels

Hazard level	Indication
DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury

Hazard level	Indication
WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	• A potential situation which, if not avoided, could result in undesirable conditions • A practice not related to personal injury

Electrical hazards

Electrical hazards are indicated by the following specific symbol. This symbol warns for presence of a dangerous voltage.

Electrical Hazard:

User safety and health

Introduction

All government regulations, local health and safety directives must be observed.

Prevent danger due to electricity

All danger due to electricity must be avoided. Electrical connections must always be carried out in compliance with the following:

- The standard connections shown in the product documentation that is delivered together with the product
- All international, national, state, and local regulations. (For details, consult the regulations of your local electricity supplier.)

For more information about requirements, see sections dealing specifically with electrical connections.

Product warranty

Coverage

Xylem undertakes to remedy faults in products from Xylem under these conditions:

- The fault is due to defects in design, materials, or workmanship.
- The fault is reported to a Xylem representative within the warranty period.
- The product is used only under the conditions described in this manual.
- All service and repair work is done by qualified and authorized personnel. All modifications must be done by qualified technicians.
- Genuine Xylem parts are used.

Limitations

The warranty does not cover faults caused by these situations:

- Deficient maintenance
- Improper installation
- Modifications or changes to the product and installation made without consulting Xylem

- Incorrectly executed repair work
- Normal wear and tear

Xylem assumes no liability for these situations:

- Bodily injury
- Material damage
- Economic loss

Warranty claim

Xylem products are high quality products with expected reliable operation and long life. However, should the need arise for a warranty claim, then contact your Xylem representative.

Qualification of personnel

All work on the product should be carried out by certified electricians or Xylem authorized mechanics.

Xylem disclaims all responsibility for work done by untrained, unauthorized personnel.

Support

Xylem only supports products that have been tested and approved. Xylem does not support unapproved equipment.

Product Description

Introduction

Product description

The ENM-10 is the simplest possible method for level control. A mechanical switch in a plastic casing, freely suspended at the desired height from its own cable. When the liquid level reaches the regulator, the casing will tilt and the mechanical switch will close or break the circuit, thereby starting or stopping a pump or actuating an alarm device. No wear, no maintenance. In sewage pumping stations, for ground water and drainage pumping – in fact, for most level control applications – the ENM-10 is the ideal solution.

Liquid density

The product is available in different versions for different liquid densities.

Temperature limit

The regulator can withstand up to 60°C (140°F).

Manual coverage

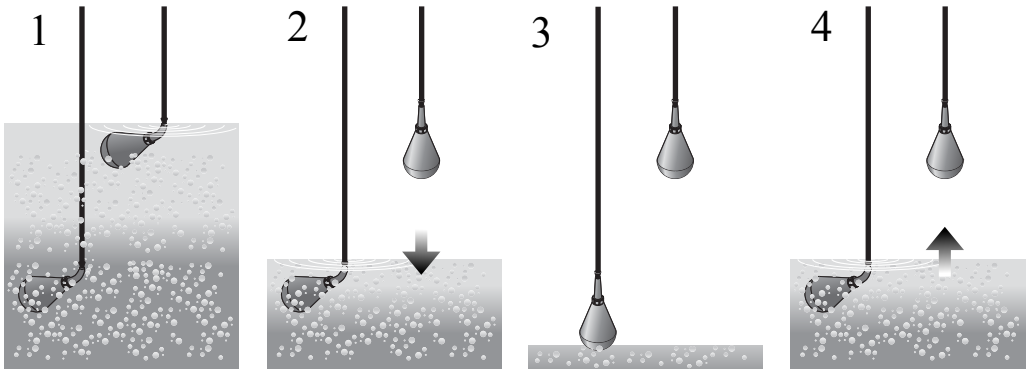
This manual is applicable to the following versions:

- Standard version Blue casing of ENM-10
- EX-version Black casing of ENM-10.

Available languages

For manuals in other languages, visit *tpi.xyleminc.com*

Process description



WS004996A

1. When the pumped media reaches a predetermined level, the upper level regulator tips over to horizontal position and the pump starts to drain the basin.
2. The basin is drained of fluid.
3. The pump stops when the lower level regulator returns to the vertical position.
4. The basin fills up again. The process restarts.

Material

Standard version

Part	Material
Regulator casing	Polypropylene
Cable sheath	PVC or Nitrile/PVC rubber compound

The plastic components are welded and screwed together. Adhesive is never used. Impurities and deposits will not adhere to the smooth casing.

EX-version

The version for Ex-applications has a black casing, made conductive by adding carbon to the polypropylene.

Cable lengths

For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Version	Lengths m (ft)
Standard	• 6 m (20 ft) • 13 (42) • 20 (65) • 30 (100) • 50 (167)
Ex-version	• 6 m (20 ft) • 13 (42) • 20 (65) Nitrile/PVC rubber cable

Electrical data

Country	Electrical data
Canada	5 A, 250 V, DC 10 A, 250 V, AC
Denmark	10 A, 250 V, AC
Switzerland	6 A, 250 V, AC
Sweden	10 A, 230 V, AC Resistive load 3 A, 250 V, AC Inductive load 5 A, 30 V, DC Resistive load *1 mA, 5 V, DC, Gold Contact

* Part no: 594 79 19 and 594 79 20

Micro switch

The level regulator contains a micro switch, max rated 250 VAC/10 A.

Low-voltage supply

In many cases, local codes require that the regulator is connected to a low-voltage supply, even though it is approved for a higher voltage.

It is recommended that the regulator is connected to a low-voltage supply, 48 V or 24 V, and a protective transformer.

Electrical data for Ex-approved installation

Description	Data
Maximum input voltage, U_i	30 V
Maximum input current, I_i	100 mA
Maximum input power, P_i	1.2 W
Depth of immersion	Max 20 m

For cable

Description	Data
Maximum internal capacitance, C_i:	1.8 nF
Maximum internal inductance, L_i:	10 µH

Installation

There are special rules that apply to installation in an explosive atmosphere. Intrinsically safe circuits are normally required: Ex i. Use a EX-safety barrier, for example, Prod. No. 84 01 07.

Approvals

CE, CSA, SEMKO, NEMKO, DEMKO, EX

LVD approval according to EN61058

CSA approval: Cert No. 1330172

IECEx ia IIC T4 Ga: -20°C<Ta<60°C

IECEx NEMKO 09.008

ATEX II 1G ia IIC T4

NEMKO 10ATEX 1082

Applied standards

- EN 60079-0:2009/IEC 60079-0:2007
- EN 60079-11:2007/IEC 60079-0:2006
- EN 60079-26:2007/IEC 60079-26:2006

Intrinsically safe circuits are required for the automatic control system.

Use a Ex-safety barrier: For example, Prod. No. 84 01 07

0080

Mechanical Installation

Precautions

CAUTION:

- Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.
- The operator must be aware of safety precautions to prevent physical injury.

General

To conform to local regulations, the regulators are normally connected through a transformer to a low-tension control circuit.

Make sure that two regulators are used, one for starting and one for stopping.

If an alarm is required at a given level, then connect a third regulator.

Identical regulators can be used for all functions.

Make sure that the cables do not become tangled during the installation.

The regulator cables must hang freely from each other.

Electrical Installation

Precautions

WARNING:

- Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.[R]
- There is a risk of electrical shock or explosion if the electrical connections are not correctly carried out or if there is fault or damage on the product. [R]
- A certified electrician must supervise all electrical work. Comply with all local codes and regulations. [R]
- All electrical equipment must be grounded (earthed). Make sure that the ground (earth) lead is correctly connected by testing it. [R]
- Make sure that all unused conductors are insulated. [R]

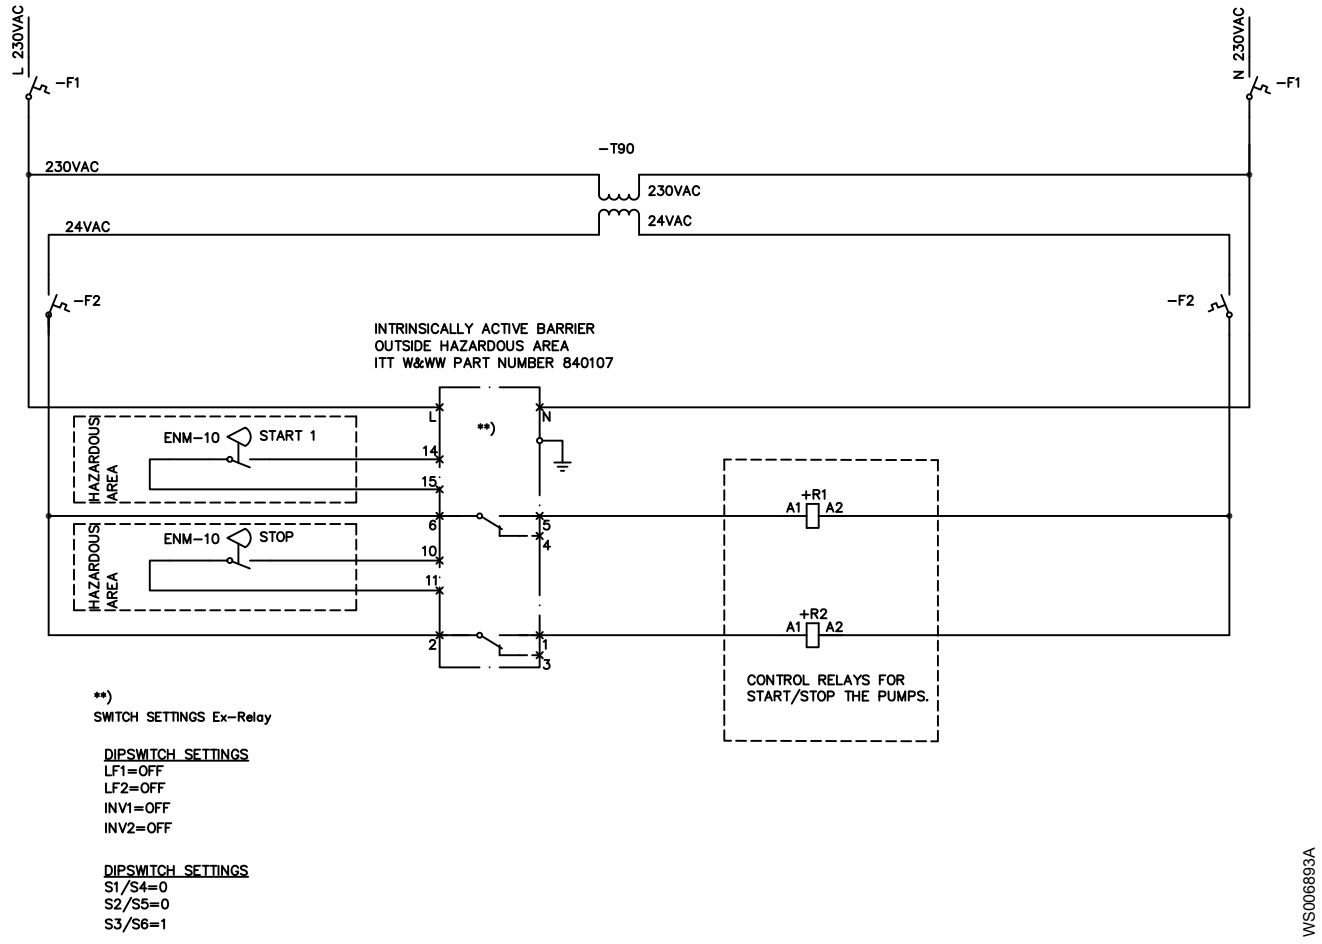
Ex-installation

EX-safety barrier

Intrinsically safe circuits are required for the automatic control system. EX-safety barrier (Prod. No. 84 01 07) must be installed.



Maintenance

General

To ensure its continual operation:

- Clean the product, especially when fat/grease covers the plastic surface
- Make an occular inspection of the regulator. Make sure neither cable, protective sleeve or plastic casing show any signs of damage.
- A damaged regulator cannot be repaired in any way, due to the hermetic encapsulation. If the product is found to be damaged, replace it with a new one

EX-istallations

Make absolutely sure that the Ex-barrier is operating correctly.

- The LED changes when the switch is toggled.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots
2) A leading global water technology company

We're 12,500 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

For more information on how Xylem can help you, go to xyleminc.com

Refer to www.xylemwatersolutions.com/contacts/ for contact details of your local sales and service representative.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

1. Safety instructions

These installation and operating instructions contain general instructions that must be observed during installation, operation and maintenance of the pump. It must therefore be read by the installation engineer and the relevant qualified operator prior to installation and start-up, and must be available at the installation location at all times.

1.1 Symbols used in this document

Warning

If these safety instructions are not observed, it may result in personal injury.

Caution

If these safety instructions are not observed, it may result in malfunction or damage to the equipment.

Note

Notes or instructions that make the job easier and ensure safe operation.

1.2 Qualification and training of personnel

The personnel responsible for the installation, operation and service must be appropriately qualified for these tasks. Areas of responsibility, levels of authority and the supervision of the personnel must be precisely defined by the operator. If necessary, the personnel must be trained appropriately.

Risks of not observing the safety instructions

Non-observance of the safety instructions may have dangerous consequences for the personnel, the environment and the pump and may result in the loss of any claims for damages.

It may lead to the following hazards:

- Personal injury from exposure to electrical, mechanical and chemical influences.
- Damage to the environment and personal injury from leakage of harmful substances.

1.3 Safety instructions for the operator/user

The safety instructions described in these instructions, existing national regulations on health protection, environmental protection and for accident prevention and any internal working, operating and safety regulations of the operator must be observed.

Information attached to the pump must be observed.

Leakages of dangerous substances must be disposed of in a way that is not harmful to the personnel or the environment.

Damage caused by electrical energy must be prevented, see the regulations of the local electricity supply company.

Caution

Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

Note

The mains plug is the separator separating the pump from the mains.

Only original accessories and original spare parts should be used. Using other parts can result in exemption from liability for any resulting consequences.

1.4 Safety of the system in the event of a failure in the dosing pump

The dosing pump was designed according to the latest technologies and is carefully manufactured and tested.

If it fails regardless of this, the safety of the overall system must be ensured. Use the relevant monitoring and control functions for this.

Caution

Make sure that any chemicals that are released from the pump or any damaged lines do not cause damage to system parts and buildings.

The installation of leak monitoring solutions and drip trays is recommended.

1.5 Dosing chemicals

Warning

Before switching the supply voltage back on, the dosing lines must be connected in such a way that any chemicals in the dosing head cannot spray out and put people at risk.

The dosing medium is pressurised and can be harmful to health and the environment.

Warning

When working with chemicals, the accident prevention regulations applicable at the installation site should be applied (e.g. wearing protective clothing).

Observe the chemical manufacturer's safety data sheets and safety instructions when handling chemicals!

Caution ***A deaeration hose, which is routed into a container, e.g. a drip tray, must be connected to the deaeration valve.***

Caution ***The dosing medium must be in liquid aggregate state!***

Observe the freezing and boiling points of the dosing medium!

The resistance of the parts that come into contact with the dosing medium, such as the dosing head, valve ball, gaskets and lines, depends on the medium, media temperature and operating pressure.

Caution ***Ensure that parts in contact with the dosing media are resistant to the dosing medium under operating conditions, see data booklet!***

Should you have any questions regarding the material resistance and suitability of the pump for specific dosing media, please contact Grundfos.

1.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head. Observe section *7.6 Diaphragm breakage*.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section 7.6.1 Dismantling in case of diaphragm breakage.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  - If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

2. General information

The DDA dosing pump is a self-priming diaphragm pump. It consists of a housing with stepper motor and electronics, a dosing head with diaphragm and valves and the control cube.

Excellent dosing features of the pump:

- Optimal intake even with degassing media, as the pump always works at full suction stroke volume.
- Continuous dosing, as the medium is sucked up with a short suction stroke, regardless of the current dosing flow, and dosed with the longest possible dosing stroke.

2.1 Applications

The pump is suitable for liquid, non-abrasive, non-flammable and non-combustible media strictly in accordance with the instructions in these installation and operating instructions.

Areas of application

- Drinking water treatment
- Wastewater treatment
- Swimming pool water treatment
- Boiler water treatment
- CIP (Clean-In-Place)
- Cooling water treatment
- Process water treatment
- Wash plants
- Chemical industry
- Ultrafiltration processes and reverse osmosis
- Irrigation
- Paper and pulp industry
- Food and beverage industries

2.2 Improper operating methods

The operational safety of the pump is only guaranteed if it is used in accordance with section *2.1 Applications*.

Warning

Other applications or the operation of pumps in ambient and operating conditions, which are not approved, are considered improper and are not permitted. Grundfos cannot be held liable for any damage resulting from incorrect use.

Warning

The pump is NOT approved for operation in potentially explosive areas!

Warning

A sunscreen is required for outdoor installation!

Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.

Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

2.3 Symbols on the pump

Symbol	Description
	Indication of universally dangerous spot.
	In case of emergency and prior to all maintenance work and repairs, take the mains plug out of the mains supply!
	The device complies with electrical safety class II.
	Connection for deaeration hose at dosing head. If the deaeration hose is not correctly connected, danger will arise due to possible leakage of dosing liquid!

2.4 Warranty

A guarantee claim in accordance with our general terms of sale and delivery is only valid if the following requirements are fulfilled:

- The pump is used in accordance with the information within this manual.
- The pump is not dismantled or incorrectly handled.
- The maintenance is carried out by authorised and qualified personnel.

2.5 Nameplate

4. Assembly and installation

Note

For use in Australia:

Installation of this product must comply with AS/NZS3500!

Certificate of suitability number: CS9431

C-tick number: N20683

4.1 Pump assembly

Warning

Install the pump in such a way that the plug can easily be reached by the operator during operation! This will enable the operator to separate the pump from the mains quickly in case of emergency!

The pump is delivered with a mounting plate.
The mounting plate can be mounted vertically e.g. on a wall or horizontally e.g. on a tank. It takes just a few quick steps to firmly secure the pump to the mounting plate by means of a slot mechanism.

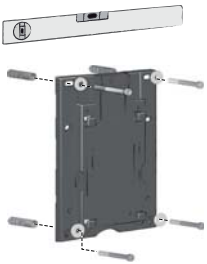
The pump can easily be released from the mounting plate for maintenance.

4.1.1 Requirements

- The mounting surface must be stable and must not vibrate.
- Dosing must flow upwards vertically.

4.1.2 Align and install mounting plate

- **Vertical installation**: Mounting plate slot mechanism must be above.
- **Horizontal installation**: Mounting plate slot mechanism must be opposite the dosing head.
- The mounting plate can be used as a drill template, please see fig. 4 for drill hole distances.



TM04 1162 0110

Fig. 5 Locate mounting plate

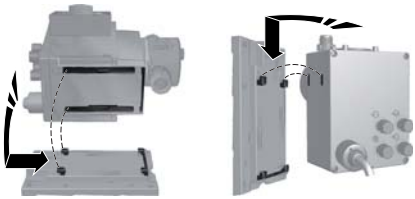
Warning

Make sure that you do not damage any cables and lines during installation!

1. Indicate drill holes.
2. Drill holes.
3. Secure mounting plate using four screws, diameter 5 mm, to the wall, on the bracket or the tank.

4.1.3 Engage pump in mounting plate

1. Attach the pump to the mounting plate support clamps and slide under slight pressure until it engages.



TM04 1159 0110

Fig. 6 Engaging the pump

4.1.4 Adjusting control cube position

The control cube is fitted to the front of the pump on delivery. It can be turned by 90 ° so that the user can select to operate the pump from the right or left side.

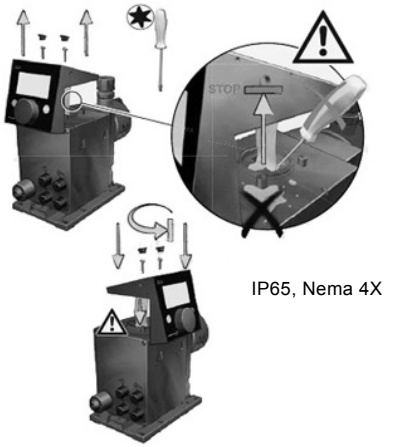
Caution

The enclosure class (IP65/Nema 4X) and shock protection are only guaranteed if the control cube is installed correctly!

Caution

Pump must be disconnected from the power supply!

1. Carefully remove both protective caps on the control cube using a thin screwdriver.
2. Loosen screws.
3. Carefully lift off control cube only so far from the pump housing that no tensile stress is produced on the flat band cable.
4. Turn control cube by 90 ° and re-attach.
   – Make sure the O-ring is secure.
5. Tighten screws slightly and attach protective caps.



TM04 1182 0110

Fig. 7 Adjusting control cube

4.2 Hydraulic connection

Warning

Risk of chemical burns!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

The dosing head may contain water from the factory check!

Caution ***When dosing media which should not come into contact with water, another medium must be dosed beforehand!***

Caution ***Faultless function can only be guaranteed in conjunction with lines supplied by Grundfos!***

Caution ***The lines used must comply with the pressure limits as per section 3.1 Technical data!***

Important information on installation

- Observe suction lift and line diameter, see section *3.1 Technical data*.
- Shorten hoses at right angles.
- Ensure that there are no loops or kinks in the hoses.
- Keep suction line as short as possible.
- Route suction line up towards the suction valve.
- Installing a filter in the suction line protects the entire installation against dirt and reduces the risk of leakage.
- Only control variant FC/FCM: For discharge quantities < 1 l/h we recommend the use of an additional spring-loaded valve (approx. 3 bar) on the discharge side for the safe generation of the necessary differential pressure.

Hose connection procedure

1. Push union nut and tensioning ring across hose.
2. Push cone part fully into hose, see fig. 8.
3. Attach cone part with hose to corresponding pump valve.
4. Tighten union nut manually.
   – Do not use tools!
5. Tighten up union nuts after 2-5 operating hours if using PTFE gaskets!
6. Attach deaeration hose to the corresponding connection (see fig. 3) and run into a container or a collecting tray.

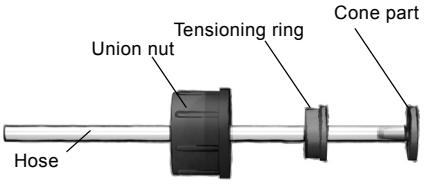


Fig. 8 Hydraulic connection

Note ***Pressure differential between suction and discharge side must be at least 1 bar/14.5 psi!***

Caution ***Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.***

Installation example

The pump offers various installation options. In the picture below, the pump is installed in conjunction with a suction line, level switch and multifunction valve on a Grundfos tank.

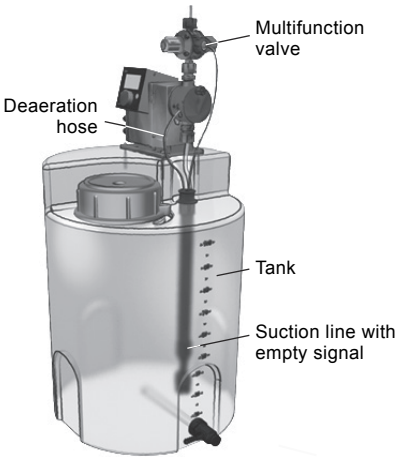

Fig. 9 Installation example

4.3 Electrical connection

Warning

The enclosure class (IP65/Nema 4X) is only guaranteed if plugs or protective caps are correctly installed!

Warning

The pump can start automatically when the mains voltage is switched on!

Do not manipulate mains plug or cable!

Note

The mains plug is the separator separating the pump from the mains.

The rated voltage of the pump, see section 2.5 Nameplate, must conform to local conditions.

Signal connections

Warning

Electric circuits of external devices connected to the pump inputs must be separated from dangerous voltage by means of double or reinforced insulation!

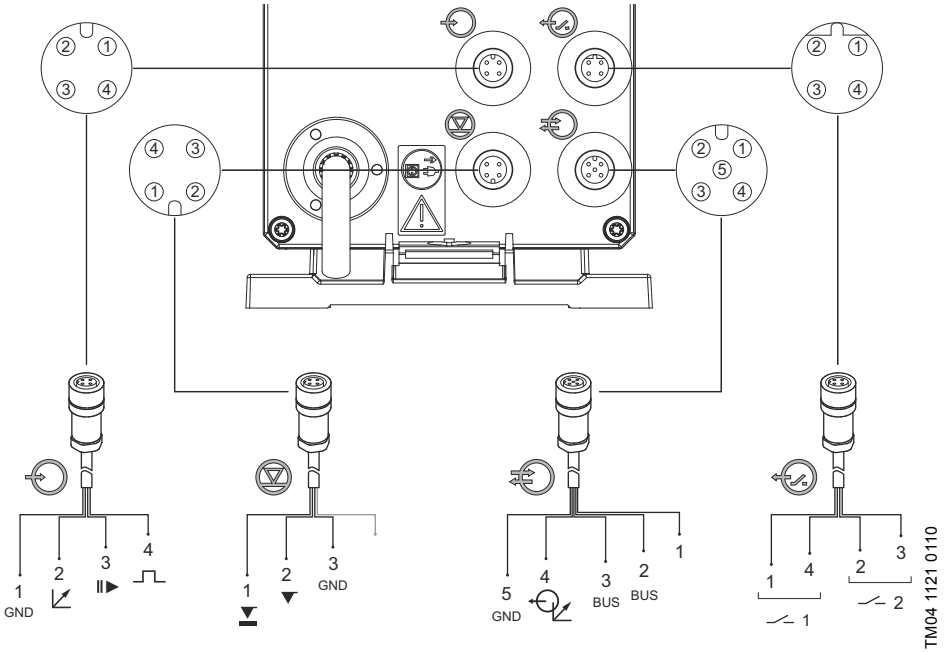

Fig. 10 Wiring diagram of the electrical connections

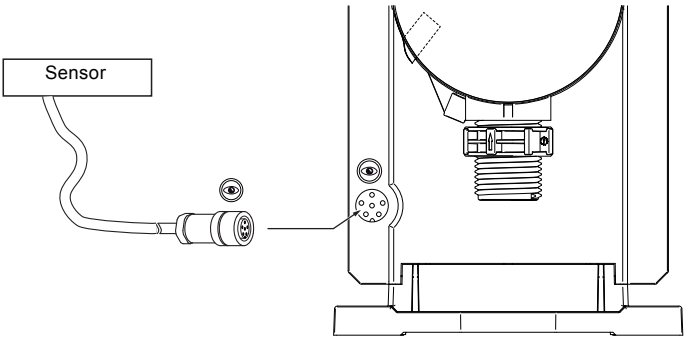
Relay 1	X			X	Pulse
Relay 2		X	X		Pulse

FlowControl signal connection



TM04 1158 0110

Fig. 11 FlowControl signal connection

5. Startup

5.1 Setting the menu language

For description of control elements, see section 6.

1. Turn click wheel to highlight the cog symbol.
2. Press the click wheel to open the "Setup" menu.
3. Turn the click wheel to highlight the "Language" menu.
4. Press the click wheel to open the "Language" menu.
5. Turn the click wheel to highlight the desired language.
6. Press the click wheel to select the highlighted language.
7. Press the click wheel again to confirm the "Confirm settings?" prompt and apply the setting.

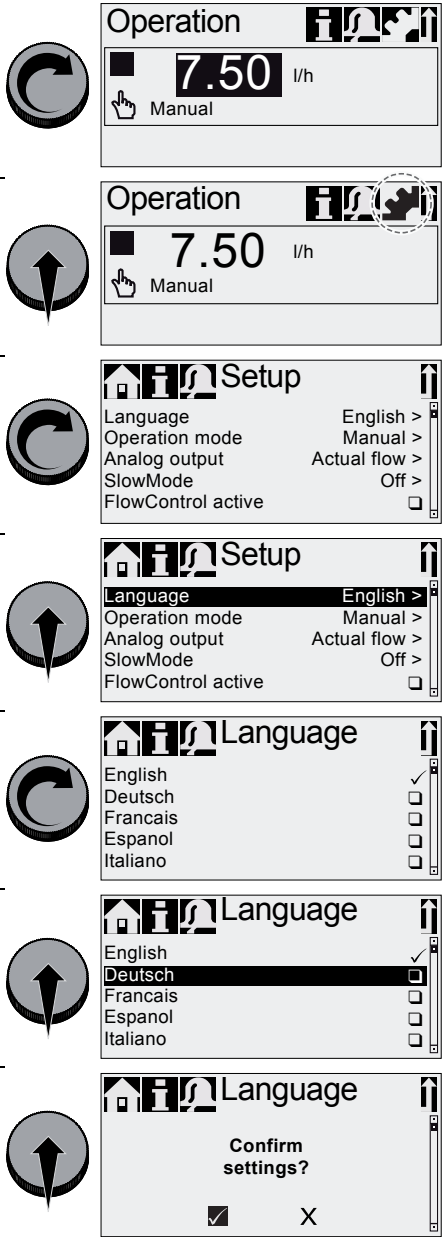


Fig. 12 Set menu language

5.2 Deaerating the pump

Warning

The deaeration hose must be connected correctly and inserted into a suitable tank!

1. Open deaeration valve by approximately half a turn.
2. Press and hold down the [100%] key (deaeration key) until liquid flows continuously without any bubbles from the deaeration hose.
3. Close deaeration valve.

Note

Press the [100%] key and simultaneously turn the click wheel clockwise to increase the duration of the process to up to 300 seconds. After setting the seconds, do not press the key any longer.

5.3 Calibrating the pump

The pump is calibrated in the factory for media with a viscosity similar to water at maximum pump backpressure (see section *3.1 Technical data*).

If the pump is operated with a backpressure that deviates or if dosing a medium whose viscosity deviates, the pump must be calibrated.

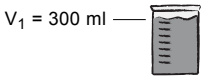
For pumps with FCM control variant, it is not necessary to calibrate the pump if there is deviating or fluctuating backpressure as long as the "AutoFlowAdapt" function has been enabled (see section *6.10 AutoFlowAdapt*).

Requirements

- The hydraulics and electrics of the pump are connected (see section *4. Assembly and installation*).
- The pump is integrated into the dosing process under operating conditions.
- The dosing head and suction hose are filled with dosing medium.
- The pump has been deaerated.

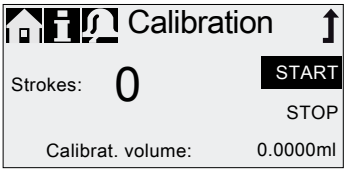
Calibration process - example for DDA 7.5-16

1. Fill a measuring beaker with dosing medium. Recommended filling volumes V_1:
   – DDA 7.5-16: 0.3 l
   – DDA 12-10: 0.5 l
   – DDA 17-7: 1.0 l
   – DDA 30-4: 1.5 l

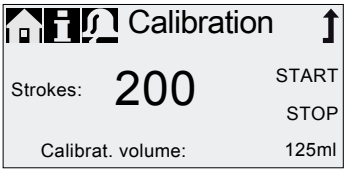


2. Read off and note down the fill volume V_1 (e.g. 300 ml).
3. Place the suction hose in the measuring beaker.

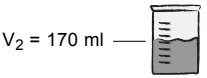
4. Start the calibration process in the "Setup > Calibration" menu.



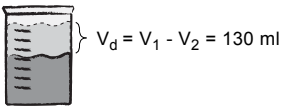
5. The pump executes 200 dosing strokes and displays the factory calibration value (e.g. 125 ml).



6. Remove the suction hose from the measuring beaker and check the remaining volume V_2 (e.g. 170 ml).

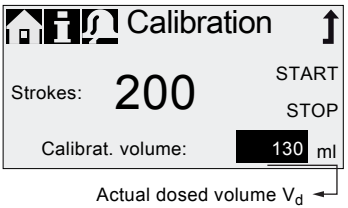


7. From V_1 and V_2, calculate the actual dosed volume $V_d = V_1 - V_2$ (e.g. 300 ml - 170 ml = 130 ml).



8. Set and apply V_d in the calibration menu.

• The pump is calibrated.



TM04 1154 1110

6. Operation

6.1 Control elements

The pump control panel includes a display and the following control elements.

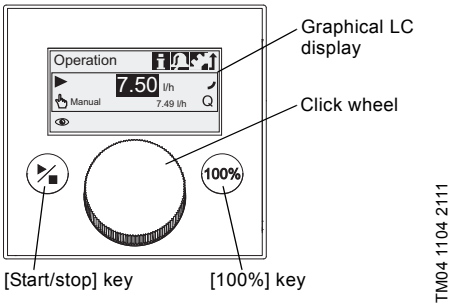


Fig. 13 Control panel

Keys

Key	Function
[Start/stop] key	Starting and stopping the pump.
[100%] key	The pump doses at maximum flow regardless of the operation mode.

Click wheel

The click wheel is used to navigate through the menus, select settings and confirm them.

Turning the click wheel clockwise moves the cursor clockwise in increments in the display. Turning the click wheel counter-clockwise moves the cursor counter-clockwise.

6.2 Display and symbols

6.2.1 Navigation

In the "Info", "Alarm" and "Setup" main menus, the options and submenus are displayed in the rows below. Use the "Back" symbol to return to the higher menu level. The scroll bar at the right edge of the display indicates that there are further menu items which are not shown.

The active symbol (current cursor position) flashes. Press the click wheel to confirm your selection and open the next menu level. The active main menu is displayed as text, the other main menus are displayed as symbols. The position of the cursor is highlighted in black in the sub-menus.

When you position the cursor on a value and press the click wheel, a value is selected. Turning the click wheel clockwise increases the value, turning the click wheel counter-clockwise reduces the value. When you now press the click wheel, the cursor will be released again.

6.2.2 Operating states

The operating state of the pump is indicated by a symbol and display colour.

Display	Fault	Operating state		
White	-	Stop ■	Standby ❚❚	
Green	-			Running ▶
Yellow	Warning	Stop ■	Standby ❚❚	Running ▶
Red	Alarm	Stop ■	Standby ❚❚	

6.2.3 Sleep mode (energy-saving mode)

If in the "Operation" main menu the pump is not operated for 30 seconds, the header disappears. After two minutes, the display brightness is reduced.

If in any other menu the pump is not operated for two minutes, the display switches back to the "Operation" main menu and the display brightness is reduced. This state will be cancelled when the pump is operated or a fault occurs.

6.2.4 Overview of display symbols

The following display symbols may appear in the menus.

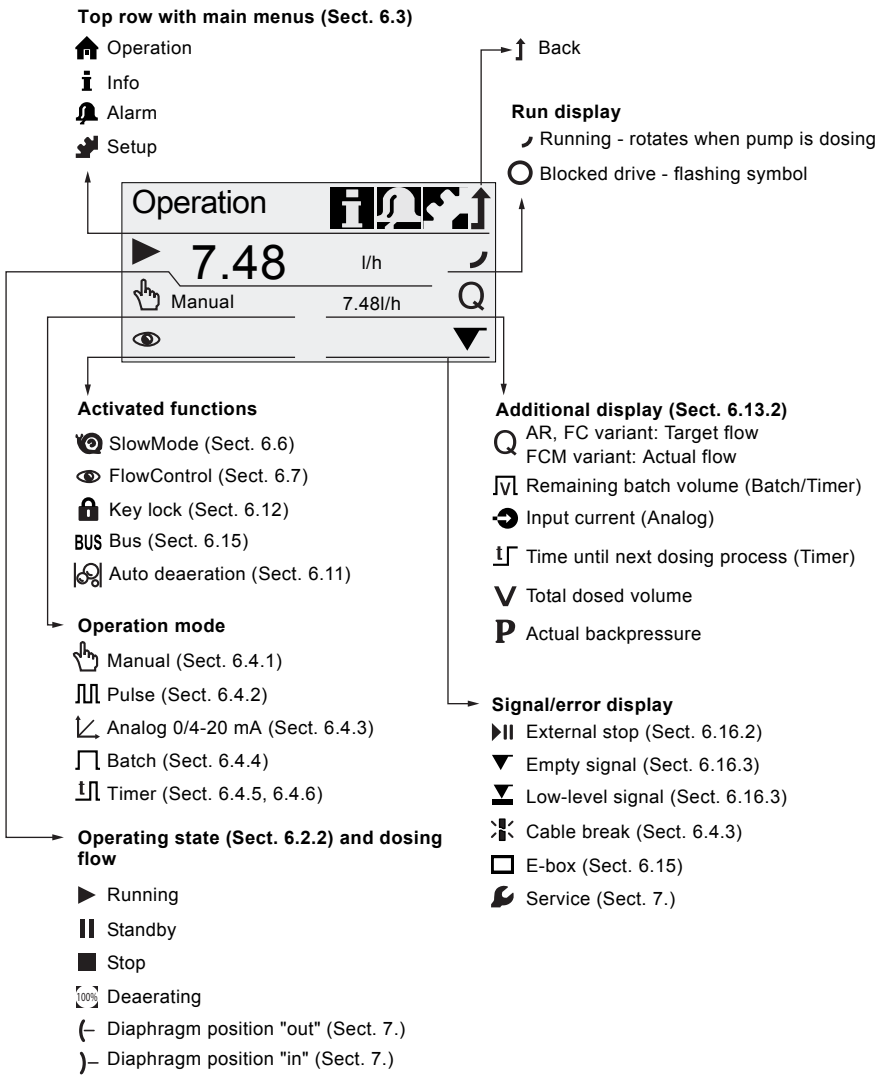

Fig. 14 Overview of display symbols

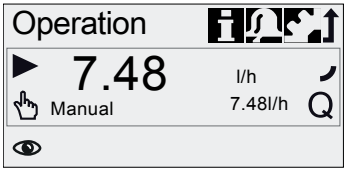
TM04 1161 1710

6.3 Main menus

The main menus are displayed as symbols at the top of the display. The currently active main menu is displayed as text.

6.3.1 Operation

Status information such as the dosing flow, selected operation mode and operating state is displayed in the "Operation" main menu.

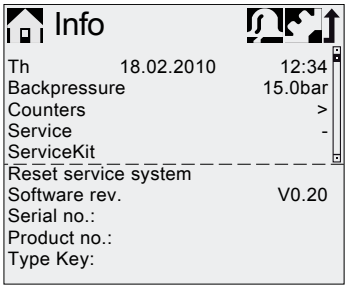


TM04 1157 2011

6.3.2 Info

You can find the date, time and information about the active dosing process, various counters, product data and the service system status in the "Info" main menu. The information can be accessed during operation.

The service system can also be reset from here.



TM04 1106 1010

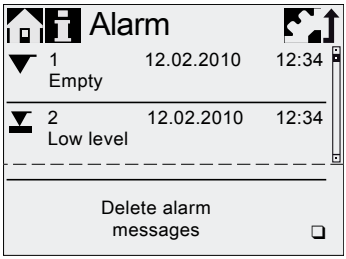
Counters

The "Info > Counters" menu contains the following counters:

Counters	Resettable
Volume Total dosed volume [l] or US gallons	Yes
Operating hours Accumulated operating hours (pump switched on) [h]	No
Motor runtime Accumulated motor runtime [h]	No
Strokes Accumulated number of dosing strokes	No
Power on/off Accumulated frequency of switching mains voltage on	No

6.3.3 Alarm

You can view errors in the "Alarm" main menu.



TM04 1109 1010

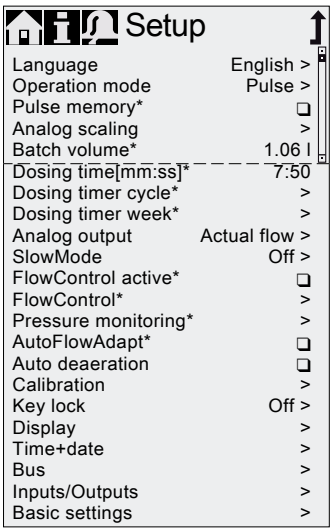
Up to 10 warnings and alarms, together with their date, time and cause, are listed in chronological order. If the list is full, the oldest entry will be overwritten, see section *8. Faults*.

6.3.4 Setup

The "Setup" main menu contains menus for pump configuration. These menus are described in the following sections.

Note

Check all pump settings after any change in the "Setup" menu.



TM04 1110 1010

* These submenus are only displayed for specific default settings and control variants. The contents of the "Setup" menu also vary depending on the operation mode.

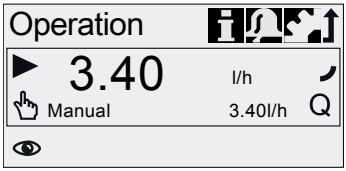
6.4 Operation modes

Six different operation modes can be set in the "Setup > Operation mode" menu.

- Manual, see section 6.4.1
- Pulse, see section 6.4.2
- Analog 0-20mA, see section 6.4.3
  Analog 4-20mA, see section 6.4.3
- Batch (pulse-based), see section 6.4.4
- Dosing timer cycle, see section 6.4.5
- Dosing timer week, see section 6.4.6

6.4.1 Manual

In this operation mode, the pump constantly doses the dosing flow set with the click wheel. The dosing flow is set in l/h or ml/h in the "Operation" menu. The pump automatically switches between the units. Alternatively, the display can be reset to US units (gph). See section *6.13 Display Setup*.



TM04 1125 1110

Fig. 15 Manual mode

The setting range depends on the pump type:

Type	Setting range*	
	[l/h]	[gph]
DDA 7.5-16	0.0025 - 7.5	0.0007 - 2.0
DDA 12-10	0.012 - 12	0.0031 - 3.1
DDA 17-7	0.017 - 17	0.0045 - 4.5
DDA 30-4	0.03 - 30	0.0080 - 8.0

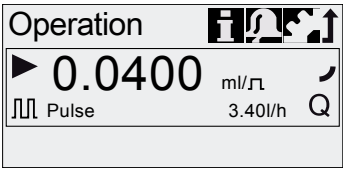
* When the "SlowMode" function is active, the maximum dosing flow is reduced, see section *3.1 Technical data*.

6.4.2 Pulse

In this operation mode, the pump doses the set dosing volume for each incoming (potential-free) pulse, e.g. from a water meter. The pump automatically calculates the optimum stroke frequency for dosing the set volume per pulse.

The calculation is based on:

- the frequency of external pulses
- the set dosing volume/pulse.



TM04 1126 1110

Fig. 16 Pulse mode

The dosing volume per pulse is set in ml/pulse in the "Operation" menu using the click wheel. The setting range for the dosing volume depends on the pump type:

Type	Setting range [ml/pulse]
DDA 7.5-16	0.0015 - 14.9
DDA 12-10	0.0029 - 29.0
DDA 17-7	0.0031 - 31.0
DDA 30-4	0.0062 - 62.0

The frequency of incoming pulses is multiplied by the set dosing volume. If the pump receives more pulses than it can process at the maximum dosing flow, it runs at the maximum stroke frequency in continuous operation. Excess pulses will be ignored if the memory function is not enabled.

Memory function

When the "Setup > Pulse memory" function is enabled, up to 65,000 unprocessed pulses can be saved for subsequent processing.

Warning

Subsequent processing of saved pulses can cause local increase in concentration!

The contents of the memory will be deleted by:

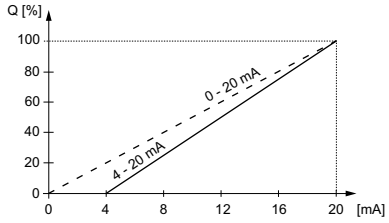
- Switching off the power supply
- Changing the operation mode
- Interruption (e.g. alarm, External stop).

6.4.3 Analog 0/4-20 mA

In this operation mode, the pump doses according to the external analog signal.
The dosing volume is proportional to the signal input value in mA.

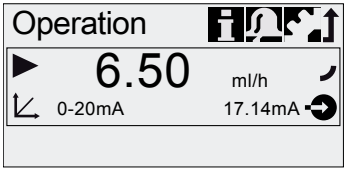
Operation mode	Input value [mA]	Dosing flow [%]
4-20 mA	≤ 4.1	0
	≥ 19.8	100
0-20 mA	≤ 0.1	0
	≥ 19.8	100

If the input value in operation mode 4-20 mA falls below 2 mA, an alarm is displayed and the pump stops. A cable break or signal transmitter error has occurred. The "Cable break" symbol is displayed in the "Signal and error display" area of the display.



TM04 1120 2010

Fig. 17 Analog scaling



TM04 1127 1110

Fig. 18 Analog operation mode

Set analog scaling

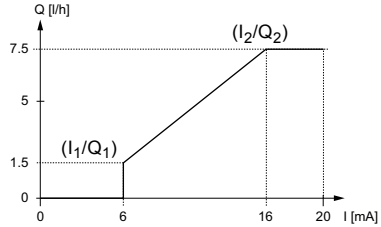
Analog scaling refers to the assignment of the current input value to the dosing flow.

Changes of analog scaling affect also the analog output signal. See section *6.5 Analog output*.

Analog scaling passes through the two reference points (I_1/Q_1) and (I_2/Q_2), which are set in the "Setup > Analog scaling" menu. The dosing flow is controlled according to this setting.

Example 1 (DDA 7.5-16)

Analog scaling with positive gradient:



TM04 1160 2010

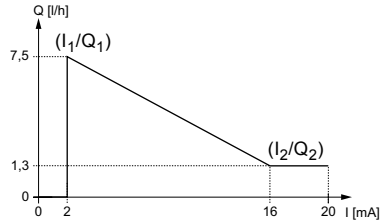
Fig. 19 Analog scaling with pos. gradient

In example 1, the reference points I_1 = 6 mA, Q_1 = 1.5 l/h and I_2 = 16 mA, Q_2 = 7.5 l/h have been set.

From 0 to 6 mA analog scaling is described by a line that passes through Q = 0 l/h, between 6 mA and 16 mA it rises proportionally from 1.5 l/h to 7.5 l/h and from 16 mA onwards it passes through Q = 7.5 l/h.

Example 2 (DDA 7.5-16)

Analog scaling with negative gradient (Operation mode 0-20 mA):



TM04 1101 2010

Fig. 20 Analog scaling with neg. gradient

In example 2, the reference points I_1 = 2 mA, Q_1 = 7.5 l/h and I_2 = 16 mA, Q_2 = 1.3 l/h have been set.

From 0 to 2 mA analog scaling is described by a line that passes through Q = 0 l/h, between 2 mA and 16 mA it drops proportionally from 7.5 l/h to 1.3 l/h and from 16 mA onwards it passes through Q_2 = 1.3 l/h.

Set analog scaling in the "Operation" menu

Analog scaling can also be modified after a security prompt directly in the "Operation" menu. This is how the dosing flow is directly modified for the current flow input value.

Caution

Please observe that changes also have a direct effect on point I_2/Q_2 (see fig. 21)!

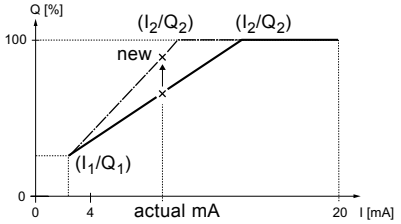


Fig. 21 Set analog scaling ("Operation" menu)

6.4.4 Batch (pulse-based)

In this operation mode, the pump doses the set batch volume in the set dosing time (t_1). A batch is dosed with each incoming pulse.

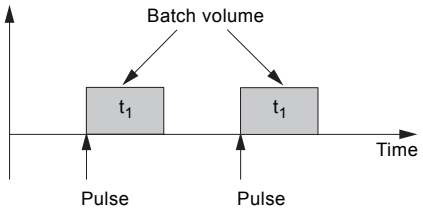

Fig. 22 Batch (pulse-based)

The setting range depends on the pump type:

Type	Setting range per batch		
	from [ml]	to [l]	Resolution* [ml]
DDA 7.5-16	0.74	999	0.0925
DDA 12-10	1.45	999	0.1813
DDA 17-7	1.55	999	0.1938
DDA 30-4	3.10	999	0.3875

* Thanks to the digital motor control, dosing quantities with a resolution of up to 1/8 of the dosing stroke volume can be dosed.

The batch volume (e.g. 75 ml) is set in the "Setup > Batch volume" menu. The minimum dosing time required for this (e.g. 36 seconds) is displayed and can be increased.

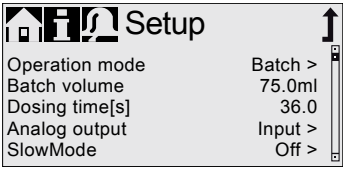

Fig. 23 Batch mode

Signals received during a batch process or an interruption (e.g. alarm, External stop) will be ignored. If the pump is restarted following an interruption, the next batch volume is dosed on the next incoming pulse.

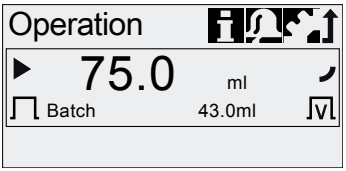

Fig. 24 Batch mode

In the "Operation" menu, the total batch volume (e.g. 75 ml) and the remaining batch volume still to be dosed (e.g. 43 ml) are shown in the display.

6.4.5 Dosing timer cycle

In this operation mode, the pump doses the set batch volume in regular cycles.
Dosing starts when the pump is started after a singular start delay. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

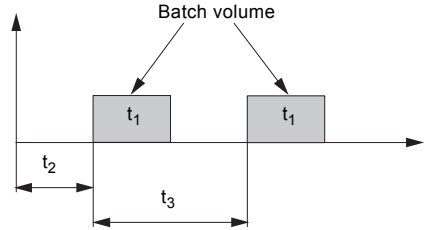

Fig. 25 Dosing timer cycle diagram

t_1	Dosing time
t_2	Start delay
t_3	Cycle time

In the event of an interruption (e.g. interruption of the mains voltage, External stop), the dosing will be stopped while the time continues running.
After suspending the interruption, the pump will continue to dose according to the actual timeline position.

The following settings are required in the "Setup > Dosing timer cycle" menu:

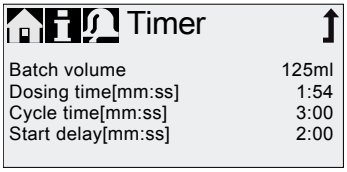

Fig. 26 Dosing timer cycle

The batch volume to be dosed (e.g. 125 ml) is set in the "Setup > Dosing timer cycle" menu. The dosing time required for this (e.g. 1:54) is displayed and can be changed.

The total batch volume (e.g. 125 ml) and the remaining batch volume still to be dosed are displayed in the "Operation" menu. During breaks in dosing, the time until the next dosing process (e.g. 1:21) is displayed.

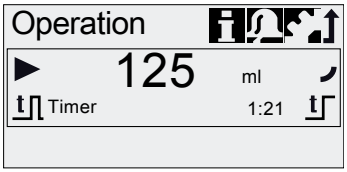

Fig. 27 Dosing timer cycle

6.4.6 Dosing timer week

In this operation mode, up to 16 dosing procedures are defined for a week.
These dosing procedures may take place regularly on one or several week days. The setting range for the batch volume corresponds to the values in section *6.4.4 Batch (pulse-based)*.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

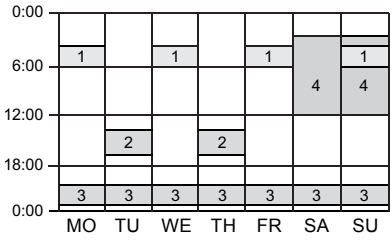

Fig. 28 Example for Dosing timer week function

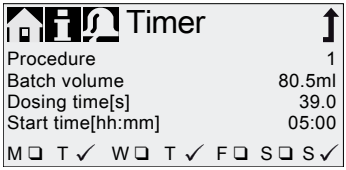
Note

If several procedures overlap, the process with the higher dosing flow has priority!

In the event of an interruption (e.g. disconnection of the mains voltage, External stop), the dosing is stopped while the time continues running.
After suspending the interruption, the pump continues to dose according to the actual timeline position.

The following settings are required in the "Setup > Dosing timer week" menu for each dosing procedure:

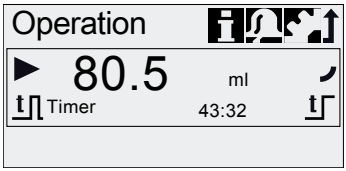


TM04 1138 1110

Fig. 29 Setting the timer

The batch volume (e.g. 80.5 ml) is set in the "Setup > Dosing timer week" menu. The dosing time required for this (e.g. 39.0) is displayed and can be changed.

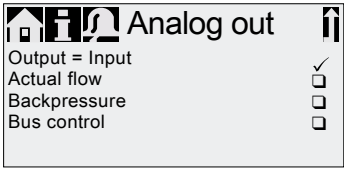
In the "Operation" menu, the total batch volume (e.g. 80.5 ml) and the remaining batch volume to be dosed is displayed. During breaks in dosing, the time (e.g. 43:32) until the next dosing is displayed.



TM04 1136 1110

Fig. 30 Weekly timer dosing (break in dosing)

6.5 Analog output



TM04 1153 1110

Fig. 31 Configure analog output

The analog output of the pump is parametrised in the "Setup > Analog output" menu. The following settings are possible:

Setting	Description of output signal	Variant FCM	Variant FC	Variant AR
Output = Input	Analog feedback signal (not for master-slave application). The analog input signal is mapped 1:1 to the analog output.	X	X	X
Actual flow**	Current actual flow • 0/4 mA = 0 % • 20 mA = 100 % see section *6.9 Flow measurement*	X	X*	X*
Backpressure	Backpressure, measured in the dosing head • 0/4 mA = 0 bar • 20 mA = Max. operating pressure see section *6.8 Pressure monitoring*	X	X	
Bus control	Enabled by command in Bus control, see section *6.15 Bus communication*	X	X	X

* Output signal is based on motor speed and pump status (target flow).

** Signal has same analog scaling as the current analog input signal. See *6.4.3 Analog 0/4-20 mA*.

Wiring diagram see section *4.3 Electrical connection*.

Note

In all operation modes, the analog output has a range of 4-20 mA. Exception: Operation mode 0-20 mA. Here, the analog output range is 0-20 mA.

6.6 SlowMode

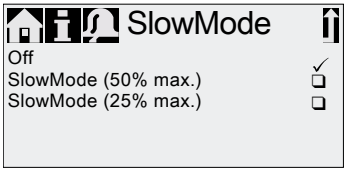
When the "SlowMode" function is enabled, the pump slows down the suction stroke. The function is enabled in the "Setup > SlowMode" menu and is used to prevent cavitation in the following cases:

- for dosing media with a high viscosity
- for degassing dosing media
- for long suction lines
- for large suction lift.

In the "Setup > SlowMode" menu, the speed of the suction stroke can be reduced to 50 % or 25 %.

Caution

Enabling the 'SlowMode' function reduces the maximum dosing flow of the pump to the set percentage value!



TM04 1153 1110

Fig. 32 SlowMode menu

6.7 FlowControl

Applies to DDA-FC/FCM control variant.

This function is used to monitor the dosing process. Although the pump is running, various influences e.g. air bubbles, can cause a reduced flow or even stop the dosing process. In order to guarantee optimum process safety, the enabled "FlowControl" function directly detects and indicates the following errors and deviations:

- Overpressure
- Damaged discharge line
- Air in the dosing chamber
- Cavitation
- Suction valve leakage > 70 %
- Discharge valve leakage > 70 %.

The occurrence of a fault is indicated by the "eye" symbol flashing. The faults are displayed in the "Alarm" menu (see section *8. Faults*).

FlowControl works with a maintenance-free sensor in the dosing head. During the dosing process, the sensor measures the current pressure and continuously sends the measured value to the microprocessor in the pump. An internal indicator diagram is created from the current measured values and the current diaphragm position (stroke length). Causes for deviations can be identified immediately by aligning the current indicator diagram with a calculated optimum indicator diagram. Air bubbles in the dosing head reduce e.g. the discharge phase and consequently the stroke volume (see fig. 33).

Requirements for a correct indicator diagram are:

- FlowControl function is active
- pressure difference between suction and discharge side is > 2 bar
- No interruption/pause in discharge stroke
- Pressure sensor and cable are functioning properly
- No leakage > 50 % in suction or discharge valve

If one of these requirements is not met, the indicator diagram cannot be evaluated.

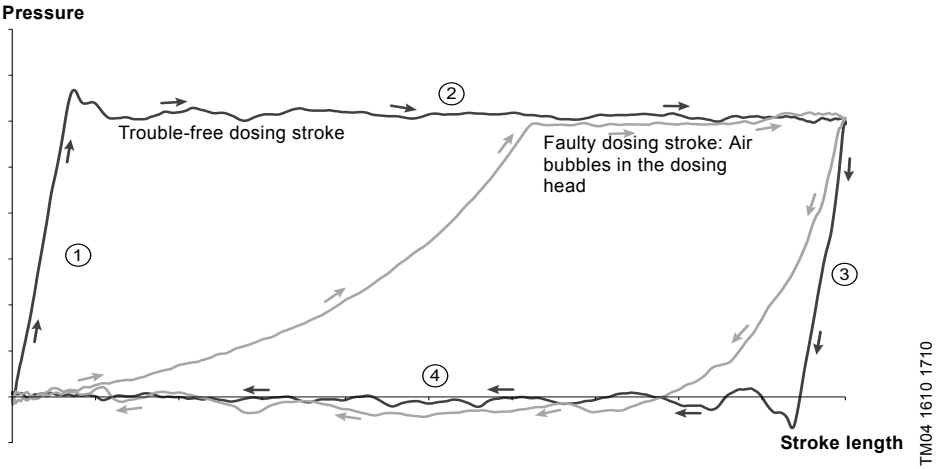


Fig. 33 Indicator diagram

1	Compression phase
2	Discharge phase
3	Expansion phase
4	Suction phase

Setting FlowControl

The "FlowControl" function is set using the two parameters "Sensitivity" and "Delay" in the "Setup > FlowControl" menu.

Sensitivity

In "Sensitivity" the deviation in stroke volume, which will result in an error message, is set in percent.

Sensitivity	Deviation
low	approx. 70 %
medium	approx. 50 %
high	approx. 30 %

Delay

The "Delay" parameter is used to define the time period until an error message is generated: "short", "medium" or "long". The delay depends on the set dosing flow and therefore cannot be measured in strokes or time.

Air bubbles

The "FlowControl" function identifies air bubbles > 60 % of the stroke volume. After switching to "Air bubble" warning status, the pump adapts the stroke frequency to approximately 30-40 % of max. stroke frequency, and starts a special motor drive strategy. The adaptation of the stroke frequency allows the air bubbles to rise from suction to discharge valve. Due to the special motor drive strategy the air bubbles are displaced from the dosing head into the discharge line.

If the air bubbles have not been eliminated after a maximum of 60 strokes, the pump returns to the normal motor drive strategy.

6.8 Pressure monitoring

Applies to DDA-FC/FCM control variant.

A pressure sensor monitors the pressure in the dosing head. If the pressure during the discharge phase falls below 2 bar, a warning is generated (pump continues running). If in the "Setup > Pressure monitoring" menu the function "Min. pressure alarm" is activated, an alarm is generated and the pump is stopped.

If the pressure exceeds the "Max. pressure" set in the "Setup > Pressure monitoring" menu, the pump is shut down, enters the standby state and indicates an alarm.

Caution ***The pump restarts automatically once the backpressure falls below the set "Max. pressure"!***

6.8.1 Pressure setting ranges

Type	Fixed min. pressure [bar]	Adjustable max. pressure [bar]
DDA 7.5-16	< 2	3-17
DDA 12-10	< 2	3-11
DDA 17-7	< 2	3-8
DDA 30-4	< 2	3-5

Warning

Install a pressure-relief valve in the pressure line to provide protection against impermissibly high pressure!

Caution ***The pressure measured in the dosing head is slightly higher than the actual system pressure.***

Therefore the "Max. pressure " should be set at least 0.5 bar higher than the system pressure.

6.8.2 Calibration of pressure sensor

The pressure sensor is calibrated in the factory. As a rule, it does not need to be re-calibrated. If specific circumstances (e.g. pressure sensor exchange, extreme air pressure values at the location of the pump) necessitate a calibration, the sensor can be calibrated as follows:

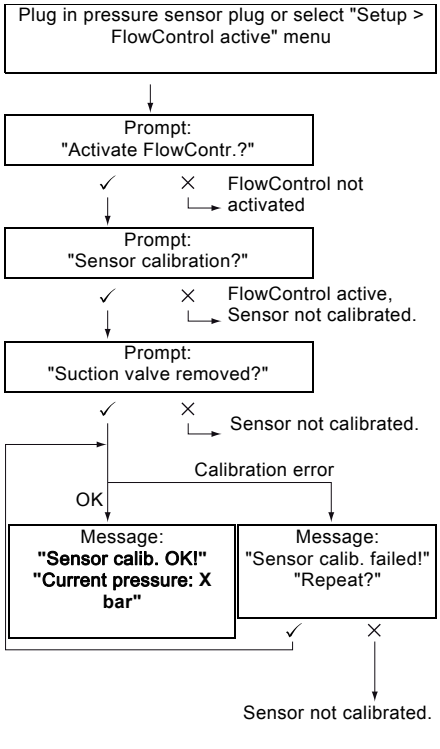
1. Set pump to "Stop" operating state.
2. Make system pressureless and flush.
3. Dismantle suction line and suction valve.

Warning

Calibrating when the suction valve is installed produces incorrect calibration and can cause personal injuries and damage to property!

Only carry out a calibration if this is technically required!

4. Proceed as described below to calibrate:



If a calibration is not successfully possible, check plug connections, cable and sensor and replace defective parts where necessary.

6.9 Flow measurement

Applies to DDA-FCM control variant.

The pump accurately measures the actual flow and displays it. Via the 0/4-20 mA analog output, the actual flow signal can easily be integrated into an external process control without additional measuring equipment (see section *6.5 Analog output*).

The flow measurement is based on the indicator diagram as described in section *6.7 FlowControl*. The accumulated length of the discharge phase multiplied by the stroke frequency produces the displayed actual flow. Faults e.g. air bubbles or backpressure that is too low result in a smaller or larger actual flow. When the "AutoFlowAdapt" function is activated (see section *6.10 AutoFlowAdapt*), the pump compensates for these influences by correction of the stroke frequency.

Note

Strokes which cannot be analysed (partial strokes, pressure differential which is too low) are provisionally calculated based on the setpoint value and displayed.

6.10 AutoFlowAdapt

Applies to DDA-FCM control variant.

The "AutoFlowAdapt" function is activated in the "Setup" menu. It detects changes in various parameters and responds accordingly in order to keep the set target flow constant.

Note

Dosing accuracy is increased when "AutoFlowAdapt" is activated.

This function processes information from the pressure sensor in the dosing head. Errors detected by the sensor are processed by the software. The pump responds immediately regardless of the operation mode by adjusting the stroke frequency or where necessary compensating for the deviations with a corresponding indicator diagram.

If the target flow cannot be achieved by the adjustments, a warning is issued.

"AutoFlowAdapt" operates on the basis of the following functions:

- FlowControl: malfunctions are identified (see section *6.7 FlowControl*).
- Pressure monitoring: pressure fluctuations are identified (see section *6.8 Pressure monitoring*).
- Flow measurement: deviations from the target flow are identified (see section *6.9 Flow measurement*).

Example of "AutoFlowAdapt"

Pressure fluctuations

The dosing volume decreases as backpressure increases and conversely the dosing volume increases as the backpressure decreases.

The "AutoFlowAdapt" function identifies pressure fluctuations and responds by adjusting the stroke frequency. The actual flow is thus maintained at a constant level.

6.11 Auto deaeration

Dosing degassing media can result in air pockets in the dosing head during breaks in dosing. This can result in no medium being dosed when restarting the pump. The "Setup > Auto deaeration" function performs pump deaeration automatically at regular intervals. Software-controlled diaphragm movements encourage any bubbles to rise and gather at the discharge valve so that they can be removed on the next dosing stroke.

The function works:

- when the pump is not in the "Stop" operating state
- during breaks in dosing (e.g. External stop, no incoming pulses, etc.).

Note

The diaphragm movements can displace small volumes into the discharge line. When dosing strongly degassing media, this is however virtually impossible.

6.12 Key lock

The key lock is set in the "Setup > Key lock" menu by entering a four-digit code. It protects the pump by preventing changes to settings. Two levels of key lock can be selected:

Level	Description
Settings	All settings can only be changed by entering the lock code. The [Start/stop] key and the [100%] key are not locked.
Settings + keys	The [Start/stop] key and the [100%] key and all settings are locked.

It is still possible to navigate in the "Alarm" and "Info" main menu and reset alarms.

6.12.1 Temporary deactivation

If the "Key lock" function is activated but settings need to be modified, the keys can be unlocked temporarily by entering the deactivation code. If the code is not entered within 10 seconds, the display automatically switches to the "Operation" main menu. The key lock remains active.

6.12.2 Deactivation

The key lock can be deactivated in the "Setup > Key lock" menu via the "Off" menu point. The key lock is deactivated after the general code "2583" or a pre-defined custom code has been entered.

6.13 Display Setup

Use the following settings in the "Setup > Display" menu to adjust the display properties:

- Units (metric/US)
- Display contrast
- Additional display.

6.13.1 Units

Metric units (litres/millilitres/bar) or US units (US gallons/PSI) can be selected. According to the operation mode and menu, the following units of measurement are displayed:

Operation mode / function	Metric units	US units
Manual control	ml/h or l/h	gph
Pulse control	ml/⊓	ml/⊓
0/4-20 mA Analog control	ml/h or l/h	gph
Batch (pulse- or timer-controlled)	ml or l	gal
Calibration	ml	ml
Volume counter	l	gal
Pressure monitoring	bar	psi

6.13.2 Additional display

The additional display provides additional information about the current pump status. The value is shown in the display with the corresponding symbol.

In "Manual" mode the "Actual flow" information can be displayed with Q = 1.28 l/h (see fig. 34).

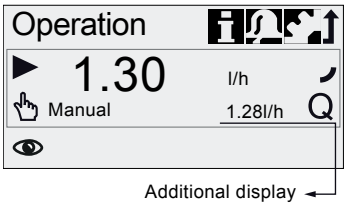


Fig. 34 Display with additional display

The additional display can be set as follows:

Setting	Description
Default display	Depending on the operation mode:
	Q Actual flow (Manual/Pulse)[1), 2)]
	Q Target flow (Pulse)
	Input current (analog)
	Remaining batch volume (Batch, Timer)
	t⊓ Period until next dosing (Timer)
Dosed volume	V Dosed vol. since last reset (see *Counters* on page 21)
Actual flow	Q Current actual flow[1)]
Backpressure	P Current backpressure in the dosing head[3)]

1) only DDA-FCM control variant

2) only if indicator diagram can be evaluated (see *6.7 FlowControl*)

3) only DDA-FCM/FC control variant

6.14 Time+date

The time and date can be set in the "Setup > Time+date" menu.

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

Caution

The conversion between summer and winter time does not take place automatically!

6.15 Bus communication

BUS

The bus communication enables remote monitoring and setting of the pump via a fieldbus system.

Further manuals, functional profiles and support files (e.g. GSD-files) are available on the CD delivered with the interface hardware and on www.grundfos.com.

6.15.1 GENIbus communication

The pump is supplied with an integrated module for GENIbus communication. The pump identifies the bus control after connecting to the corresponding signal input. The "Activate communication?" prompt is displayed. After confirmation, the corresponding symbol appears in the "Activated functions" area in the "Operation" menu.

In the "Setup > Bus" menu the GENIbus address can be set from 32 to 231 and bus control can be deactivated.

TM04 1139 2410

Fig. 35 Bus menu

Caution ***The maximum cable length for GENIbus connection is 3 m and must not be exceeded!***

6.15.2 Possible industrial bus types

The pump can be integrated into several networks using the additional E-box (Extension-Box).

Bus type	Interface hardware	Retrofitting possible for pump software
Profibus® DP	E-Box 150	V2.0 and higher
Modbus RTU	E-Box 200	V2.5 and higher

The pump can also be connected to a Grundfos CIU unit (CIU = Communication Interface Unit) equipped with one of the following CIM modules (CIM = Communication Interface Module):

- CIM150 Profibus
- CIM200 Modbus
- CIM270 GRM
- CIM500 Ethernet

For internal communication between the E-Box/CIU and the dosing pump, GENIbus is used.

Caution ***The maximum cable length for GENIbus connection is 3 m and must not be exceeded!***

Caution ***Prior to installation and start-up, read the documentation delivered with the E-Box or CIU unit!***

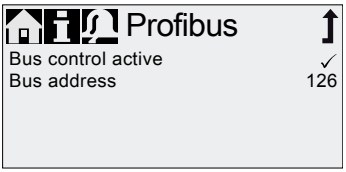
6.15.3 Activate communication

1. Set the pump to operating state "Stop" with the [Start/stop] key.
2. Switch off the power supply of the pump.
3. Install and connect the E-Box/CIU as described in the respective separate installation and operating instructions.
4. Switch on the power supply of the pump.

The "Activate communication?" prompt is displayed.

After confirmation, the "Bus" symbol appears in the "Activated functions" area of the "Operation" menu, no matter if the prompt was accepted or refused.

If the prompt has been accepted, the bus control function is activated. If the prompt has been refused, bus control function can be activated in "Setup > Bus" menu.



TM04 1139 2410

Fig. 36 Example of submenu for Profibus®

6.15.4 Setting the bus address

1. Enter "Setup > Bus" menu and set desired bus address:

Bus type	Address range
Profibus® DP	0 - 126
Modbus RTU	1 - 247

2. The pump needs to be restarted to initialise the new bus address. Switch off the power supply of the pump and wait for approximately 20 seconds.
3. Switch on the power supply of the pump.

The pump is initialised with the new bus address.

6.15.5 Characteristics of bus communication

To start and stop the pump via bus, it needs to be in operating state "Running". When the pump is remotely stopped from bus, the "External stop" symbol is displayed and the pump switches to operating state "Standby".

While bus control function is activated, the "Setup" menu only shows the "Bus" and "Key lock" submenus. The other main menus, the "External stop" function and the keys are still available.

All operation modes (see section *6.4 Operation modes*) can still be used when bus control is activated. This allows to use the bus control only for monitoring and setting the pump. In this case the respective "BusWatchDog" (see funtional profile on E-Box/CIU product CD) should be deactivated in bus control, because otherwise faults in communication can stop the pump.

Note

To change any settings manually, the bus control function must be deactivated temporarily.

The analog output can not be used while the pump is bus-controlled as both functions use the same electrical connection. See section *4.3 Electrical connection*.

6.15.6 Deactivate communication

Warning

After deactivating the bus control function, the pump can start automatically!

Before deactivating the bus control function, set the pump to operating state "Stop"!

Bus control function can be deactivated in the "Setup > Bus" menu. After deactivation all submenus in "Setup" menu are available.

The "Bus" symbol in the display disappears at next restart of the pump, after the E-Box/CIU plug was disconnected.

Caution

After disconnecting any plug, always refit protective cap!

6.15.7 Communication faults

Faults are only detected, if the respective "BusWatchDog" (see functional profile on E-Box/CIU product CD) is activated.

Warning

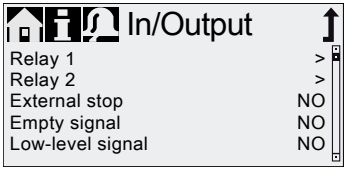
After a communication fault is repaired, the pump can start automatically, depending on current bus control and pump settings!

Before repairing any fault, set the pump to operating state "Stop"!

In case of bus communication faults (e.g. communication cable break), the pump stops dosing and switches to operating state "Standby" approximately 10 seconds after the fault was detected. An alarm is triggered, detailing the cause of the fault. See section *8. Faults*.

6.16 Inputs/Outputs

In the "Setup > Inputs/Outputs" menu, you can configure the two outputs "Relay 1+Relay 2" and the signal inputs "External stop", "Empty signal" and "Low-level signal".



TM04 1152 1110

Fig. 37 Inputs/Outputs menu

Warning

When time or date is changed in "Time+date" menu, timer dosing and timer relay output functions (Relay 2) are stopped!

Timer dosing and timer relay output functions must be restarted manually!

Changing time or date can cause increase or decrease in concentration!

6.16.1 Relay outputs

The pump can switch two external signals using installed relays. The relays are switched by potential-free pulses. The connection diagram of the relays is shown in section *4.3 Electrical connection*. Both relays can be allocated with the following signals:

Relay 1 signal	**Relay 2 signal**	**Description**
Alarm*	Alarm	Display red, pump stopped (e.g. empty signal, etc.)
Warning*	Warning	Display yellow, pump is running (e.g. low-level signal, etc.)
Stroke signal	Stroke signal	Each full stroke
Pump dosing	Pump dosing*	Pump running and dosing
Pulse input**	Pulse input**	Each incoming pulse from pulse input
Bus control	Bus control	Activated by a command in the bus communication
	Timer Cycle	See following sections
	Timer Week	See following sections
Contact type		
NO*	NO*	Normally open contact
NC	NC	Normally closed contact

* Factory setting

** The correct transmission of incoming pulses can only be guaranteed up to a pulse frequency of 5 Hz.

Timer Cycle (Relay 2)

For the "Relay 2 > Timer Cycle" function, set the following parameters:

- On (t_1)
- Start delay (t_2)
- Cycle time (t_3)

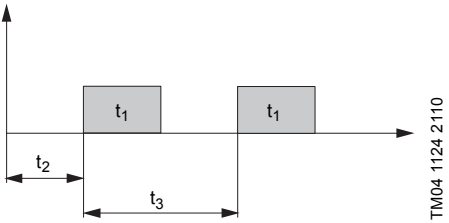


Fig. 38 Diagram

Timer Week (Relay 2)

This function saves up to 16 relay on-times for a week. The following settings can be made for each relay switching operation in the "Relay 2 > Timer Week" menu:

- Procedure (No.)
- On time (duration)
- Start time
- Weekdays.

6.16.2 External stop

The pump can be stopped via an external pulse, e.g. from a control room. When activating the external stop pulse, the pump switches from the operating state "Running" into the operating state "Standby". The corresponding symbol appears in the "Signal/error display" area of the display.

Caution

Frequent disengagement from the mains voltage, e.g. via a relay, can result in damage to the pump electronics and in the breakdown of the pump. The dosing accuracy is also reduced as a result of internal start procedures.

Do not control the pump via the mains voltage for dosing purposes!

Only use the "External stop" function to start and stop the pump!

The contact type is factory-set to normally open contact (NO). In the "Setup > Inputs/Outputs > External stop" menu, the setting can be changed to normally closed contact (NC).

6.16.3 Empty and Low level signals

In order to monitor the filling level in the tank, a dual-level sensor can be connected to the pump. The pump responds to the signals as follows:

Sensor signal	Pump status
Low level	• Display is yellow • ⧗ Flashes • Pump continues running
Empty	• Display is red • ▼ Flashes • Pump stops

Caution

When the tank is filled up again, the pump restarts automatically!

Both signal inputs are allocated to the normally open contact (NO) in the factory. They can be re-allocated in the "Setup > Inputs/Outputs" menu to normally closed contact (NC).

6.17 Basic settings

All settings can be reset to the settings default upon delivery in the "Setup > Basic settings" menu.

Selecting "Save customer settings" saves the current configuration to the memory. This can then be activated using "Load customer settings".

The memory always contains the previously saved configuration. Older memory data is overwritten.

7. Service

In order to ensure a long service life and dosing accuracy, wearing parts such as diaphragms and valves must be regularly checked for signs of wear. Where necessary, replace worn parts with original spare parts made from suitable materials.

Should you have any questions, please contact your service partner.

Warning

Maintenance work must only be carried out by qualified staff.

7.1 Regular maintenance

Interval	Task
Daily	Check, if liquid leaks from the drain opening (fig. 41, pos. 11) and if the drain opening is blocked or soiled. If so, follow the instructions given in section *7.6 Diaphragm breakage*.
	Check, if liquid leaks from the dosing head or valves. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. If necessary, tighten valves and cap nuts, or perform service (see *7.4 Perform service*).
	Check, if a service requirement is present at the pump display. If so, follow the instructions given in section *7.3 Service system*.
Weekly	Clean all pump surfaces with a dry and clean cloth.
Every 3 months	Check dosing head screws. If necessary, tighten dosing head screws with a torque wrench at 4 Nm. Replace damaged screws immediately.

7.2 Cleaning

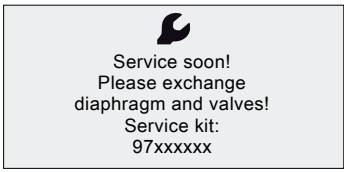
If necessary, clean all pump surfaces with a dry and clean cloth.

7.3 Service system

According to the motor runtime or after a defined period of operation, service requirements will appear. Service requirements appear regardless of the current operating state of the pump and do not affect the dosing process.

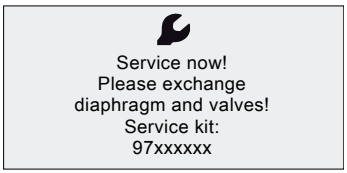
Service requirement	Motor runtime [h]*	Time interval [months]*
Service soon!	7500	23
Service now!	8000	24

* Since the last service system reset



TM04 1131 1110

Fig. 39 Service soon!



TM04 1131 1110

Fig. 40 Service now!

Caution ***For media which result in increased wear, the service interval must be shortened.***

The service requirement signals when the replacement of wearing parts is due and displays the number of the service kit. Press the click wheel to temporarily hide the service prompt.

When the "Service now!" message appears (displayed daily), the pump must be serviced immediately. The symbol appears in the "Operation" menu.

The number of the service kit required is also displayed in the "Info" menu.

7.4 Perform service

Only spare parts and accessories from Grundfos should be used for maintenance. The usage of non-original spare parts and accessories renders any liability for resulting damages null and void.

Further information about carrying out maintenance can be found in the service kit catalogue on our homepage. See www.grundfos.com.

Warning

Risk of chemical burns!

When dosing dangerous media, observe the corresponding precautions in the safety data sheets!

Wear protective clothing (gloves and goggles) when working on the dosing head, connections or lines!

Do not allow any chemicals to leak from the pump. Collect and dispose of all chemicals correctly!

Caution

Before any work to the pump, the pump must be in the "Stop" operating state or be disconnected from the power supply. The system must be pressureless!

7.4.1 Dosing head overview

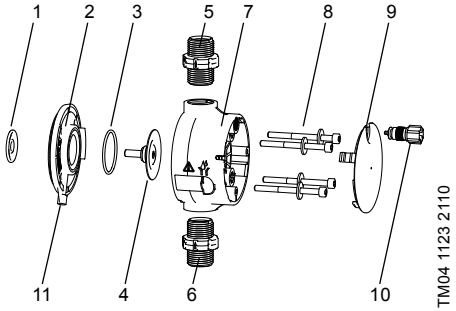


Fig. 41 Changing the diaphragm and valves

1	Safety diaphragm
2	Flange
3	O-ring
4	Diaphragm
5	Valve on discharge side
6	Valve on suction side
7	Dosing head
8	Screws with discs
9	Cover
10	Deaeration valve
11	Drain opening

7.4.2 Dismantling the diaphragm and valves

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

If the diaphragm is possibly damaged, don't connect the pump to the power supply! Proceed as described in section 7.6 Diaphragm breakage!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Set pump to "Stop" ■ operating state using the [Start/stop] key.
4. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "out" position.
   – Symbol (– must be displayed (see fig. 14).
5. Take suitable steps to ensure that the returning liquid is safely collected.
6. Dismantle suction, pressure and deaeration hose.
7. Dismantle valves on suction and discharge side (5, 6).
8. Remove the cover (9).
9. Loosen screws (8) on the dosing head (7) and remove with discs.
10. Remove the dosing head (7).
11. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
12. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
13. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.4.3 Reassembling the diaphragm and valves

The pump must only be reassembled, if nothing indicates that dosing liquid has entered the pump housing. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

This section refers to fig. 41.

1. Attach flange (2) correctly and screw on new diaphragm (4) clockwise.
   – Make sure that the O-ring (3) is seated correctly!
2. Press the [Start/stop] and [100%] keys at the same time to put the diaphragm into "in" position.
   – Symbol)– must be displayed (see fig. 14).
3. Attach the dosing head (7).
4. Install screws with discs (8) and cross-tighten with a torque wrench.
   – Torque: 4 Nm.
5. Attach the cover (9).
6. Install new valves (5, 6).
   – Do not interchange valves and pay attention to direction of arrow.
7. Connect suction, pressure and deaeration hose (see section *4.2 Hydraulic connection*)
8. Press the [Start/stop] key to leave the service mode.

Caution

Tighten the dosing head screws with a torque wrench once before commissioning and again after 2-5 operating hours at 4 Nm.

9. Deaerate dosing pump (see section *5.2 Deaerating the pump*).
10. Please observe the notes on commissioning in section *5. Startup*!

7.5 Resetting the service system

After performing the service, the service system must be reset using the "Info > Reset service system" function.

7.6 Diaphragm breakage

If the diaphragm leaks or is broken, dosing liquid escapes from the drain opening (fig. 41, pos. 11) on the dosing head.

In case of diaphragm breakage, the safety diaphragm (fig. 41, pos. 1) protects the pump housing against ingress of dosing liquid.

When dosing crystallising liquids the drain opening can be blocked by crystallisation. If the pump is not taken out of operation immediately, a pressure can build up between the diaphragm (fig. 41, pos. 4) and the safety diaphragm in the flange (fig. 41, pos. 2). The pressure can press dosing liquid through the safety diaphragm into the pump housing.

Most dosing liquids don't cause any danger when entering the pump housing. However a view liquids can cause a chemical reaction with inner parts of the pump. In the worst case, this reaction can produce explosive gases in the pump housing.

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Operation with damaged diaphragm can lead to dosing liquid entering the pump housing.

In case of diaphragm breakage, immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

Dismantle the dosing head without connecting the pump to the power supply and make sure no dosing liquid has entered the pump housing. Proceed as described in section 7.6.1 Dismantling in case of diaphragm breakage.

To avoid any danger resulting from diaphragm breakage, observe the following:

- Perform regular maintenance. See section *7.1 Regular maintenance*.
- Never operate the pump with blocked or soiled drain opening.
  – If the drain opening is blocked or soiled, proceed as described in section *7.6.1 Dismantling in case of diaphragm breakage*.
- Never attach a hose to the drain opening. If a hose is attached to the drain opening, it is impossible to recognise escaping dosing liquid.
- Take suitable precautions to prevent harm to health and damage to property from escaping dosing liquid.
- Never operate the pump with damaged or loose dosing head screws.

7.6.1 Dismantling in case of diaphragm breakage

Warning

Danger of explosion, if dosing liquid has entered the pump housing!

Do not connect the pump to the power supply!

This section refers to fig. 41.

1. Make system pressureless.
2. Empty dosing head before maintenance and flush it if necessary.
3. Take suitable steps to ensure that the returning liquid is safely collected.
4. Dismantle suction, pressure and deaeration hose.
5. Remove the cover (9).
6. Loosen screws (8) on the dosing head (7) and remove with discs.
7. Remove the dosing head (7).
8. Unscrew diaphragm (4) counter-clockwise and remove with flange (2).
9. Make sure the drain opening (11) is not blocked or soiled. Clean if necessary.
10. Check the safety diaphragm (1) for wear and damage. Replace if necessary.

If nothing indicates that dosing liquid has entered the pump housing, go on as described in section *7.4.3 Reassembling the diaphragm and valves*. Otherwise proceed as described in section *7.6.2 Dosing liquid in the pump housing*.

7.6.2 Dosing liquid in the pump housing

Warning

Danger of explosion!

Immediately separate the pump from the power supply!

Make sure the pump cannot be put back into operation by accident!

If dosing liquid has entered the pump housing:

- Send the pump to Grundfos for repair, following the instructions given in section *7.7 Repairs*.
- If a repair isn't economically reasonable, dispose of the pump observing the information in section *9. Disposal*.

7.7 Repairs

Warning

The pump housing must only be opened by personnel authorised by Grundfos!

Repairs must only be carried out by authorised and qualified personnel!

Switch off the pump and disconnect it from the voltage supply before carrying out maintenance work and repairs!

After consulting Grundfos, please send the pump, together with the safety declaration completed by a specialist, to Grundfos. The safety declaration can be found at the end of these instructions. It must be copied, completed and attached to the pump.

The pump must be cleaned prior to dispatch!

Caution ***If dosing liquid has possibly entered the pump housing, state that explicitly in the safety declaration! Observe section 7.6 Diaphragm breakage.***

If the above requirements are not met, Grundfos may refuse to accept delivery of the pump. The shipping costs will be charged to the sender.

8. Faults

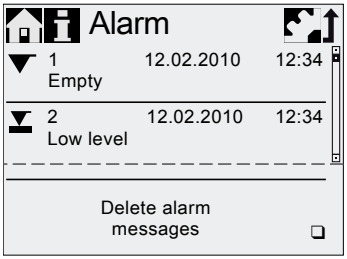
In the event of faults in the dosing pump, a warning or an alarm is triggered.
The corresponding fault symbol flashes in the "Operation" menu, see section *8.1 List of faults*.
The cursor jumps to the "Alarm" main menu symbol. Press the click wheel to open the "Alarm" menu and, where necessary, faults to be acknowledged will be acknowledged.

A yellow display indicates a warning and the pump continues running.

A red display indicates an alarm and the pump is stopped.

The last 10 faults are stored in the "Alarm" main menu. When a new fault occurs, the oldest fault is deleted.

The two most recent faults are shown in the display, you can scroll through all the other faults. The time and cause of the fault are displayed.



TM04 1109 1010

The list of faults can be deleted at the end of the list.

If there is a service requirement, this appears when the "Alarm" menu is opened. Press the click wheel to temporarily close the service prompt (see section *7.3 Service system*).

8.1 List of faults

8.1.1 Faults with error message

Display in the "Alarm" menu	Possible cause	Possible remedy
▼ Empty (Alarm)	• Dosing medium tank empty	• Fill tank. • Check contact setting (NO/NC).
▼ Low level (Warning)	• Dosing medium tank almost empty	
Overpressure (Alarm)	• Discharge valve blocked • Isolating valve in discharge line closed • Pressure peaks due to high viscosity • Max. pressure set too low (see section *6.8 Pressure monitoring*)	• Replace valve if necessary (see section *7.4 Perform service*). • Check flow direction of valves (arrow) and correct if necessary. • Open the isolating valve (on the discharge side). • Enlarge diameter of discharge line. • Change pressure setting (see section *6.8 Pressure monitoring*).
Low backpressure (Warning/alarm*)	• Faulty diaphragm • Broken discharge line • Pressure differential between suction and discharge side too low • Leakage in the pressure loading valve at Q < 1 l/h • Deaeration valve open	• Change the diaphragm (see section *7.4 Perform service*). • Check discharge line and repair if necessary. • Install additional spring-loaded valve (approx. 3 bar) on the discharge side. • Close the deaeration valve.
Air bubble (Warning)	• Broken/leaky suction line • Strongly degassing medium • Tank dosing medium empty	• Check suction line and repair if necessary. • Provide positive inlet pressure (place dosing medium tank above the pump). • Enable "SlowMode" (see section *6.6 SlowMode*). • Fill tank.
Cavitation (Warning)	• Blocked/constricted/squeezed suction line • Blocked/constricted suction valve • Suction lift too high • Viscosity too high	• Enable "SlowMode" (see section *6.6 SlowMode*). • Reduce suction lift. • Increase suction hose diameter. • Check suction line and open isolating valve if necessary.
Suct. valve leak (Warning)	• Leaky/dirty suction valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install filter in suction line. • Close the deaeration valve.
Disch. valve leak (Warning)	• Leaky/dirty discharge valve • Leakage in the pressure loading valve • Deaeration valve open	• Check valve and tighten it up. • Flush system. • Replace valve if necessary (see section *7.4 Perform service*). • Check O-ring position. • Install screen in suction line. • Close the deaeration valve. • Install spring-loaded valve on the discharge side.
Flow deviation (Warning)	• Considerable deviation between target and actual flow • Pump not or incorrectly calibrated	• Check installation. • Calibrate the pump (see section *5.3 Calibrating the pump*).

Display in the "Alarm" menu	Possible cause	Possible remedy
Pressure sensor (Warning)	• Broken "FlowControl" cable (see fig. 11) • Sensor defect • Pressure sensor not correctly calibrated.	• Check plug connection. • Change sensor if necessary. • Calibrate pressure sensor correctly (see section *6.8.2 Calibration of pressure sensor*).
Motor blocked (Alarm)	• Backpressure greater than nominal pressure • Damage to gears	• Reduce backpressure. • Arrange for repair of gears, if necessary.
BUS Bus error (Alarm)	• Fieldbus communication error	• Check cables for correct specification and damage; replace if necessary. • Check cable routing and shielding; correct if necessary.
E-Box (Alarm)	• E-Box connection error • Faulty E-Box	• Check plug connection. • Replace E-Box if necessary.
Cable break (Alarm)	• Defect in analog cable 4-20 mA (input current < 2 mA)	• Check cable/plug connections and replace, if necessary. • Check signal transmitter.
Service now (Warning)	• Time interval for service expired	• Perform service (see section *7.4 Perform service*).

* Depending on setting

8.1.2 General faults

Fault	Possible cause	Possible remedy
Dosing flow too high	Inlet pressure greater than backpressure	Install additional spring-loaded valve (approx. 3 bar) on the discharge side.
		Increase pressure differential.
	Incorrect calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
No dosing flow or dosing flow too low	Air in dosing head	Deaerate the pump.
	Faulty diaphragm	Change the diaphragm (see section *7.4 Perform service*).
	Leakage/fracture in lines	Check and repair lines.
	Valves leaking or blocked	Check and clean valves.
	Valves installed incorrectly	Check that the arrow on the valve housing is pointing in the direction of flow. Check whether all O-rings are installed correctly.
	Blocked suction line	Clean suction line/install filter.
	Suction lift too high	Reduce suction lift.
		Install priming aid.
		Enable "SlowMode" (see section *6.6 SlowMode*).
	Viscosity too high	Enable "SlowMode" (see section *6.6 SlowMode*).
		Use hose with larger diameter.
		Install spring-loaded valve on the discharge side.
	Faulty calibration	Calibrate the pump (see section *5.3 Calibrating the pump*).
	Deaeration valve open	Close the deaeration valve.

Fault	Possible cause	Possible remedy
Irregular dosing	Valves leaking or blocked	Tighten up valves, replace valves if necessary (see section *7.4 Perform service*).
	Backpressure fluctuations	Keep backpressure constant.
		Activate "AutoFlowAdapt" (only DDA-FCM).
Liquid escaping from the drain opening on the flange	Faulty diaphragm	Immediately separate the pump from the power supply! Observe section *7. Service* and especially section *7.6 Diaphragm breakage*.
Liquid escaping	Dosing head screws not tightened	Tighten up screws (see section *4.2 Hydraulic connection*).
	Valves not tightened	Tighten up valves/union nuts (see section *4.2 Hydraulic connection*).
Pump not sucking in	Suction lift too high	Reduce suction lift; if necessary, provide positive inlet pressure.
	Backpressure too high	Open the deaeration valve.
	Soiled valves	Flush system, replace valves if necessary (see section *7.4 Perform service*).

9. Disposal

This product or parts of it must be disposed of in an environmentally sound way.
Use appropriate waste collection services.
If this is not possible, contact the nearest Grundfos company or service workshop.

Subject to alterations.

Safety declaration

Please copy, fill in and sign this sheet and attach it to the pump returned for service.

Note ***Fill in this document using English or German language.***

Mi, a Grundfos, egyedüli felelősséggel kijelentjük, hogy a DDA, DDC és DDC termékek, amelyekre jelen nyilatkozik vonatkozik, megfelelnek az Európai Unió tagállamainak jogi irányelveit összehangoló tanács alábbi előírásainak:

NL: EC overeenkomstigheidsverklaring
Wij, Grundfos, verklaren geheel onder eigen verantwoordelijkheid dat de producten DDA, DDC en DDE waarop deze verklaring betrekking heeft, in overeenstemming zijn met de Richtlijnen van de Raad in zake de onderlinge aanpassing van de wetgeving van de EG Lidstaten betreffende:

NO: EU samsvarserklæring
Vi, Grundfos, erklærer på eget ansvar at produktene DDA, DDC og DDE, som denne erklæringen gjelder, er i samsvar med disse rådsdirektivene slik de omtrentlig samsvarer med lovene for EU-medlemlandene:

UA: Декларація відповідності ЄС
Компанія Grundfos заявляє про свою виключну відповідальність за те, що продукти DDA, DDC та DDE, на які поширюється дана декларація, відповідають таким рекомендаціям Ради з уніфікації правових норм країн - членів ЄС:

PL: Deklaracja zgodności WE
My, Grundfos, oświadczamy z pełną odpowiedzialnością, że nasze wyroby DDA, DDC oraz DDE, których deklaracja niniejsza dotyczy, są zgodne z następującymi wytycznymi Rady d/s ujednolicenia przepisów prawnych krajów członkowskich WE:

PT: Declaração de conformidade CE
A Grundfos declara sob sua única responsabilidade que os produtos DDA, DDC e DDE, aos quais diz respeito esta declaração, estão em conformidade com as seguintes Directivas do Conselho sobre a aproximação das legislações dos Estados Membros da CE:

RU: Декларация о соответствии ЕС
Мы, компания Grundfos, со всей ответственностью заявляем, что изделия DDA, DDC и DDE, к которым относится настоящая декларация, соответствуют следующим Директивам Совета Евросоюза об унификации законодательных предписаний стран-членов ЕС:

RO: Declaraţie de conformitate CE
Noi, Grundfos, declarăm pe propria răspundere că produsele DDA, DDC şi DDE, la care se referă această declaraţie, sunt în conformitate cu aceste Directive de Consiliu asupra armonizării legilor Statelor Membre CE:

SK: Prehlásenie o konformite ES
My firma Grundfos prehlasujeme na svoju plnú zodpovednosť, že výrobky DDA, DDC a DDE, na ktoré sa toto prehlásenie vzťahuje, sú v súlade s ustanovením smernice Rady pre zblíženie právnych predpisov členských štátov Európskeho spoločenstva v oblastiach:

SI: ES izjava o skladnosti
V Grundfosu s polno odgovornostjo izjavljamo, da so naši izdelki DDA, DDC in DDE, na katere se ta izjava nanaša, v skladu z naslednjimi direktivami Sveta o približevanju zakonodaje za izenačevanje pravnih predpisov držav članic ES:

RS: EC deklaracija o usaglašenosti
Mi, Grundfos, izjavljujemo pod vlastitom odgovornošću da je proizvod DDA, DDC i DDE, na koji se ova izjava odnosi, u skladu sa direktivama Saveta za usklađivanje zakona država članica EU:

FI: EY-vaatimustenmukaisuusvakuutus

Me, Grundfos, vakuutamme omalla vastuullamme, että tuotteet DDA, DDC ja DDE, joita tämä vakuutus koskee, ovat EY:n jäsenvaltioiden lainsäädännön yhdenmukaistamiseen tähtäävien Euroopan neuvoston direktiivien vaatimusten mukaisia seuraavasti:

SE: EG-försäkran om överensstämmelse

Vi, Grundfos, försäkrar under ansvar att produkterna DDA, DDC och DDE, som omfattas av denna försäkran, är i överensstämmelse med rådets direktiv om inbördes närmande till EU-medlemsstaternas lagstiftning, avseende:

TR: EC uygunluk bildirgesi

Grundfos olarak bu beyannameye konu olan DDA, DDC ve DDE ürünlerinin, AB Üyesi Ülkelerin kanunlarını birbirine yaklaştırma üzerine Konsey Direktifleriyle uyumlu olduğunun yalnızca bizim sorumluluğumuz altında olduğunu beyan ederiz:

CN: EC 产品合格声明书

我们格兰富在我们的全权责任下声明，产品 DDA, DDC 和 DDE，即该合格证所指之产品，符合欧共体使其成员国法律趋于一致的以下欧共理事会指令：

JP: EC 適合宣言

Grundfos は、その責任の下に、DDA, DDC 製品および DDE 製品が EC 加盟諸国の法規に関連する、以下の評議会指令に適合していることを宣言します：

KO: EC 적합성 선언

Grundfos 에서는 자사의 단독 책임에 따라 이 선언과 관련된 DDA, DDC 및 DDE 제품이 EC 회원국 법률에 기반한 다음 이사회 지침을 준수함을 선언합니다：

– Machinery Directive (2006/42/EC).
  Standards used: EN 809: 1998, DIN EN ISO 12100:2010.
– Low Voltage Directive (2006/95/EC).
  Standard used: EN 61010-1: 2001 (second edition).
– EMC Directive (2004/108/EC).
  Standards used: EN 61326-1: 2006,
  EN 61000-3-2: 2006+A1: 2009+A2: 2009, EN 61000-3-3: 2008.

This EC declaration of conformity is only valid when published as part of the Grundfos installation and operating instructions.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

Warning

Electrical work: All electrical work should be performed by a qualified electrician in accordance with the latest edition of national, state, and local codes and regulations.

Warning

Shock Hazard: A faulty motor or wiring can cause electrical shock that could be fatal, whether touched directly or conducted through standing water. For this reason, proper grounding of the pump to the power supply's grounding terminal is required for safe installation and operation. In all installations, the above-ground metal plumbing should be connected to the power supply ground as described in Article 250-80 of the National Electrical Code.

1. Limited warranty

Products manufactured by GRUNDFOS PUMPS CORPORATION (Grundfos) are warranted to the original user only to be free of defects in material and workmanship for a period of 24 months from date of installation, but not more than 30 months from date of manufacture. Grundfos' liability under this warranty shall be limited to repairing or replacing at Grundfos' option, without charge, F.O.B. Grundfos' factory or authorized service station, any product of Grundfos' manufacture. Grundfos will not be liable for any costs of removal, installation, transportation, or any other charges which may arise in connection with a warranty claim. Products which are sold but not manufactured by Grundfos are subject to the warranty provided by the manufacturer of said products and not by Grundfos' warranty. Grundfos will not be liable for damage or wear to products caused by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with Grundfos' printed installation and operating instructions.

To obtain service under this warranty, the defective product must be returned to the distributor or dealer of Grundfos' products from which it was purchased together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, the distributor or dealer will contact Grundfos or an authorized service station for instructions.
Any defective product to be returned to Grundfos or a service station must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

GRUNDFOS WILL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, LOSSES, OR EXPENSES ARISING FROM INSTALLATION, USE, OR ANY OTHER CAUSES. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH EXTEND BEYOND THOSE WARRANTIES DESCRIBED OR REFERRED TO ABOVE.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limit actions on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

2. Symbols used in this document

Warning

If these safety instructions are not observed, it may result in personal injury.

Warning

If these instructions are not observed, it may lead to electric shock with consequent risk of serious personal injury or death.

Caution ***If these safety instructions are not observed, it may result in malfunction or damage to the equipment.***

Note ***Notes or instructions that make the job easier and ensure safe operation.***

3. Introduction

The CR range is based on the inline multistage centrifugal pump first pioneered by Grundfos. CR is available in four basic materials and over one million configurations. CR is suitable for pumping water and water-like liquids in industry, petrochemical plants, water treatment plants, commercial buildings, and many other applications. Some of the outstanding characteristics of CR are:

- superior efficiency
- reliability
- easy maintenance
- compact size and small footprint
- quiet operation.

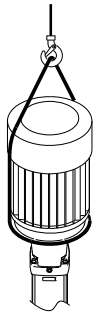
4. Shipment inspection

Examine the components carefully to make sure no damage has occurred to the pump during shipment. Ensure that the pump is NOT dropped or mishandled.

4.1 Lifting instructions

Caution ***Do not use the lifting eyes of the motor for lifting the entire pump and motor assembly.***

Lift pump assembly with lifting straps that pass through the motor stool. Ensure that the load is not applied to the pump shaft.



TM04 0339 0608

Fig. 1 Correct lifting of a CR pump

4.2 Ensure you have the right pump

Check the pump nameplate to make sure that it is the one you ordered.

- **CR:** Centrifugal pump; all parts in contact with the pumped liquid are made of standard cast iron and AISI 304 stainless steel
- **CRI:** Centrifugal pump; all parts in contact with the pumped liquid are made of AISI 304 stainless steel
- **CRN:** Centrifugal pump; all parts in contact with the pumped liquid are made of AISI 316 stainless steel
- **CRT:** Centrifugal pump; all parts in contact with the pumped liquid are made of titanium
- **CRE:** Centrifugal pump with a Grundfos MLE variable frequency drive motor.

4.3 Checking the condition of the pump

The packing in which your pump arrived is specially designed for your pump to prevent damage during shipment. As a precaution, leave the pump in the packing until you are ready to install it. Examine the pump for any damage that may have occurred during shipping. Examine any other parts of the shipment as well for any visible damage.

Note ***If the shipment consists of a complete unit (motor attached to pump end), the position of the coupling connecting the pump shaft to the motor shaft is set to factory specifications. No adjustment is required. If the shipment is a pump end without motor, follow the adjustment procedures in section 13. Replacing the motor.***

Pump without motor (CR, CRI, CRN 1s, 1, 3, 5, 10, 15, and 20 only):

If you purchased a pump end without motor, the shaft seal has been set from factory. Do not loosen the three set screws on the shaft seal when attaching the motor.

Pump without motor (CR, CRN 32, 45, 64, 90, 120, and 150 only):

If you purchased a pump end without motor, you must install the shaft seal. The shaft seal is protected in its own box inside the pump packing crate. To protect the shaft and bearings during shipment, a transport protector is used. Remove the transport protector prior to installation of the shaft seal. Read the seal installation instructions which are included in the pump packing.

4.4 Electrical requirements

Warning

Electrical work: All electrical work should be performed by a qualified electrician in accordance with the current national, state, and local codes and regulations.

Warning

Shock hazard: A faulty motor or faulty wiring can cause electric shock that could be fatal, whether the motor is touched directly or the current is conducted through standing water. For this reason, safe installation and operation require proper grounding of the pump to the power supply ground (earth) terminal.

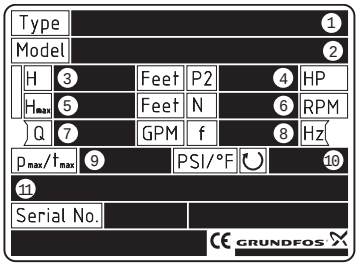
In all installations, connect the above-ground metal plumbing to the power supply ground terminal as described in Article 250-80 of the National Electrical Code.

Verify the power supply to make sure that the voltage, phases and frequency match those of the pump. The proper operating voltage and other electrical information appear on the motor nameplate. These motors are designed to run on - 10 %/+ 10 % of the rated nameplate voltage. For dual-voltage motors, the motor should be internally connected to operate on the voltage closest to the 10 % rating, i.e., a 208 V motor should be wired according to the 208 V wiring diagram. The wiring diagram can be found on either a plate attached to the motor or on a label inside the terminal box cover.

Caution ***Do not operate the pump if voltage variations are greater than - 10 % /+ 10 %.***

5. Identification

5.1 Nameplate data



1. Type designation
2. Model, material number, production number
3. Head in feet at rated flow
4. Rated motor hp
5. Head at zero flow
6. Rated rpm
7. Rated flow
8. Rated frequency
9. Maximum pressure and maximum liquid temperature
10. Direction of rotation
11. Production country

Fig. 2 Key to model line in nameplates

5.2 Type keys

5.2.1 CR, CRI, CRN 1s, 1, 3, 5, 10, 15, and 20

Example	CR 3-	10	A	FG	A	E	HQQE
Type range: CR, CRI, CRN							
Rated flow rate in [m^3/h] (x 5 gpm)							
Number of impellers							
Code for pump version							
Code for pipe connection							
Code for materials							
Code for rubber parts							
Code for shaft seal							

5.2.2 CR, CRN 32, 45, 64, 90, 120, and 150

Example	CR 32-	2-	1	A	G	A	E	KUBE
Pump range: CR, CRN								
Rated flow rate in [m^3/h] (x 5 gpm)								
Number of impellers								
Number of reduced-diameter impellers								
Code for pump version								
Code for pipe connection								
Code for materials								
Code for rubber parts								
Code for shaft seal								

5.2.3 CRT 2, 4, 8, and 16

Example	CRT	16-	30	/2	A	G	A	AUUE
Pump range: CRT								
Rated flow rate in [m^3/h] (x 5gpm)								
Number of stages x 10								
Code for impellers (used only if the pump has fewer impellers than stages)								
Code for pump version								
Code for pipe connection								
Code for materials								
Code for shaft seal and rubber parts								

5.2.4 Codes

Example		A	-G	-A	-E	-H	QQ	E
Pump version								
A	Basic version[1)]							
B	Oversize motor							
E	Certificate/approval							
F	CR pump for high temperatures (air-cooled top assembly)							
H	Horizontal version							
HS	High-pressure pump with high-speed MLE motor							
I	Different pressure rating							
J	Pump with different max. speed							
K	Pump with low NPSH							
M	Magnetic drive							
N	Fitted with sensor							
P	Undersize motor							
R	Horizontal version with bearing bracket							
SF	High-pressure pump							
T	Oversize motor (two flange sizes bigger)							
U	NEMA version[1)]							
X	Special version[2)]							
Pipe connection								
A	Oval flange, Rp thread							
B	Oval flange, NPT thread							
CA	FlexiClamp (CRI(E), CRN(E) 1, 3, 5, 10, 15, 20)							
CX	Triclamp (CRI(E), CRN(E) 1, 3, 5, 10, 15, 20)							
F	DIN flange							
G	ANSI flange							
J	JIS flange							
N	Changed diameter of ports							
P	PJE coupling							
X	Special version							
Materials								
A	Basic version							
D	Carbon-graphite filled PTFE (bearings)							
G	Wetted parts, AISI 316							
GI	All parts stainless steel, wetted parts, AISI 316							
I	Wetted parts, AISI 304							
II	All parts stainless steel, wetted parts, AISI 304							
K	Bronze (bearings)							
S	SiC bearings + PTFE neck rings							
X	Special version							
Code for rubber parts								
E	EPDM							
F	FXM							
K	FFKM							
V	FKM							

Example		A	-G	-A	-E	-H	QQ	E
Shaft seal								
A	O-ring seal with fixed driver							
B	Rubber bellows seal							
E	Cartridge seal with O-ring							
H	Balanced cartridge seal with O-ring							
K	Metal bellows cartridge seal							
O	Double seal, back-to-back							
P	Double seal, tandem							
X	Special version							
B	Carbon, synthetic resin-impregnated							
H	Cemented tungsten carbide, embedded (hybrid)							
Q	Silicon carbide							
U	Cemented tungsten carbide							
X	Other ceramics							
E	EPDM							
F	FXM							
K	FFKM							
V	FKM							

1) In August 2003 the NEMA version pump code was discontinued for all material numbers created by Grundfos manufacturing companies in North America. The NEMA version pump code will still remain in effect for existing material numbers. NEMA version pumps built in North America after this change will have either an A or a U as the pump version code depending on the date the material number was created.

2) If a pump incorporates more than two pump versions, the code for the pump version is X. X also indicates special pump versions not listed above.

6. Applications

Compare the pump's nameplate data or its performance curve with the application in which you plan to install it. Make sure the application falls within the following limits.

Type	Application/liquid
CR	Hot and chilled water, boiler feed, condensate return, glycols and solar thermal liquids.
CRI/CRN	Deionized, demineralized and distilled water. Brackish water and other liquids unsuitable for contact with iron or copper alloys. (Consult manufacturer for specific liquid compatibilities.)
CRN-SF	High-pressure washdown, reverse osmosis or other high-pressure applications.
CRT	Salt water, chloride based liquids and liquids approved for titanium.

7. Operating conditions

7.1 Ambient temperature and altitude

If the ambient temperature exceeds the maximum temperature limits of the pump or the pump is installed at an altitude exceeding the altitude values in the chart below, the motor must not be fully loaded due to the risk of overheating.

Overheating may result from excessive ambient temperatures or the low density and consequently low cooling effect of the air at high altitudes. In such cases, it may be necessary to use a motor with a higher rated output (P_2).

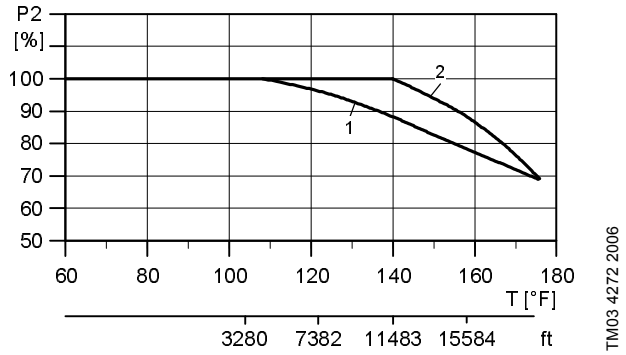

Fig. 3 Relationship between motor output (P_2) and ambient temperature/altitude

Legend

Pos.	Description
1	NEMA standard-efficiency motors
2	NEMA premium-efficiency motors

Example: From fig. 3 it appears that P_2 must be reduced to 88 % when a pump with a NEMA premium-efficiency ML motor is installed 15,584 feet above sea level. At an ambient temperature of 167 °F, P_2 of a standard-efficiency motor must be reduced to 74 % of rated output.

In cases where both the maximum temperature and the maximum altitude are exceeded, the derating factors must be multiplied. Example: 0.89 x 0.89 = 0.79.

7.2 Liquid temperatures

Pump	Liquid temperature
CR, CRI, CRN 1s, 3, 5, 10, 15, and 20	-4 - +248 °F (-20 - +120 °C)
CR, CRN 32, 45, 64, and 90*	-22 - +248 °F (-30 - +120 °C)
CR, CRN 120 and 150* (up to 60 hp)	-22 - +248 °F (-30 - +120 °C)
CR, CRN 120 and 150 (75 and 100 hp)	32-248 °F (0-120 °C)
CRT 2, 4, 8, 16	-4 - +248 °F (-20 - +120 °C)
CRN-SF	-4 - +221 °F (-15 - +105 °C)
Pumps with Cool-Top™	up to 356 °F (180 °C)

All motors are designed for continuous duty in 104 °F (40 °C) ambient air conditions. For higher ambient temperature conditions, consult Grundfos.

* We recommend xUBE shaft seals for temperatures above 200 °F. Pumps with KUHE hybrid shaft seals can only operate up to 200 °F (90 °C). Pumps with xUUE shaft seals can be operated down to -40 °F (-40 °C). ("x" is the seal type).

7.3 Minimum inlet pressures

All CR, CRI, CRN	NPSHR + 2 feet
CRN-SF	29 psi (2 bar)

7.4 Maximum inlet pressures

Pump type	Stages		Max. [psi (bar)]
	60 Hz	50 Hz	
CR, CRI, CRN 1s	2-27	2-36	145 (10)

	10-12	10-16	362 (25)

Consult Grundfos in case of other operating conditions.

8. Installation

Warning

Do not turn on the power supply until the pump is properly installed.

8.1 Pump location

Locate the pump in a dry, well-ventilated, frost-free area which is not subject to extreme variation in temperature.

Make sure the pump is mounted at least 6 inches (150 mm) clear of any obstruction or hot surfaces.

The motor requires an adequate air supply to prevent overheating and adequate vertical space to remove the motor for repair.

In open systems requiring suction lift, locate the pump as close to the liquid source as possible to reduce friction loss in pipes.

8.2 Foundation

Use concrete or similar foundation material to provide a secure, stable mounting base for the pump.

See table below for bolt hole center line dimensions for the various pump types.

Secure the pump to the foundation using all four bolts and shim pump base to assure the pump is vertical and all four pads on the base are properly supported (uneven surfaces can result in pump base breakage when mounting bolts are tightened).

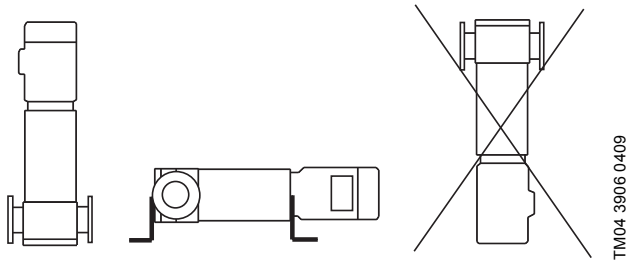

Fig. 4 Pump position

The pump can be installed vertically or horizontally. See fig. 4.

Ensure that an adequate supply of cool air reaches the motor cooling fan. The motor must never fall below the horizontal plane.

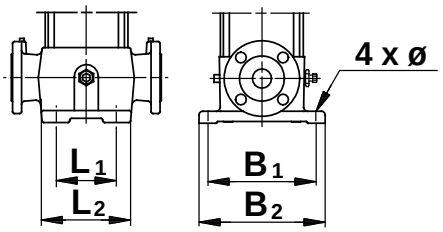
Arrows on the pump base show the direction of flow of liquid through the pump.

To minimize possible noise from the pump, it is advisable to fit expansion joints on either side of the pump and anti-vibration mountings between the foundation and the pump.

Note ***Make sure the vent plug is located in the uppermost position.***

Fit isolating valves on either side of the pump to avoid draining the system if the pump needs to be cleaned, repaired or replaced.

Base and bolt hole center line dimensions



Pump type	L1		L2		B1		B2		ø	
	[inches]	[mm]	[inches]	[mm]	[inches]	[mm]	[inches]	[mm]	[inches]	[mm]
CR 1s, 1, 3, 5	3 15/16	100	5 11/16	145	7 1/16	180	8 11/16	220	1/2	13

CR 45, 64	7 1/2	190	9 3/4	248	10 1/2	266	13 1/16	331	9/16	14
CRN 45, 64	7 1/2	190	9 7/8	251	10 1/2	266	13 1/16	331	9/16	14
CR, CRN 90	7 13/16	199	10 1/4	261	11	280	13 11/16	348	9/16	14
CR, CRN 120, 150	10 13/16	275	13 9/16	344	14 15/16	380	18 9/16	472	11/16	18

8.3 Pump mounting

Warning

CR, CRI, CRN pumps are shipped with covered suction and discharge ports. Remove the covers before the pipes are connected to the pump.

8.3.1 Recommended installation torques

Pump type	Recommended foundation torque [ft-lbs]	Recommended flange torque [ft-lbs]
CR, CRI, CRN 1s/1/3/ 5 and CRT 2/4	30	37-44
CR, CRI, CRN 10/15/ 20 and CRT 8/16	37	44-52
CR, CRN 32/45/64/90/ 120/150	52	52-59

8.4 Suction pipe

The suction pipe should be adequately sized and run as straight and short as possible to keep friction losses to a minimum (minimum of four pipe diameters straight run prior to the suction flange). Avoid using unnecessary fittings, valves or accessory items. Use butterfly valves in the suction line only when it is necessary to isolate a pump because of a flooded suction condition. This would occur if the water source is above the pump. See fig. 5 and fig. 6. Flush piping prior to pump installation to remove loose debris.

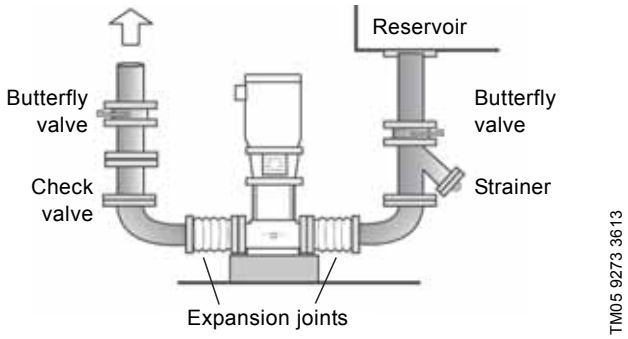

Fig. 5 Flooded suction

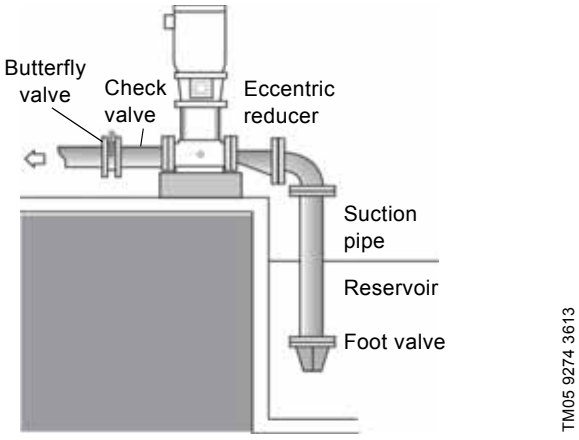

Fig. 6 Suction lift*

* The suction pipe should have a fitting on it for priming. CRN-SF pumps cannot be used for suction lift.

8.4.1 Suction pipe sizes

The following recommended suction pipe sizes are the smallest sizes which should be used with any specific CR pump type.

Verify the suction pipe size in each installation to ensure that good pipe practices are being observed and excess friction losses are not encountered.

High temperatures may require larger diameter pipes to reduce friction and improve NPHSA.

Pump type	Min. suction pipe size	
CR, CRI, CRN 1s, 1, 3; CRT 2	1"	Nominal diameter acc. to ANSI schedule 40
CR, CRI, CRN 5; CRT 4	1 - 1/4"	Nominal diameter acc. to ANSI schedule 40
CR, CRI, CRN 10, 15, 20; CRT 8, 16	2"	Nominal diameter acc. to ANSI schedule 40
CR, CRN 32	2 - 1/2"	Nominal diameter acc. to ANSI schedule 40
CR, CRN 45	3"	Nominal diameter acc. to ANSI schedule 40
CR, CRN64, 90	4"	Nominal diameter acc. to ANSI schedule 40
CR, CRN 120, 150	5"	Nominal diameter acc. to ANSI schedule 40

8.5 Discharge pipe

We suggest to install a check valve and a isolating valve in the discharge pipe.

Pipe, valves and fittings should be at least the same diameter as the discharge pipe or sized in accordance with good piping practices to reduce excessive flow velocities and friction losses in pipes.

Caution ***The pressure rating of pipes, valves and fittings must be equal to or greater than the maximum system pressure.***

Before installing the pump, pressure check the discharge piping to at least the maximum pressure the pump is capable of generating or as required by codes or local regulations.

Whenever possible, avoid high pressure-loss fittings, such as elbows or branch tees directly on either side of the pump. The piping should be adequately supported to reduce thermal and mechanical stresses on the pump.

According to good installation practices, clean the system thoroughly and flush it of all foreign materials and sediment prior to pump installation. Furthermore, never install the pump at the lowest point of the system due to the natural accumulation of dirt and sediment. If there is excessive sediment or suspended particles, we recommend that a strainer or filter is used. Grundfos recommends that pressure gauges are installed on suction and discharge flanges or in pipes to monitor pump and system performance.

Warning

To avoid problems with water hammer, do not use quick-closing valves in CRN-SF applications.

8.6 Bypass

Install a bypass in the discharge pipe if there is any risk that the pump may operate against a closed valve in the discharge line. Flow through the pump is required to ensure that adequate cooling and lubrication of the pump is maintained.
See *7.3 Minimum inlet pressures* for minimum flow rates.

Elbows should be at least 12" from the bypass opening to prevent erosion.

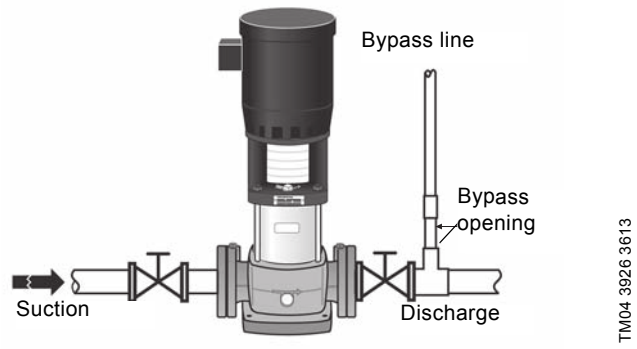

Fig. 7 Recommended bypass arrangement

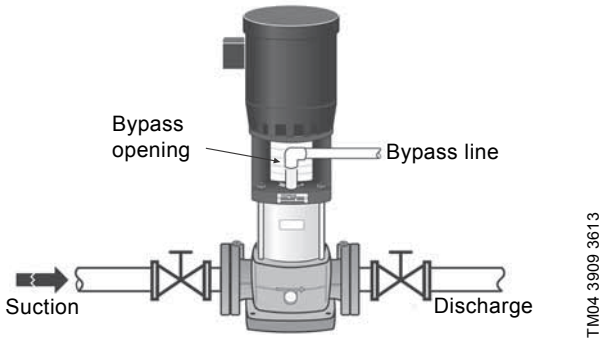

Fig. 8 Optional bypass arrangement

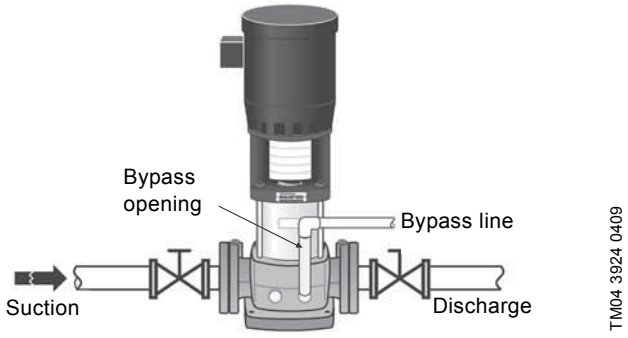

Fig. 9 Optional bypass arrangement for CR, CRN 32, 45, 64 and CR 90, 120 and 150 only

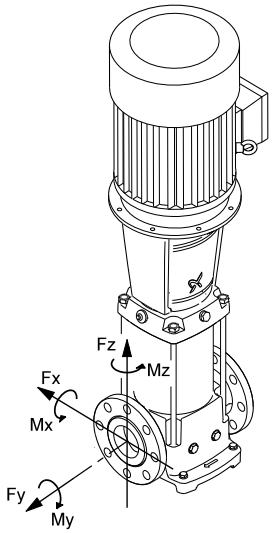
8.7 Flange forces and torques

If not all loads reach the maximum permissible value stated in the tables after fig. 10, one of these values may exceed the normal limit. Contact Grundfos for further information.



Y-direction: Direction of chamber stack
Z-direction: 90 ° from inlet/outlet
X-direction: Inlet/outlet

Fig. 10 Flange forces and torques

N version (CRN)	●	●	●	●	●	●	●	●	●	●	●

8.9 Check valves

A check valve may be required on the discharge side of the pump to prevent the pump inlet pressure from being exceeded.

When a pump with no check valve is stopped because there is no demand on the system (all valves are closed), the high system pressure on the discharge side of the pump will "find" its way back to the inlet of the pump.

This is especially critical for CRN-SF applications because of the very high discharge pressures involved. As a result, most CRN-SF installations require a check valve on the discharge piping.

8.10 Temperature rise

It may sometimes be necessary to stop the flow through a pump during operation.

When the flow is stopped, the power to the pump is transferred to the pumped liquid as heat, causing a temperature rise in the liquid.

The result is risk of overheating and consequent damage to the pump. The risk depends on the temperature of the pumped liquid and for how long the pump is operating without flow. See the following temperature rise table.

Pump type	Time for temperature rise of 18 °F (10 °C)	
	Seconds	Minutes
CR 1s, 1, 3	210	3.5
CR 5	240	4.0
CR 10	210	3.5
CR 15	150	2.5
CR 20	120	2.0
CR 32, 45, 64, 90, 120, 150	60	1.0

Conditions/reservations

The listed times are subject to the following conditions/ reservations:

- No exchange of heat with the surroundings.
- The pumped liquid is water with a specific heat capacity of 1.0 $^{Btu}/_{lb.}$ °F (4.18 $^{kJ}/_{kg}$ °C).
- Pump parts (chambers, impellers and shaft) have the same heat capacity as water.
- The water in the base and the pump head is not included.

These reservations should give sufficient safety margin against excessive temperature rise.

The maximum temperature must not exceed the pump maximum temperature rating.

8.11 Electrical connection

Warning

The safe operation of this pump requires that it is grounded in accordance with the National Electrical Code and local codes and regulations. Connect the ground conductor to the grounding screw in the terminal box and then to the ACCEPTABLE grounding point. All electrical work must be performed by a qualified electrician in accordance with the latest edition of the National Electrical Code and local codes and regulations.

8.12 Motors

Grundfos CR pumps are supplied with heavy-duty, 2-pole (3600 rpm), ODP (open drip-proof) or TEFC (totally enclosed fan cooled), NEMA C frame motors selected to our rigid specifications.

Motors with other enclosure types and for other voltages and frequencies are available on a special-order basis.

CRN-SF pumps are supplied with an IEC (metric) type motor with a reverse thrust bearing.

If you replace the pump, but keep a motor previously used on another CR pump, be sure to read *12. Maintaining the motor* for proper adjustment of the coupling height.

8.13 Position of terminal box

The motor terminal box can be turned to any of four positions in steps of 90 °.

To rotate the terminal box, remove the four bolts securing the motor to the pump but do not remove the coupling. Turn the motor to the desired position; replace and securely tighten the four bolts. See fig. 11.

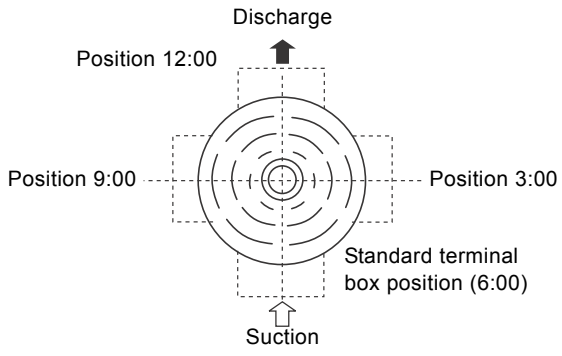

Fig. 11 Motor terminal box positions (top view)

8.14 Field wiring

Lead sizes should be based on the current carrying properties of conductors required by the latest edition of the National Electrical Code or local regulations. Direct-on-line (DOL) starting is approved due to the extremely short run-up time of the motor and the low moment of inertia of the pump and motor. If DOL starting is not acceptable and reduced starting current is required, use an auto transformer, resistance starter or soft starter. We suggest to use a fused disconnect for each pump in case standby pumps are installed.

8.15 Motor protection

8.15.1 Single-phase motors

All CR pumps with single phase motors, except 10 hp, are equipped with multi-voltage, squirrel cage induction motors which include built-in thermal protection.

8.15.2 Three-phase motors

CR pumps with three-phase motors must be used with the proper size and type of motor-protective circuit breaker to ensure the motor is protected against damage from low voltage, phase failure, current unbalance and overloads.

Use a properly sized circuit breaker with manual reset and ambient-temperature compensated extra-quick trip in all three phases. The overload protection should be set and adjusted to the full-load current rating of the motor. Under no circumstances should the overload protection be set to a higher value than the full-load current shown on the motor nameplate. This will void the warranty.

Set overload protection for auto transformers and resistance starters in accordance with the recommendations of the manufacturer.

Three-phase MLE motors (CRE-pumps) require only fuses as circuit breaker. They do not require a motor-protective circuit breaker. Check for phase unbalance (worksheet is provided. See section *18. Worksheet for three-phase motors*).

Caution ***Standard allowable phase unbalance is 5 %.***

8.15.3 CRN-SF

The CRN-SF is typically operated in series with a feed pump. Because the maximum allowable inlet pressure of the CRN-SF increases from 73 psi (when pump is off and during start-up) to 365 psi (during operation), use a control device to start the CRN-SF pump one second before the feed pump starts. Similarly, the CRN-SF must stop one second after the feed pump stops. See CRN-SF start-up timeline below.

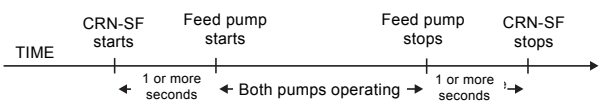

Fig. 12 CRN-SF start-up

9. Commissioning

9.1 Priming

To prime the pump in a closed system or an open system where the water source is above the pump, close the pump isolating valve(s) and open the priming plug on the pump head. See fig. 13, fig. 14, and fig. 15.

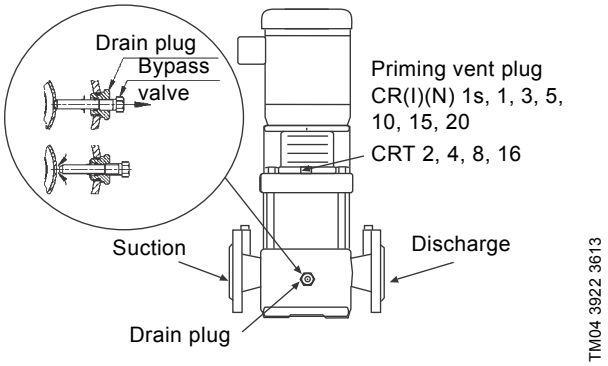

Fig. 13 Position of plugs and bypass valve

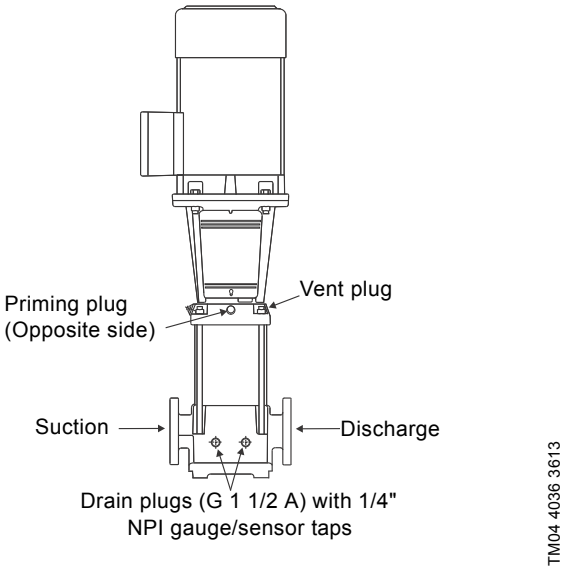

Fig. 14 Position of plugs CR, CRN 32, 45, 64, 90, 120, 150

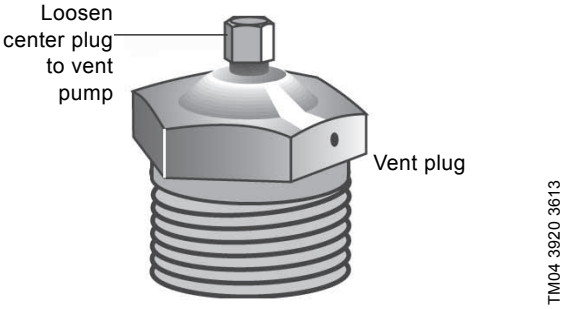

Fig. 15 Vent plug

In open systems where the water level is below the pump inlet, the suction pipe and pump must be filled with liquid and vented before starting the pump.

1. Close the discharge isolating valve and remove the priming plug.
2. Pour water through the priming hole until the suction pipe and pump are completely filled with liquid. If the suction pipe does not slope downwards away from the pump, the air must be purged while priming the pump.
3. Replace the priming plug and tighten securely.

9.2 Startup

1. Gradually open the isolating valve in the suction line until a steady stream of airless water runs out of the priming hole.
2. Close the plug and tighten securely.
3. Completely open the isolating valves.

For pumps with Cool-Top®, see section *16. Startup of pump with air-cooled top (Cool-Top®)*.

Follow these steps:

1. Switch off the power supply.
2. Check to make sure the pump has been filled and vented.
3. Remove the coupling guard and rotate the pump shaft by hand to make sure it turns freely.
4. Verify that the electrical connections are in accordance with the wiring diagram on the motor.
5. Switch on the power and observe the direction of rotation. When viewed from above, the pump should rotate counter-clockwise (clockwise for CRN-SF).
6. To reverse the direction of rotation, first switch off the power supply.
7. On three-phase motors, interchange any two phases of the power supply.
   On single-phase motors, see wiring diagram on the nameplate. Change wiring as required.
8. Switch on the power again and check for proper direction of rotation. Once direction of rotation has been verified, switch off the power again. Do not attempt to reinstall the coupling guards while the motor is on. Replace the coupling guard if the direction of rotation is correct. When the guards are in place, the power can be switched on again.

Note

For CR, CRI, CRN 1s to 5 it is advisable to open the bypass valve during start-up. See fig. 13. The bypass valve connects the suction and discharge sides of the pump, thus making the filling procedure easier. Close the bypass valve when operation is stable.

Caution

Motors should not be run unloaded or uncoupled from the pump at any time; damage to the motor bearings will occur.

Do not start the pump before priming or venting the pump. See fig. 15. Never let the pump run dry.

10. Operation

10.1 Operating parameters

CR multi-stage centrifugal pumps installed in accordance with these instructions and sized for correct performance will operate efficiently and provide years of service. The pumps are water-lubricated and do not require any external lubrication or inspection. The motors may require periodic lubrication as described in section *12. Maintaining the motor*.

Under no circumstances should the pump be operated for any prolonged periods of time without flow through the pump. This can result in motor and pump damage due to overheating. A properly sized relief valve should be installed to allow sufficient liquid to circulate through the pump to provide adequate cooling and lubrication of the pump bearings and seals.

10.2 Pump cycling

Pump cycling should be checked to ensure the pump is not starting more often than the following max. starts per hour:

Grundfos ML motors:

- 200 times per hour on 1/3 to 5 hp models
- 100 times per hour on 7 1/2 to 15 hp models
- 40 times per hour on 20 to 30 hp models.

Baldor motors:

- 20 times per hour on 1/3 to 5 hp models
- 15 times per hour on 7 1/2 to 15 hp models
- 10 times per hour on 20 to 100 hp models.

Rapid cycling is a major cause of premature motor failure due to overheating of the motor. If necessary, adjust controller to reduce the frequency of starts and stops.

10.3 Boiler feed installations

If the pump is used as a boiler feed pump, make sure the pump is capable of supplying sufficient water throughout its entire evaporation and pressure ranges. Where modulating control valves are used, a bypass around the pump must be installed to ensure pump lubrication. See section *7.3 Minimum inlet pressures*.

10.4 Frost protection

If the pump is installed in an area where frost could occur, the pump and system should be drained during freezing temperatures to avoid damage. To drain the pump, close the isolating valves, remove the priming plug and drain plug at the base of the pump. Do not refit the plugs until the pump is to be used again. Always replace the drain plug with the original or an exact replacement. Do not replace with a standard plug. Internal recirculation will occur, reducing the output pressure and flow.

11. Maintaining the pump

Depending on the conditions and operating time, make the following checks at regular intervals:

- Check that the pump meets the required performance and is operating smoothly and quietly.
- Check that there are no leaks, particularly at the shaft seal.
- Check that the motor is not overheating.
- Remove and clean all strainers or filters in the system.
- Check that the tripping function of the motor overload protection works.
- Check the operation of all controls.
- If the pump is not operated for unusually long periods, maintain the pump in accordance with these instructions. In addition, if the pump is not drained, the pump shaft should be manually rotated or run for short periods of time at monthly intervals.
- In severe-duty applications, pump life may be extended by performing one of the following actions:
  - Drain the pump after each use.
  - Flush the pump with water or other liquid that is compatible with the pump materials and process liquid.
  - Disassemble the pump and thoroughly rinse or wash components in contact with the pumped liquid with water or other liquid that is compatible with the pump materials and process liquid.

If the pump fails to operate or there is a loss of performance, see to *section 17. Diagnosing specific problems*.

12. Maintaining the motor

Warning

Before starting work on the motor, make sure that all power supplies to the motor have been switched off and that they cannot be accidentally switched on. Electric shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation, and maintenance of this equipment.

12.1 Motor inspection

Inspect the motor approximately every 500 hours of operation or every three months, whichever occurs first. Keep the motor clean and the ventilation openings clear.

Go through the following steps during each inspection:

1. Check that the motor is clean. Check that the interior and exterior of the motor are free of dirt, oil, grease, water, etc. Oily residue, paper, pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.
2. Use an ohmmeter periodically to ensure that the winding insulation is OK. Record the ohmmeter readings, and immediately investigate any significant drop in insulation resistance.
3. Check all electrical connections to be sure that they are tightened securely.

12.2 Motor lubrication

Electric motors are pre-lubricated from factory and do not require additional lubrication at start-up. Motors without external grease zerks have sealed bearings that cannot be re-lubricated.
Motors with grease zerks should only be lubricated with approved types of grease. Do not over-grease the bearings. Over-greasing will cause increased bearing heat and can result in bearing or motor failure. Do not mix oil-based grease and silicon grease in motor bearings.

Bearing grease will lose its lubricating ability over time.
The lubricating ability of a grease depends primarily on the type of grease, the size of the bearings, the speed at which the bearings operate and the severity of the operating conditions.

Good results can be obtained if the following recommendations are used in your maintenance program. It should also be noted that multistage pumps, pumps running to the left of the performance curve, and certain pump ranges may have higher thrust loads. Pumps with high thrust loads should be greased according to the next service interval level.

Warning

The grease outlet plug MUST be removed before adding new grease.

12.3 Recommended lubricant

Severity of duty	Ambient temperature (max.)	Environment	Approved types of grease
Standard	104 °F (40 °C)	Clean, little corrosion	Grundfos ML motors are greased for life, or the grease type will be stated on the nameplate. Baldor motors are greased with Polyrex EM (Exxon Mobile).
Severe	122 °F (50 °C)	Moderate dirt, corrosion	
Extreme	> 122 °F (50 °C) or class H insulation	Severe dirt, abrasive dust, corrosion	

12.4 Lubricating chart (for motors with grease zerks)

New motors that have been stored for a year or more should be regreased according to the following table:

NEMA (IEC) frame size	Service intervals [hours]			Weight of grease [oz (grams)]	Volume of grease [in^3 (teaspoons)]
	Standard duty	Severe duty	Extreme duty		
Up to and incl. 210 (132)	5500	2750	550	0.30 (8.4)	0.6 (2)
Over 210 up to and incl. 280 (180)	3600	1800	360	0.61 (17.4)	1.2 (3.9)
Over 280 up to and incl. 360 (225)	2200	1100	220	0.81 (23.1)	1.5 (5.2)
Over 360 (225)	2200	1100	220	2.12 (60.0)	4.1 (13.4)

12.5 Lubricating procedure

Caution

Keep grease free from dirt to avoid damage to motor bearings. If the environment is extremely dirty, contact Grundfos, the motor manufacturer, or an authorized service center for additional information.

Do not mix dissimilar types of grease.

1. Clean all grease zerks. If the motor does not have grease zerks, the bearing is sealed and cannot be greased externally.
2. If the motor is equipped with a grease outlet plug, remove it. This will allow the old grease to be displaced by the new grease. If the motor is stopped, add the recommended amount of grease. If the motor is to be lubricated while running, add a slightly greater quantity of grease.
3. Add grease SLOWLY taking approximately one minute until new grease appears at the shaft hole in the flange or grease outlet plug. Never add more than 1 1/2 times the amount of grease shown in the lubricating chart.

Note

If new grease does not appear at the shaft hole or grease outlet, the outlet passage may be blocked. Contact Grundfos service center or certified motor shop.

4. Let motors equipped with a grease outlet plug run for 20 minutes before replacing the plug.

13. Replacing the motor

Caution

Motors used on CR pumps are specifically selected to our rigid specifications. Replacement motors must be of the same frame size, should be equipped with the same or better bearings and have the same service factor. Failure to follow these recommendations may result in premature motor failure.

If the motor is damaged due to bearing failure, burning or electrical failure, observe the following instructions as to how to remove the motor and how to mount the replacement motor.

Warning

Before starting work on the motor, make sure that the mains switch has been switched off. It must be ensured that the power supply cannot be accidentally switched on.

13.1 Disassembly

Proceed as follows:

1. Disconnect the power supply leads from the motor. Remove the coupling guards.

Note

For CR 1s, 1, 3, 5, 10, 15, and 20: Do not loosen the three hexagon socket head cap screws securing the shaft seal.

2. Use the proper metric hexagon key to loosen the four cap screws in the coupling. Remove coupling halves completely. On CR 1s-CR 20, the shaft pin can be left in the pump shaft. CR, CRN 32, 45, 64, 90, 120, and 150 do not have a shaft pin.
3. Use the correct size spanner to loosen and remove the four mounting bolts joining motor and pump.
4. Lift the motor straight up until the shaft has cleared the motor stool.

13.2 Assembly

Proceed as follows:

1. Remove key from motor shaft, if present, and discard.
2. Thoroughly clean the surfaces of the motor and pump mounting flanges. The motor and shaft must be clean of all oil or grease and other contaminants where the coupling attaches. Place the motor on top of the pump.
3. Turn the terminal box to the desired position by rotating the motor.
4. Insert the four mounting bolts, then tighten diagonally and evenly:
   – for 3/8" bolts (1/2 - 2 hp), torque = 17 ft-lb
   – for 1/2" bolts (3 - 40 hp), torque = 30 ft-lb
   – for 5/8" bolts (50 - 100 hp), torque = 59 ft-lb
   – follow instructions for particular pump model in sections *13.2.2 CR 1s, 1, 3, and 5* to *13.2.5 CR, CRN 32, 45, 64, 90, 120, and 150*.

13.2.1 Torque specifications

Torque specifications for CR, CRI, CRN 1s, 1, 3, 5, 10, 15, and 20 CRT 2, 4, 8, and 16

Coupling screw size	Minimum torque
M6	10 ft-lb
M8	23 ft-lb
M10	46 ft-lb

13.2.2 CR 1s, 1, 3, and 5

1. Insert shaft pin into shaft hole.
2. Mount the coupling halves onto shaft and shaft pin.
3. Fit the coupling screws and leave loose. Check that the gaps on either side of the coupling are even and that the motor shaft keyway is centered in the coupling half as shown in fig. 16.
4. Tighten the screws to the correct torque. See section *13.2.1 Torque specifications*.

13.2.3 CR 10, 15 and 20

1. Insert shaft pin into shaft hole.
2. Insert plastic shaft seal spacer beneath shaft seal collar.
3. Mount the coupling halves onto shaft and shaft pin.
4. Fit the coupling screws and leave loose. Check that the gaps on either side of the coupling are even and that the motor shaft keyway is centered in the coupling half as shown in fig. 16.
5. Tighten the screws to the correct torque. See section *13.2.1 Torque specifications*.
6. Remove plastic shaft seal spacer and hang it on inside of coupling guard.

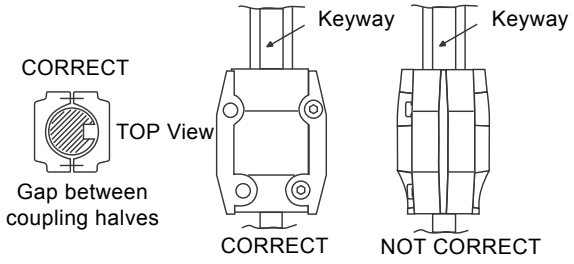

Fig. 16 Coupling adjustment all CR, CRI, CRN, CRT

13.2.4 CRT 2, 4, 8 and 16

1. Mount coupling halves. Make sure the shaft pin is located in the pump shaft.
2. Put the cap screws loosely back into the coupling halves.
3. Using a large screwdriver, raise the pump shaft by placing the tip of the screwdriver under the coupling and carefully raising the coupling to its highest point. See fig. 17.

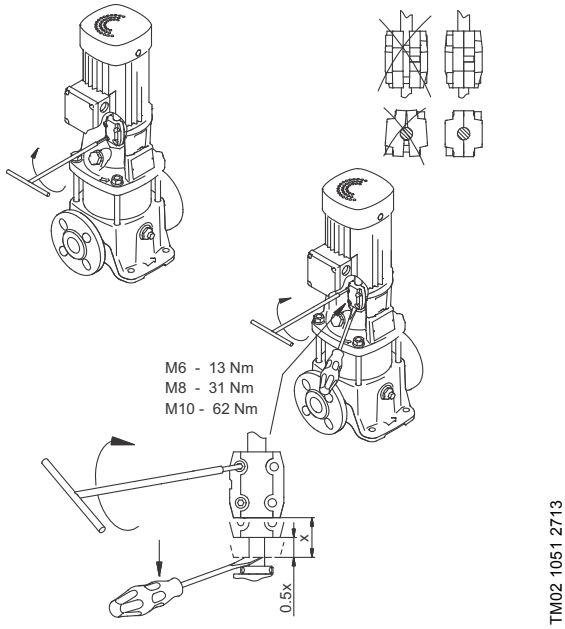

Fig. 17 Coupling adjustment CRT 2, 4, 8, and 16

Note ***The shaft can only be raised approximately 0.20 inches (5 mm).***

4. Now lower the shaft halfway back the distance you just raised it and tighten the coupling screws (finger tight) while keeping the coupling gap equal on both sides. When the screws are tight enough to keep the coupling in place, then cross-tighten the screws.
   - Note the clearance below the coupling.
   - Raise the coupling as far as it will go.
   - Lower it halfway back down (1/2 the distance you just raised it).
   - Tighten screws (see torque specifications).

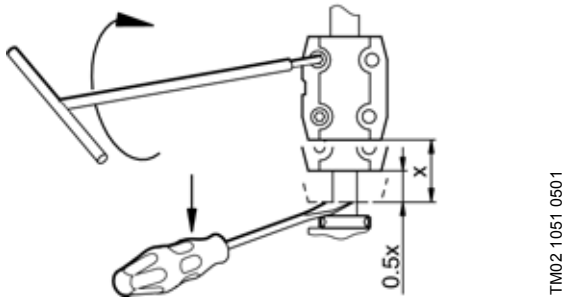

Fig. 18 Coupling adjustment clearance CRT 2, 4, 8, and 16

13.2.5 CR, CRN 32, 45, 64, 90, 120, and 150

1. Make sure pump shaft is all the way down. Tighten the set screws on the mechanical shaft seal.
2. Place the plastic adjusting fork under the cartridge seal collar. See fig. 19.

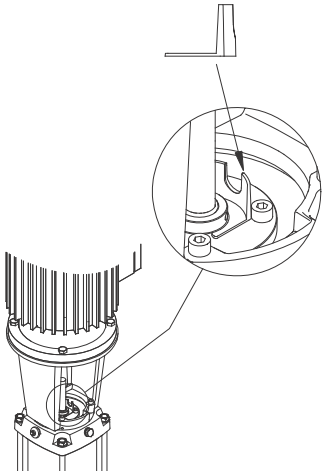

Fig. 19 Coupling adjustment CR, CRN 32, 45, 64, 90, 120, and 150

3. Fit the coupling on the shaft so that the top of the pump shaft is flush with the bottom of the coupling chamber. See fig. 20.

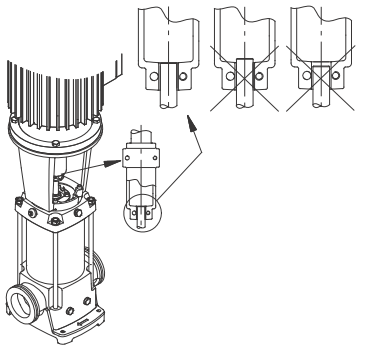

Fig. 20 Coupling adjustment, CR, CRN 32, 45, 64, 90, 120, and 150

Caution ***To avoid damaging the coupling halves, ensure that the motor shaft keyway is centered in the coupling half as shown in fig. 16.***

4. Lubricate the coupling screws with an anti-seize, lubricating compound. Tighten the coupling screws (finger tight) while keeping the coupling gap equal on both sides and the motor shaft keyway centered in the coupling half as shown in fig. 16. When the screws are tight enough to keep the coupling in place, then cross-tighten the screws.
5. Tighten coupling screws to 62 ft-lbs (75 and 100 hp motors to 74 ft-lbs). Remove the adjusting fork from under the cartridge seal collar and replace it to the storage location. See fig. 21.

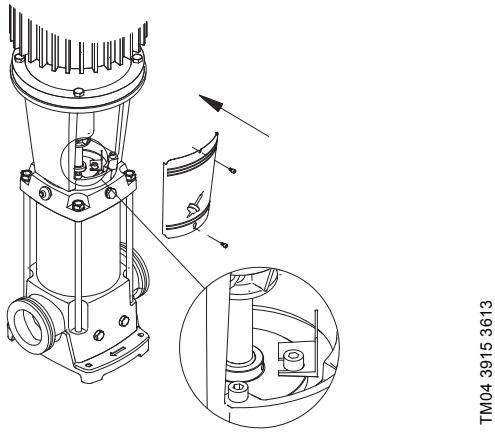

Fig. 21 Adjusting fork storage CR, CRN 32, 45, 64, 90, 120, and 150

6. Check to see that the gaps between the coupling halves are equal. Loosen and readjust, if necessary.
7. Make sure the pump shaft can be rotated by hand. If the shaft cannot be rotated or it jams, disassemble and check for misalignment.
8. Prime the pump.
9. Follow the wiring diagram on the motor label for the correct motor wiring combination which matches your supply voltage. Once this has been confirmed, reconnect the power supply leads to the motor.
10. Check the direction of rotation by bump-starting the motor. Direction of rotation must be left to right (counter-clockwise) when looking directly at the coupling.
11. Switch off the power, then mount the coupling guards. When the coupling guards have been mounted, the power can be switched on again.

14. Parts list

Grundfos offers an extensive parts list for each CR pump model. A parts list typically covers the following items:

- a diagram of pump parts which we recommend to have on hand for future maintenance
- a list of prepacked service kits covering the pump components most likely to be exposed to wear over time
- complete chamber stacks needed to replace the rotating assembly of each model.

These parts lists are available separately from the Grundfos literature warehouse or as a set with extensive service instructions in the Grundfos CR Service Manuals.

TM05 9272 3613

Fig. 22 Prepacked chamber stack kits

TM04 3916 1609

Fig. 23 Prepacked flange kits

14.1 Spare parts

Grundfos offers an extensive list of spare parts for CR pumps. For a current list of these parts, see Grundfos All Product Spare Parts/Service Kits Price List, part number L-SK-SL-002.

15. Preliminary electrical tests

Warning

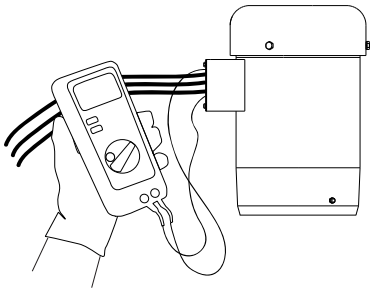
When working with electrical circuits, use caution to avoid electrical shock. It is recommended that rubber gloves and boots be worn, and metal terminal boxes and motors are grounded before any work is done. For your protection, always disconnect the pump from its power source before handling.

15.1 Supply voltage

15.1.1 How to measure the supply voltage

Use a voltmeter (set to the proper scale) to measure the voltage at the pump terminal box or starter. On single-phase units, measure between power leads L1 and L2 (or L1 and N for 115 volt units). On three-phase units, measure between:

– Power leads L1 and L2
– Power leads L2 and L3
– Power leads L3 and L1.



TM04 3911 2609

Fig. 24 Measuring supply voltage

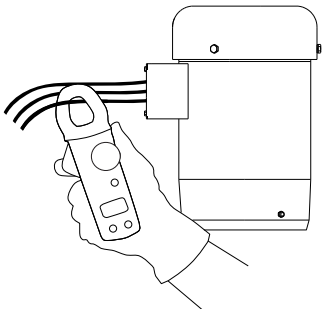
15.1.2 Meaning of supply voltage measurement

When the motor is under load, the voltage should be within + 10 %/- 10 % of the nameplate voltage. Larger voltage variation may cause winding damage. Large variations in the voltage indicate a poor electrical supply and the pump should not be operated until these variations have been corrected. If the voltage constantly remains high or low, the motor should be changed to the correct supply voltage.

15.2 Current

15.2.1 How to measure the current

Use an ammeter (set on the proper scale) to measure the current on each power lead at the terminal box or starter. See the motor nameplate for amp draw information. Current should be measured when the pump is operating at constant discharge pressure.



TM04 3908 2609

Fig. 25 Measuring current

15.2.2 Meaning of current measurement

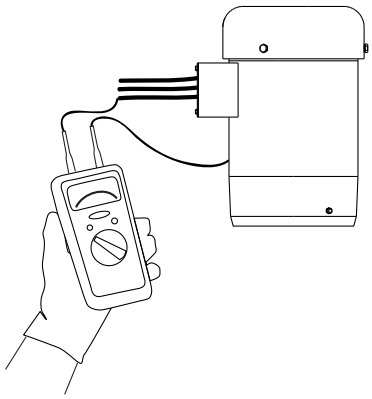
If the amp draw exceeds the listed service factor amps (SFA) or if the current unbalance is greater than 5 % between each leg on three-phase units, check for the following faults:

Fault	Remedy
Burned contacts in the motor-protective circuit breaker.	Replace contacts.
Loose terminals in motor-protective circuit breaker or terminal box or possibly defective lead.	Tighten terminals or replace lead.
Too high or too low supply voltage.	Reestablish correct supply voltage.
Motor windings are short-circuited or grounded. (Check winding and insulation resistances).	Remove cause of short circuit or grounding.
Pump is damaged causing motor overload.	Replace defective pump parts.

15.3 Insulation resistance

15.3.1 How to measure the insulation resistance

Turn off power and disconnect the supply power leads in the pump terminal box. Using an ohmmeter or megohmmeter, set the scale selector to R x 100K and zero-adjust the meter.
Measure and record the resistance between each of the terminals and ground.



TM04 3907 2609

Fig. 26 Measuring insulation resistance

15.3.2 Meaning of insulation resistance measurement

Motors of all hp, voltage, phase and cycle duties have the same value of insulation resistance. Resistance values for new motors must exceed 1,000,000 ohms. If they do not, the motor should be repaired or replaced.

16. Startup of pump with air-cooled top (Cool-Top®)

Caution ***Do not start the pump until it has been filled with liquid and vented.***

Warning

Pay attention to the direction of the vent hole and ensure that the escaping liquid does not cause injury to persons or damage to the motor or other components. In hot-liquid installations, pay special attention to the risk of injury caused by scalding hot liquid. We recommend you to connect a drain pipe to the 1/2" air vent in order to lead the hot water/steam to a safe place.

Step		Action
1	 TM02 4151 5001	The air-cooled top should only be started up with cold liquid. Close the isolating valve on the discharge side and open the isolating valve on the suction side of the pump.
2	 TM02 4153 1503	Remove the priming plug from the air-cooled chamber (pos. 2) and slowly fill the chamber with liquid. When the chamber is completely filled with liquid, replace the priming plug and tighten securely.
3	 TM02 5907 1503	Open the isolating valve on the discharge side of the pump. The valve may have to be partially closed when the pump is started if there is no counter pressure (i.e. boiler not up to pressure).
4	 TM01 1406 3702 - TM01 1405 4497	Start the pump and check the direction of rotation. See the correct direction of rotation of the pump on the motor fan cover. If the direction of rotation is wrong, interchange any two of the incoming power supply leads. After 3 to 5 minutes, the air vent has been filled with liquid. Note ***During start-up of a cold pump with hot liquid, it is normal that a few drops of liquid are leaking from the sleeve.***

17. Diagnosing specific problems

Warning

Before removing the terminal box cover and before removing/dismantling the pump, make sure that the power supply has been switched off and that it cannot be accidentally switched on.

Problem	Possible cause	Remedy
1. The pump does not run.	a) No power to motor.	Check voltage to motor terminal box. If no voltage to motor, check starter panel for tripped circuits and reset circuits.
	b) Fuses blown or circuit breaker tripped.	Turn off power and remove fuses. Check for continuity with ohmmeter. Replace blown fuses or reset circuit breaker. If new fuses blow or circuit breaker trips, the electrical installation, motor and wires must be checked.
	c) Motor starter overload protection burned or tripped out.	Check for voltage on line and load side of starter. Replace or reset burned motor protection. Inspect starter for other damage. If protection trips again, check the supply voltage and starter holding coil.
	d) Starter does not energize.	Energize control circuit and check for voltage to the holding coil. If no voltage, check control circuit fuses. If voltage, check holding coil for short circuits. Replace bad coil.
	e) Defective control devices.	Check that all safety and pressure switches function correctly. Inspect contacts in control devices. Replace worn or defective parts or control devices.
	f) Motor is defective.	Turn off power and disconnect wiring. Measure the lead-to-lead resistances with ohmmeter (RX-1). Measure lead-to-ground values with ohmmeter (RX-100K). Record measured values. If an open or grounded winding is found, remove motor and repair or replace it.
	g) Defective capacitor (single-phase motors).	Turn off power and discharge capacitor. Check with ohmmeter (RX-100K). When the meter is connected to the capacitor, the needle should jump towards 0 ohms and slowly drift back to infinity (h). Replace capacitor if defective.
	h) Pump is blocked or seized.	Turn off power and manually rotate pump shaft. If shaft does not rotate easily, check coupling setting and adjust as necessary. If shaft rotation is still tight, remove pump and inspect. Disassemble and repair the pump.

Problem	Possible cause	Remedy
2. The pump runs but at reduced performance or does not deliver water.	a) Wrong direction of rotation.	Check wiring for proper connections. Correct wiring.
	b) Pump is not primed or is air-bound.	Turn pump off, close isolation valve(s) and remove priming plug. Check liquid level. Refill the pump, replace plug and start the pump. Long suction lines must be filled before starting the pump.
	c) Strainers, check or foot valves are clogged.	Remove strainer, screen or check valve and inspect. Clean and replace. Reprime pump.
	d) Suction lift too large.	Install compound pressure gauge at the suction side of the pump. Start pump and compare reading to performance data. Reduce suction lift by lowering pump, increase suction line size or removing high friction loss devices.
	e) Suction and/or discharge pipes leaking. (Pump spins backwards when turned off)	Air in suction pipe. Suction pipe, valves and fittings must be airtight. Repair any leaks and retighten all loose fittings.
	f) Pump worn.	Install pressure gauge, start pump, gradually close the discharge valve and read pressure at shutoff. Convert measured pressure (in psi) to head (in feet): (Measured psi x 2.31 ft/psi = ___ ft). Refer to the specific pump curve for shutoff head for that pump model. If head is close to curve, pump is probably OK. If not, remove pump and inspect.
	g) Pump impeller or guide vane is clogged.	Disassemble and inspect pump passageways. Remove any foreign materials found.
	h) Incorrect drain plug installed.	If the proper drain plug is replaced with a standard plug, water will recirculate internally. Replace with proper plug.
	i) Improper coupling setting.	Check/reset the coupling. See page 18.
3. Pump cycles too much	a) Pressure switch is not properly adjusted or is defective.	Check that pressure switch is set and functions correctly. Check voltage across closed contacts. Readjust switch or replace if defective.
	b) Level control is not properly adjusted or is defective.	Check that level control is set and functions correctly. Readjust setting (refer to level control manufacturer's data). Replace if defective.
	c) Insufficient air charging or leaking tank or piping.	Pump air into tank or diaphragm chamber. Check diaphragm for leaks. Check tank and piping for leaks with soap and water solution. Check air-to-water volume. Repair as necessary.
	d) Tank is too small.	Check tank size and air volume in tank. Tank volume should be approximately 10 gallons for each gpm of pump performance. The normal air volume is 2/3 of the total tank volume at the pump cut-in pressure. Replace tank with one of correct size.
	e) Pump is oversized.	Install pressure gauges on or near pump suction and discharge ports. Start and run pump under normal conditions, record gauge readings. Convert psi to feet (Measured psi x 2.31 ft/psi = ____ ft) Refer to the specific pump curve for that model, ensure that total head is sufficient to limit pump delivery within its design flow range. Throttle pump discharge flow if necessary.

Problem	Possible cause	Remedy
4. Fuses blow or circuit breakers or overload relays trip	a) Tank is too small.	Check voltage at starter panel and motor. If voltage varies more than - 10 %/+ 10 %, contact power company. Check wire sizing.
	b) Motor overload protection set too low.	Cycle pump and measure amperage. Increase size of overload protection or adjust trip setting to maximum motor nameplate (full load) current.
	c) Three-phased current is imbalanced.	Check current draw on each lead to the motor. Must be within - 5 %/+ 5 %. If not, check motor and wiring. Rotating all leads may eliminate this problem.
	d) Motor short-circuited or grounded.	Turn off power and disconnect wiring. Measure the lead-to-lead resistance with an ohmmeter (RX-1). Measure lead-to-ground values with an ohmmeter (RX-100K) or a megaohmmeter. Record values. If an open or grounded winding is found, remove the motor, repair and/or replace.
	e) Wiring or connections are faulty.	Check proper wiring and loose terminals. Tighten loose terminals. Replace damaged wires.
	f) Pump is blocked or seized.	Turn off power and manually rotate pump shaft. If shaft does not rotate easily, check coupling setting and adjust as necessary. If shaft rotation is still tight, remove pump and inspect. Disassemble and repair the pump.
	g) Defective capacitor (single-phase motors).	Turn off power and discharge capacitor. Check with ohmmeter (RX-100K). When the meter is connected to the capacitor, the needle should jump towards 0 ohms and slowly drift back to infinity (∞). Replace capacitor if defective.
	h) Motor overload protection devices at higher ambient temperature than motor.	Use a thermometer to check the ambient temperature near overload protection devices and motor. Record these values. If ambient temperature at motor is lower than at overload protection devices, especially where temperature at overload protection devices is above 104 °F (40 °C), replace standard protection devices with ambient-compensated protection devices.

18. Worksheet for three-phase motors

Below is a worksheet for calculating current unbalance on a three-phase hookup. Use the calculations below as a guide.

Note

Current unbalance should not exceed 5 % at service factor load or 10 % at rated input load. If the unbalance cannot be corrected by rolling the leads, the source of the unbalance must be located and corrected. If, on the three possible hookups, the leg farthest from the average stays on the same power lead, most of the unbalance is coming from the power source. However, if the reading farthest from the averages moves with the same motor lead, the primary source of unbalance is on the "motor side" of the starter. In this instance, consider if the cause can be a damaged cable, an untight cable splice, a poor connection, or a faulty motor winding.

Explanation and examples	
Here is an example of current readings at maximum pump loads on each leg of a three-wire hookup. You must make calculations for all three hookups. To begin, add up all three readings for hookup numbers 1, 2, and 3.	**Hookup 1** T1 = 51 amps T2 = 46 amps T3 = 53 amps TOTAL = 150
Divide the total by three to obtain the average.	**Hookup 1** 50 amps 3 | 150 amps
Calculate the greatest current difference from the average.	**Hookup 1** 50 amps — 46 amps 4 amps
Divide this difference by the average to obtain the percentage of the unbalance. In this case, the current unbalance for **Hookup 1** is 8 %.	**Hookup 1** .08 or 8 % 50 | 4.00 amps

Blank worksheet

Hookup 1	Hookup 2	Hookup 3
L_1 to T_1 = ___ amps	L_1 to T_3 = ___ amps	L_1 to T_2 = ___ amps
L_2 to T_2 = ___ amps	L_2 to T_1 = ___ amps	L_2 to T_3 = ___ amps

19. Disposal

This product or parts of it must be disposed of in an environmentally sound way:

1. Use the public or private waste collection service.
2. If this is not possible, contact the nearest Grundfos company or service workshop.

Subject to alterations.

Section 1 Specifications

Specifications are subject to change without notice.

Measuring Technique	Infrared Duo scattered light technique for color-independent turbidity measurement Turbidity in accordance with DIN EN 27027 / TS equivalent DIN 38414
Measuring Range	t-line turbidity: 0.001–4000 FNU/NTU ts-line, inline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–50 g/L hs-line, highline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–500 g/L TSS
Reproducibility	Turbidity < 1 %, Total Suspended Solids (TSS) < 3 %
Measuring Accuracy	Turbidity up to 1000 FNU/NTU: without calibration < 5 % of the measured value ± 0.01 FNU/NTU with calibration < 1 % of the measured value ± 0.01 FNU/NTU
Technique variation coefficient	1 % in accordance with DIN 38402
Response Time	1 s ≤ T90 ≤ 300 s (adjustable)
Calibration	Zero point permanently set from the factory, gradient once for the TS content
Cable Length	10 m (33 ft), max. 100 m (328 ft) with extension cable
Ambient Temperature	0 to +40 °C (32 to 104 °F)
Pressure Range	Stainless steel: ≤ 6 bar or ≤ 60 m (87 psi) PVC: ≤ 1 bar or ≤ 10 m (14,5 psi)
Flow Velocity	Max. 3 m/s (the presence of air bubbles affects the measurement)
Materials	Optics carrier and sleeve: stainless steel 1.4571 or PVC black
	Wiper shaft: stainless steel 1.4104
	Wiper arm: stainless steel 1.4581
	Wiper rubber: silicone rubber (standard) Optional: Viton[1] (LZX578)
	Windows and light guide: quartz glass
	O-rings (optics carrier, wiper, windows): NBR (acrylonitrile butadiene rubber)
	Housing seals: NBR 70
	Sensor connecting cable (hard-wired): 1 cable pair AWG 22 / 12 V DC twisted, 1 cable pair AWG 24 / data twisted, common cable screen, Semoflex (PUR)
	Sensor connection plug (hard-wired): type M12 enclosure rating IP 67
	Threaded cable fitting: stainless steel 1.4305
Inspection interval	On request 1/year service contract with guarantee extension to 5 years
Dimensions	Tank probe: D x L 60 mm x 200 mm (2 x 8 in.) Probe for pipe installation: D x L 60 mm x 315 mm (2 x 12.4 in.) (Pipe installation fitting: DN 65 / PN 16 DIN 2633; < 5 bar (73 psi); for pipes from DN 80) Distance sensor - wall (floor): TS > 10 cm (4 in.), turbidity > 50 cm (20 in.)
Weight	Tank probe: approx. 1.8 kg (63 oz) (t-line: approx. 0.6 kg (21 oz)) Probe for pipe installation: approx. 2.4 kg (85 oz) Pipe installation fitting: approx. 2.7 kg (95 oz) (without probe) Pipe installation safety fitting:approx. 18 kg (40 lb) (without probe)
User Maintenance	1 h / month, typical
Certifications	CE

Section 2 General Information

2.1 Safety Information

Please read this entire manual before unpacking, setting up, or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired, do not use or install this equipment in any manner other than that specified in this manual.

2.1.1 Use of Hazard Information

DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

CAUTION
Indicates a potentially hazardous situation that may result in minor or moderate injury.

Important Note: *Information that requires special emphasis.*

Note: *Information that supplements points in the main text.*

2.1.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For return for recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal.*

2.2 Sensor Overview

Note: *All sensors are also available without wipers for special applications.*

t-line: 0.001–4000 FNU/NTU

High-resolution turbidity probe made of plastic for the outlets of sewage treatment plants and bodies of water.

ts-line: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of fine turbidities and sludges.

hs-line: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of highly concentrated sludges.

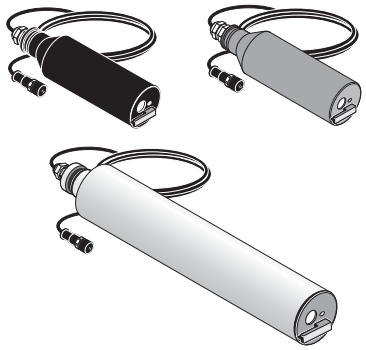
inline: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision pipe installation probe for turbidity and solids made of stainless steel for color-independent measurement of fine turbidities and sludges.

highline: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

High-precision pipe installation probe for turbidity and suspended solids made of stainless steel for color-independent measurement of highly concentrated sludges.

Figure 2 Solitax sc Sensors



2.3 Measuring Principle

The measuring principle is based on a combined infrared absorption scattered light technique that measures the lowest turbidity values in accordance with DIN EN 27027 just as precisely and continuously as high sludge content. Using this method, the light scattered sideways by the turbidity particles is measured over an angle of 90°.

2.4 Handling

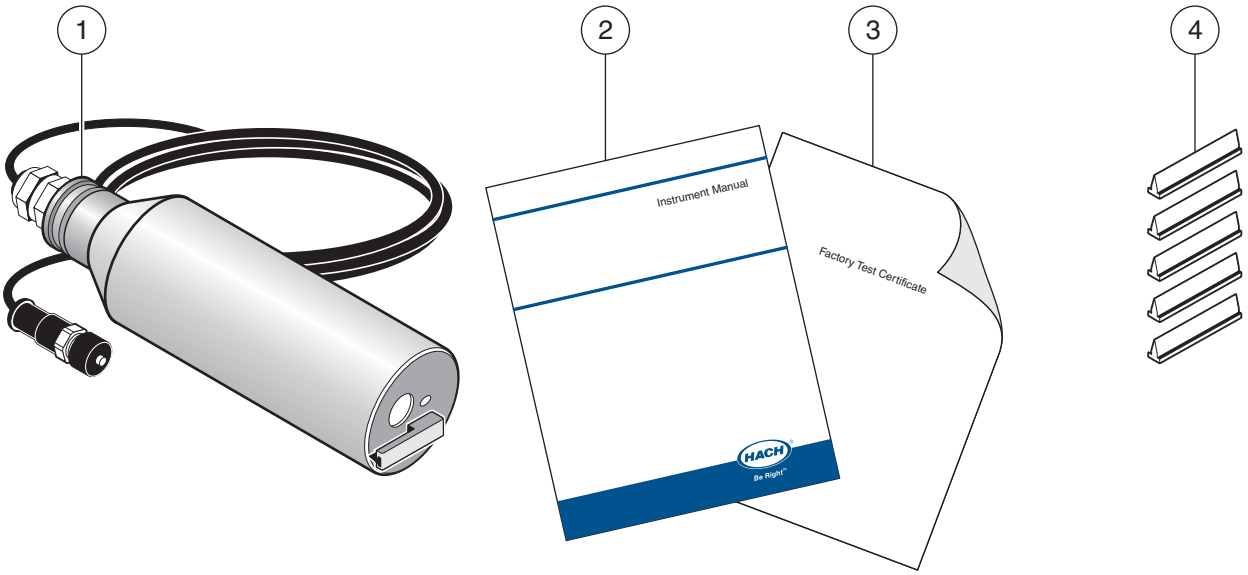
The sensor contains high-quality optical and electronic assemblies. Make sure the sensor is not subjected to any hard mechanical knocks. There are no customer-serviceable items inside the sensor.

Section 3 Installation

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

3.1 Unpacking the Instrument

Figure 3 Items Supplied with Sensorl



1.	SOLITAX sc Sensor	**3.**	Factory Test Certificate
2.	User Manual	**4.**	Wiper Set (for 5 changes) LZX050

3.1.1 Function Check

After unpacking, both components should be checked for any transport damage and a short function check performed prior to installation.

To perform a function check, connect the sensor to the display unit and power the unit. Shortly after the unit is plugged in, the display is activated and the instrument switches to the measurement display. Measured values taken in air is meaningless.

If no messages appear in the lower part of the display, the function check is then complete.

3.2 Sensor Installation

Figure 4 on page 10 illustrates the installation overview for Solitax sc Models t-line, ts-line, and hs-line for immersion in open tanks.

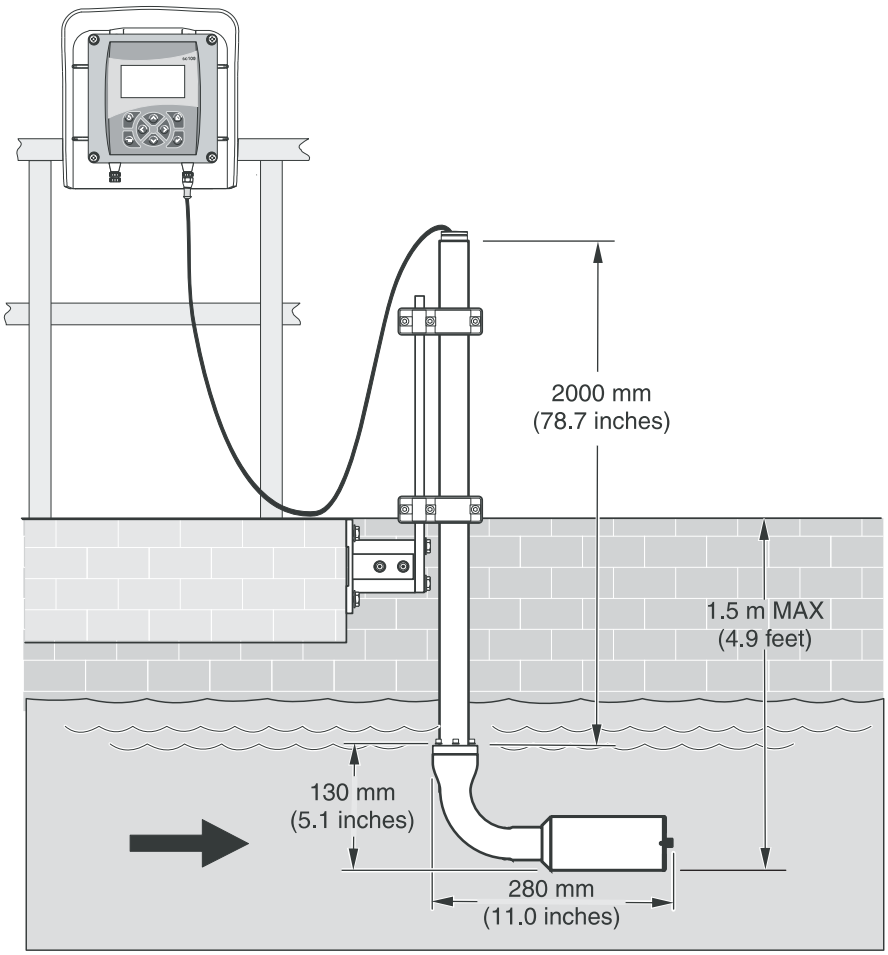
The maximum distance from the mounting surface to the sensor without the use of an extension tube is 1.5 m (4.9 ft). When that distance exceeds 1.5 m (4.9 ft), one of the following extension tubes is required and can be ordered separately:

- 1.0 m (3.28 ft) extension pipe LZY413
- 1.8 m (5.90 ft) extension pipe LZY414

To ensure a suitable measuring position, install the probe to the following conditions:

- The probe optical window must have a ground clearance of at least 30 cm (11.8 in.).
- Install the probe with the optical window facing (downstream) in the direction of the flow to minimize the risk of fouling.
- Avoid installation sites where air bubbles are inconsistent. If this not possible, try moving the probe slightly or adjusting its alignment to minimize the bubble effect.
- Protect the probe against the oncoming flow of large objects, such as branches or ice and against flow surges.
- Avoid installing the probe with the optical window facing into direct light or facing a highly-reflective surface.

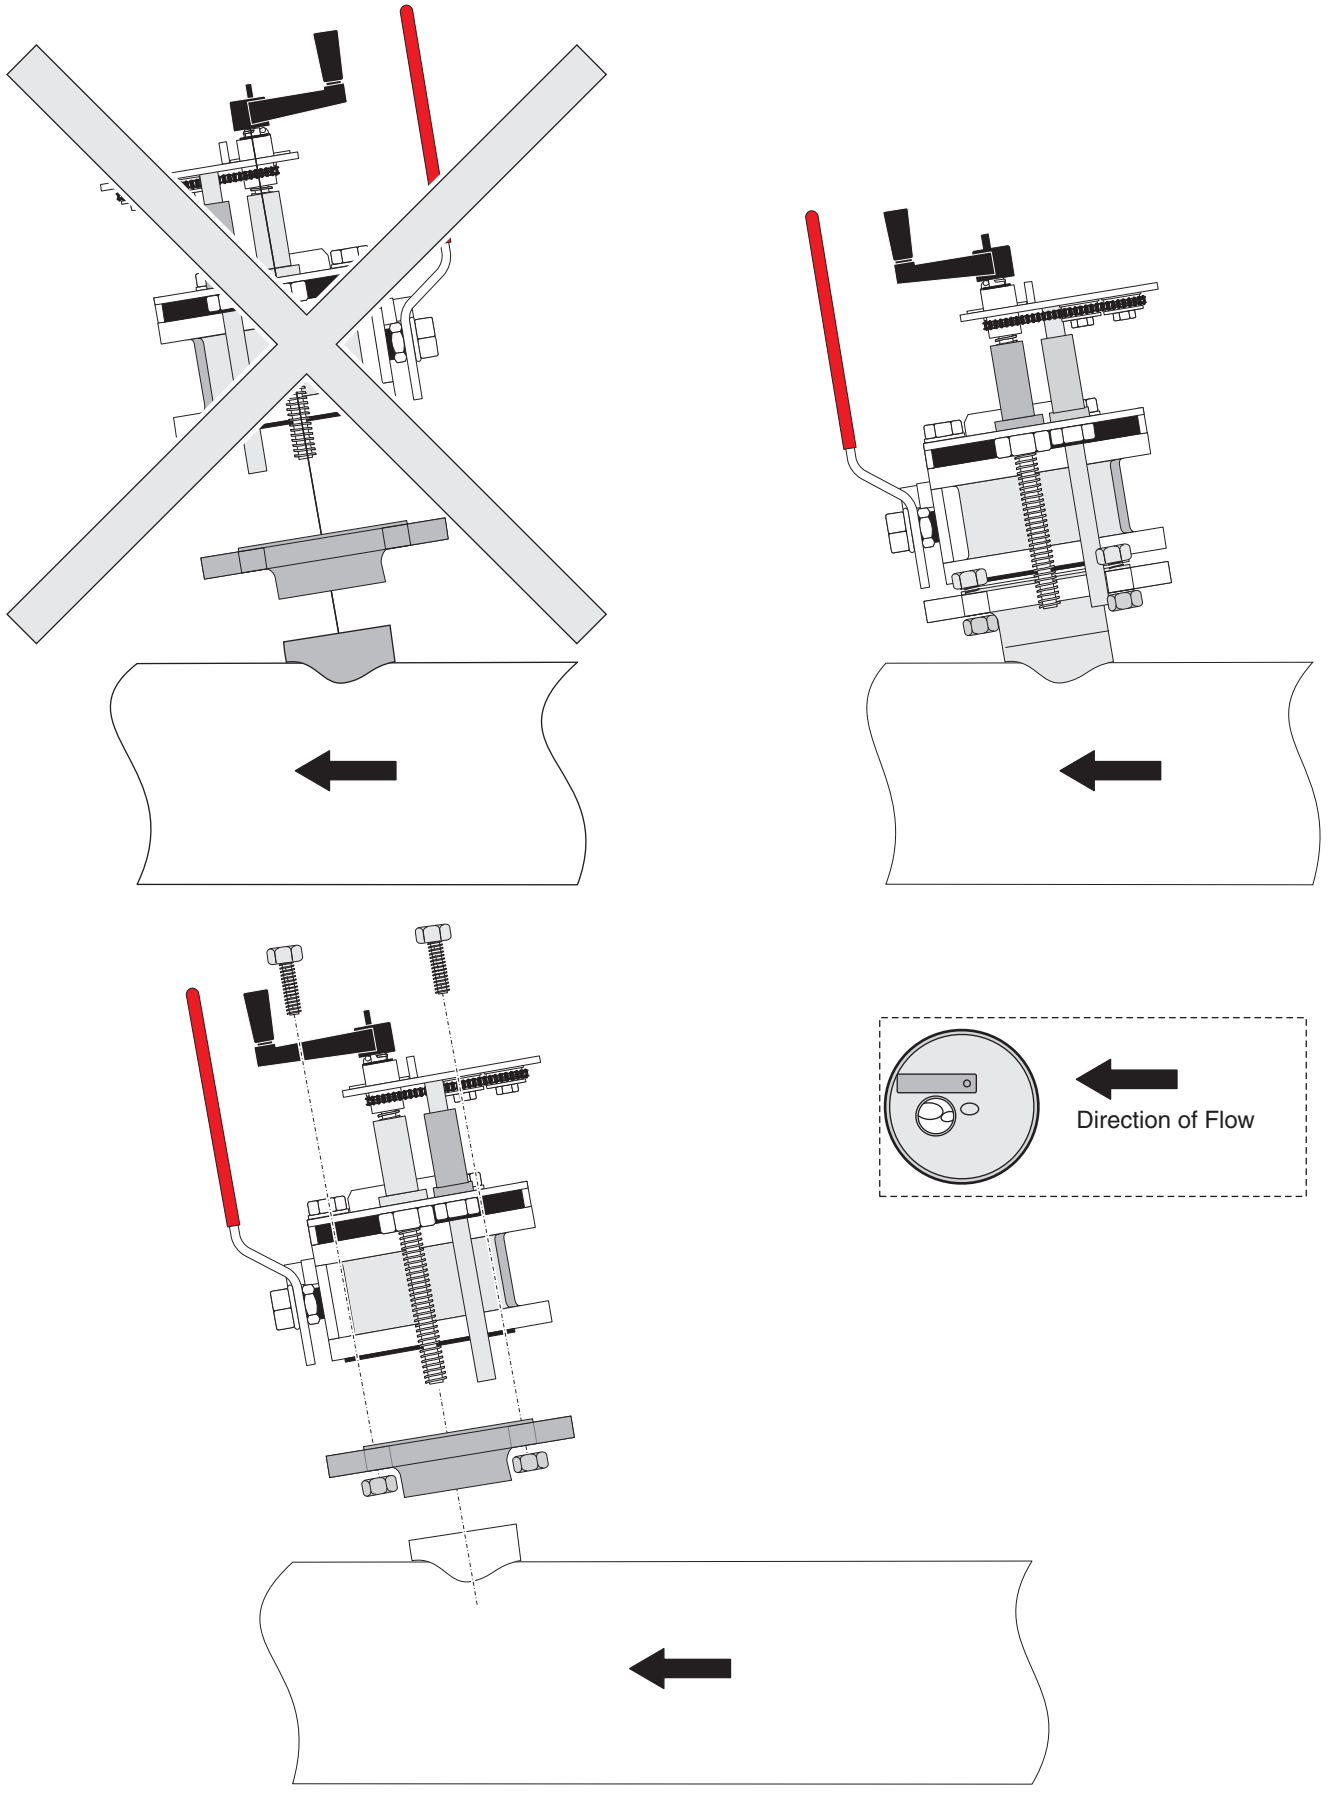
Figure 4 Sensor Installation Overview



3.3 Pipe Installation

- Install the sensor in an up-flow pipe section for best results. Do not mount the sensor in a down-flow pipe section.
- Mounting in a horizontal pipe section is acceptable if the sensor is fully immersed at all times. Usually, mounting 90 degrees from the top of the pipe guarantees full immersion. Do not mount on the top or bottom of a horizontal pipe section.
- Install the sensor in a pipe that is equal to or greater than 4 inches in diameter.
- Install the sensor at least 1.5 m (5 ft.) or three times the pipe diameter (whichever is greater) downstream of pumps, valves, or pipe elbows.
- Install the sensor on the discharge side of a pump, if possible, with a dilution or flush valve installed on the suction side of the pump.
- If the sensor is to be used to measure sludge with significant amounts of debris, install it after a sludge grinding pump or after a pump with a grinding/comminuting unit in front of it.
- Install the sensor within 7.8 m (25 ft.) of the controller with the standard probe cable. Optional cable extensions can be added for a maximum combined distance of 100 meters (330 ft.).
- If the flange cannot be welded to the pipe due to incompatibility of materials between the stud and the pipe, it is recommended that a stainless steel pipe section be fabricated. Weld the flange onto the stainless steel pipe section and attach the stainless steel section as a segment of the process pipe.

Figure 5 Proper Positioning for Insertion into Pipe



3.4 Connecting sensor cable

CAUTION
Always lay cables and hoses so they do not pose a trip hazard and are not bent.

1. Unscrew the protective cap on the controller socket and retain it.
2. Pay attention to the guide in the plug and push the plug into the socket.
3. Tighten the nuts.

Connector cables are available in various lengths (refer to Section 7 Replacement Parts and Accessories on page 23). Maximum overall cable length: 50 m (165 ft).

Figure 6 Connection of the sensor plug to the controller

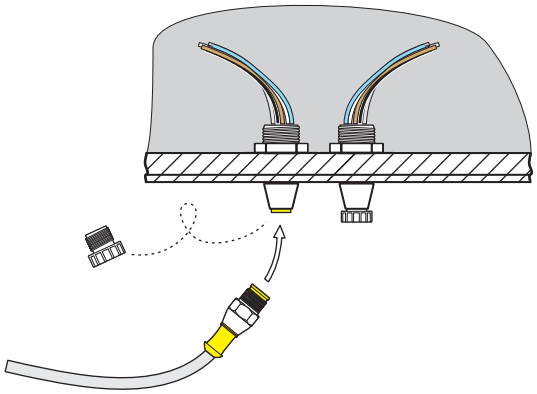


Figure 7 Sensor connector pin assignment

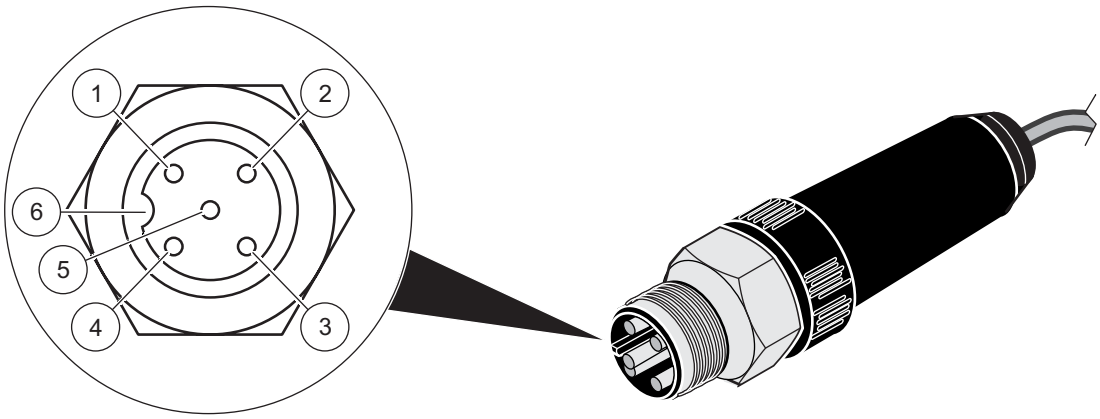


Number	Description	Cable colour (Standard-Cable)
1	+12 VDC	brown
2	Ground	black
3	Data (+)	blue
4	Data (–)	white
5	Screen	Screen (grey)
6	Notch	–

Section 4 Operations

4.1 Use of an sc controller

Before using the sensor in combination with an sc controller, refer to the controller user manual for navigation information.

4.2 Sensor Setup

When a sensor is initially installed, the serial number of the sensor will be displayed as the sensor name. To change the sensor name refer to the following instructions:

1. Select Main Menu.
2. From the Main Menu, select SENSOR SETUP and confirm.
3. Highlight the appropriate sensor if more than one sensor is attached and confirm.
4. Select CONFIGURE and confirm.
5. Select EDIT NAME and edit the name. Confirm or cancel to return to the Sensor Setup menu.

4.3 Sensor Data Logging

A data memory and event memory per sensor are available via the sc controller. While measured data are saved in the data memory at stipulated intervals, the event memory collects numerous events such as configuration changes, alarms and warning conditions. Both the data memory and the event memory can be read out in CSV format. For information on how you can download the data, please see the controller manual.

4.4 Sensor Diagnostics Menu for pH and ORP

SELECT SENSOR (if more than one sensor is attached)

STATUS	
ERROR LIST	See section 6.1 on page 21.
WARNING LIST	See section 6.2 on page 21..

4.5 Sensor Setup Menu

SELECT SENSOR (if more than one sensor is attached)

WIPE	
Initiates a wiping action on the sensor window.	
CALIBRATE	
SET OUTMODE	Select the behavior of the outputs during calibration for zero point setting (Hold, Active, Transfer, Selection). Hold maintains the last reading prior to going into the menu. Active transmits the current level readings, corrected with previous calibration data until new data is entered. Set Transfer transmits the value designated during the system setup
SENSOR MEASURE	Displays the current, uncorrected measured value.
CONFIGURE	Select the calibration type and follow the calibration steps for 2 point, 3 point, 4 point, and 5 point calibration.
FACTOR/2 POINTS/ 3 POINTS/4 POINTS/ 5 POINTS	Display depends on the selection in configuration.
SET CAL DEFAULT	Return the instrument to the default calibration settings.

4.5 Sensor Setup Menu (continued)

CONFIGURE		
	EDIT NAME	Enter up to a 10-digit name in any combination of symbols and alpha or numeric characters.
	SET PARAMETER	This setting configures the Solitax to measure turbidity or suspended solids. The Solitax cannot simultaneously measure both. Choose “TRB” for turbidity measurements, or “TS” for suspended solids measurement. This selection determines which units may be selected in the “Meas Units” menu.
	MEAS UNITS	Choose from the displayed units. TRB (FNU, EBC, TE/F, NTU); TS (mg/L, g/L, ppm, %) Default: FNU If TRB was selected in set parameter, select “NTU” (commonly used in the U.S.), FNU, EBC, or TE/F. If TS was selected, choose mg/L, g/L, ppm, or %. Press enter to choose the selection. If the units selected result in a reading that exceeds 4 digits, the display will only show dashes. For example, if mg/L were selected, and the measurement was 10,500 mg/L, the display will show dashes until the reading drops to 9999 or lower.
	CLEAN INTERVAL	Select the cleaning interval (1, 5, 15 or 30 minutes; 1, 4, or 12 hours; 1, 3, 7 days) Default: 12 hours This is the interval between wiper cleaning of the sensor window. It is recommended to start with a setting of 30 minutes. This time may be adjusted according to the application. If readings continue to be accurate, try a longer interval. If not, shorten the interval.
	RESPONSE TIME	This is a damping function. While the Solitax takes readings continually, it will average them together over the period of the response time. Once the response time has elapsed, the displayed reading, 4-20 outputs, and alarm status are updated. (0 to 300 seconds) Default: 3 seconds
	LOGGER INTERVAL	This is the datalog interval, with options from 1–15 minutes. Values logged are the average of the all readings during the previous logging interval. The controller will hold approximately 360 days of readings for one sensor at 15 minute intervals, or 24 days at 1 minute intervals (and proportional in between). Default:10 minutes
	SET DEFAULTS	Resets all user-editable options to the factory-defaults.
TEST/MAIN		
	PROBE INFO	Displays the sensor type, entered name of the sensor (Default: sensor serial number), the sensor serial number, the software version number, and the sensor driver version number.
	PROFILE	Select Profile Counter to display the number of wipes made (from 20000 backwards). Select Reset Config to manually reset the profile counter.
	COUNTER	Shows the number of hours or cycles left for operating hours, test/maint, gasket, and the motor.
	TEST/MAIN	WIPE—Initiates the wiping action of the wiper.
		SIGNALS—displays the signal outputs for the device.
		OUTPUT MODE—Select the behavior of the instrument outputs (Hold, Active, Transfer, Selection)
		DEFAULT SETUP—Resets all user-editable options to the factory defaults.

4.6 Calibration

There are two calibration techniques; depending on whether turbidity or suspended solid is required (refer to section 4.6.2 or section 4.6.3 on page 18). Before calibration, determine the behavior of the 4–20 outputs and alarm relays while the user is in the CALIBRATE menu (refer to section 4.6.1).

4.6.1 Setting the Outmode

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SET OUTMODE. Select the available Out Mode (Active, Hold, Transfer) and confirm.

4.6.2 Calibration for Turbidity

Turbidity calibration requires the use of a Turbidity Standard Solution. The manufacturer recommends the 800 NTU Turbidity Standard Solution (part of the calibration kit No. 57330-00). A zero-point calibration using deionized water is also recommended.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SENSOR MEASURE and confirm.
5. Place the sensor in the calibration cylinder with deionized water, mounting it with the supplied clamp. The tip of the probe should be approximately 1-inch below the surface of the water. Record the reading from the sensor measure display.
6. Select OFFSET. Multiply the reading obtained in step 5 and enter the value.
7. Select SENSOR MEASURE.
8. Rinse the outside of the StablCal® 800 NTU standard with water to remove any dust or debris adhering to the surface of the bottle. Gently invert both StablCal standard bottles a minimum of 50 times. Remove the lid and seal from each bottle. Slowly (to avoid creating bubbles) pour the contents of the bottles into the calibration cylinder. Immediately place the tip of the probe into the positioning bracket in the calibration cylinder. The tip of the probe should be approximately 1-inch below the surface standard. Allow the reading to become stable on the SENSOR MEASURE screen. Record the value (measured value). Calculate the factor. Refer to section 4.6.2.1.
9. Select FACTOR to display the corrected measurement.

4.6.2.1 Calculating the Factor

$$\text{New Factor} = \frac{\text{800 NTU Standard}}{\text{measured value}}$$

For example, if a sample measures 750 NTU using the sensor and the standard is 800 NTU, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{\text{800 NTU}}{\text{750 NTU}} = 1.07$$

4.6.3 Calibration for Suspended Solids

Suspended solids calibration requires calibration to the actual sample. This optimizes the compensation for the particle size and shape typical at a measuring site. It is best performed by mounting the sensor as usual for normal measurement, and then grab samples collected and evaluated by laboratory methods. While a single point calibration is usually sufficient to provide accuracy, the SOLITAX does offer the ability to calibrate with up to 5 calibration points.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select CONFIGURE and confirm.
5. Select the number of points desired for calibration (the unit with linearly interpolate values between calibration points). Select Factor for a single point calibration.
6. Mount the sensor as is during normal operation. Alternatively, place the sensor in the calibration cylinder (or a container with dark, non-reflective walls) 2 inches of clearance from the probe face with the probe face submerged by 1 inch or more.
7. Select SENSOR MEASURE and record the reading.
8. Immediately take a grab sample. Determine the total suspended solids using a gravimetric method such as Method 2540 D in *Standards Methods for the Examination of Water and WasteWater.*
9. Calculate the new factor. Refer to section 4.6.3.1 for single point (Factor) calibration. Refer section 4.6.3.2 on page 18 for multiple point calibrations.
10. Select FACTOR and press confirm. The corrected measurement should be displayed.

4.6.3.1 For Single Point (Factor) Calibration

Calculate the new factor:

$$\text{New Factor} = \frac{\text{Determined gravimetric value}}{\text{measured value}}$$

For example, if a sample measures 2.3 g/L using the SS sensor and the gravimetric value was 2.0 g/L, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{2.0\ \text{g/L}}{2.3\ \text{g/L}} = 0.87$$

4.6.3.2 Multi-point Calibration

1. Repeat steps 6–8 in section 4.6.3 on page 18 at different times to obtain different measurements.
2. From the CONFIGURE menu, select the appropriate calibration point menu.
3. Enter the pairs of values for each reading, the target value being the laboratory determined value, and the actual value being the reading that the SOLITAX produced in step 5. The pairs should be entered in order from lowest values to highest.

Section 5 Maintenance

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

Proper maintenance of the measuring windows in the sensor is critical for accurate measurements. The measuring windows should be checked monthly for soiling and the wiper checked for wear.

Important Note: *The seals must be replaced every 2 years by the Service Department. If the seals are not changed regularly, water may enter the probe head and seriously damage the instrument.*

5.1 Maintenance Schedule

Maintenance Task	Duration
Visual inspection	monthly
Check calibration	monthly *(depending on the ambient conditions)*
Inspection	six months (counter)
Seal change	every 2 years (counter)
Change wiper and reset counter	as per counter (20000 cycles)

5.2 Cleaning the Sensor Measuring Windows

CAUTION
Always were
- ***Safety glasses,***
- ***Gloves and***
- ***Overal***

handling hydrochloric acid and observe safety regulations.

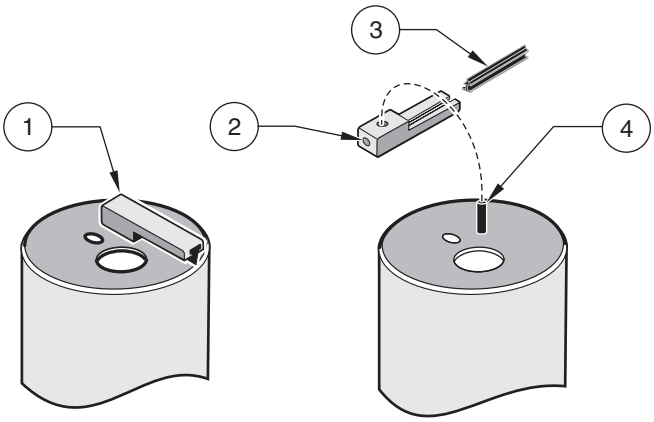
The measuring windows are made of quartz glass. If necessary, they can be cleaned with a cleaning agent and a cloth.

5.3 Replacing the Wiper

The life of the wiper is dependent on the number of cleaning actions performed and the type of deposits to be removed. The life of the wiper varies. The wipers supplied with the instrument should last for approximately one year.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select TEST/MAINT and press confirm.
4. Select PROFILE and confirm. Change the wiper, see section 5.3 on page 20.
5. Select RESET CONFIG and confirm.
6. Select MAN. RESET ARE YOU SURE? and confirm.

Figure 8 Wiper Replacement



1.	Wiper arm	**3.**	Wiper
2.	M4 hex socket head bolt	**4.**	Wiper axle

Section 6 Troubleshooting

6.1 Error Codes

In the case of an error, the indication of the measured value flashes on the display and all the contacts and current outputs allocated to this sensor are placed on hold. The following conditions will result in flashing measured values:

- Data transmission between controller and sensor interrupted

On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the fault.

Table 1 Error Messages

Error Displayed	Cause	Solution
POS. UNKNOWN	Wiper position unknown	Open the TEST/MAINT menu and trigger the ”WIPE” function, if the problem persists contact the manufacturer's customer service
LED FAULTY	Faulty LED	Contact customer service
MOIST	Moisture value > 10	Remove the sensor immediately and store in a dry place, contact customer service
CAL. DATA	Factory calibration data lost	Contact customer service

6.2 Warnings

A warning results in a flashing warning icon on the right of the display, all menus, contacts and outputs remain unaffected and continue to work normally. On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the warning.

A warning may be used to trigger a relay and users can set warning levels to define the severity of the warning.

Table 2 Warnings

Warning Displayed	Cause	Solution
WARNING	Cause	Action
REPLACE WIPER	Counter elapsed	Replace wiper, reset counter
TEST/MAINT	Counter elapsed	Contact customer service
GASKET	Counter elapsed	Contact customer service

Section 7 Replacement Parts and Accessories

7.1 Immersion Sensors[1]

Description	Catalog Number
Turbidity, t-line sc, PVC with wiper (0.001 to 4000 NTU)	LXV423.99.10000
Turbidity, t-line sc, PVC without wiper (0.001 to 4000 NTU)	LXV423.99.12000
Turbidity and Suspended Solids, ts-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.10100
Turbidity and Suspended Solids, ts-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.12100
Turbidity and Suspended Solids, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.00100
Turbidity and Suspended Solids, ts-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.02100
Turbidity and Suspended Solids, hs-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.10200
Turbidity and Suspended Solids, hs-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.12200
Turbidity and Suspended Solids, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.00200
Turbidity and Suspended Solids, hs-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.02200

Section 9 Limited warranty

Hach Company warrants its products to the original purchaser against any defects that are due to faulty material or workmanship for a period of one year from date of shipment unless otherwise noted in the product manual.

In the event that a defect is discovered during the warranty period, Hach Company agrees that, at its option, it will repair or replace the defective product or refund the purchase price excluding original shipping and handling charges. Any product repaired or replaced under this warranty will be warranted only for the remainder of the original product warranty period.

This warranty does not apply to consumable products such as chemical reagents; or consumable components of a product, such as, but not limited to, lamps and tubing.

Contact Hach Company or your distributor to initiate warranty support. Products may not be returned without authorization from Hach Company.

Limitations

This warranty does not cover:

- Damage caused by acts of God, natural disaster, labor unrest, acts of war (declared or undeclared), terrorism, civil strife or acts of any governmental jurisdiction
- Damage caused by misuse, neglect, accident or improper application or installation
- Damage caused by any repair or attempted repair not authorized by Hach Company
- Any product not used in accordance with the instructions furnished by Hach Company
- Freight charges to return merchandise to Hach Company
- Freight charges on expedited or express shipment of warranted parts or product
- Travel fees associated with on-site warranty repair

This warranty contains the sole express warranty made by Hach Company in connection with its products. All implied warranties, including without limitation, the warranties of merchantability and fitness for a particular purpose, are expressly disclaimed.

Some states within the United States do not allow the disclaimer of implied warranties and if this is true in your state the above limitation may not apply to you. This warranty gives you specific rights, and you may also have other rights that vary from state to state.

This warranty constitutes the final, complete, and exclusive statement of warranty terms and no person is authorized to make any other warranties or representations on behalf of Hach Company.

Limitation of Remedies

The remedies of repair, replacement or refund of purchase price as stated above are the exclusive remedies for the breach of this warranty. On the basis of strict liability or under any other legal theory, in no event shall Hach Company be liable for any incidental or consequential damages of any kind for breach of warranty or negligence.

BG Преди инсталацията/монтажа на продукта, прочетете внимателно всички инструкции за инсталация и ги спазвайте по време на инсталирането. Инсталацията трябва да се извършва от квалифициран специалист в съответствие с местните разпоредби за безопасност. Погрижете се избраното място на инсталацията да гарантира безопасна инсталация и експлоатация. Продуктът е предназначен единствено за придържане/прикрепване на измервателните сензори/продукти на HACH/HACH LANGE. Всяко друго приложение може да носи риск за потребителя. Работите по поддръжката и ремонта трябва да се извършват изключително от оторизирания отдел за обслужване на клиенти. Могат да се използват само оригинални резервни части и препоръчани от производителя принадлежности. Всякакви изменения по продукта водят до анулиране на всички отговорности от страна на производителя. Неспазването на инструкциите за употреба или използването на продукта за цели, различни от тези, за които е предназначен, може да доведе до сериозно нараняване на потребителя и/или повреда на оборудването. Работата по заваряване, трябва да бъде извършвана само от квалифицирани заварчици съгласно DIN/EN 287 или от сертифицирани фирми по EN 3834-2.

CS Při instalaci/montáži produktu si pečlivě přečtěte všechny pokyny k instalaci a v průběhu instalace tyto pokyny dodržujte. Instalaci musí provádět kvalifikovaný odborník v souladu s místními bezpečnostními předpisy. Pečlivě vyberte umístění pro instalaci, které zajistí bezpečnou instalaci a provoz. Produkt je určen pouze k upevnění/přichycení měřicích snímačů/produktů HACH/HACH LANGE. Jakékoli jiné použití může znamenat riziko pro uživatele. Údržbu a opravy smí provádět výhradně autorizované oddělení zákaznických služeb. Je dovoleno používat pouze originální náhradní díly a příslušenství doporučené výrobcem. Jakékoli změny provedené na produktu způsobí neplatnost veškerých záruk. Nedodržení těchto pokynů nebo používání produktu pro jiný účel než pro který je určen může způsobit uživateli vážné zranění anebo poškodit zařízení. Potřebné svářečské práce musí být provedeny kvalifikovaným svářečem výhradně podle DIN/EN 287 nebo dodavatelem v souladu s EN 3834-2.

DA Før du installerer/monterer produktet, skal du læse alle installationsinstruktionerne grundigt og følge dem under installeringen. Installationen skal udføres af en kvalificeret ekspert i overensstemmelse med alle lokale sikkerhedsbestemmelser. Vælg sikker og betjeningsvenligt placering til installationen. Produktet er kun beregnet til at holde/fastgøre HACH/HACH LANGE-målesensorer/-produkter. Enhver anden form for brug kan medføre skadesrisiko for brugeren. Vedligeholdelse og reparation bør kun udføres af en autoriseret kundeserviceafdeling. Der må kun anvendes originale reservedele og tilbehør, der er anbefalet af producenten. Alle ændringer af produktet ophæver garantien. Hvis du ikke følger disse instruktioner eller bruger produktet til et andet formål, end det er beregnet til, kan der forekomme alvorlige personskader og/eller skader på udstyret. Svejsearbejde må kun udføres af DIN/EN 287 kvalificerede svejsere, eller EN 3834-2 certificerede firmaer.

DE Die Montageanleitung ist vor der Installation/Montage des Produktes sorgfältig und vollständig zu lesen und zu befolgen. Die Installation muss von einer Fachkraft (qualifiziertes Personal) unter Einhaltung aller lokal gültigen Sicherheitsvorschriften erfolgen. Der Montageort ist so zu wählen, dass eine sichere Installation und der sichere Betrieb gewährleistet ist. Die Verwendung des Produktes ist ausschließlich zum Halten/Befestigen von HACH/HACH LANGE Messsonden/Produkten vorgesehen. Jede andere Benutzung ist mit Risiken für den Benutzer verbunden. Wartungs- und Reparaturarbeiten sollten nur vom autorisierten Kundendienst durchgeführt werden. Es dürfen nur vom Hersteller empfohlene Originalersatz- und Zubehörteile verwendet werden. Änderungen am Produkt haben den Verlust jeglicher Haftungsansprüche zur Folge. Nichtbeachtung dieser Anweisungen oder eine andere Verwendung des Produktes kann schwerwiegende Verletzungen der Anwender oder Beschädigung am Gerät zur Folge haben. Die notwendigen Schweißarbeiten dürfen ausschließlich von entsprechend DIN/EN 287 qualifizierten Schweißern durchgeführt werden, oder von Fachfirmen entsprechend EN 3834-2.

EL Πριν από την εγκατάσταση/τοποθέτηση του προϊόντος, διαβάστε προσεκτικά και ακολουθήστε όλες τις οδηγίες εγκατάστασης κατά την εγκατάσταση. Η εγκατάσταση πρέπει να πραγματοποιηθεί από κατάλληλα εκπαιδευμένο τεχνικό και σύμφωνα με όλους τους τοπικούς κανονισμούς ασφάλειας. Επιλέξτε μια θέση τοποθέτησης που θα διασφαλίσει την ασφαλή εγκατάσταση και λειτουργία. Το προϊόν προορίζεται αποκλειστικά για τη στήριξη/σύνδεση των αισθητήρων μέτρησης/προϊόντων HACH/HACH LANGE. Οποιαδήποτε άλλη χρήση ενδέχεται να ενέχει κινδύνους για τον χρήστη. Οι εργασίες συντήρησης και επισκευής θα πρέπει να εκτελούνται αποκλειστικά από το εξουσιοδοτημένο τμήμα εξυπηρέτησης πελατών. Επιτρέπεται η χρήση μόνον των γνήσιων ανταλλακτικών και των αξεσουάρ που συνιστά ο κατασκευαστής. Οποιεσδήποτε αλλαγές στο προϊόν ακυρώνουν την ευθύνη της εταιρείας. Σε περίπτωση που δεν τηρηθούν αυτές τις οδηγίες ή χρησιμοποιηθεί το προϊόν για διαφορετικό σκοπό από αυτόν που προορίζεται, ενδέχεται να προκληθεί σοβαρός τραυματισμός στον χειριστή και/ή βλάβη στον εξοπλισμό. Οι απαιτούμενες εργασίες συγκόλλησης θα πρέπει να διεξαχθούν από εξειδικευμένο προσωπικό σύμφωνα με DIN / EN287 ή από κατασκευαστικές εταιρείες σύμφωνα με DIN 3834-2.

EN Before installing/mounting the product, read all the installation instructions carefully and follow the instructions during installation. Installation must be carried out by a qualified expert in accordance with all local safety regulations. Take care to choose an installation location that will ensure safe installation and operation. The product is intended solely for holding/attaching HACH/HACH LANGE measuring sensors/products. Any other use may involve risks for the user. Maintenance and repair work should be carried out exclusively by the authorized customer service department. Only original replacement and accessory parts recommended by the manufacturer may be used. Any changes made to the product will nullify all liability. Failure to follow these instructions or use of the product for a purpose other than that for which it was intended may result in serious injury to the user and/or damage to the equipment. The required welding work must be performed exclusively in accordance with DIN / EN 287 qualified welders, or from contractors in accordance with EN 3834-2.

ES Antes de instalar o fijar el producto, lea con atención todas las instrucciones de instalación y sígalas durante el montaje. La instalación debe llevarla a cabo un experto cualificado, de acuerdo con las normas de seguridad locales. Elija una ubicación para la instalación que garantice que ésta y el funcionamiento del producto sean seguros. El producto sólo está diseñado para sujetar o fijar sensores o productos de medición de HACH/HACH LANGE. Cualquier otro uso puede conllevar riesgos para el usuario. El trabajo de mantenimiento y reparación sólo debe llevarse a cabo por el departamento de atención al cliente autorizado. Sólo deben utilizarse las piezas de repuesto recomendadas por el fabricante. Cualquier cambio que se realice en el producto anulará toda responsabilidad. Si no se siguen estas instrucciones o si se utiliza el producto para un uso distinto del uso para el que fue diseñado, el usuario puede sufrir heridas graves y/o se puede dañar el equipo. Los trabajos de soldadura requeridos deben ser realizados exclusivamente por soldadores cualificados según DIN / EN 287, o por contratistas de acuerdo a EN 3834-2.

FI Ennen kuin asennat/kiinnität tuotteen, lue kaikki asennusohjeet huolellisesti ja noudata niitä. Tuotteen saa asentaa vain valtuutettu henkilö, ja asennuksessa on noudatettava kaikkia paikallisia turvallisuusmääräyksiä. Asenna tuote sellaiseen paikkaan, johon asentaminen on turvallista ja jossa tuote toimii oikein. Tuote on tarkoitettu ainoastaan HACH/HACH LANGE -mittausanturien/-tuotteiden ripustamiseen/kiinnittämiseen. Muunlainen käyttö voi aiheuttaa vaaratilanteita käyttäjälle. Huolto- ja korjaustyöt saa tehdä vain valtuutettu asiakaspalveluosasto. Tuotteessa saa käyttää vain valmistajan suosittelemia alkuperäisiä varaja lisäosia. Tuotteeseen tehdyt muutokset mitätöivät kaikki vastuut. Jos näitä ohjeita ei noudateta tai jos tuotetta käytetään johonkin muuhun kuin sen varsinaiseen käyttötarkoitukseen, käyttäjälle voi aiheutua vakavia vammoja ja/tai laite voi vaurioitua. Vain DIN / EN 287 mukaan hyväksytyt hitsaajat tai EN 3834-2 mukaiset urakoitsijat saavat tehdä vaaditut hitsaustyöt.

FR Avant l'installation/le montage du produit, lisez attentivement toutes les instructions d'installation et suivez-les au cours de l'installation. L'installation doit être réalisée par un expert qualifié conformément à toutes les réglementations de sécurité locales. Veillez à choisir un emplacement permettant d'assurer une installation et un fonctionnement en toute sécurité. Ce produit est uniquement destiné à maintenir/fixer des capteurs/équipements de mesure HACH LANGE. Toute autre utilisation entraînerait un risque pour l'utilisateur. Seul le service clientèle agréé est autorisé à effectuer les travaux de maintenance et de réparation. Seuls les pièces de rechange et les accessoires d'origine recommandés par le fabricant doivent être utilisés. La modification du produit annule toute responsabilité. Le non-respect de ces instructions ou l'utilisation de ce produit à des fins autres que celles auxquelles il est destiné risqueraient de gravement blesser l'utilisateur et/ou d'endommager le matériel. Le travail de soudure requis doit être réalisé exclusivement par des soudeurs qualifiés en conformité avec DIN / EN 287, ou par prestataires conformément à EN 3834-2.

HR Prije instalacije/postavljanja uređaja, pažljivo pročitajte sve upute za montažu i pratite ih tijekom postupka instalacije. Instalaciju mora provesti kvalificirani stručnjak u skladu s lokalnim sigurnosnim propisima. Brižljivo odaberite mjesto instalacije na kojem će se postavljanje uređaja i njegovo korištenje odvijati u sigurnim uvjetima. Uređaj je namijenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mjernih senzora/uređaja. Upotreba uređaja u druge svrhe može predstavljati rizik za korisnika. Održavanje i popravke smije provoditi isključivo ovlašteni servisni odjel. Mogu se upotrebljavati samo originalni rezervni i dodatni dijelovi koje je preporučio proizvođač. Bilo kakve izmjene izvršene na uređaju poništit će njegovu pouzdanost. Nepoštivanje ovih uputa ili upotreba uređaja za svrhe za koje nije namijenjen mogu dovesti do ozbiljnih ozljeda osoba koje se njime koriste i/ili štete na opremi. Potreban posao za zavarivanje mora biti izveden prema DIN / EN 287 od strane kvalificiranih varioca ili izvođača radova prema EN 3834-2.

HU A termék üzembe helyezése/rögzítése előtt tekintse át a vonatkozó utasításokat, és tartsa is be azokat. Az üzembe helyezést kizárólag szakember végezheti, a hatályos biztonsági előírásoknak megfelelően. A telepítéshez biztonságos üzemet szavatoló helyet válasszon. A termék kizárólag HACH/HACH LANGE mérőberendezések és készülékek rögzítésére szolgál. Az ettől eltérő bármilyen használat kockázattal jár. A karbantartást és egyéb javításokat kizárólag az arra feljogosított ügyfélszolgálati részleg végezheti el. Csak a gyártó által ajánlott cserealkatrészek használhatóak. A terméken végzett bármilyen módosítás a felelősség kizárását vonja maga után. Az utasítások be nem tartása, a termék megadott felhasználási területtől eltérő célra való alkalmazása a kezelő súlyos sérülését és/vagy a berendezés károsodását okozhatja. A szükséges hegesztési munkákat csak DIN/EN 287 bizonyítvánnyal rendelkező hegesztő szakember, vagy EN 3834-2 minősítéssel rendelkező szakcég végezheti.

IT Prima di installare/montare il prodotto, leggere le istruzioni sull'installazione e attenersi scrupolosamente ad esse durante l'installazione. L'installazione deve essere eseguita da personale qualificato in base alle norme di sicurezza locali. Scegliere con cura il punto di installazione per un'installazione corretta e un funzionamento sicuro. Il prodotto è adatto esclusivamente per il sostegno/collegamento di prodotti/sensori di misura HACH/HACH LANGE. Qualsiasi altro utilizzo può provocare lesioni all'utente. La manutenzione e gli interventi di riparazione devono essere eseguiti esclusivamente dal reparto assistenza clienti. Il produttore consiglia di sostituire gli accessori solo con ricambi originali. Qualsiasi modifica apportata al prodotto prevede l'esclusione da qualsiasi responsabilità. La mancata osservanza della procedura di installazione o l'utilizzo inappropriato del prodotto possono provocare serie lesioni all'utente e/o danni all'apparecchiatura. Il lavoro di saldatura richiesto deve essere effettuato esclusivamente in accordo alla direttiva DIN / EN 287 da saldatori qualificati o da costruttori in accordo a EN 3834-2.

JA 製品を取り付ける前にすべての設置手順をよく読み、手順に従って設置してください。 設置は地域の安全基準に従い、資格のある担当者が行ってください。 設置場所は、安全に取り付けて操作できる場所を選んでください。 本製品は、HACH/HACH LANGE 測定センサー/製品の保持および接続専用です。 その他の用途には、ユーザーの責任において使用してください。 メンテナンスおよび修理は、認定されたカスタマー・サービス部門のみが実施できます。 交換部品および付属品には、メーカー推奨の純正品のみを使用してください。 製品を改変した場合、保証は無効になります。 手順に従わなかった場合、または製品を用途外に使用した場合は、重傷を負ったり、装置が破損することがあります。 ウェルディングはDIN/EN287に基づいて認定された作業者あるいはEN3834-2に基づく受託業者が実施する。

KO 본 제품을 설치하거나 장착하기 전에 모든 설치 지침을 충분히 검토하고 설치 시 반드시 해당 지침을 따르십시오. 설치는 숙련된 기술자가 지역의 모든 관련 안전 규정을 준수하여 수행해야 합니다. 설치 및 작동 시 안전한 장소를 신중하게 고르십시오. 본 제품은 HACH/HACH LANGE 측정 센서 또는 측정 제품을 지지하거나 연결하는 용도로만 사용됩니다. 그 외 다른 용도로 사용 시 작업자가 위험할 수 있습니다. 유지 관리 및 보수 작업은 공인된 고객 서비스 부서에서 전적으로 담당해야 합니다. 제조사가 승인한 교체용 부품 및 주변 장치만 사용 가능합니다. 제품 변경으로 인한 책임은 지지 않습니다. 이러한 지침에 어긋나거나 원래 제품의 용도와 다른 목적으로 사용할 경우 작업자에게 심각한 부상이 일어나거나 장비가 손상될 수 있습니다. 용접 작업이 필요한 경우에는 반드시 DIN/EN 287 자격을 가진 용접공이나 EN3834-2에 상응한 사람에 의해서 반드시 수행되어져야 합니다.

NL Lees vóór montage van het product alle montage-instructies grondig door en volg de instructies tijdens de montage op. Montage dient te worden uitgevoerd door een gekwalificeerde persoon en in overeenstemming met alle plaatselijke veiligheidsvoorschriften. Kies een montagelocatie die een veilige montage en werking garandeert. Het product is uitsluitend bedoeld voor opname/bevestiging van meetsensoren/-producten van HACH/HACH LANGE. Elk ander gebruik kan gevaren voor de gebruiker met zich meebrengen. Onderhoud en reparatie mogen uitsluitend worden uitgevoerd door de geautoriseerde afdeling klantenservice. Er mogen alleen originele, door de fabrikant aanbevolen reservedelen en accessoires worden gebruikt. Bij elke aanpassing van het product vervalt de aansprakelijkheid. Als u deze instructies niet opvolgt of als u het product voor een ander doel gebruikt dan waarvoor het is bedoeld, kan dit leiden tot ernstig letsel van de gebruiker en/of beschadiging van de apparatuur. Het benodigde laswerk mag uitsluitend uitgevoerd worden door DIN/EN287 gekwalificeerde lassers, of door EN3834-2 gecertificeerde installateurs.

PL Przed zainstalowaniem/zamontowaniem produktu, uważnie przeczytać wszystkie instrukcje i postępować zgodnie z ich zaleceniami podczas instalacji. Instalacja powinna zostać wykonana przez specjalistę o odpowiednich kwalifikacjach, zgodnie ze wszystkimi obowiązującymi lokalnie przepisami bezpieczeństwa. Wybrać takie miejsce instalacji, które zapewni bezpieczeństwo podczas instalacji i użytkowania. Produkt jest przeznaczony wyłącznie do zamocowania/zawieszenia czujników/mierników firmy HACH/HACH LANGE. Jakiekolwiek inne zastosowanie niesie ze sobą ryzyko dla użytkownika. Konserwacje i naprawy powinny być przeprowadzane wyłącznie przez upoważniony personel działu serwisowego klienta. Wolno używać tylko oryginalnych części zamiennych i części wyposażenia zalecanych przez producenta. Jakiekolwiek modyfikacje w budowie i działaniu produktu oznaczają wygaśnięcie

gwarancji i wykluczają wszelką odpowiedzialność producenta. Nieprzestrzeganie tych instrukcji lub używanie produktu do celów innych niż wynika z opisu jego przeznaczenia, może być przyczyną poważnych wypadków z udziałem użytkownika i/lub uszkodzenia sprzętu. Wymagane prace spawalnicze muszą być wykonane zgodnie z normą DIN / EN 287 przez wykfalifikowany personel lub przez firmy pośredniczące zgodnie z EN3834-2.

PT Antes de instalar/montar o produto, leia atentamente as instruções de instalação e siga-as durante a instalação. A instalação deve ser efectuada por um profissional qualificado em conformidade com todas as regulamentações locais de segurança. Escolha cuidadosamente o local de instalação de modo a assegurar uma operação e instalação com segurança. Este produto foi concebido apenas para segurar/fixar sensores/produtos para medições da HACH/HACH LANGE. Qualquer outro tipo de utilização pode implicar riscos para o utilizador. O trabalho de manutenção e reparação deve ser efectuado única e exclusivamente pelo departamento de assistência ao cliente devidamente autorizado. Apenas podem ser utilizados acessórios e peças de substituição originais recomendados pelo fabricante. Qualquer alteração feita ao produto anula qualquer responsabilidade da nossa parte. O não cumprimento das instruções ou a utilização do produto para outros fins que não aqueles para que o produto foi concebido pode resultar em ferimentos graves e/ou danos no equipamento. O trabalho de soldadura exigido deverá ser executado exclusivamente por soldadores qualificados de acordo com a norma DIN /EN 287, ou por empreiteiros em conformidade com a norma EN 3834-2.

RO Înainte de instalarea/montarea produsului, citiți cu atenție toate instrucțiunile de instalare și urmați instrucțiunile în timpul instalării. Instalarea trebuie realizată de un expert calificat în conformitate cu toate reglementările locale pentru siguranță. Aveți grijă să alegeți o locație de instalare care să asigure instalarea și funcționarea în siguranță. Produsul este destinat exclusiv pentru menținerea/atașarea senzorilor/produselor de măsurare HACH/HACH LANGE. Utilizarea în alte scopuri poate implica riscuri pentru utilizator. Întreținerea și lucrările de reparație trebuie realizate exclusiv de departamentul de service autorizat pentru clienți. Pot fi utilizate numai piesele de schimb și accesoriile originale recomandate de producător. Orice modificare adusă produsului va duce la anularea oricărei răspunderi. Nerespectarea acestor instrucțiuni sau utilizarea produsului în alte scopuri decât în cele destinate pot duce la accidente grave pentru utilizator și/sau defectarea echipamentului. Lucrările de sudură necesare trebuie să fie efectuate exclusiv de sudori calificați în conformitate cu DIN / EN 287 , sau de contractori în conformitate cu EN 3834-2.

RU Перед установкой/монтажом изделия необходимо внимательно прочитать инструкции по установке и строго следовать им во время выполнения работ. Установка должна быть выполнена квалифицированным специалистом с соблюдением действующих правил по технике безопасности. Выбирая место для установки, необходимо учитывать требования по безопасности при монтаже и эксплуатации изделий. Данное изделие предназначено только для крепления измерительных датчиков/приборов компании HACH/HACH LANGE. Любое другое применение может представлять опасность для пользователя. Работы по ремонту и техобслуживанию должны выполняться исключительно специалистами уполномоченной сервисной организации. С изделием могут использоваться только запчасти и принадлежности, рекомендуемые изготовителем. Любые изменения, внесенные в конструкцию изделия, приведут к отмене гарантии поставщика. Несоблюдение требований инструкций или использование изделия не по назначению могут стать причиной серьезных травм для людей и/или повреждения оборудования. Необходимые сварочные работы должны проводиться только сварщиками, квалифицированными в соответствии с DIN / EN 287, или подрядчиками в соотвествии с DIN 3834-2.

SK Pred inštaláciou/upevnením produktu si pozorne prečítajte všetky pokyny k inštalácii a počas inštalácie ich dodržujte. Inštaláciu musí vykonať kvalifikovaný expert v súlade so všetkými miestnymi bezpečnostnými nariadeniami. Uistite sa, že si vyberiete miesto inštalácie, ktoré zaručí bezpečnú inštaláciu a prevádzku. Produkt je určený výlučne pre uchytenie/upevnenie meracích snímačov/produktov HACH/HACH LANGE. Akékoľvek iné použitie môže zahŕňať riziká pre používateľa. Údržbu a opravy by malo vykonávať výlučne autorizované oddelenie služieb pre zákazníkov. Môžu sa použiť len originálne náhradné diely a príslušenstvo, ktoré odporúča výrobca. Akékoľvek zmeny vykonané na produkte spôsobia neplatnosť všetkej zodpovednosti. Nedodržanie týchto pokynov alebo používanie produktu na iný než určený účel môže spôsobiť vážne zranenie používateľa alebo poškodenie zariadenia. Požadované zváračské práce musia byť vykonané výhradene v súlade s DIN/EN 287 kvalifikovanými zváračmi, alebo dodávateľmi v súlade s EN 3834-2.

SL Pred namestitvijo/postavitvijo izdelka natančno preberite vsa navodila za namestitev in jih med nameščanjem upoštevajte. Namestitev mora izvesti usposobljen strokovnjak v skladu z vsemi lokalnimi varnostnimi predpisi. Za namestitev izberite mesto, ki zagotavlja varno namestitev in uporabo. Izdelek je namenjen izključno za namestitev/pritrditev merilnih senzorjev/izdelkov HACH/HACH LANGE. Vsakršna drugačna uporaba lahko predstavlja nevarnost za uporabnika. Vzdrževanje in popravilo lahko izvaja izključno osebje pooblaščenega servisnega oddelka. Uporabljate lahko samo originalne nadomestne dele in dodatno opremo, ki jih priporoča proizvajalec. Spremembe izdelka razveljavijo vsakršno odgovornost. Če teh navodil ne upoštevate ali izdelek uporabljate v neprimeren namen, lahko pride do hudih poškodb uporabnika in/ali poškodovanja opreme. Zahtevana dela varenja lahko izvajajo izključno usposobljeni varilci v skladu z DIN/EN 287 ali izvajalci v skladu z EN 3834-2.

SR Pre instalacije/montaže uređaja pažljivo pročitajte sva uputstva za montažu i pratite ih tokom postupka montaže. Instalaciju mora provesti kvalifikovani stručnjak u skladu sa lokalnim propisima o bezbednosti. Brižljivo odaberite mesto instalacije na kom će se montaža uređaja i korišćenje odvijati u bezbednim uslovima. Uređaj je namenjen isključivo za držanje/pričvršćivanje HACH/HACH LANGE mernih senzora/uređaja. Upotreba uređaja u druge svrhe može da predstavlja rizik po korisnika. Održavanje i opravke sme da provodi isključivo ovlašćeni serviser. Kod zamene i opravaka smeju da se koriste samo originalni rezervni i dodatni delovi koje je preporučio proizvođač. Bilo kakve izmene izvršene na uređaju poništiće njegovu pouzdanost. Nepridržavanje uputstava ili upotreba uređaja u svrhe za koje nije namenjen mogu dovesti do ozbiljnih povreda ljudi koji ga koriste i/ili štete na opremi. Neophodni radovi zavarivanja treba da budu izvršeni od strane zavarivača u skladu sa DIN / EN 287 ili od ugovorenog izvođača radova u skladu sa EN 3834-2.

SV Läs alla installationsanvisningar noggrant innan du installerar/monterar produkten och följ anvisningarna under installationen. Installationen måste utföras av en kvalificerad expert i enlighet med alla lokala säkerhetsföreskrifter. Se till att välja en installationsplats som garanterar säker installation och drift. Produkten är endast ämnad för att hålla/fästa mätsensorer/-produkter från HACH/HACH LANGE. Annan användning kan medföra risker för användaren. Underhålls- och reparationsarbeten ska uteslutande utföras av den auktoriserade kundserviceavdelningen. Endast originalreservdelar och -tillbehör som rekommenderas av tillverkaren ska användas. Om någon ändring görs på produkten upphävs tillverkarens ansvar. Det kan det medföra allvarliga skador för användaren eller skador på utrustningen om du inte följer anvisningarna eller om du använder produkten i installationer den inte är avsedd för. Svetsarbeten skall uteslutande utföras av svetsare kvalificerade enligt DIN/EN 287, eller av entreprenör enligt EN3834-2.

TR Ürünün montajını yapmadan önce, tüm montaj talimatlarını dikkatlice okuyun ve kurulum sırasında talimatları mutlaka takip edin. Montaj, kalifiye bir uzman tarafından tüm yerel güvenlik düzenlemelerine uygun şekilde yapılmalıdır. Ürünü, montaj ve kullanımın güvenli olacağı bir yere monte edin. Ürün sadece HACH/HACH LANGE ölçüm sensörlerini/ ürünlerini, tutmak/takmak için tasarlanmıştır. Başka amaçlarla kullanılması, kullanıcı için tehlikeler doğurabilir. Bakım ve onarım sadece yetkili müşteri hizmetleridepartmanı tarafından gerçekleştirilmelidir. Sadece üretici tarafından önerilen orijinal yedek parça ve aksesuarlar kullanılmalıdır. Ürüne yapılan her türlü değişiklik, tüm sorumluluğu ortadan kaldırır. Bu talimatlara uyulmaması veya ürünün üretim amacından başka bir amaçla kullanılması sonucunda kullanıcı ciddi şekilde yaralanabilir ve/veya ürün zarar görebilir. Gerekli kaynak işi yalnızca kalifiye kaynakçılar tarafından DIN / EN 287'ye göre yapılmalıdır, veya müteahhitler tarafından EN 3834-2'ye göre yapılmalıdır.

ZH 在安装/固定产品之前，请仔细阅读所有安装说明，并在安装过程中遵守这些说明。 必须由合格的专家完成安装，并遵守当地的所有安全法规。仔细选择安装地点，确保安全地安装和操作。 本产品只能用于固定/连接 HACH/HACH LANGE 测量传感器/产品。 用于其他用途可能会给用户带来危险。 维护和修理工作应由经授权的客户服务部门完成。 只能使用正宗替换件和制造商推荐的附件。 对本产品进行任何更改均可能导致所有担保失效。不遵守这些说明，或者将本产品用于其它用途，可能会对用户造成严重伤害和/或设备损坏。所需的焊接工作必须要根据DIN/EN 287，由合格的焊接工人单独执行，或者根据EN 3834-2由承包人执行。

Specifications

Specifications are subject to change without notice.

Specification	Details
Component description	Microprocessor-controlled and menu-driven controller that operates the sensor and displays measured values.
Operating temperature	-20 to 60 ºC (-4 to 140 ºF); 95% relative humidity, non-condensing with sensor load <7 W; -20 to 50 ºC (-4 to 104 ºF) with sensor load <28 W
Storage temperature	-20 to 70 ºC (-4 to 158 ºF); 95% relative humidity, non-condensing
Enclosure[1]	NEMA 4X/IP66 metal enclosure with a corrosion-resistant finish
Power requirements	**AC powered controller:** 100-240 VAC ±10%, 50/60 Hz; Power 50 VA with 7 W sensor/network module load, 100 VA with 28 W sensor/network module load (optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection).
	24 VDC powered controller: 24 VDC—15%, + 20%; Power 15 W with 7 W sensor/network module load, 40 W with 28 W sensor/network module load (optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection).
Altitude requirements	Standard 2000 m (6562 ft) ASL (Above Sea Level)
Pollution degree/Installation category	Polution Degree 2; Installation Category II
Outputs	Two analog (0-20 mA or 4-20 mA) outputs. Each analog output can be assigned to represent a measured parameter such as pH, temperature, flow or calculated values. Optional module supplies three additional analog outputs (5 total).
Relays	Four SPDT, user-configured contacts, rated 250 VAC, 5 Amp resistive maximum for the AC powered controller and 24 VDC, 5A resistive maximum for the DC powered controller. Relays are designed for connection to AC Mains circuits (i.e., whenever the controller is operated with 115 - 240 VAC power) or DC circuits (i.e., whenever the controller is operated with 24 VDC power).
Dimensions	½ DIN—144 x 144 x 180.9 mm (5.7 x 5.7 x 7.12 in.)
Weight	1.7 kg (3.75 lb)
Compliance information[2]	CE approved (with all sensor types). Listed for use in general locations to UL and CSA safety standards by ETL (with all sensor types). Certain AC mains powered models are listed for use in general safety locations to UL and CSA safety standards by Underwriters Laboratories (with all sensor types).
Digital communication	Optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection for data transmission
Data logging	Secure Digital Card (32 GB maximum) or special RS232 cable connector for data logging and performing software updates. The controller will keep approximately 20,000 data points per sensor.
Warranty	2 years

General information

In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual. The manufacturer reserves the right to

[1] Units that have the Underwriters Laboratories (UL) certification are intended for indoor use only and do not have a NEMA 4X/IP66 rating.

[2] DC powered units are not listed by UL.

make changes in this manual and the products it describes at any time, without notice or obligation. Revised editions are found on the manufacturer's website.

Safety information

NOTICE

The manufacturer is not responsible for any damages due to misapplication or misuse of this product including, without limitation, direct, incidental and consequential damages, and disclaims such damages to the full extent permitted under applicable law. The user is solely responsible to identify critical application risks and install appropriate mechanisms to protect processes during a possible equipment malfunction.

Please read this entire manual before unpacking, setting up or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in this manual.

Use of hazard information

⚠ DANGER

Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation that may result in minor or moderate injury.

NOTICE

Indicates a situation which, if not avoided, may cause damage to the instrument. Information that requires special emphasis.

Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed. A symbol on the instrument is referenced in the manual with a precautionary statement.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	This symbol indicates the presence of devices sensitive to Electro-static Discharge (ESD) and indicates that care must be taken to prevent damage with the equipment.
	Electrical equipment marked with this symbol may not be disposed of in European domestic or public disposal systems. Return old or end-of-life equipment to the manufacturer for disposal at no charge to the user.

Certification

Canadian Radio Interference-Causing Equipment Regulation, IECS-003, Class A:

Supporting test records reside with the manufacturer.

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de classe A répond à toutes les exigences de la réglementation canadienne sur les équipements provoquant des interférences.

FCC Part 15, Class "A" Limits

Supporting test records reside with the manufacturer. The device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:

1. The equipment may not cause harmful interference.
2. The equipment must accept any interference received, including interference that may cause undesired operation.

Changes or modifications to this equipment not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at their expense. The following techniques can be used to reduce interference problems:

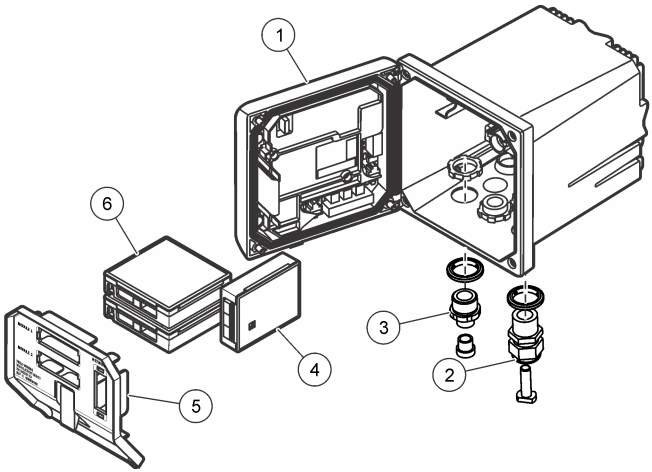
1. Disconnect the equipment from its power source to verify that it is or is not the source of the interference.
2. If the equipment is connected to the same outlet as the device experiencing interference, connect the equipment to a different outlet.
3. Move the equipment away from the device receiving the interference.
4. Reposition the receiving antenna for the device receiving the interference.
5. Try combinations of the above.

Product overview

The controller displays sensor measurements and other data, can transmit analog and digital signals, and can interact with and control other devices through outputs and relays. Outputs, relays, sensors and sensor modules are configured and calibrated through the user interface on the front of the controller.

Figure 1 shows the product components. Components may vary according to controller configuration. Contact the manufacturer if parts are damaged or missing.

Figure 1 System components



1 Controller	**4** Network module (optional)
2 Strain relief assembly (optional depending on controller version)	**5** High-voltage barrier
3 Digital connection fitting (optional depending on controller version)	**6** Sensor modules (optional)

Sensors and sensor modules

The controller accepts up to a maximum of two sensor modules or two digital sensors (depending on the controller configuration), along with one communication module. A single digital sensor and a single sensor module can be installed in combination. A variety of sensors can be wired to the sensor modules. Sensor wiring information is given in the specific sensor manuals and in the user instructions for specific modules.

Relays outputs and signals

The controller has four configurable relay switches and two analog outputs. An optional analog output module can increase the number of analog outputs to five.

Device scans

With two exceptions, the controller automatically scans for connected devices without user input when it is powered on. The first exception is when the controller is powered on for the first time before initial use. The second exception is after the controller configuration settings have been set to their default values and the controller is powered on. In both cases, the controller first displays the language, date and time edit screens. After the language, date and time entries are accepted, the controller performs a device scan. Refer to Connect a digital sc sensor on page 20 for instructions about how to scan for devices when the controller is already powered on.

Controller enclosure

The controller enclosure is NEMA 4X/IP66-rated and has a corrosion-resistant finish designed to withstand corrosive environmental constituents such as salt spray and hydrogen sulfide. Protection against environmental damage is strongly recommended for outdoor use.
Note: *Units that have the Underwriters Laboratories (UL) certification are intended for indoor use only and do not have a NEMA 4X/IP66 rating.*

Controller mounting options

The controller can be mounted to a panel, to a wall or to a vertical or horizontal pipe. A neoprene sealing gasket is included and can be used to reduce vibration. The gasket can be used as a template for panel mounting before the inner gasket component is separated.

Installation

Mounting components and dimensions

⚠ CAUTION

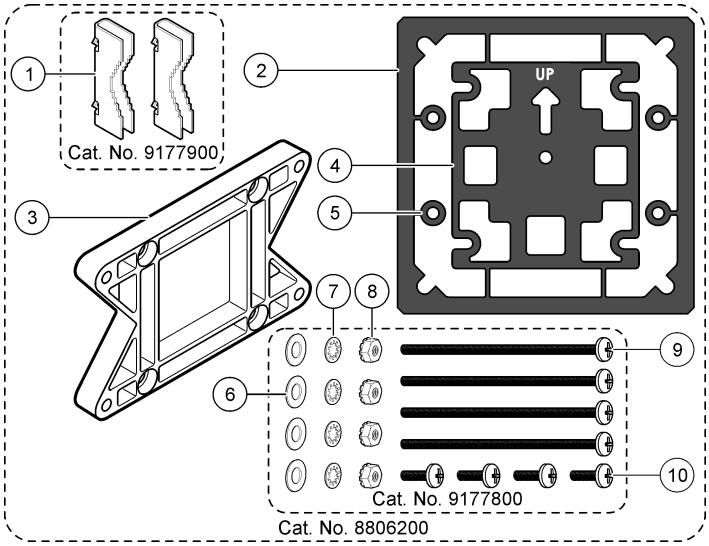
Personal injury hazard. Only qualified personnel should conduct the tasks described in this section of the manual.

The controller can be installed on a surface, panel or pipe (horizontal or vertical). For mounting options and instructions, refer to Figure 2, Figure 3 on page 8, Figure 4 on page 9, Figure 5 on page 10 and Figure 6 on page 11.

For horizontal pipe mounts, the mounting feet (Figure 2) must be attached to the mounting bracket in a vertical position.

For both horizontal and vertical pipe mounts, attach the mounting bracket to the controller as shown in Figure 5 on page 10.

Figure 2 Mounting components



1 Mounting foot (2x)	**6** Flat washer, ¼-inch ID (4x)
2 Sealing gasket for panel mount, Neoprene	**7** Lock washer, ¼-inch ID (4x)
3 Bracket for wall and pipe mounting	**8** M5 x 0.8 Keps hexnut (4x)
4 Vibration isolation gasket for pipe mount	**9** Pan head screws, M5 x 0.8 x 100mm (4x) (Used for variable diameter pipe mount installations)
5 Vibration isolation washer for pipe mount (4x)	**10** Pan head screws, M5 x 0.8 x 15 mm (4x)

Note: *A bracket for panel mounting is available as an optional accessory.*

Controller mounting

Figure 3 Surface mounting dimensions

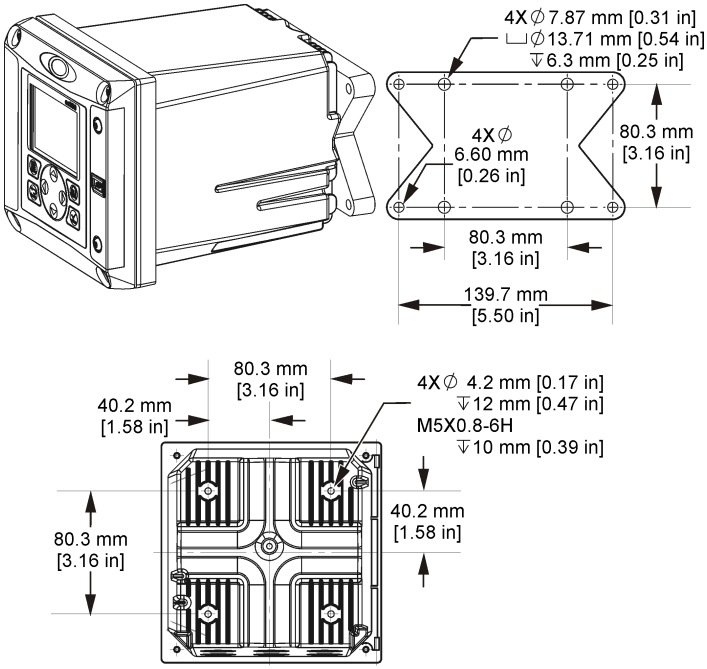


Figure 4 Panel mounting dimensions

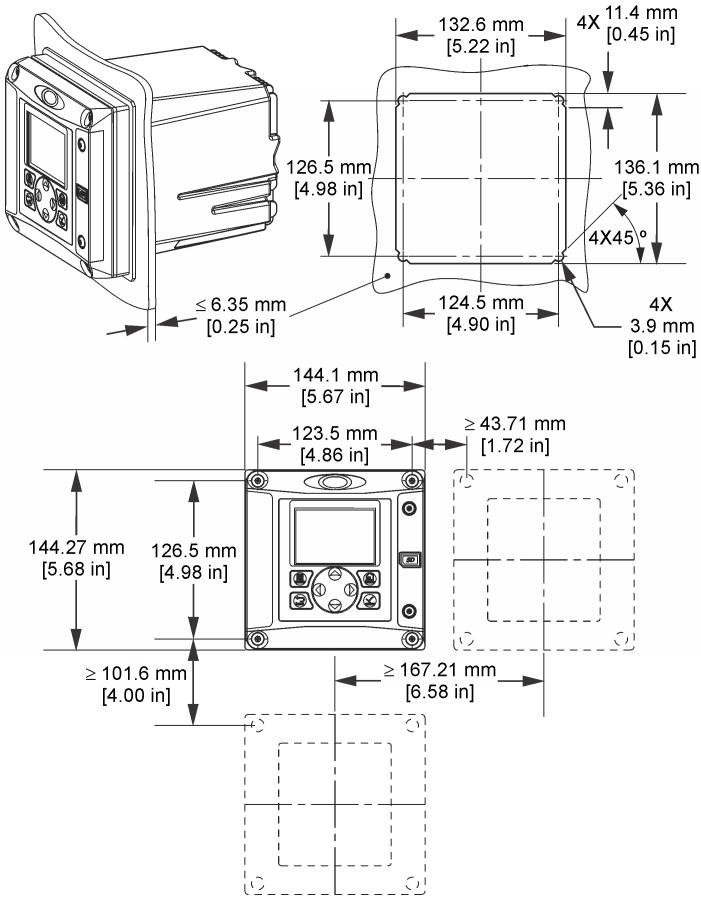

Note: *If using the bracket (optional) for panel mounting, push the controller through the hole in the panel and then slide the bracket over the controller on the back side of the panel. Use the four 15 mm pan head screws (supplied) to attach the bracket to the controller and secure the controller to the panel.*

Figure 5 Pipe mounting (vertical pipe)

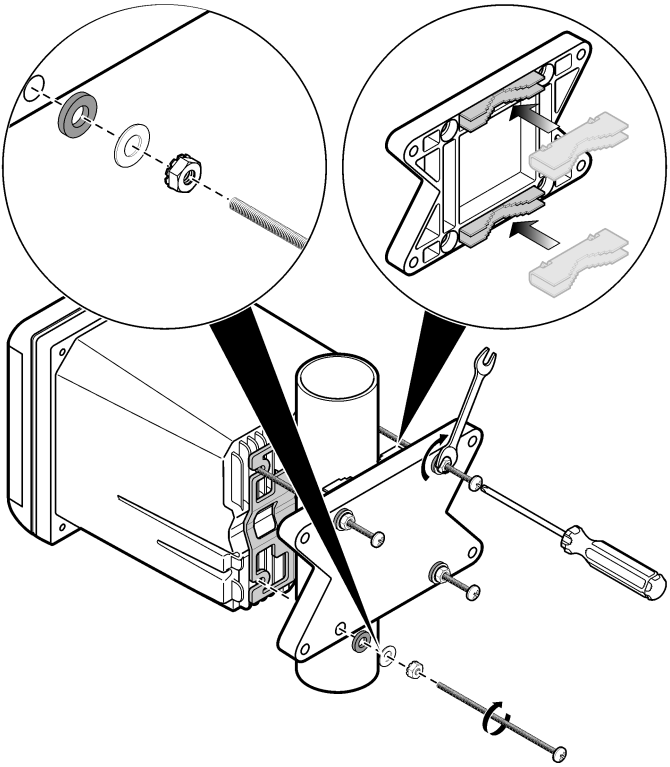

Figure 6 Top and bottom views

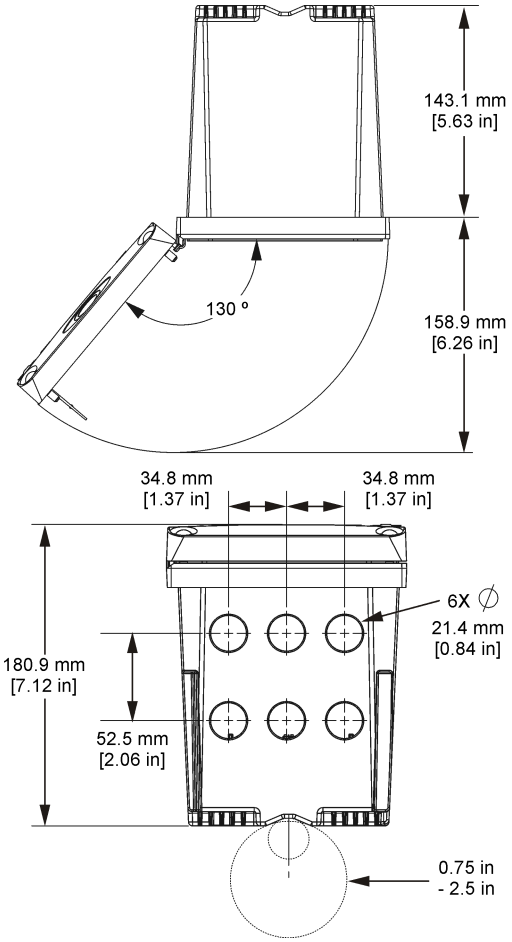


High-voltage barrier

High-voltage wiring for the controller is located behind the high-voltage barrier in the controller enclosure. The barrier must remain in place except when installing modules or when a qualified installation technician is wiring for power, alarms, outputs or relays. Do not remove the barrier while power is applied to the controller.

Electrostatic discharge (ESD) considerations

NOTICE	
	Potential Instrument Damage. Delicate internal electronic components can be damaged by static electricity, resulting in degraded performance or eventual failure.

Refer to the steps in this procedure to prevent ESD damage to the instrument:

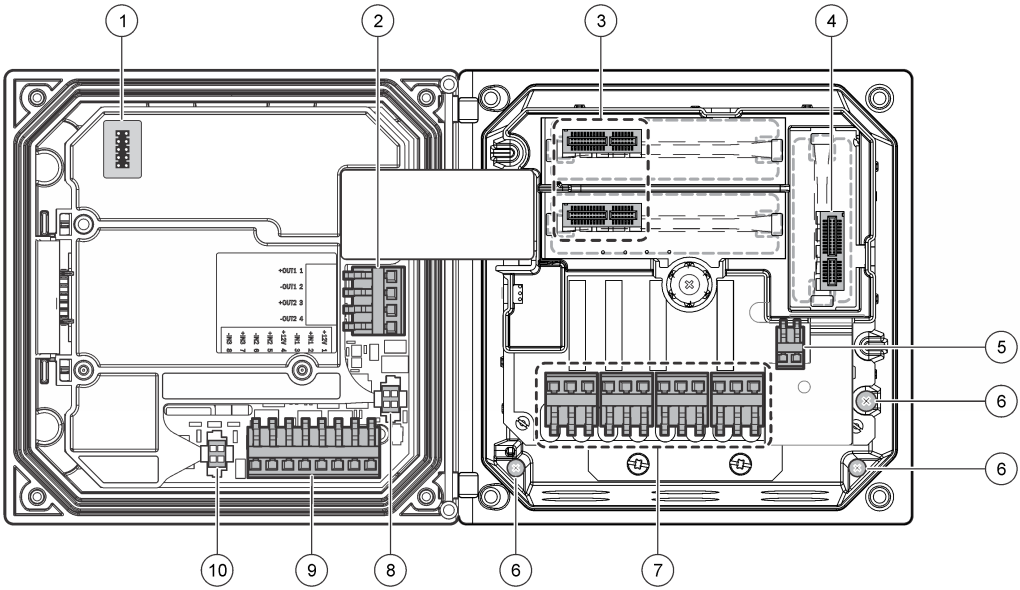
- Touch an earth-grounded metal surface such as the chassis of an instrument, a metal conduit or pipe to discharge static electricity from the body.

- Avoid excessive movement. Transport static-sensitive components in anti-static containers or packages.
- Wear a wrist strap connected by a wire to earth ground.
- Work in a static-safe area with anti-static floor pads and work bench pads.

Wiring overview

Figure 7 shows an overview of the wiring connections inside the controller with the high voltage barrier removed. The left side of the figure shows the back side of the controller cover.
Note: *Remove connector caps from the connectors before module installation.*

Figure 7 Wiring connections overview



1 Service cable connection	**5** AC and DC power connector[3]	**9** Discrete input wiring connector[3]
2 4-20 mA output[3]	**6** Ground terminals	**10** Digital sensor connector[3]
3 Sensor module connector	**7** Relay connections[3]	
4 Communication module connector (e.g., Modbus, Profibus, HART, optional 4-20 mA module, etc.)	**8** Digital sensor connector[3]	

Wiring for power

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

[3] Terminals can be removed for improved access.

⚠ WARNING

Potential Electrocution Hazard. If this equipment is used outdoors or in potentially wet locations, a **Ground Fault Interrupt** device must be used for connecting the equipment to its mains power source.

⚠ DANGER

Electrocution Hazard. Do not connect AC power to a 24 VDC powered model.

⚠ WARNING

Potential Electrocution Hazard. A protective earth (PE) ground connection is required for both 100-240 VAC and 24 VDC wiring applications. Failure to connect a good PE ground connection can result in shock hazards and poor performance due to electromagnetic interferences. ALWAYS connect a good PE ground to the controller terminal.

NOTICE

Install the device in a location and position that gives easy access to the disconnect device and its operation.

The controller can be purchased as either a 100-240 VAC powered model or a 24 VDC powered model. Follow the appropriate wiring instructions for the purchased model.

The controller can be wired for line power by hard-wiring in conduit or wiring to a power cord. Regardless of the wire used, the connections are made at the same terminals. A local disconnect designed to meet local electrical code is required and must be identified for all types of installation. In hard-wired applications, the power and safety ground service drops for the instrument must be 18 to 12 AWG.

Notes:

- The voltage barrier must be removed before making any electrical connections. After making all connections, replace the voltage barrier before closing the controller cover.
- A sealing type strain relief and a power cord less than 3 meters (10 feet) in length with three 18-gauge conductors (including a safety ground wire) can be used to maintain the NEMA 4X/IP66 environmental rating.
- Controllers can be ordered with AC power cords pre-installed. Additional power cords may also be ordered.
- The DC power source that supplies power to the 24 VDC powered controller must maintain voltage regulation within the specified 24 VDC-15% +20% voltage limits. The DC power source must also provide adequate protection against surges and line transients.

Wiring procedure

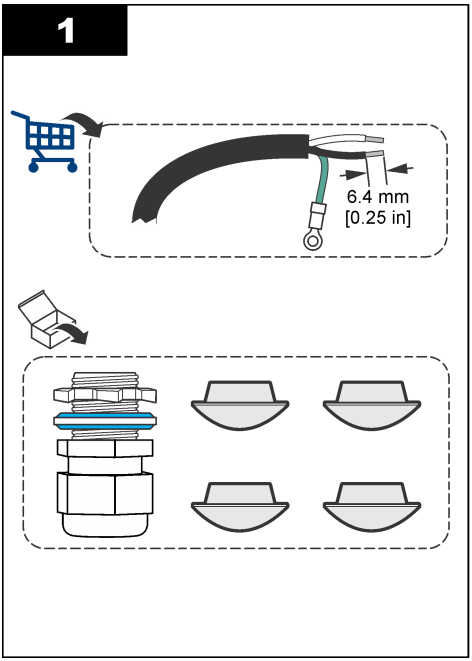
Refer to the illustrated steps that follow and Table 1 or Table 2 to wire the controller for power. Insert each wire into the appropriate terminal until the insulation is seated against the connector with no bare wire exposed. Tug gently after insertion to make sure that there is a secure connection. Seal any unused openings in the controller box with conduit opening sealing plugs.

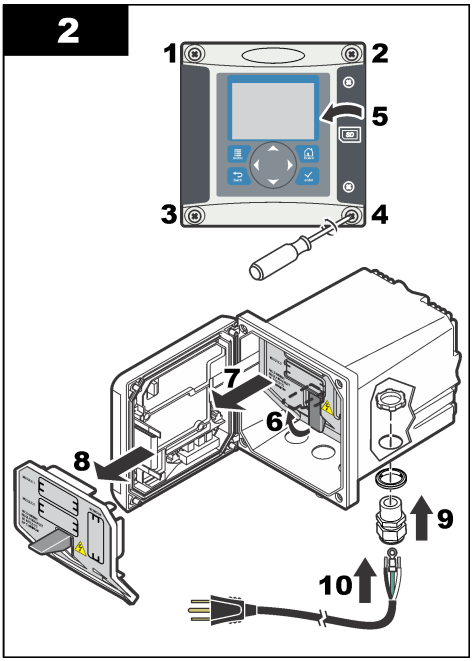
Table 1 AC power wiring information (AC powered models only)

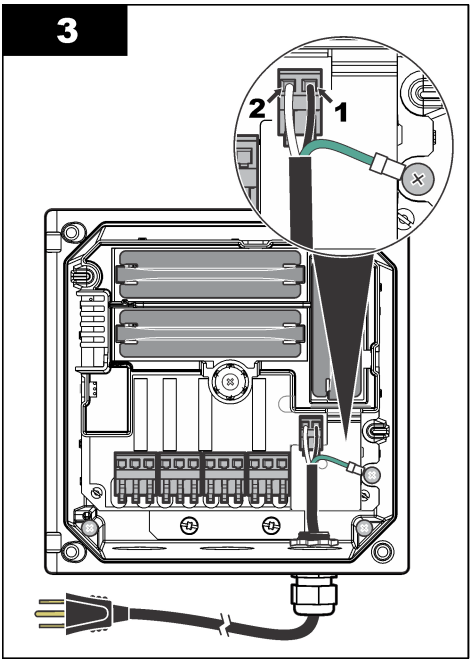
Terminal	Description	Color—North America	Color—EU
1	Hot (L1)	Black	Brown
2	Neutral (N)	White	Blue
—	Protective Earth (PE) Ground lug	Green	Green with yellow stripe

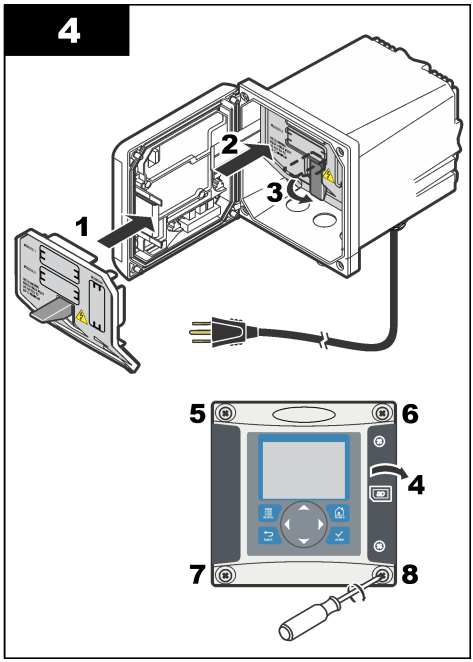
Table 2 DC power wiring information (DC powered models only)

Terminal	Description	Color—North America	Color—EU
1	+24 VDC	Red	Red
2	24 VDC return	Black	Black
—	Protective Earth (PE) Ground lug	Green	Green with yellow stripe









Alarms and relays

The controller is equipped with four unpowered, single pole relays rated 100-250 VAC, 50/60 Hz, 5 amp resistive maximum. Contacts are rated 250 VAC, 5 amp resistive maximum for the AC powered controller and 24 VDC, 5A resistive maximum for the DC powered controller. The relays are not rated for inductive loads.

Wiring relays

⚠ WARNING
Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING
Potential fire hazard. The relay contacts are rated 5A and are not fused. External loads connected to the relays must have current limiting devices provided to limit current to < 5 A.

⚠ WARNING
Potential fire hazard. Do not daisy-chain the common relay connections or jumper wire from the mains power connection inside the instrument.

⚠ WARNING
Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

AC line (100—250 V) powered controllers

The wiring compartment is not designed for voltage connections in excess of 250 VAC.

24 VDC powered controllers

⚠WARNING

Potential electrocution hazard. AC mains powered controllers (115 V–230 V) are designed for relay connections to AC mains circuits (i.e., voltages greater than 16 V-RMS, 22.6 V-PEAK or 35 VDC).

⚠WARNING

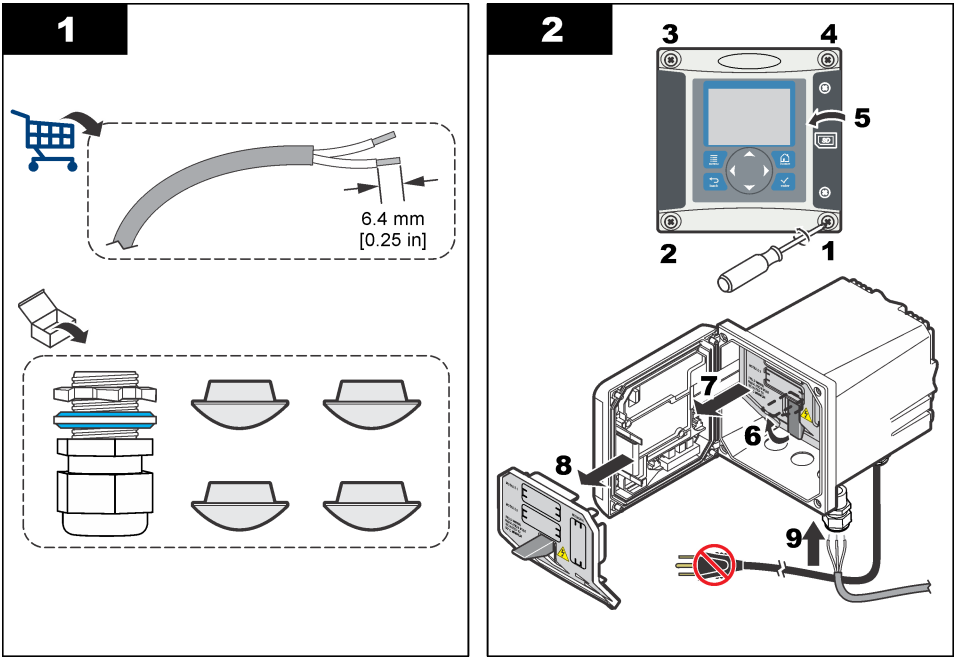
Potential electrocution hazard. 24 V powered controllers are designed for relay connections to low voltage circuits (i.e., voltages less than 16 V-RMS, 22.6 V-PEAK or 35 VDC).

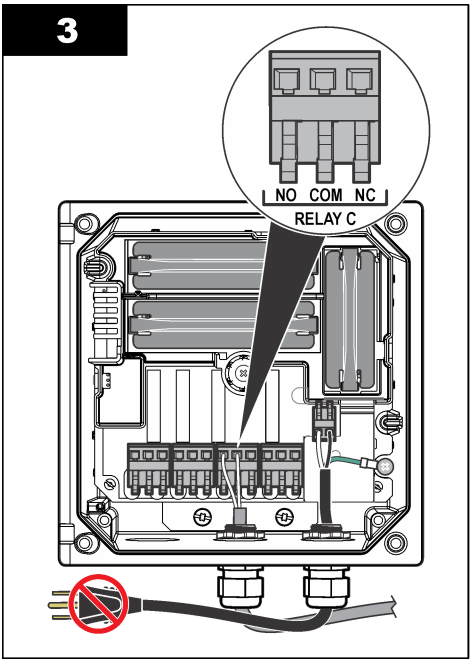
The 24 VDC controller relays are designed for the connection to low voltage circuits (i.e., voltages less than 30 V-RMS, 42.2 V-PEAK or 60 VDC). The wiring compartment is not designed for voltage connections above these levels.

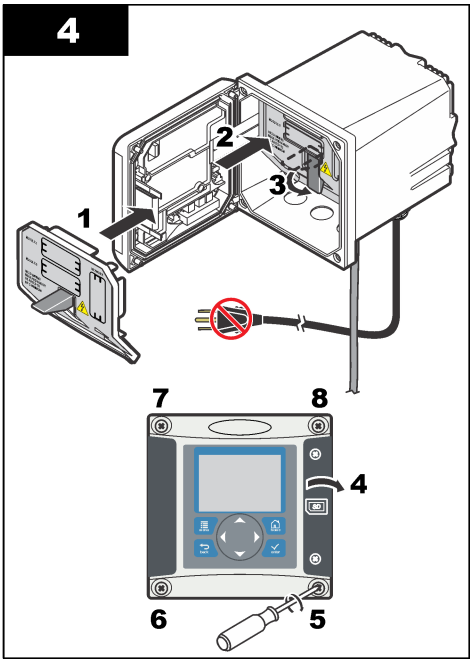
The relay connector accepts 18–12 AWG wire (as determined by load application). Wire gauge less than 18 AWG is not recommended.

The Normally Open (NO) and Common (COM) relay contacts will be connected when an alarm or other condition is active. The Normally Closed (NC) and Common relay contacts will be connected when an alarm or other condition is inactive (unless the Fail Safe is set to Yes) or when power is removed from the controller.

Most relay connections use either the NO and COM terminals or the NC and COM terminals. The numbered installation steps show connection to the NO and COM terminals.







Analog output connections

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING

Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

Two isolated analog outputs (1 and 2) are provided (Figure 8). Such outputs are commonly used for analog signaling or to control other external devices.

Make wiring connections to the controller as shown in Figure 8 and Table 3.
Note: *Figure 8 shows the back of the controller cover and not the inside of the main controller compartment.*

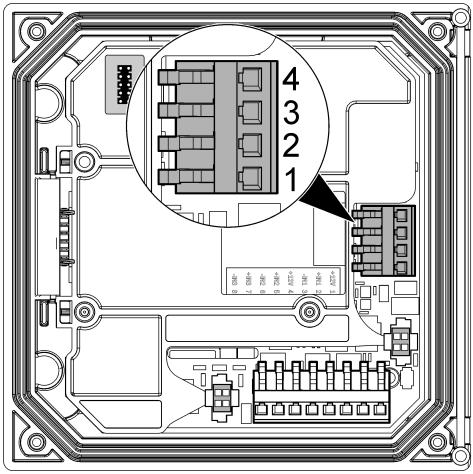
Table 3 Output connections

Recorder wires	Circuit board position
Output 2–	4
Output 2+	3
Output 1–	2
Output 1+	1

1. Open the controller cover.
2. Feed the wires through the strain relief.
3. Adjust the wire as necessary and tighten the strain relief.

4. Make connections with twisted-pair shielded wire and connect the shield at the controlled component end or at the control loop end.
   - Do not connect the shield at both ends of the cable.
   - Use of non-shielded cable may result in radio frequency emission or susceptibility levels higher than allowed.
   - Maximum loop resistance is 500 ohm.
5. Close the controller cover and tighten the cover screws.
6. Configure outputs in the controller.

Figure 8 Analog output connections



Discrete input wiring connections

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING

Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

Three discrete inputs are provided for switch closure inputs or logic level voltage inputs. Make wiring connections and configure jumper settings to the controller as shown in Figure 9, Table 4 and Figure 10.

Note: Figure 9 *shows the back of the controller cover and not the inside of the main controller compartment.*

Figure 9 Discrete input wiring connections

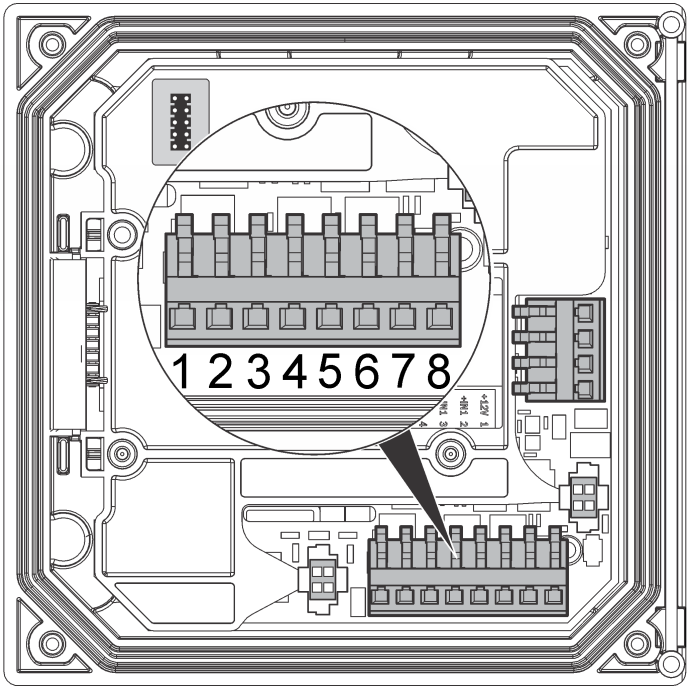


Table 4 Input connections

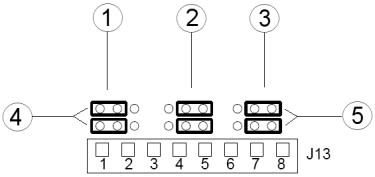
Discrete inputs	Connector position - Switch input	Connector position - Voltage input
Input 1+	3	2
Input 1-	2	3
Input 2+	6	5
Input 2-	5	6
Input 3+	8	7
Input 3-	7	8

Figure 10 Jumper settings



1 Input 1 configuration jumpers	**4** Jumpers positioned to the left for switch inputs
2 Input 2 configuration jumpers	**5** Jumpers positioned to the right for voltage inputs
3 Input 3 configuration jumpers	

1. Open the controller cover.
2. Feed the wires through the cable gland.
3. Adjust the wire as necessary and tighten the cable gland.
4. The jumpers are positioned immediately behind the connector. Remove the connector for improved access to the jumpers and configure the jumper settings according to the type of input as shown in Figure 10.
5. Close the controller cover and tighten the cover screws.
6. Configure inputs in the controller.

Note: *In* ***switch input*** *mode the controller supplies 12 volts to the switch and is not isolated from the controller. In* ***voltage input*** *mode the inputs are isolated from the controller (user input voltage from 0 to 30 volts).*

Connect a digital sc sensor

Note: *To connect an analog sensor, refer to the instructions supplied in the module or sensor manual.*

A digital sc sensor can be connected to the controller using the keyed quick-connect fitting (Figure 11). A digital sensor can be connected with the controller powered on or off.

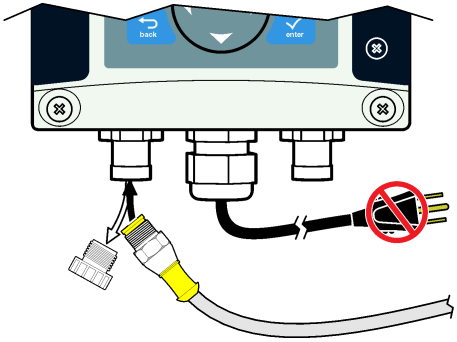
When a sensor is connected with the controller powered on, the controller does not automatically perform a device scan. To make the controller perform a device scan, navigate to the Test/Maintenance menu and select Scan Devices. If a new device is found, the controller performs the installation process without further user action.

When a sensor is connected with the controller powered off, the controller will perform a device scan when it is powered on again. If a new device is found, the controller performs the installation process without further user action.

Retain the connector cap to seal the connector opening in case the sensor must be removed.

Figure 11 Digital sensor quick connect

1.



Connect the optional digital communication output

The manufacturer supports Modbus RS485, Modbus RS232, Profibus DPV1 and HART communication protocols. The optional digital output module is installed in the location indicated by item 4 in Figure 7 on page 12. Refer to the instructions supplied with the network module for more details.

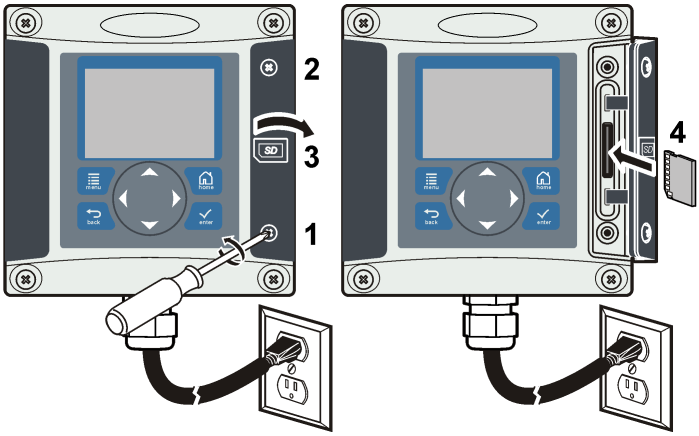
For information about Modbus registers, go to http://www.de.hach.com or http://www.hach.com and search *Modbus registers* or go to any sc200 product page.

Install a Secure Digital (SD) memory card

For instructions on how to install an SD card in the controller, refer to Figure 12. Information on how to use the SD memory card can be found in Using the secure digital memory (SD) card on page 42.

To remove an SD card, push down on the edge of the card and release, then pull the card up and out of the slot. After the card is removed, close the slot cover and tighten the cover screws.

Figure 12 SD card installation

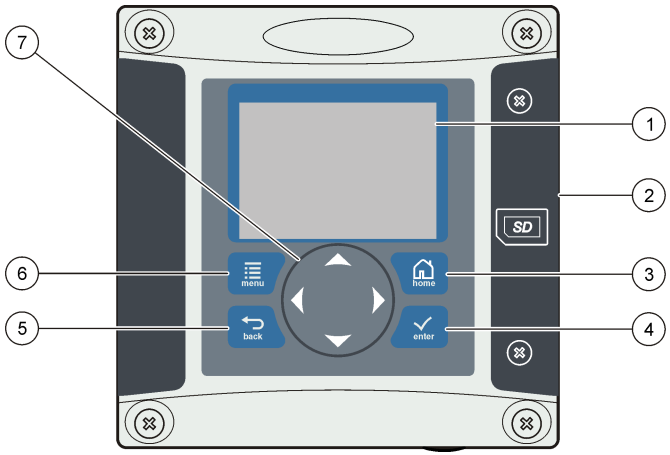


User interface and navigation

User interface

The keypad has four menu keys and four directional keys as shown in Figure 13.

Figure 13 Keypad and front panel overview



1 Instrument display	**5** **BACK** key. Moves back one level in the menu structure.
2 Cover for secure digital memory card slot	**6** **MENU** key. Moves to the Settings Menu from other screens and submenus.
3 **HOME** key. Moves to the Main Measurement screen from other screens and submenus.	**7** Directional keys. Used to navigate through the menus, change settings, and increment or decrement digits.
4 **ENTER** key. Accepts input values, updates, or displayed menu options.	

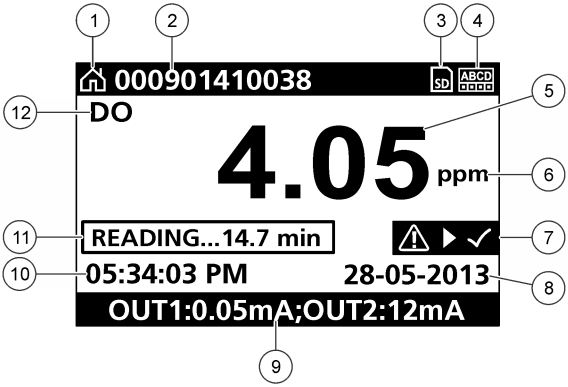
Inputs and outputs are set up and configured through the front panel using the keypad and display screen. This user interface is used to set up and configure inputs and outputs, create log information and calculated values, and calibrate sensors. The SD interface can be used to save logs and update software.

Display

Figure 14 shows an example of the main measurement screen with a DO sensor connected to the controller.

The front panel display screen shows sensor measurement data, calibration and configuration settings, errors, warnings and other information.

Figure 14 Example of Main Measurement screen



1 Home screen icon	**7** Warning status bar
2 Sensor name	**8** Date
3 SD Memory card icon	**9** Analog output values
4 Relay status indicator	**10** Time
5 Measurement value	**11** Progress bar
6 Measurement unit	**12** Measurement parameter

Table 5 Icon descriptions

Icon	Description
Home screen	The icon may vary depending on the screen or menu being displayed. For example, if an SD card is installed, an SD card icon appears here when the user is in the SD Card Setup menu.
SD memory card	This icon appears only if an SD card is in the reader slot. When a user is in the SD Card Setup menu, this icon appears in the upper left corner.
Warning	A warning icon consists of an exclamation point within a triangle. Warning icons appear on the right of the main display below the measurement value. Push the **ENTER** key then select the device to view any problems associated with that device. The warning icon will no longer be displayed once all problems have been corrected or acknowledged.
Error	An error icon consists of an exclamation point within a circle. When an error occurs, the error icon and the measurement screen flash alternately in the main display. To view errors, push the **MENU** key and select **Diagnostics**. Then select the device to view any problems associated with that device.

Additional display formats

- From the Main Measurement screen push the **UP** and **DOWN** arrow keys to switch between measurement parameters
- From the Main Measurement screen push the **RIGHT** arrow key to switch to a split display of up to 4 measurement parameters. Push the **RIGHT** arrow key to include additional measurements. Push the **LEFT** arrow key as needed to return to the Main Measurement screen
- From the Main Measurement screen push the **LEFT** arrow key to switch to the graphical display (see Graphical display on page 23 to define the parameters). Push the **UP** and **DOWN** arrow keys to switch measurement graphs

Graphical display

The graph shows concentration and temperature measurements for each channel in use. The graph supplies easy monitoring of trends and shows changes in the process.

1. From the graphical display screen use the up and down arrow keys to select a graph and push the **HOME** key.
2. Select an option:

Option	Description
MEASUREMENT VALUE	Set the measurement value for the selected channel. Select between Auto Scale and Manually Scale. For manual scaling enter the minimum and maximum measurement values
DATE & TIME RANGE	Select the date and time range from the available options

System startup

When initially powered up, the Language, Date Format and Date/Time screens appear in order. After these options are set, the controller performs a device scan and displays the message **Scanning for devices. Please wait...** If a new device is found, the controller performs an installation process before displaying a main measurement screen.

If the scan finds previously installed devices without configuration changes, the main measurement screen of the device in the number one position appears immediately after the scan is complete.

If a device has been removed from the controller or is not found during the next power-cycled or menu-driven scan, the controller displays a **Device missing** message and prompts to delete the missing device.

If no sensor is connected to an installed analog module, the controller will indicate an error. If devices are connected but not found by the controller, refer to Troubleshooting on page 46.

Set the language, date and time for the first time

The controller displays the language, date and time edit screens when the controller is powered on for the first time, and when it is powered on after the configuration settings have been set to their default values.
After the language, date and time options are set for the first time, update the options as necessary through the sc200 setup menu.

1. In the Language screen, highlight a language in the options list and push the **ENTER** key. English is the default language for the controller.
   The selected language is saved. The Date Format screen appears.
2. In the Date Format screen, highlight a format and push the **ENTER** key.
   The date and time format is saved. Next, the Date /Time screen appears.
3. In the Date/Time screen, push the **RIGHT** or **LEFT** arrow keys to highlight a field, then push the **UP** and **DOWN** arrow keys to update the value in the field. Update the other fields as necessary.
4. Push the **ENTER** key.
   The changes are saved and the controller performs a start-up scan for devices. If connected devices are found, the controller displays the main measurement screen for the device in the number one position. If the controller fails to find connected devices, refer to Troubleshooting on page 46.

Controller configuration information

General information about configuration options is listed in the table.

1. To navigate to the menu options, from the Settings Menu, select sc200 Setup.

Option	Description
Security setup	Sets the passcode preferences (refer to Security setup on page 25)
Output setup	Configures the controller analog outputs (refer to Configure the controller analog outputs on page 27)

Option	Description
Relay setup	Configures the controller relays (refer to Configure relays on page 30)
Display setup	Configures the controller display (refer to Display setup on page 39)
Set Date/Time	Sets the controller time and date (refer to Update the date and time on page 40)
Datalog setup	Configures data logging options. Available only if Calculation has been setup. At least one sensor must be attached to enter a calculation (refer to Set the datalog mode and interval on page 40)
Manage Data	Select the device from the list of installed components to view the data or event log
Error Hold Mode	**Hold Outputs**—Holds outputs at last known value when controller loses communication with the sensor. **Transfer Outputs**—Switches to transfer mode when controller loses communication with the sensor. Outputs transfer to a pre-defined value.
Calculation	Configures the controller math function (refer to Set up a calculation on page 40)
sc200 Information	**S/W VER:**—Displays the current version of controller software **Bootloader VER:**—Displays the current Bootloader version. The Bootloader is a file that loads the main operating system for the controller **S/N:**—Displays the controller serial number **Version:**—Displays the current version of controller hardware
Discrete Input Setup	Configures three discrete input channels (refer to Set up the discrete inputs on page 41)
Language	Assigns the language used in the controller (refer to Update the display language on page 42)

2. Select an option and push **ENTER** to activate the menu item.

Advanced operation

Security setup

Enable or disable the passcode

By default the passcode option is disabled and all configuration settings and calibrations can be changed. When the passcode function is enabled, access to Sensor calibration and Test/Maint menus requires a passcode.
To enable the passcode:

1. From the Settings Menu, select sc200 Setup and push the **ENTER** key.
2. Select Security Setup and push the **ENTER** key.
3. Select Set Passcode and push the **ENTER** key.
4. Select Disabled or Enabled and push the **ENTER** key.
   The passcode is enabled.
5. Push the **BACK** key to return to the sc200 Setup Menu, or push the **MENU** key to return to the Settings Menu.

Edit the passcode

The passcode is factory set to SC200. The Edit Passcode menu option appears in the Security Setup menu only after the passcode feature is enabled and a valid passcode has been entered.
A passcode consists of up to six upper or lower-case alpha, numeric and special characters. Passcodes are case-sensitive.

To edit the passcode:

1. Make sure the passcode is enabled. Refer to Enable or disable the passcode on page 25 for information on how to enable the passcode.
2. From the Settings menu, select Security Setup and push **ENTER**.
3. Use the arrow keys to enter the current valid passcode and push **ENTER**.
   The Edit Passcode option appears in the Security Setup menu.
4. Select Edit Pass Code and push **ENTER**.
   The Edit Pass Code screen appears.
5. Use the arrow keys to edit the passcode and push **ENTER**.
   The new passcode is saved and the Security Setup menu appears.
   Note: *All menus stay accessible until the* ***HOME*** *key is pushed or the controller is restarted.*
6. Push the **HOME** key or perform a controller restart.
   The new passcode settings are saved, and the new passcode is required to enter the Security Setup, Datalog Setup and Test/Maint menus.

Protect features

This option is only displayed if an analyzer or sensor that supports this feature is connected to the controller. Security categories are displayed that are defined by the connected analyzer or sensor. The user can then enable or disable password protection against individual menu options within these categories.

Configure a 4-20 mA input module

An analog module must be installed in the controller.

1. Determine what output the connected device is using (0-20 mA or 4-20 mA). This information will be used to set the scale.
2. Determine what the 20 mA value is equal to (e.g, 100 psi).
3. Determine what the low end (0 or 4 mA) value is equal to (e.g., 10 psi). This information will be used to set the display range.
4. From the Settings Menu, select Sensor Setup.
5. Select Configure.
6. Update the options.
   a. Highlight an option and push **ENTER**.
   b. Make a selection or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Edit name	Edits the module name
Edit units	Edits the measurement units
Edit parameter	Edits the parameter name
Display range **For the 0-20 mA scale:** • **Set the 20 mA value** • **Set the 0 mA value** **For the 4-20 mA scale:** • **Set the 20 mA value** • **Set the 4 mA value**	Sets the values used for the selected scale (0-20 mA or 4-20 mA)

Option	Description
Signal average	Sets how often signals are averaged. Higher values produce a smoother signal but increase the time it takes for a signal to respond to a change in the process value.
Set resolution— **X.XXX, XX.XX, XXX.X, XXXX**	Sets the number of decimal places used in the display.
Select scale— **4-20 mA or 0-20 mA**	Sets scale used for the 4-20 mA input
Data log interval—5 sec, 30 sec, 1 min, 2 min, 5 min, 10 min, 15 min, 30 min, 60 min	Sets how often data is logged to the internal controller memory.
Reset defaults—Push ENTER to reset configuration settings or push the BACK key to cancel.	Resets configuration settings to the default values.

For additional information, refer to the *sc200 4–20 Analog Input Module User Manual*.

Configure a 4-20 mA output module

The Network Setup option appears in the Settings Menu only if an analog output module or other network module such as Modbus or Profibus is installed in the controller.

Outputs for analog output modules are set at 4-20 mA. Outputs can be assigned to represent a measured parameter such as pH, temperature, flow or calculated values.

1. From the Settings menu, select Network Setup.
2. Select Edit Name and enter a name for the module. Push **ENTER** to save the name.
3. Select an output (A, B, C, D) and push **ENTER**.
   a. Highlight an option and push **ENTER**.
   b. Make a selection from the list or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Select Source	Selects the output to configure—None, sensor 1 name, sensor 2 name, calculation (if set up). For sensor output, Select Parameter sets the measurement options. When the measurement is autorange, Set Range sets the range.
Set Low Value	Sets the 4 mA value (default: 0.000). (Range and units depend on sensor)
Set High Value	Sets the 20 mA value (default: 1.000). (Range and units depend on sensor)
Set Transfer	Sets the transfer value. Range 3.0 to 25.0 mA (default 4.000).
Set Filter	Sets a time-average filter value of 0 (default) to 120 seconds.

For additional information, refer to the *sc200 4-20 Output Module User Manual*.

Configure the controller analog outputs

The controller analog outputs can be assigned to represent the measured parameter or secondary measurements such as temperature and calculations. To configure the options, highlight a menu option, push **ENTER** and select an option or update the entries. Push **ENTER** after an option is selected or the entries are updated.

1. From the Settings menu, select sc200 Setup.
2. Select Output Setup.
3. Select Output 1 or Output 2.

4. Choose Select Source and select a source from the list. Typically the source is one of the sensors attached to the system. If an analog input card is installed, the analog input may be used as a source.
5. From the Output Setup menu, choose Select Parameter and choose an option from the list. Parameters will vary depending on the type of sensors installed.
6. From the Output Setup menu, select Set Function and choose a function. Further setup options will vary depending on which function is chosen.

Option	Description
Linear	Signal is linearly dependent on the process value
PID	Signal works as a PID (Proportional, Integral, Derivative) controller
Logarithmic	Signal is represented logarithmically within the process variable range
Bilinear	Signal is represented as two linear segments within the process variable range

7. From the Output Setup menu, select Activation. Use the information in the table below the chosen function to configure the options.
8. If Transfer is or will be selected as the Error Hold Mode, or if the Transfer will be used during calibration or other functions within the sensor menu, select Set Transfer from the Output Setup menu and enter the transfer value.
9. From the Output Setup menu, select Set Filter and enter the filter value.
10. From the Output Setup menu, select Scale and choose the scale (0-20 mA or 4-20 mA).

- **Linear**

Option	Description
Set low value	Sets the low endpoint of the process variable range
Set high value	Sets the high endpoint of the process variable range

- **PID**

Option	Description
Set mode (Auto or Manual)	Auto—the signal is automatically controlled by the algorithm within the analyzer using proportional, integral, and derivative inputs. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase (Direct or Reverse)	The direction in which the signal responds to process change. Direct—signal increases as the process increases. Reverse—signal increases as process decreases.
Set setpoint	Creates a desired control point of process
Prop band	A function of the difference between the measured signal and the desired setpoint.
Integral	The period of time from the injection point of a reagent to contact with the measuring device.
Derivative	Used to compensate for the 2nd order effects of the process. The majority of applications can be controlled without the use of the derivative setting.
Transit time	Stops all PID control for a selected period of time as the sample travels from the control pump to the measurement sensor.

- **Logarithmic**

Option	Description
Set 50% value	Sets the value corresponding to 50% of the process variable range.
Set high value	Sets the upper value of the process variable range.

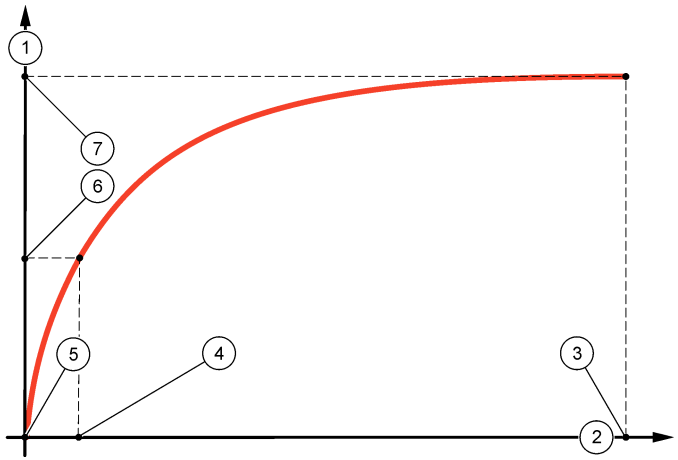
- **Bilinear**

Option	Description
Set low value	Sets the low endpoint value of the process variable range.
Set high value	Sets the high endpoint value of the process variable range.
Set knee point value	Sets the value at which the process variable range divides into another linear segment.
Set knee point current	Sets the value of the current at the knee point value.

Logarithmic output mode

Figure 15 shows in graph form the operation of the logarithmic output mode.

Figure 15 Logarithmic output

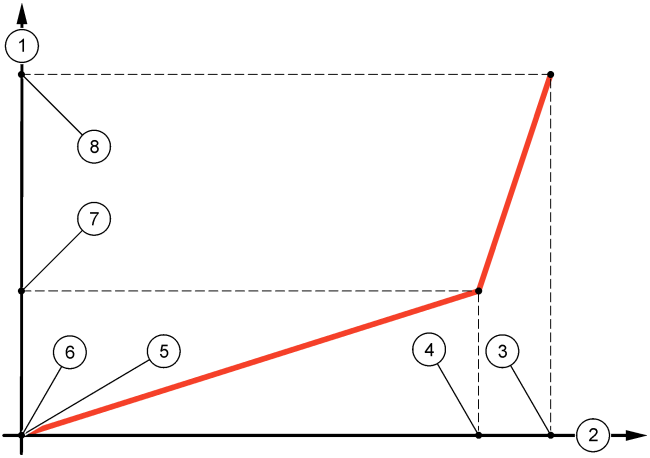


1 Output current axis	**5** Minimum output current (0-4 mA)
2 Source value axis	**6** 50% output current
3 High value	**7** Maximum output current (20 mA)
4 50% value	

Bilinear output mode

Figure 16 shows in graph form the operation of the bilinear output mode.

Figure 16 Bilinear output



1 Output current axis	**5** Low value
2 Source value axis	**6** Minimum output current (0-4 mA)
3 High value	**7** Knee point current
4 Knee point value	**8** Maximum output current (20 mA)

Configure relays

The Normally Open (NO) and Common (COM) relay contacts will be connected when an alarm or other condition is active. The Normally Closed (NC) and Common relay contacts will be connected when an alarm or other condition is inactive (unless the Fail Safe is set to Yes), or when power is removed from the controller. To select a menu option, highlight the option and push **ENTER**.

1. From the sc200 Setup menu, select Relay Setup.
2. Select a relay from the list.
3. From the Relay Setup menu, choose Select Source and push **ENTER**. Normally, a source is one of the sensors attached to the system, but the controller can also function as a source. If an analog input module is installed, the source may be the analog input.
4. From the Relay Setup menu, select Set Parameter and choose from the list of parameters. The list of parameter options will vary with the type of attached sensor.
5. From the Relay Setup menu, select Set Function and choose from the list. Further setup will depend on the function chosen.

Option	Description
Scheduler Function (available if the controller is selected as the relay source)	Relay switches at certain times independently of any process value
Alarm Function	Relay activates when upper or lower alarm value is exceeded
Feeder Control Function	Relay indicates if a process value exceeds or falls below a setpoint
Event Control Function	Relay toggles if a process value reaches an upper or lower limit
Pulse Width Modulation (PWM) Control Function	Relay uses a Pulse Width Modulation control depending on a process value

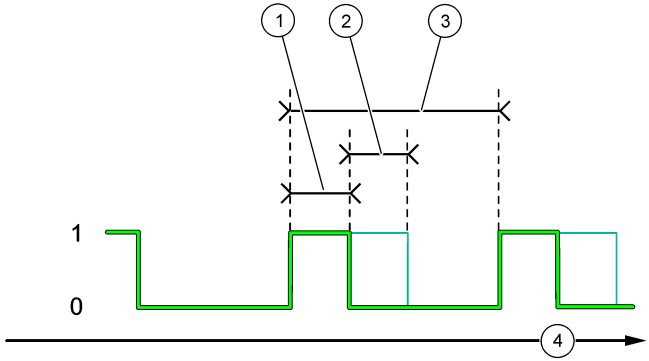
Option	Description
Frequency control	Relay switches with a frequency depending on a process value
Warning	Relay indicates warning and error conditions in probes

6. From the Relay Setup menu, select Set Transfer and choose Active or Inactive.
7. From the Relay Setup menu, select Fail Safe and choose Yes or No.
8. From the Relay Setup menu, select Activation.
   The activation options for the selected function appear. Use the information in the table below each function to update the options.
9. Test the relay function to make sure it is properly energizing the connected device. To do relay testing, go to the Setting menu, then select **Test/Maint>Test Relay**.

- **Scheduler Function (refer to Figure 17)**

Option	Description
Hold outputs	Holds outputs in the present ON or OFF state
Run days	Sets the weekday(s) that the relay operates. Options: Sunday, Monday, Tuesday., Wednesday, Thursday, Friday, Saturday
Start time	Sets the start time.
Interval	Sets the time between activation cycles (Default value: 5 min).
Duration	Sets the period of time the relay is energized (Default value: 30 sec).
Off delay	Sets the time for additional hold/output time after the relay has been turned off.

Figure 17 Scheduler function



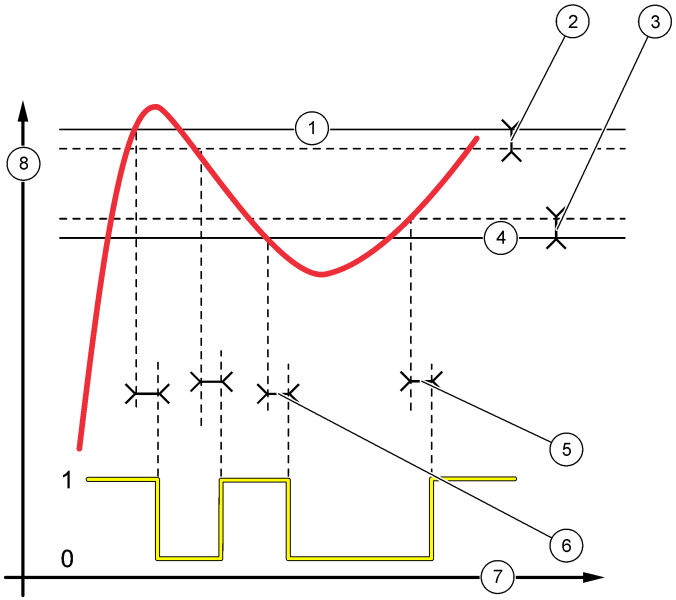
1 Duration	**3** Interval
2 OFF delay	**4** Time (x-axis)

- **Alarm Function (refer to Figure 18)**

Option	Description
Low alarm	Sets the value where the relay will turn on in response to decreasing measured value. For example, if the low alarm is set for 1.0 and the measured value drops to 0.9, the relay activates.
High alarm	Sets the value where the relay will turn on in response to increasing measured value. For example, if the high alarm is set for 1.0 and the measured value increases to 1.1, the relay activates.

Option	Description
Low deadband	Sets the range where the relay remains on after the measured value increases above the low alarm value. For example, if the low alarm is set for 1.0 and the low deadband is set for 0.5, the relay remains on between 1.0 and 1.5. Default is 5% of the range.
High deadband	Sets the range where the relay remains on after the measured value decreases below the high alarm value. For example, if the high alarm is set for 4.0 and the high deadband is set for 0.5, the relay remains on between 3.5 and 4.0. Default is 5% of the range.
Off delay	Sets a time (0-300 seconds) to delay the relay from normally turning off (Default: 0 seconds).
On delay	Sets a delay time for the relay to turn on (Default: 0 seconds).

Figure 18 Alarm function



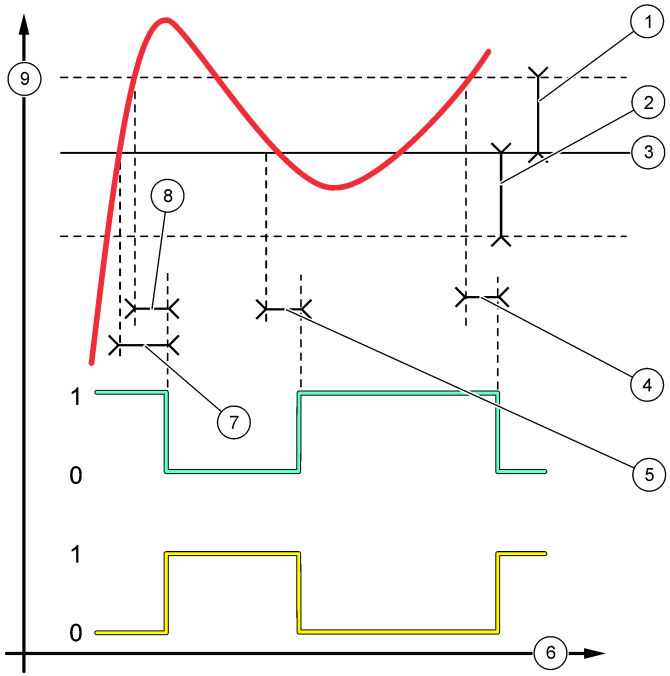
1 High alarm	**5** ON delay
2 High deadband	**6** OFF delay
3 Low deadband	**7** Time (x-axis)
4 Low alarm	**8** Source (y-axis)

- **Feeder Control Function (refer to Figure 19 and Figure 20)**

Option	Description
Phase	Defines the relay status if the process value exceeds the setpoint. High (default)—turns the relay on when the process value exceeds the setpoint. Low—turns the relay on when the process value falls below the setpoint.
Set setpoint	Sets the process value at which the relay toggles. The default value is different for each sensor.
Deadband	Sets the area for an amount of change necessary after the relay setpoint is reached in order to satisfy a condition.

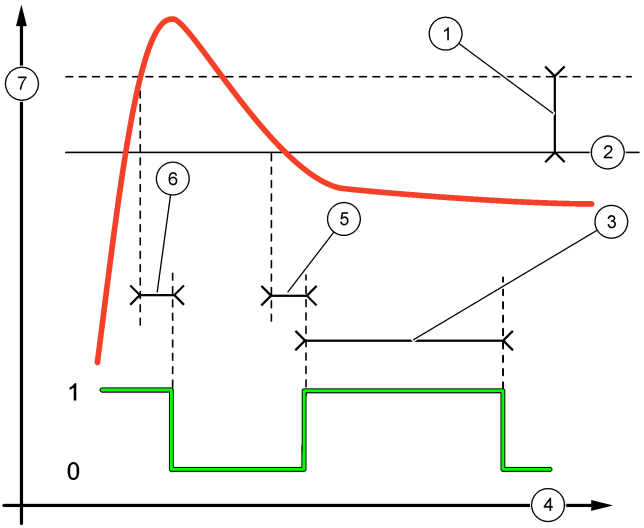
Option	Description
Overfeed timer	Sets a time period for de-activating an active relay if the process setpoint cannot be reached. Once an overfeed alarm is present, it must be manually reset.
Off delay	Sets a delay time for the relay to turn off (default: 0 seconds).
On delay	Sets a delay time for the relay to turn on (default: 0 seconds).

Figure 19 Feeder control function



1 Deadband (Phase = Low)	**6** Time (x-axis)
2 Deadband (Phase = High)	**7** ON delay (phase set high)
3 Setpoint	**8** OFF delay (phase set low)
4 OFF delay (phase set high)	**9** Source (y-axis)
5 ON delay (phase set low)	

Figure 20 Feeder control function (Phase low, Overfeed timer)

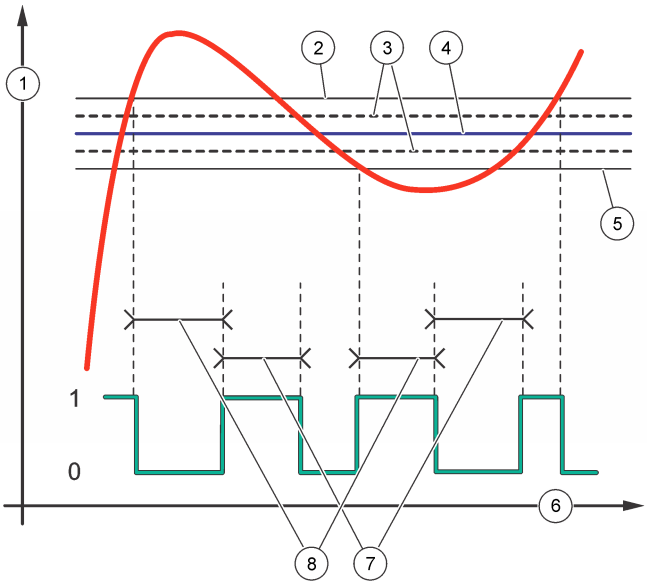


1 Deadband	**5** ON delay
2 Setpoint	**6** OFF delay
3 Overfeed timer	**7** Source (y-axis)
4 Time (x-axis)	

- **Event Control Function (refer to Figure 21, Figure 22 and Figure 23)**

Option	Description
Set setpoint	Sets the value where the relay will turn on.
Deadband	Sets a hysteresis so the relay will not swing unregulated when the process value converges to the setpoint.
OnMax timer	Sets the maximum time the relay can stay on independent from the measured value (default: + 0 min).
OffMax timer	Sets the maximum time the relay can stay off independent from the measured value (default: + 0 min).
OnMin timer	Sets the minimum time the relay can stay on independent from the measured value (default: + 0 min).
OffMin timer	Sets the minimum time the relay can stay off independent from the measured value (default: + 0 min).

Figure 21 Event control function (no delay)



1 Source (y-axis)	**5** Low alarm
2 High alarm	**6** Time (x-axis)

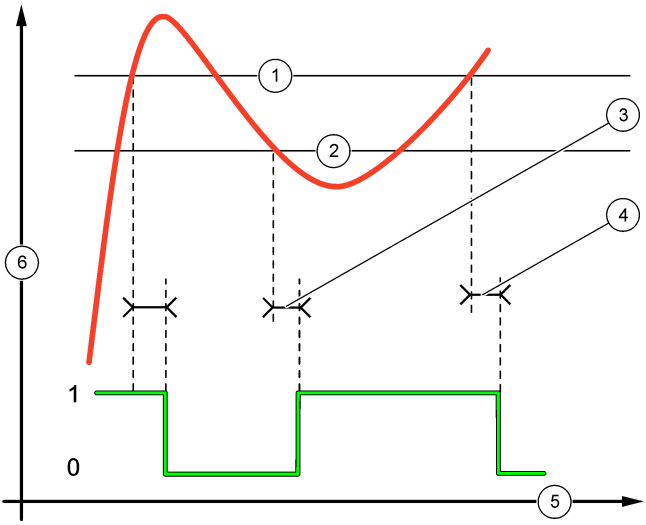
Figure 23 Event control function (ON/OFF delay)

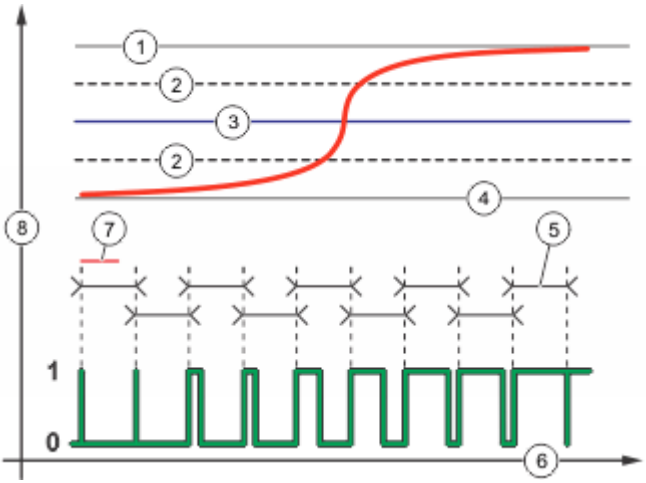


1 High alarm	**4** OFF delay
2 Low alarm	**5** Time (x-axis)
3 ON delay	**6** Source (y-axis)

- **Pulse Width Modulation Control Function (refer to Figure 24)**

Option	Description
Set mode	Auto—the relay output works as a PID controller. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase	Reverses the leading sign of the control deviation for the PID controller (default: Reverse). The phase selects whether the relay will operate at the first part of a cycle (direct phase) or the second part (reverse phase).
Set setpoint	Creates a setpoint value.
Dead zone	The range above and below the setpoint. In this set range, the PID controller does not take action to change the Pulse Width Modulation On/Off Ratio output signal until the limits of the dead zone are reached.
Period	Sets the cycle duration of the PWM output signal (default: 5 seconds).
Min width	Sets the minimum PWM ratio (default: 1.0 second).
Max width	Sets the maximum PWM ratio (default: 4.0 seconds).
Prop band	Sets the proportional part of the PID controller. The proportional part of the controller supplies an output signal which is linearly dependent to the control deviation. The proportional part reacts on any changes at the input but starts to oscillate easily if the value is set high. The proportional part cannot completely compensate for disturbances.
Integral	Sets the integral part of the PID controller (default: 000 minutes). The integration part of the controller supplies an output signal. The output signal increases linearly if the control deviation is constant. The integration part responds slower than the proportional part and can completely compensate disturbances. The higher the integration part, the slower it responds. If the integration part is set too low, it starts to oscillate.

Figure 24 Pulse Width Modulation function (linear mode)

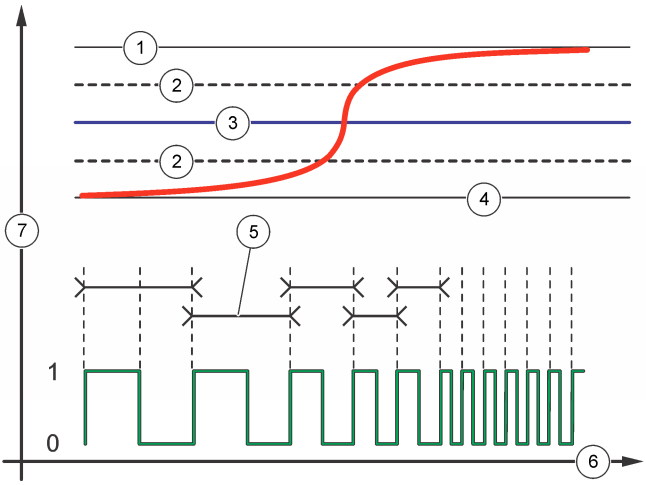


1 High alarm	**5** Period
2 Deadband	**6** Time (x-axis)
3 Setpoint	**7** Phase
4 Low alarm	**8** Selected source (y-axis)

- **Frequency Control Function (refer to Figure 25)**

Option	Description
Set mode	Auto—The relay works as a PID controller. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase	Reverses the leading sign of the control deviation for the PID controller (default: Reverse). The phase selects whether the relay will operate at the first part of a cycle (direct phase) or the second part (reverse phase).
Set setpoint	Sets the process value which is controlled by the PID controller.
Dead zone	In this set range, the PID controller does not take action to change the output frequency until within the limits of the dead zone.
Pulse width	Sets the cycle duration (0-600 seconds) of the PWM output signal. (default: 0.5 seconds) The cycle duration is equal to the duty cycle of the output signal.
Minimum pulses	Sets the minimum number of pulses per minute at which the relay can operate. Range: 0.001–4.000 (default: 1.000)
Maximum pulses	Sets the maximum number of pulses per minute at which the relay can operate. Range: 0.001–60.000 (default: 04.000). This value cannot be set lower than Minimum Pulses value.
Prop band	Sets the proportional part of the PID controller. The proportional part of the controller supplies an output signal which is linearly dependent to the control deviation. The proportional part reacts on any changes at the input but starts to oscillate easily if the value is set high. The proportional part cannot fully compensate for disturbances.
Integral	Sets the derivative part of the PID controller (default: 000 minutes). The integration part of the controller generates an output signal. The output signal increases linearly if the control deviation is constant. The integration part responds slower than the proportional part and can fully compensate disturbances. The higher the integration part, the slower it responds. If the integration part is set too low, it starts to oscillate.

Figure 25 Frequency control function



1 High limit	**5** Cycle duration
2 Deadband	**6** Time (x-axis)
3 Setpoint	**7** Selected source (y-axis)
4 Low limit	

- **Warning Function**

Option	Description
Warning	Sets the level for warning activation. Refer to the sensor manual for the numbers for individual warning messages.

Display setup

Configures the controller display.

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Display Setup and push **ENTER**.

Option	Description
Adjust Order	View and modify the measurement display order. • **See Current Order**—View the current display order • **Add Measurements**—Add selected measurements to the display • **Remove Measurements**—Remove selected measurements from the display • **Reorder List**—Select one or more measurements and change their order in the display • **See Default Order**—View the default display order • **Set to Default**—Set the display order to the default configuration ***Note:*** *Some of the above will not be available if no adjustment is possible for that option (e.g.* ***Reorder List*** *and* ***Remove Measurements*** *will not be available if only one measurement is selected for display).*
Display Contrast	Adjust the contrast to a value between the minimum of +1 and the maximum of +9
Edit Name	Assigns a name to the controller

Update the date and time

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Set Date/Time and push **ENTER**.
3. Select Date Format from the Set Date/Time screen and push **ENTER**.
4. Select a format and push **ENTER**.
5. Select Date/Time from the Set Date/Time screen and push **ENTER**.
6. Update the entries.
   a. Use the right and left arrow keys to highlight a field.
   b. Use the up and down arrow keys to change the values in the field and push **ENTER**.
   c. At the end of the date field, push the right arrow to wrap down to the time fields.
   d. Use the up and down and arrow keys to update the time fields.
7. Push **ENTER** to save the changes.
   The controller returns to the Set Date/Time menu.

Set the datalog mode and interval

Datalog Setup is available if a calculation has been set up.

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Datalog Setup and push **ENTER**.
3. Select Set Mode and push **ENTER**.
4. Select an option (Snap Shot, Average, Maximum, Minimum) and push **ENTER**.
5. From the Datalog Setup menu, select Set Interval and push **ENTER**.
6. Select an interval from the list and push **ENTER**.

Set up a calculation

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Calculation and push **ENTER**. Select a menu option and choose from the displayed list or update the entry. Refer to the table below for more information about each option.

Option	Description
Set variable X	Selects the sensor for the x variable
Set parameter X	Selects the sensor measurement for the x variable
Set variable Y	Selects the sensor for the y variable
Set parameter Y	Selects the sensor measurement for the y variable
Set formula	Select the math function to implement: • **None**—Disables the math function • **X-Y**—Subtraction function • **X+Y**—Addition function • **X/Y**—Division function • **[X/Y]%**—Percentage function • **[X+Y]/2**—Average function • **[X*Y]**—Multiplication function • **[X-Y]%/X**—Difference function
Display format	Selects the number of digits and decimal points

Option	Description
Set units	Selects the units for the calculated reading
Set parameter	Selects the parameter for the calculated reading

3. Push **ENTER** to save the selection or setting and return to the Calculation menu.

Set up the discrete inputs

Use these inputs to switch closure inputs or logic level voltage inputs.

1. Press the **MENU** key.
2. Select sc200 Setup and push **ENTER**.
3. Select Discrete Input Setup and push **ENTER**.
4. Select the desired channel (Input 1, Input 2 or Input 3) and push **ENTER**.
5. Select a control logic option and push **ENTER**.

Option	Description
Disable	This channel is disabled and not used.
On/High	This channel is active when either the switch input is On (or closed), or the logic level voltage input is at a High level.
Off/Low	This channel is active when either the switch input is Off (or opened), or the logic level voltage input is at a Low level.

6. Select a warning option and push **ENTER**.

Option	Description
Off	An active discrete input does not trigger a device warning.
On	An active discrete input triggers a device warning.

7. Select an output mode option and push **ENTER**.

Option	Description
Active	Output level continues to represent operating conditions.
Hold	Output level is held static.
Transfer	Output level moves to a pre-configured value.

8. Select the sensors that will have their outputs (analog and relay) affected when one of the discrete inputs becomes active. Push **ENTER**.
9. Use the arrows to select the On Delay value (the duration time delay between the discrete input activation and the configured response of the controller). Push **ENTER**.
10. Use the arrows to select the Off Delay value (the duration time delay between the discrete input de-activation and the configured response of the controller). Push **ENTER**.
11. Repeat steps 4–10 for each desired channel.
12. If a discrete input needs to be changed after initially set up:
    a. Repeat steps 1–4 and an Input Settings menu appears with the following options:
       - Control Logic
       - Set Warning
       - Output Mode
       - On Delay
       - Off Delay
    b. Select the desired option and push **ENTER**.

c. Make the desired changes and push **ENTER** to save the changes and return to the Inputs Setting menu.

Update the display language

The display language can be changed through the Setup menu.

1. From the Settings Menu, select sc200 Setup and push **ENTER**.
2. Select Language and push **ENTER**.
   The list of language options appears. English is the default language for the controller.
3. Highlight the language to be used for the controller and push **ENTER**.
   The selected language is saved and is used for the controller display. The display returns to the sc200 Setup menu.

Using the secure digital memory (SD) card

An SD card must be installed in the controller.

- The SD card can be used to update software and firmware and to download event and data logs. If the SD card is installed while the controller is in the Settings Menu, push the **HOME** key and then the **MENU** key to verify the option is visible. The SD icon will also be visible in the upper status bar of the main measurement screen when a card is installed.
- Data log files on the SD card are available in XML and binary formats.
- DataCom is used to convert files from binary to CSV format. Refer to the DataCom manual for more information on how to use the application. For a copy of the DataCom manual, software updates or other downloadable resources, go to http://www.de.hach.com or http://www.hach.com. Search *DataCom* or go to any sc200 product page.

Updating software

Notes:

- The controller does not automatically transfer information to or from an SD card.
- When the SD card is put in multiple controllers, each controller has a separate set of folders in the SD card memory. To make sure software updates are in the correct folder for the controller in use, it is best to use a separate dedicated SD card for each controller.

1. From the Settings Menu, select SD Card Setup and push the **ENTER** key.
2. Select Upgrade Software and push the **ENTER** key.

   Note: *If the Upgrade Software option does not appear, do the steps in* Firmware updates with SD cards on page 44.
3. Select a device from the list and push the **ENTER** key. The list of options includes the controller and all connected devices that have software placed in the appropriate folder on the SD card.
4. If more than one version of the upgrade software is available, select the version with the highest number and push the **ENTER** key.
5. Push the **ENTER** key to begin the software transfer.
   The display will show "Transferring files. Please wait..." The percentage of completion appears in the bottom left corner of the display. The upgrade cannot be halted once it has begun.

   - When the transfer is successful, the display will show "Transfer complete" along with a prompt to push **ENTER** to restart the controller or to push the **BACK** key and exit to the SD Card Setup menu. Controller updates take effect when the controller is restarted. A restart is not necessary for sensor updates.
   - If the transfer is unsuccessful, the display will show "Transfer failed" and an error message. Press the **ENTER** key to acknowledge the warning and exit out of the menu. Error messages are different for each sensor. Refer to the applicable sensor manual.

Saving data and event logs with SD cards

Notes:

- Data and event logs can be downloaded to an SD card and viewed with any device capable of reading an SD card.
- Data logs store the measurement data at selected intervals in a packed binary format (.flg file).
- Event logs store a variety of events that occur on the devices such as configuration changes, alarms and warning conditions. Event logs are set up during the sensor or module configuration process. Event logs are stored in a CSV format.

1. From the Settings Menu, select SD Card Setup and push the **ENTER** key.
2. Select Save Logs and push the **ENTER** key.
3. If more than one device appears on the screen, all devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Select the devices from which logs will be saved and push the **ENTER** key.
4. Select the time period from which logs are to be saved.

Option	Description
Last Day	All logs from the last full 24 hours, starting from 12:00 a.m., and any additional time remaining on the current day
Last Week	All logs from the last full week (7 days) starting from 12:00 a.m., and any additional time remaining on the current day
Last Month	All logs from the last full month (30 days) starting from 12:00 a.m., and any additional time remaining on the current day
All	Save all logs in memory
New	All logs that are new since the last time logs were saved to the SD card

5. Push the **ENTER** key to confirm the choice, and push the **ENTER** key again to begin the file transfers.
6. Allow time for the files to transfer. The display will show Transferring files. Please wait... and the percentage of files transferred.
   If the transfer is successful, the display will show "Transfer complete." If the transfer is not successful, the display will show "Transfer failed."
7. Do one of the following:
   a. Push the **ENTER** key to exit back to the SD Card Setup menu.
   b. Push the **HOME** key to return to the measurement screen.
   c. Push the **BACK** keys to return to the Settings Menu.

Access data and event log files on the SD card

A PC with an SD Card reader device or USB adapter is necessary to view the event and data logs kept on the SD Card. Excel 2003 or higher (for XML files) or the Data Com application (for binary flg files) is necessary to open the event and data logs.
Data logs have the following structure: Device Name, Device Serial Number, Device Identification, Data Log, Time Stamp.

Event logs have the following structure: Device Name, Device Serial Number, Device Identification, Event Log, Time Stamp.

To view data or event log files stored on the SD card:

1. Attach the card reader device to the PC (if necessary) and install the SD card that contains the files in the reader device.
2. In the SD card directory, open the HACH folder.
3. Select the Logs folder.
4. Select a device folder.

The event and data log files in the folder are shown.

5. To view XML data log files:
   a. Make sure the HachDatalog.xsl style sheet exists in the device folder.
   b. Open the Excel application.
   c. Go to File, Open.
   d. Select the data log file.
   e. In the Import XML dialog box, select **Open the file with the following style sheet applied** and select **HachDatalog.xml**.
   f. Click OK to view the data.
6. To view binary data log (.flg) files:
   a. Make sure the device driver (.flg.drv) file exists in the device folder.
   b. Open Data Com.
   c. In the File Viewer section, click Open.
   d. Select the data log file.
   The data log file is shown in the box and a comma separated values (csv) file with the same file name is created. This csv file can be opened in Excel.

Firmware updates with SD cards

The latest firmware updates can be placed on an SD card. The SD card can then be used to update the controller or device firmware.

A PC and a USB card reader or other device capable of reading an SD card are necessary.

1. Find the zip file at http://www.hach-lange.com or http://www.hach.com and copy it to the PC.
2. Extract file(s) from the zip folder and save them to the SD card.
3. Remove the SD card and update the controller and device firmware. Refer to Updating software on page 42.

Backup settings to an SD card

Saves the configuration of a device to the SD card.

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Backup Settings and push **ENTER**.
5. Select the devices to be backed up. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers. If backup files already exist on the SD card, a confirmation window appears. Select the devices again and push **ENTER**. Wait for the "Transfer complete" message.
6. Push **ENTER** again to return to the Manage Configuration menu.

Restore settings to the controller

This menu selection only appears if a (serial number-specific) backup file for the controller or one of the sensors connected to it exists on the SD Card. This menu selection loads the configuration of a specific device from the SD card to the same device (serial number-controlled function).

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Restore Settings and push **ENTER**.
5. Select the device that will be restored. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers.

6. When the transfer is complete, push **ENTER**.
7. To have the settings take effect immediately, restart the controller. Push the **BACK** key to exit the Manage Configuration menu.

Transfer settings to another device

All device settings including calibration, sensor name, selected temperature and measurement units and data logging settings are transferred.

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Transfer Settings and push **ENTER**. Two options appear:
   - Retrieve Settings
   - Copy Settings
5. To retrieve settings from the controller (or a device connected to it) and put the settings on the SD card:
   a. Select Retrieve Settings and push **ENTER**.
   b. Select the devices that contain the information to be transferred. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers. Wait for the "Transfer complete" message.
   c. If files already exist on the SD card, a confirmation window appears. Select the devices again and push **ENTER**. Wait for the "Transfer complete" message.
   d. Push **ENTER** to return to the Manage Configuration menu.
6. To copy settings from the SD card to a controller (or a device connected to it):
   a. Select Transfer Settings and push **ENTER**.
   b. Select Copy Settings and push **ENTER**.
   c. Select the devices on the SD card. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers.
7. When the transfer is complete, push **ENTER** to restart the connected devices.
8. Push **ENTER** to restart the controller or push **BACK** to return to the Manage Configuration menu.

Using the service port

The service port is used to download data files from the controller and install new versions of controller and sensor firmware. To download data and update software, use the service port in combination with DataCom and a service cable (LZX887).

Using DataCom

When using the service port, it is necessary to use DataCom. DataCom is a PC Application Utility that downloads data log and event log files from the controller and installed sensors. Files are downloaded from the controller through the controller service port or they can be placed on a Secure Digital Memory (SD) card installed in the controller. In addition, DataCom is used to upload software for the controller and sensors. The DataCom application must be installed on a PC to read the files.

Refer to the DataCom manual for more information on how to use the application. The DataCom manual, software updates and other downloadable resources are available at http://www.de.hach.com or http://www.hach.com on any sc200 product page.

Maintenance

⚠ DANGER

Multiple hazards. Only qualified personnel must conduct the tasks described in this section of the document.

Cleaning the controller

⚠ DANGER

Always remove power from the controller before performing maintenance activities.

Note: *Never use flammable or corrosive solvents to clean any part of the controller. Use of these solvents may degrade the environmental protection of the unit and may void the warranty.*

1. Make sure the controller cover is securely closed.
2. Wipe the controller exterior with a cloth dampened with water, or with a mixture of water and mild detergent.

Fuse replacement

Fuses are not user-serviceable items. The need for fuse replacement in controllers indicates severe technical failure and is therefore considered to be a service activity. If a blown fuse is suspected, contact Technical Support.

Battery replacement

The lithium ion backup battery is not user replaceable. Contact technical support for replacement.

Troubleshooting

Problem	Resolution
No current output	Verify current output configuration.
	Test current output signal using the Test/Maintenance submenu. Input a current value and verify the output signal at the controller connections.
	Contact Technical Support.
Incorrect current output	Verify current output configuration.
	Test current output signal using the Test/Maintenance submenu. Input a current value and verify the output signal at the controller connections. If the output is incorrect, perform an output calibration.

Problem	Resolution
No relay activation	Make sure relay connections are secure.
	If using an external power source, make sure the relay wiring is correct.
	Make sure the relay configuration is correct.
	Test the relay activation through the Test/Maintenance menu. The relay should energize and de-energize as selected.
	Make sure the controller is not in calibration mode and that the relay is not being held.
	Reset the Overfeed Timer to make sure the timer has not expired.
Secure Digital Memory (SD) card not recognized by the controller	Make sure the SD card is properly oriented. The copper traces should face toward the controller display.
	Make sure the SD card is fully seated in the slot and the spring lock is engaged.
	Make sure the SD card is properly formatted with a Fat 32 format. The MMC format is not supported. Follow the instructions of the card manufacturer to format the SD card on a PC.
	Make sure the card is not larger than 32 GB.
	Make sure an SD card is being used. Other types of cards (such as xSD, micro SD, mini SD) will not work properly.
Information not saving, or not saving properly to the SD card.	Make sure the SD card is properly formatted with the FAT 32 format. The MMC format is not supported. Follow the instructions of the card manufacturer to format the SD card on a PC.
	If the SD card has previously been in use, format the card with the Fat 32 format, install the card in the controller, and try downloading files.
	Try a different SD card.
SD card full	Read the SD card with a PC or other card reader device. Save important files and then delete some or all of the files on the SD card.
Controller cannot find software updates on the SD card.	Make sure an appropriate folder is created by installing the SD card in the controller. An update folder will automatically be created.
	Install the SD card on a PC and make sure the software files are located in the appropriate update folder.
	If the same SD card is used with multiple controllers, each controller will have a separate folder on the system. Make sure the software updates are in the folder dedicated to the controller in use.
Display is lit but shows no characters or characters are faint or blurry.	Adjust the display contrast
	Make sure protective film has been removed from display.
	Clean the outside of the controller, including the display screen.

Problem	Resolution
Controller will not power up, or powers up intermittently	Make sure the AC power connections are properly terminated in the controller.
	Make sure the power strip, line power, wall plug are all properly plugged in.
	Contact Technical Support
Network or sensor module not recognized	Make sure the module is properly installed.
	Make sure the module selector switch is set to the proper number.
	Remove sensor module and install the module into the second analog slot. Apply power to the controller and allow the controller to perform a device scan.
	Contact Technical Support.
Sensor not recognized ***Note:*** *Example of possible display message: *****	If the sensor is an analog sensor and a corresponding module is installed in the controller, refer to the instructions supplied with the Network or Sensor Module.
	Make sure the digital connector wiring harness is seated on the inside of the door assembly and that the wiring harness is not damaged.
	If the digital sensor is connected to the controller with a digital termination box, user supplied junction box, digital extension cables, or a user-supplied extension cable, connect the sensor directly to the controller and perform a device scan. If the controller recognizes the sensor, check that all the wiring in the junction boxes or extension cables is correct.
	Make sure that only two sensors are installed in the controller. Although two analog module ports are available, if a digital sensor and two analog modules are installed, only two of the three devices will be seen by the controller.
	Contact Technical Support
Device Missing error message appears	Perform a Device Scan from the Test/Maintenance menu.
	Power cycle the controller

Test and Maintenance menu

1. From the Settings Menu, select Test/Maint and push **ENTER**.

Option	Description
Scan devices	Performs a scan for active and missing devices.
Output cal • **Output 1** • **Output 2**	Lets the user calibrate the 4–20 mA outputs with a 250 ohm resistor in series to the mA output terminals. The settings for each output are adjusted until the correct value (4 mA or 20 mA) is supplied. Calibrate 4 mA output (Min: 0 Max: 25000) Calibrate 20 mA output (Min: 35000 Max: 65533)
Hold outputs	Sets the value the controller sends to an external system for a defined period of time. After the time period, the instrument goes back to reporting real time values. Set activation—Launch or release Set Outmode—Hold Outputs (default) or Transfer Outputs Set Channels—All (default) or select from hardware list

Option	Description
Test output • **Output 1** • **Output 2**	Lets the user select a mA value that is sent by the controller for verification. Min: 0 mA (default +04.00) Max: 25.00 mA
Status	View status of all modules, sensors and relays.
Test relay—A, B, C, D	Energize or De-energize the selected relay
Overfeed reset	Resets the Overfeed Timer.
Reset default config	Resets the controller configuration settings to the default values (language, date and time, relay function and data output function).
Restart sc200	Performs a controller restart
Simulation (only displays if sensors or modules are connected)	After the sim value is entered, the controller outputs this value as if it was the value sent from the sensor. The simulation stops after the user exits the screen. Source- • <Module 1> • <Module 2> (Footer displays current source selection) Parameter—Source measurement type (footer displays current source selection) Sim value—Use arrow keys to change value (footer displays current source selection)
Modbus stats	Displays Error and Good count stats for selected port. • Sensor port 1, 2, 3 or 4 • Network port • Service port • Clear stats
System data	Displays the current system current, temperature and voltage data.

Warning and error conditions

Follow the steps below to acknowledge controller warnings.

1. From the Settings menu, select Diagnostics and push **ENTER**.
2. Select the device (controller, sensor, network card) with the warning or error and push **ENTER**.
3. Select the warning, error or event list and push **ENTER**.
4. Select Yes and push **ENTER** to acknowledge the warning.
   Note: *Errors cannot be acknowledged.*
5. For more information on a specific warning, error or event, refer to the device manual.

Device scan information

Display message	Action
Installing device...please wait	The controller has found a new device. No action is necessary. The controller automatically performs an installation process for the new device and displays the main measurement screen of the device installed in the number one position.
Device missing <device id>	A previously installed device has been removed from the controller or is not detected. • Push the **Enter** key to continue. • Push the left arrow key to select or de-select a missing device. • Push the **Enter** key to delete the missing device. The controller will display the main measurement screen for the device in the number one position. ***Note:*** *This message also displays when a device is missing and a new device has been installed. After the missing device is deleted, the controller automatically installs the new device and displays Installing device...please wait. The controller then displays the main measurement screen for the device installed in the number one position.*

Replacement parts and accessories

Note: *Product and Article numbers may vary for some selling regions. Contact the appropriate distributor or refer to the company website for contact information.*

Description	Item number
4 GB Secure Digital Memory (SD) card	9218100
Connector kit for digital sensor	9201000
Controller installation kit	8806200
DataCom cable	LZX887
Mounting bracket inserts	9177900
Plug, conduit opening (set of 3)	5868700
Power cord kit, with strain relief, 125 VAC, U.S.-style plug	9202900
Power cord kit, with strain relief, 230 VAC, European-style plug	9203000
Screw driver	6134300
SD card reader	9218200
SD card cover kit for sc200 controller	9200900
Screws for controller installation kit	9177800
Cord grip kit (1)	9178000
Sealing washer for cord grip assembly	1033814
UV protection screen	8809200
Weather and sun shield w/ UV protection screen	9220600
Sensor and communication modules	
Conductivity module	9013000

Description	Item number
Flow module	9012700
4-20 mA input module	9012800
pH and DO module	9012900

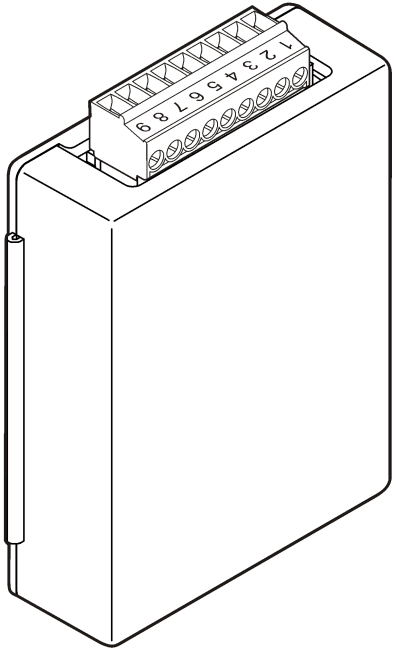
HART® Module

11/2013, Edition 4



User Manual

English 3

Specifications

Specifications are subject to change without notice.

Specification	Details
Minimum current	3 mA
Maximum current	23 mA
Linearity	± 0.05% of span
HART receive impedance	Rx ≥ 200 KΩ; Cx = 4 pF
Internal module loop power	15 VDC
Lift-off voltage	13.3 VDC
External loop power over temperature	30 VDC maximum
Loop resistance (HART communications)	Internal module loop power: 250–350 Ω; 18–24 VDC power supply: 250–500 Ω; 24–30 VDC power supply: 250–976 Ω
Loop resistance (non-HART communications)	Internal module loop power: 0–350 Ω; 12–24 VDC power supply: 0–250 Ω; 24–30 VDC power supply: 250–976 Ω
HART burst mode	Not supported
HART protocol revision	7.2
Certification	Class I, Division 2 Groups A, B, C, D and Class I, Zone 2 Group IIC, T4 Hazardous and Ordinary Locations

General information

In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual. The manufacturer reserves the right to make changes in this manual and the products it describes at any time, without notice or obligation. Revised editions are found on the manufacturer's website.

Safety information

NOTICE

The manufacturer is not responsible for any damages due to misapplication or misuse of this product including, without limitation, direct, incidental and consequential damages, and disclaims such damages to the full extent permitted under applicable law. The user is solely responsible to identify critical application risks and install appropriate mechanisms to protect processes during a possible equipment malfunction.

Please read this entire manual before unpacking, setting up or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in this manual.

Use of hazard information

⚠ DANGER

Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation that may result in minor or moderate injury.

NOTICE

Indicates a situation which, if not avoided, may cause damage to the instrument. Information that requires special emphasis.

Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed. A symbol on the instrument is referenced in the manual with a precautionary statement.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	This symbol indicates the presence of devices sensitive to Electro-static Discharge (ESD) and indicates that care must be taken to prevent damage with the equipment.
	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of-life equipment to the Producer for disposal at no charge to the user.

Product overview

The HART module enables HART digital communication and gives two HART connections to the controller. HART communication is an industrial standard bidirectional digital communication over 4-20 mA analog current loops. The module connects to the network card connector inside the controller.

Three isolated analog outputs (output A – output C) are provided. Such outputs are commonly used for analog signaling or to control other external devices. Each output can be active through the use of internal module power or external/loop power (requires an external VDC power supply). When configured for HART communication, an external power supply is recommended. For maximum loop resistance versus voltage information, refer to Figure 1.

Installation

⚠ DANGER

Explosion Hazard. For the module installation in classified hazardous locations, refer to the controller user manual for safety instructions.

⚠ DANGER

Electrocution Hazard. Always remove power from the instrument before making any electrical connections.

⚠ WARNING

Potential Electrocution Hazard. Only qualified personnel should conduct the tasks described in this section of the manual.

NOTICE

Potential Instrument Damage. Delicate internal electronic components can be damaged by static electricity, resulting in degraded performance or eventual failure.

To install the module and connect the outputs, refer to Wiring tables on page 7 and the illustrated steps that follow.

Operation

Configure a HART module

The Network Setup option appears in the Settings Menu only if a HART module or other network module such as Modbus, Profibus or 4-20 mA is installed in the controller.

The range on the HART module is set at 4-20 mA. Each of the outputs can be assigned to represent a measured parameter from a sensor that is connected to the controller such as pH, temperature, flow or calculated values.

1. From the Settings menu, select Network Setup.
2. Select Edit Name and enter a name for the module. Push **ENTER** to save the name.
3. Select an output (A, B, C) and push **ENTER**.

   Note: *Only outputs A and B can be configured for HART communications.*

   a. Highlight an option and push **ENTER**.
   b. Make a selection from the list or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Select Source	Selects the sensor to be represented on the selected output —None, sensor 1 name, sensor 2 name, calculation (if set up). For sensor output, Select Parameter sets the measurement options. When the measurement is autorange, Set Range sets the range.
Set Low Value	Sets the measured value from the sensor to be represented by a 4 mA signal (default: 0.000). (Range and units depend on sensor)
Set High Value	Sets the measured value from the sensor to be represented by a 20 mA signal (default: 1.000). (Range and units depend on sensor)
Set Transfer	Sets the transfer value. Range 3.0 to 23.0 mA (default 4.000). If a device malfunction is detected, the output goes to the user-selected transfer value. ***Note:*** *In addition, the transfer value can be set during a sensor calibration or maintenance (Diag/Test>Hold Outputs).*
Set Filter	Sets a time-average filter value of 0 (default) to 120 seconds.
Set HART Address	Sets the HART address for the selected output channel. Range 0 to 63.

Diagnostics and tests menu

1. From the Settings menu, select **Network Setup>Diag/Test**.
2. Select an option and push **ENTER** to perform the function or view the data.

Option	Description
Output Cal	Calibrates the low (4 mA) and high (20 mA) values for each of the three 4-20 mA outputs (A, B, C). Adjust the DAC counts until a connected multimeter reads the applicable output value. The default DAC counts are: • Output A—2807 for 4 mA, 14046 for 20 mA • Output B—2797 for 4 mA, 14109 for 20 mA • Output C—2641 for 4 mA, 13294 for 20 mA
Hold output	Sets the hold output options to Hold, Transfer or Release for each of the three 4-20 mA outputs (A, B, C).
Test output	Drives selected output to a simulated value.
Status	Displays the output value.
Error hold mode	Selects the behavior of the output in an error condition.

Option	Description
Module information	Displays information about the installed module. • Software version • Bootloader version • Serial Number
Default Setup	Sets the configuration to factory defaults.

Troubleshooting

For general problems with HART module communications, try the corrective actions listed below. If the problem continues or other problems occur, contact technical support.

- Make sure the connections between the module and the HART host are correct.
- Make sure the loop supply is live.
- Make sure the HART host is set to the correct device address.
- Check the module network setup for the selected channel. Make sure that the installed device is mapped to the selected channel. Make sure the SET LOW VALUE and the SET HIGH VALUE are within the range of the selected source.
- If the HART output from the HART host cannot be trimmed or fixed, make sure the sensor does not have an error that makes the controller hold or transfer the output at a fixed value.

General Information

In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual. The manufacturer reserves the right to make changes in this manual and the products it describes at any time, without notice or obligation. Revised editions are found on the manufacturer's website.

Safety information

Please read this entire manual before unpacking, setting up or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired, do not use or install this equipment in any manner other than that specified in this manual.

Use of hazard information

⚠ DANGER

Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation that may result in minor or moderate injury.

NOTICE

Indicates a situation which, if not avoided, may cause damage to the instrument. Information that requires special emphasis.

Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed. A symbol on the instrument is referenced in the manual with a precautionary statement.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol, when noted on a product enclosure or barrier, indicates that a risk of electrical shock and/or electrocution exists.
	Delicate internal electronic components can be damaged by static electricity, resulting in degraded performance or eventual failure.
	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/98/EC), European electrical equipment users must now return old or end-of-life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For return for recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxillary items for proper disposal.*

Overview of the 4-20 mA output module

The 4-20 mA output module gives three additional 4-20 mA output connections to a controller. The module connects to the network card connector inside the controller.

Installation

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING

Potential Electrocution Hazard. Only qualified personnel should conduct the tasks described in this section of the manual.

NOTICE

Potential Instrument Damage. Delicate internal electronic components can be damaged by static electricity, resulting in degraded performance or eventual failure.

Three isolated analog outputs (output 1–output 3) are provided. Such outputs are commonly used for analog signaling or to control other external devices. Each output is loop powered and requires a customer supplied 12 to 24 VDC power supply or the use of internal module power. To install the module and connect the outputs, refer to the Illustrated steps and either Table 1 or Table 2.

Table 1 Wiring information for module powered

—	—	9

1. Disconnect controller power.
2. Open the controller cover.
3. Feed the twisted-pair shielded wire through the strain relief.
4. Adjust the wire as necessary and tighten the strain relief.
5. Connect the shield at the power supply side. The power supply positive polarity connects to the (+) terminal, and the negative polarity connects to the (-) terminal (Figure 1 or Figure 2).
   - Do not connect the shield at both ends of the cable.
   - Use only shielded cable to minimize radio frequency emissions and susceptibility.
   - External loop resistance may be required (Table 3 or Table 4).
6. Close the controller cover and tighten the cover screws.
7. Connect controller power.
8. Configure outputs in the controller.

Operation

Configure a 4-20 mA output module

The Network Setup option appears in the Settings Menu only if an analog output module or other network module such as Modbus or Profibus is installed in the controller.

Outputs for analog output modules are set at 4-20 mA. Outputs can be assigned to represent a measured parameter such as pH, temperature, flow or calculated values.

1. From the Settings menu, select Network Setup.
2. Select Edit Name and enter a name for the module. Push **ENTER** to save the name.
3. Select an output (A, B, C) and push **ENTER**.
   a. Highlight an option and push **ENTER**.
   b. Make a selection from the list or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Select Source	Selects the output to configure—None, sensor 1 name, sensor 2 name, calculation (if set up). For sensor output, Select Parameter sets the measurement options. When the measurement is autorange, Set Range sets the range.
Set Low Value	Sets the 4 mA value (default: 0.000). (Range and units depend on sensor)
Set High Value	Sets the 20 mA value (default: 1.000). (Range and units depend on sensor)
Set Transfer	Sets the transfer value. Range 3.0 to 23.0 mA (default 4.000).
Set Filter	Sets a time-average filter value of 0 (default) to 120 seconds.

Diagnostics and tests menu

1. From the Settings menu, select Diagnostics and Tests.
2. Select an option and push **ENTER** to perform the function or view the data.

Option	Description
Output Cal	Calibrates the low (4 mA) and high (20 mA) values for each of the three 4-20 mA outputs (A, B, C).
Hold output	Sets the hold output options to Hold, Transfer or Release for each of the three 4-20 mA outputs (A, B, C).
Test output	Drives selected output to a known value.
Status	Displays the output value.
Error hold mode	Selects what to do on error condition.
Module information	Displays information about the installed module. • Software version • Bootloader version • Serial Number
Default Setup	Sets the configuration to factory defaults.

Modbus registers

A list of Modbus registers is available for network communication. Refer to www.hach.com or www.hach-lange.com for more information.

[1] Most pH applications are in the 2.5 to 12.5 pH range. The pHD™ Differential pH sensor with the wide-range glass process electrode performs exceptionally well in this range. Some industrial applications require accurate measurement and control below 2 or above 12 pH. In these special cases, please contact the manufacturer for further details.

[2] For best ORP measuring results in solutions containing zinc, cyanide, cadmium or nickel, the manufacturer recommends using the pHD™ ORP sensor equipped with a gold electrode.

[3] PEEK® is a registered trademark of ICI Americas, Inc.

[4] Ryton® is a registered trademark of Phillips 66 Co.

[5] Kynar® is a registered trademark of Pennwalt Corp.

[6] Viton® is a registered trademark of E.I. DuPont de Nemours + Co.

Table 2 Digital Gateway Specifications

Weight	145 g (5 oz)
Dimensions	17.5 x 3.4 cm (7 x 1 3/8 in.)
Operating Temperature	–20 to 60 °C (–4 to 140°F)

Section 2 General Information

2.1 Safety Information

Please read this entire manual before unpacking, setting up, or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

To ensure that the protection provided by this equipment is not impaired, do not use or install this equipment in any manner other than that specified in this manual.

This product is acceptable for use in a Hazardous Location when used with an sc100 Controller and installed per Control Drawing 58600-78 as described in the sc100 Controller Manual, Cat. No. 5860018.

2.1.1 Use of Hazard Information

DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION
Indicates a potentially hazardous situation that may result in minor or moderate injury.

Important Note: *Information that requires special emphasis.*

Note: *Information that supplements points in the main text.*

2.1.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol, when noted on a product enclosure or barrier, indicates that a risk of electrical shock and/or electrocution exists.
	This symbol, if noted on the product, indicates the need for protective eye wear.
	This symbol, when noted on the product, identifies the location of the connection for Protective Earth (ground).
	This symbol, when noted on the product, identifies the location of a fuse or current limiting device.

2.2 General Sensor Information

Optional equipment, such as mounting hardware for the probe, is supplied with instructions for all user installation tasks. Several mounting options are available, allowing the probe to be adapted for use in many different applications.

The electronics of the sensor are encapsulated in a PEEK® or Ryton® body. The pH sensor has an integral NTC 300 ohm thermistor to automatically compensate pH readings for temperature changes. ORP sensors have a fixed temperature value of 25 °C/300 ohm (the ORP measurement is not temperature dependent).

2.2.1 Sensor Body Styles

pHD™ Differential pH and ORP sensors are available in three body styles:

- **Convertible Body Style** — has 1-inch NPT threads at both ends of the body for mounting in any of the following configurations:
  - into a standard 1-inch NPT pipe tee
  - into a pipe adapter for union mounting with a standard 1-½ inch pipe tee
  - onto the end of a pipe for immersion into a vessel

Note: *The convertible style sensor can also be retrofitted into existing installations for 1-½ inch LCP, Ryton, and epoxy sensors.*

- **Insertion Body Style** — similar to the convertible sensor except that its 1-inch NPT threads are only on the cable end for mounting into a flow cell or the pipe adapter of a ball valve hardware assembly. This hardware enables the sensor to be inserted into or retracted from the process without stopping the process flow.
- **Sanitary Body Style** — features a built-in 2-inch flange for mounting into a 2-inch sanitary tee. Included with the sanitary-style sensor is a special cap and EDPM compound gasket for use with the sanitary hardware.

In addition, all probes are available with or without integral digital electronics. For applications with extreme temperatures, the sensor without integral digital electronics can be combined with the digital gateway.

Figure 1 Convertible Style Sensor Dimensions

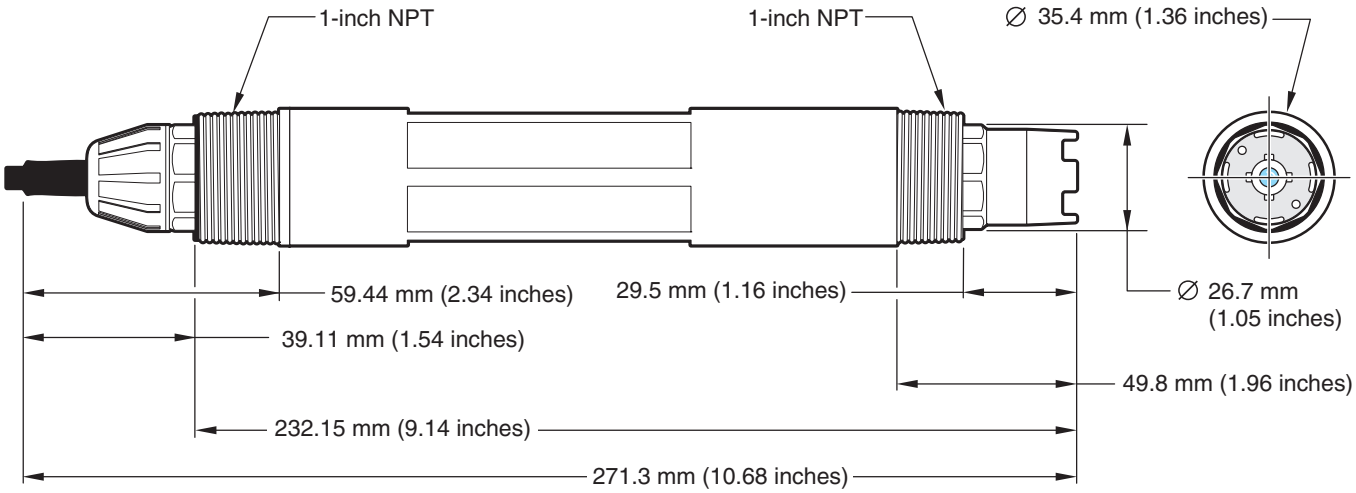

Figure 2 Insertion Style Sensor Dimensions

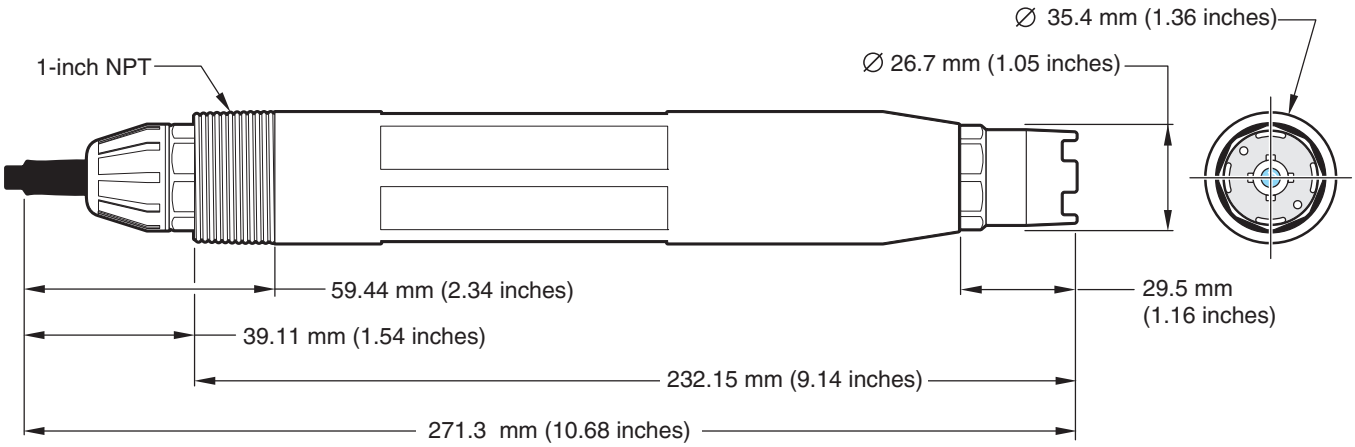

Figure 3 Sanitary Style Sensor Dimensions

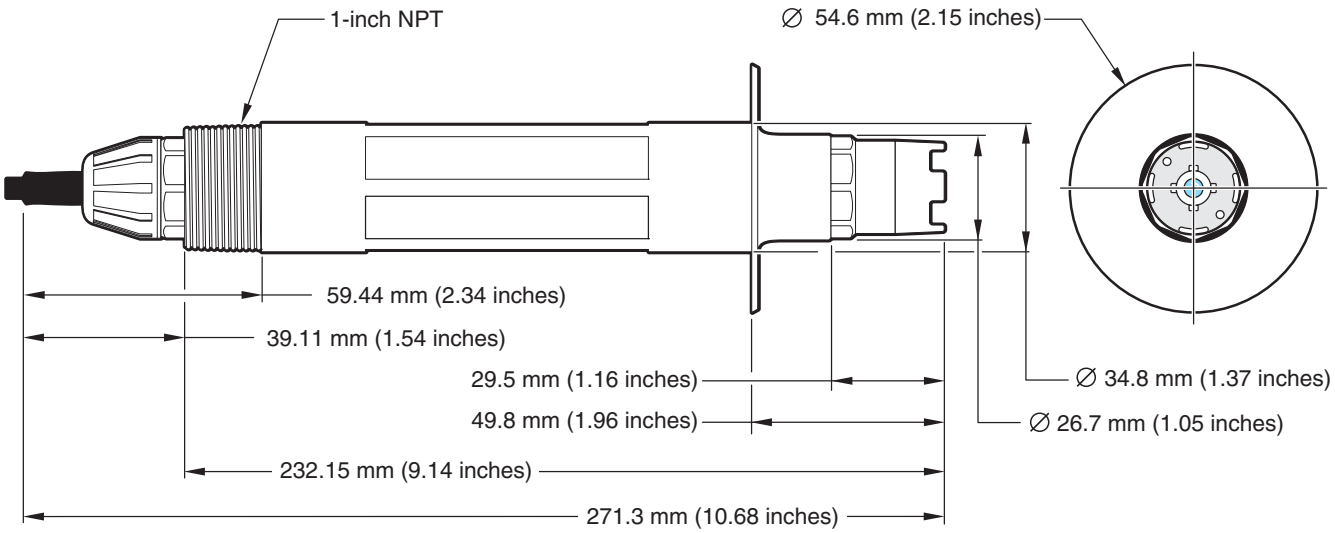

Figure 4 Stainless Steel Style Sensor (DPS1 and DRS5) Dimensions

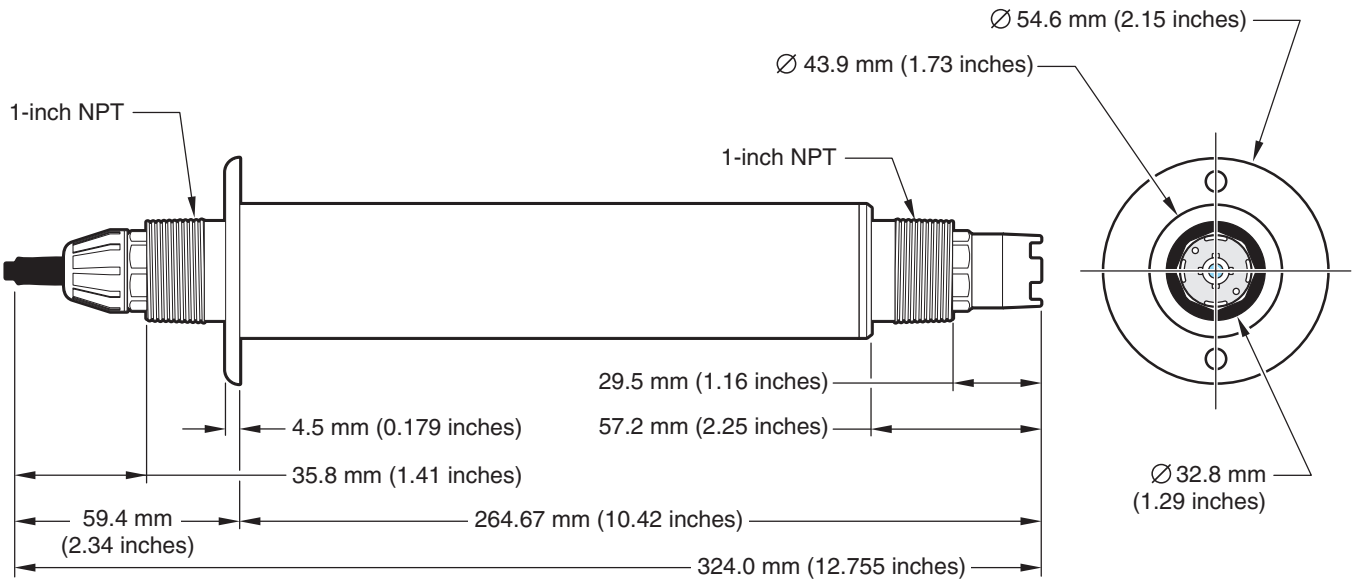


2.3 The Digital Gateway

The digital gateway was developed to provide a means to use existing analog sensors with the new digital controllers. The gateway contains all the necessary software to interface with the controller and output a digital signal. Extension cables are required for connection from the digital gateway to the digital controller. See Replacement Parts and Accessories on page 41.

2.4 Operating Precaution

CAUTION
If the pH process electrode breaks, handle the sensor very carefully to prevent injury.

Before placing the pH or ORP sensor into operation, remove the protective cap to expose the process electrode and salt bridge. Save the protective cap for future use.

For short-term storage (when sensor is out of the process for more than one hour) fill the protective cap with pH 4 buffer or DI water and place the cap back on the sensor. Keeping the process electrode and salt bridge moist will avoid slow response when the sensor is placed back in operation.

For extended storage, repeat the short-term storage procedure every 2 to 4 weeks, depending on the surrounding environmental conditions. See Specifications on page 5 for temperature storage limits.

The process electrode at the tip of the pH sensor has a glass bulb, which can be broken. Do not subject it to abrupt impact or other mechanical abuse.

The gold or platinum process electrode at the ORP sensor tip has a glass shank (hidden by the salt bridge) which can break. Do not subject this electrode to impact or other mechanical abuse.

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

DANGER
Seul un technicien qualifié peut effectuer les tâches d'installation décrites dans cette section du manuel.

3.1 Connecting/Wiring the Sensor to the sc100 Controller

DANGER
The sc100 and certain versions of the sensor are suitable for use in Class 1, Division 2, Groups A, B, C, D Hazardous Locations . See Control Drawing 58600-78 in the sc100 Controller Manual, Cat. No. 58600-18 for acceptable sensor versions and installation requirements.

DANGER
Le sc100 et certaines versions du capteur peuvent être utilisés dans des endroits dangereux de la Classe 1, Division 2, Groupes A, B, C, D. Reportez-vous au schéma de contrôle 58600-78 du Manuel du contrôleur sc100, Réf. 58600-18 pour connaître les versions des capteurs admises et les conditions d'installation.

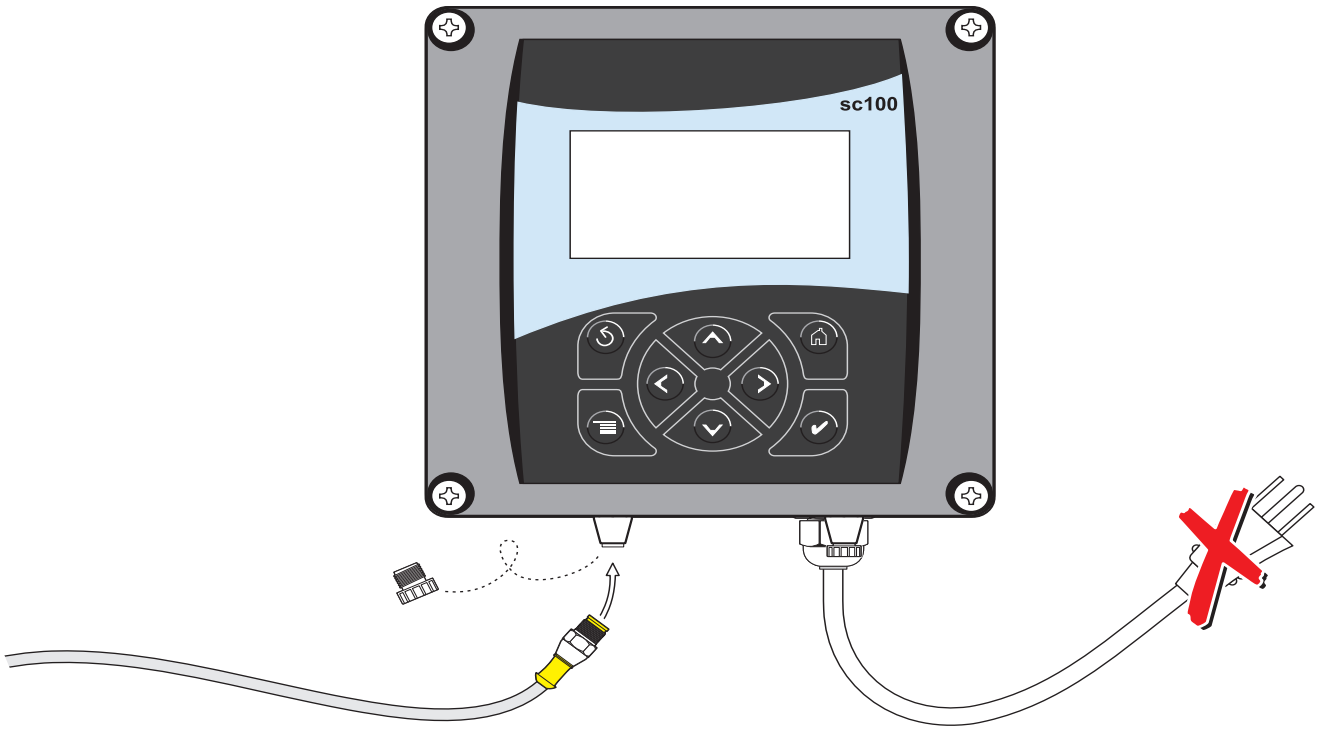
3.1.1 Connecting the sc Sensor to a sc100 Controller in a Non-hazardous Location

3.1.1.1 Attaching a sc Sensor with a Quick-connect Fitting

Important Note: *The standard quick-connect fitting is NOT suitable for Class 1, Division 2 Hazardous Location installations without the connector lock installed, see section 3.1.2 on page 13 for more information.*

The sensor has a keyed quick-connect fitting for easy attachment to the controller (Figure 5). Retain the connector cap to seal the connector opening when the sensor is removed. Extension cables may be purchased to extend the sensor cable length. If the total cable length exceeds 100 m (300 ft), a termination box must be installed. See Replacement Parts and Accessories on page 41.

Figure 5 Attaching the Sensor using the Quick-connect Fitting



3.1.1.2 Hard-wiring a sc Sensor to the Controller

Important Note: *Hard-wiring the sensor to the sc100 is not an approved method for Class I, Division 2 Hazardous Locations.*

1. Disconnect power to the controller if powered.
2. Open the controller cover.
3. Disconnect and remove the existing wires between the quick-connect and terminal strip J5, see Figure 5 on page 12.
4. Remove the quick-connect fitting and wires and install the threaded plug on the opening to maintain the environmental rating.
5. Cut the connector from the sensor cable.
6. Strip the insulation on the cable back 1-inch. Strip ¼-inch of each individual wire end.
7. Pass the cable through conduit and a conduit hub or a strain relief fitting (Cat.No.16664) and an available access hole in the controller enclosure. Tighten the fitting.

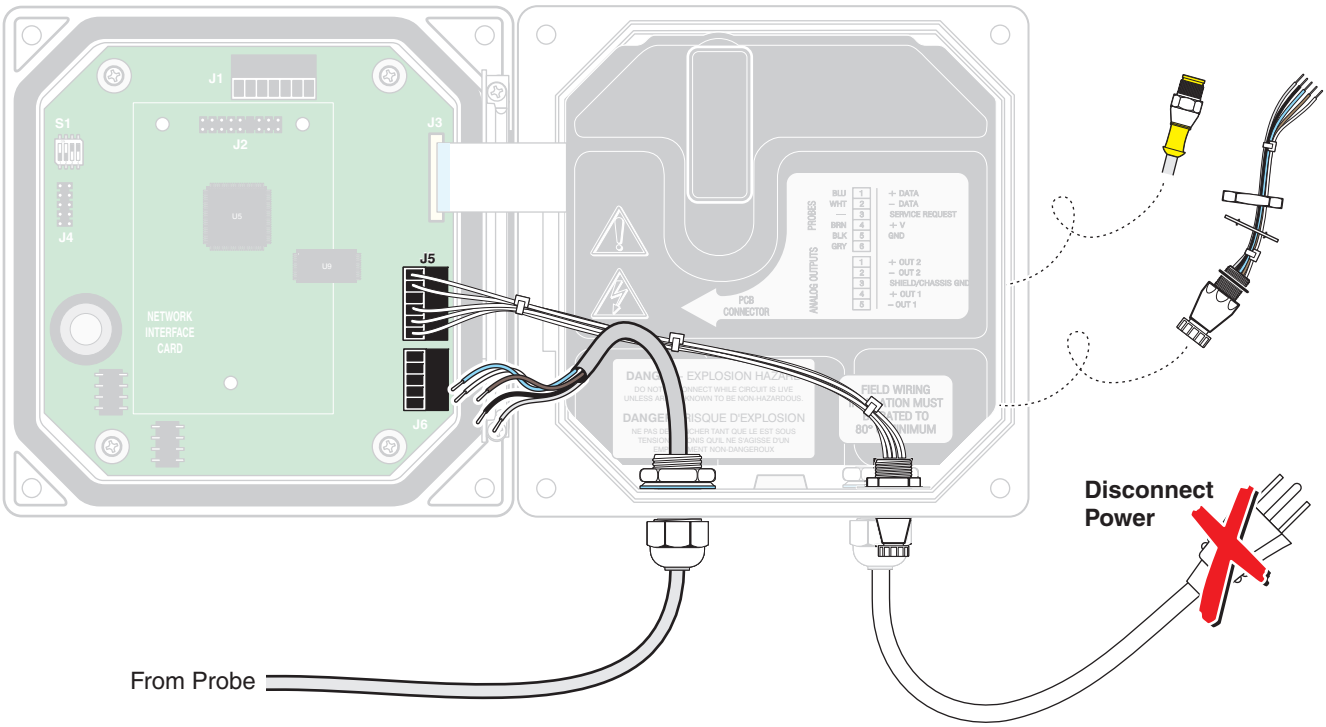
Note: *Use of strain relief fitting other than Cat. No. 16664 may result in a hazard. Use only the recommended strain relief fitting.*

8. Reinstall the plug on the sensor access opening to maintain the environmental rating.
9. Wire as shown in Table 3 and Figure 6.
10. Close and secure the cover.

Table 3 Wiring the Sensor at Terminal Block J5

Terminal Number	Terminal Designation	Wire Color
1	Data (+)	Blue
2	Data (–)	White
3	Service Request	No Connection
4	+12 V dc	Brown
5	Circuit Common	Black
6	Shield	Shield (grey wire in existing quick disconnect fitting)

Figure 6 Hard-wiring the sensor



3.1.2 Connecting the sc Sensor to a sc100 Controller in a Hazardous Location

DANGER
The sc100 and certain versions of the sensor are suitable for use in Class 1, Division 2, Groups A, B, C, D Hazardous Locations. See Control Drawing 58600-78 in the sc100 Controller Manual, Cat. No. 58600-18 for acceptable sensor versions and installation requirements.

DANGER
Le sc100 et certaines versions du capteur peuvent être utilisés dans des endroits dangereux de la Classe 1, Division 2, Groupes A, B, C, D. Reportez-vous au schéma de contrôle 58600-78 du Manuel du contrôleur sc100, Réf. 58600-18 pour connaître les versions des capteurs admises et les conditions d'installation.

DANGER
Explosion hazard. Do not connect or disconnect equipment unless power has been switched off or the area is known to be non-hazardous.

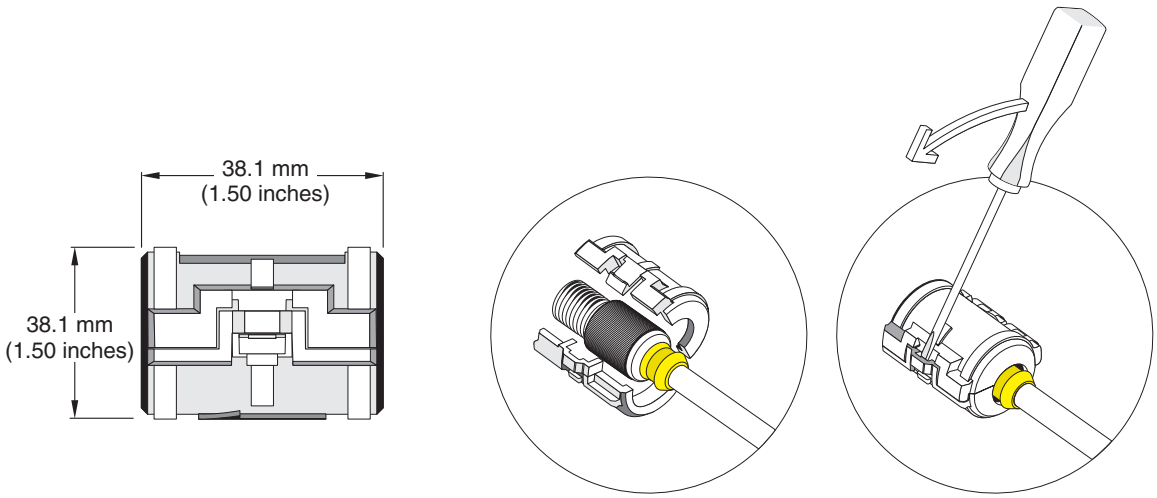
DANGER
Risque d'explosion. Couper le courant ou s'assurer que l'emplacement est designe non dangereux avant de replacer le aucon composant.

3.1.2.1 Attaching a sc Sensor with a Quick-connect Fitting in a Hazardous Location

The sensor cable is supplied with a keyed quick-connect fitting for easy attachment to the controller, see Figure 5. For hazardous locations, a connector safety lock (Cat. No. 6139900) **must** be installed. Retain the connector cap to seal the connector opening in case the sensor must be removed.

1. Remove the connector cap from sc100 controller. Retain the connector cap to seal the connector opening in case the sensor must be removed.
2. Connect the sensor connector to the plug on the sc100.
3. Install a connector safety lock (Figure 7). Align the lock over the connector and squeeze the two halves together to lock. To remove the connector safety lock by inserting a small flat-bladed screwdriver into the locking groove. Pivot the screwdriver away from the groove and separate the two halves (Figure 7).

Figure 7 Installing the Connector Safety Lock



3.2 Connecting the Sensor to the sc1000

3.2.1 Connecting the Sensor using the Quick-connect Fittings

1. Unscrew the connector cap from the controller. Retain the connector cap to seal the connector opening in case the sensor must be removed.
2. Push the connector into the socket.
3. Hand-tighten the union nut.

Note: *Do not use the middle connection for the sensors as this is reserved for the display module.*

3.3 Using the Digital Gateway

The digital gateway is designed to provide a digital interface to the controller. The non-sensor end is wired to the sc100 or sc1000 controller in a non-hazardous location as

shown in section 3.1.1 on page 11. The non-sensor end is wired to the sc100 controller in a hazardous location as shown in section 3.1.2 on page 13.

3.3.1 Wiring the Digital Gateway

DANGER
The sc100 and certain versions of the sensor are suitable for use in Class 1, Division 2, Groups A, B, C, D Hazardous Locations . See Control Drawing 58600-78 in the sc100 Controller Manual, Cat. No. 58600-18 for acceptable sensor versions and installation requirements.

DANGER
Le sc100 et certaines versions du capteur peuvent être utilisés dans des endroits dangereux de la Classe 1, Division 2, Groupes A, B, C, D. Reportez-vous au schéma de contrôle 58600-78 du Manuel du contrôleur sc100, Réf. 58600-18 pour connaître les versions des capteurs admises et les conditions d'installation.

DANGER
Explosion hazard. Do not connect or disconnect equipment unless power has been switched off or the area is known to be non-hazardous.

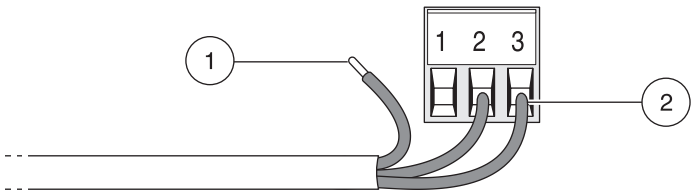
DANGER
Risque d'explosion. Couper le courant ou s'assurer que l'emplacement est designe non dangereux avant de replacer le aucon composant.

1. Route the cable from the sensor through the strain relief in the digital gateway then properly terminate the wire ends (see Figure 8).

Note: *Do not tighten the strain relief until the digital gateway is wired and the two halves are threaded securely together.*

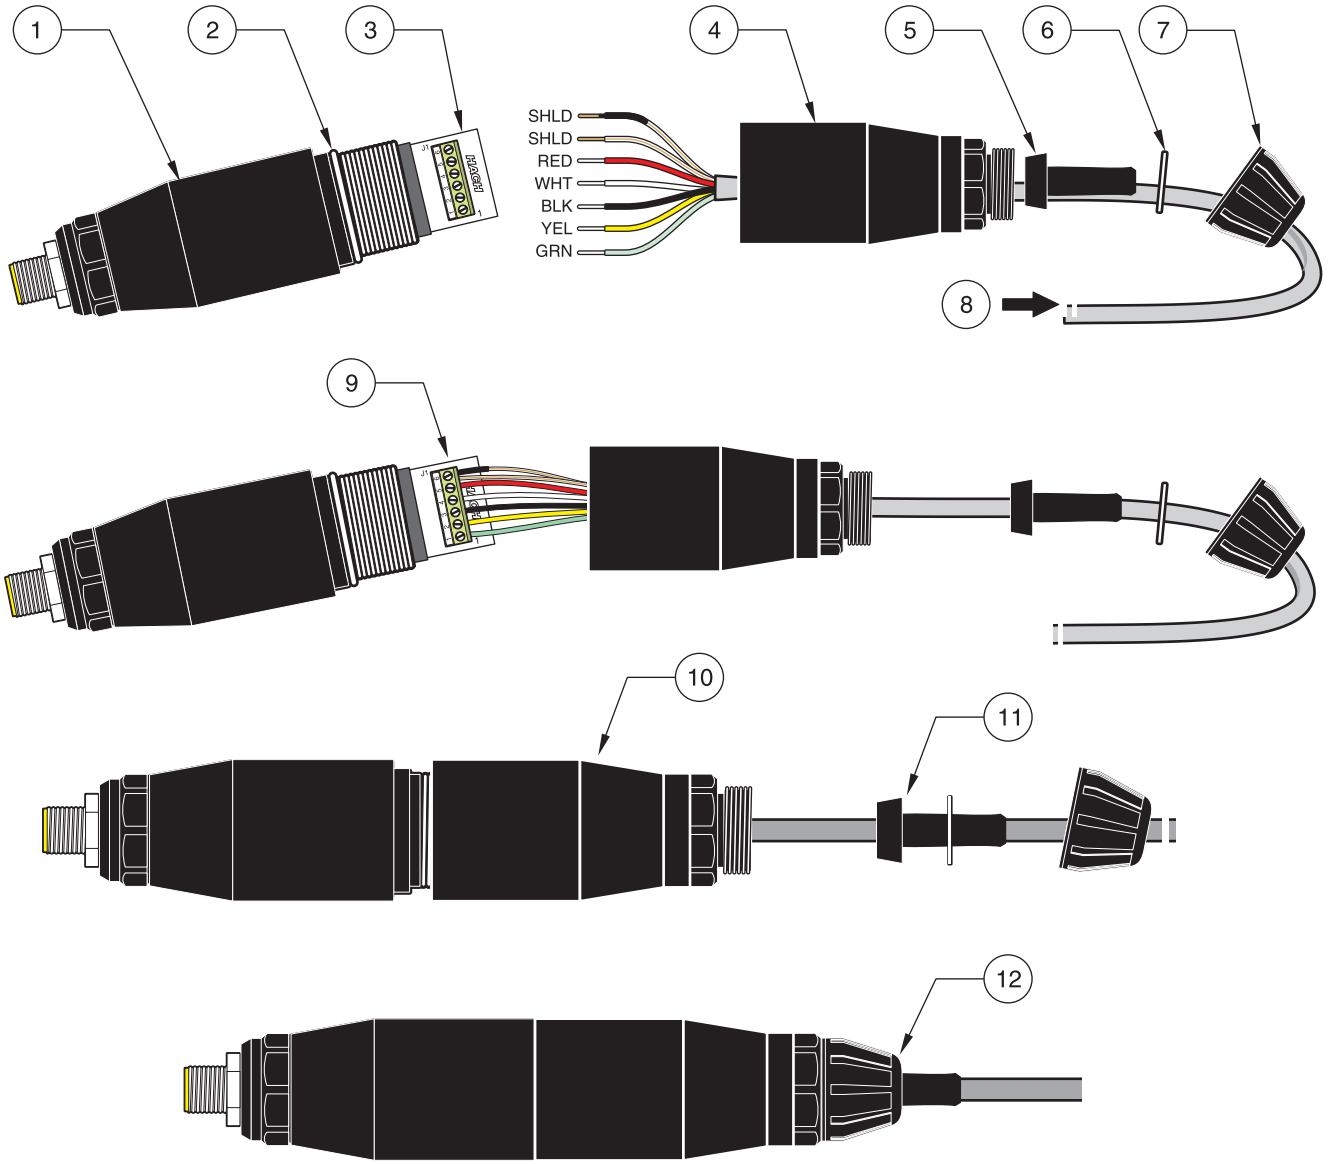
2. Insert the wires as shown in Table 4 and Figure 9.
3. Make sure the O-ring is properly installed between the two halves of the digital gateway and thread the two halves together. Hand tighten.
4. Tighten the strain relief to secure the sensor cable.
5. Connect the digital gateway to the controller.
   - sc100 Non-Hazardous Location Instructions—section 3.1.1 on page 11.
   - sc100 Hazardous Location Instructions—section 3.1.2 on page 13g
   - sc1000 Connection Instructions—Refer to section 3.2 on page 14.

Figure 8 Proper Wire Preparation and Insertion



1. Strip ¼-inch of insulation.	**1.** Seat insulation against connector with no bare wire exposed.

Figure 9 Wiring and Assembling the Digital Gateway



1. Digital gateway front	**7.** Cord grip
2. O-ring	**8.** From sensor
3. Sensor wire connector	**9.** Insert wires into connector according to Table 4. Use the included 2 mm screwdriver (Cat. No. 6134300) to secure connections.
4. Digital gateway back	**10.** Screw back of digital gateway onto front.
5. Cable bushing	**11.** Push cable bushing and anti-rotation washer into back.
6. Anti-rotation washer	**12.** Fasten cord grip securely. Assembly is complete.

Table 4 Wiring the Digital Gateway (Cat. No. 6120500)

Sensor (wire color)	Sensor Signal	Digital Gateway J1
Green	Ref	J1-1
Yellow	Temp +	J1-2
Black	Temp –	J1-3
White	VI	J1-4
Red	Active	J1-5
Clear	Shield	J1-6
Clear w/shrink wrap	Shield	J1-6

3.3.2 Mounting the Digital Gateway

The digital gateway is supplied with a mounting clip for mounting to a wall or other flat surface. See Figure 10 for dimensions. Use an appropriate fastener to secure it to the wall, see Figure 11. After the sensor is wired to the digital gateway and the two halves are threaded together, place the mounting clip over the center of the digital gateway and squeeze the clip together to secure.

Figure 10 Digital Gateway Dimensions

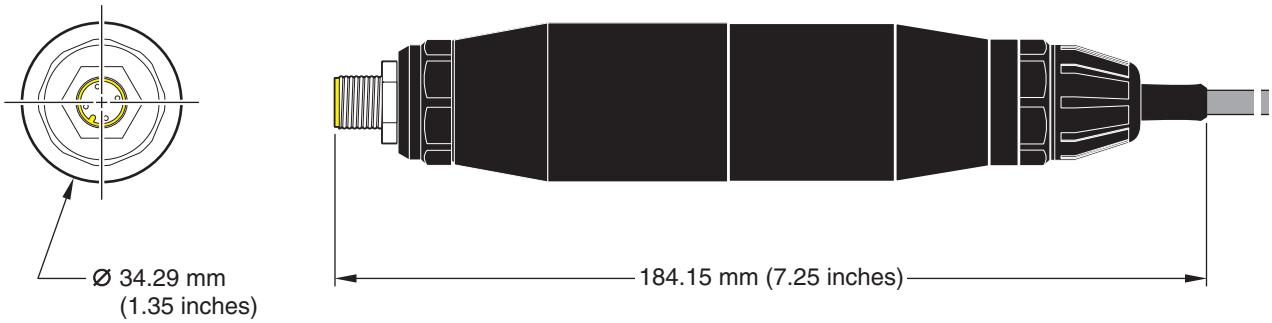


Figure 11 Mounting the Digital Gateway

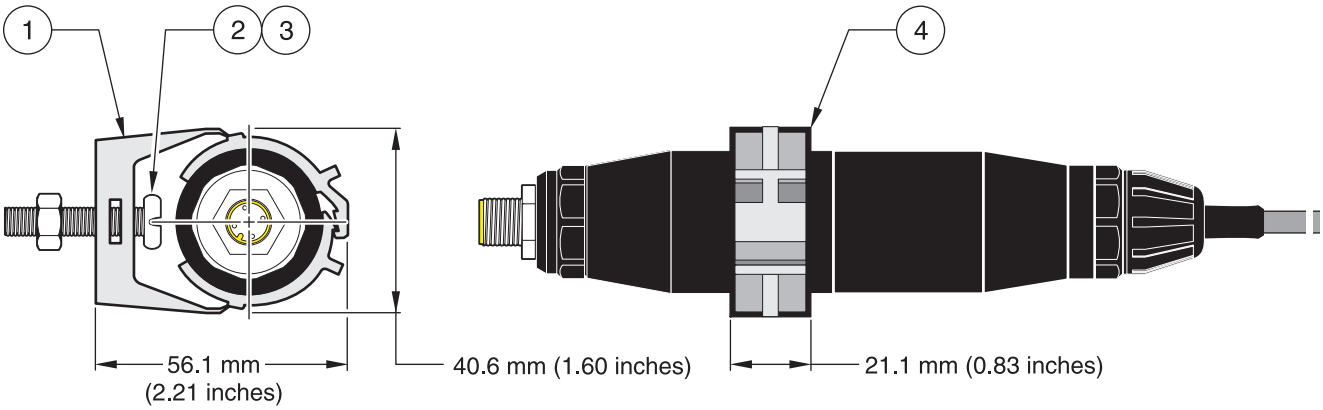
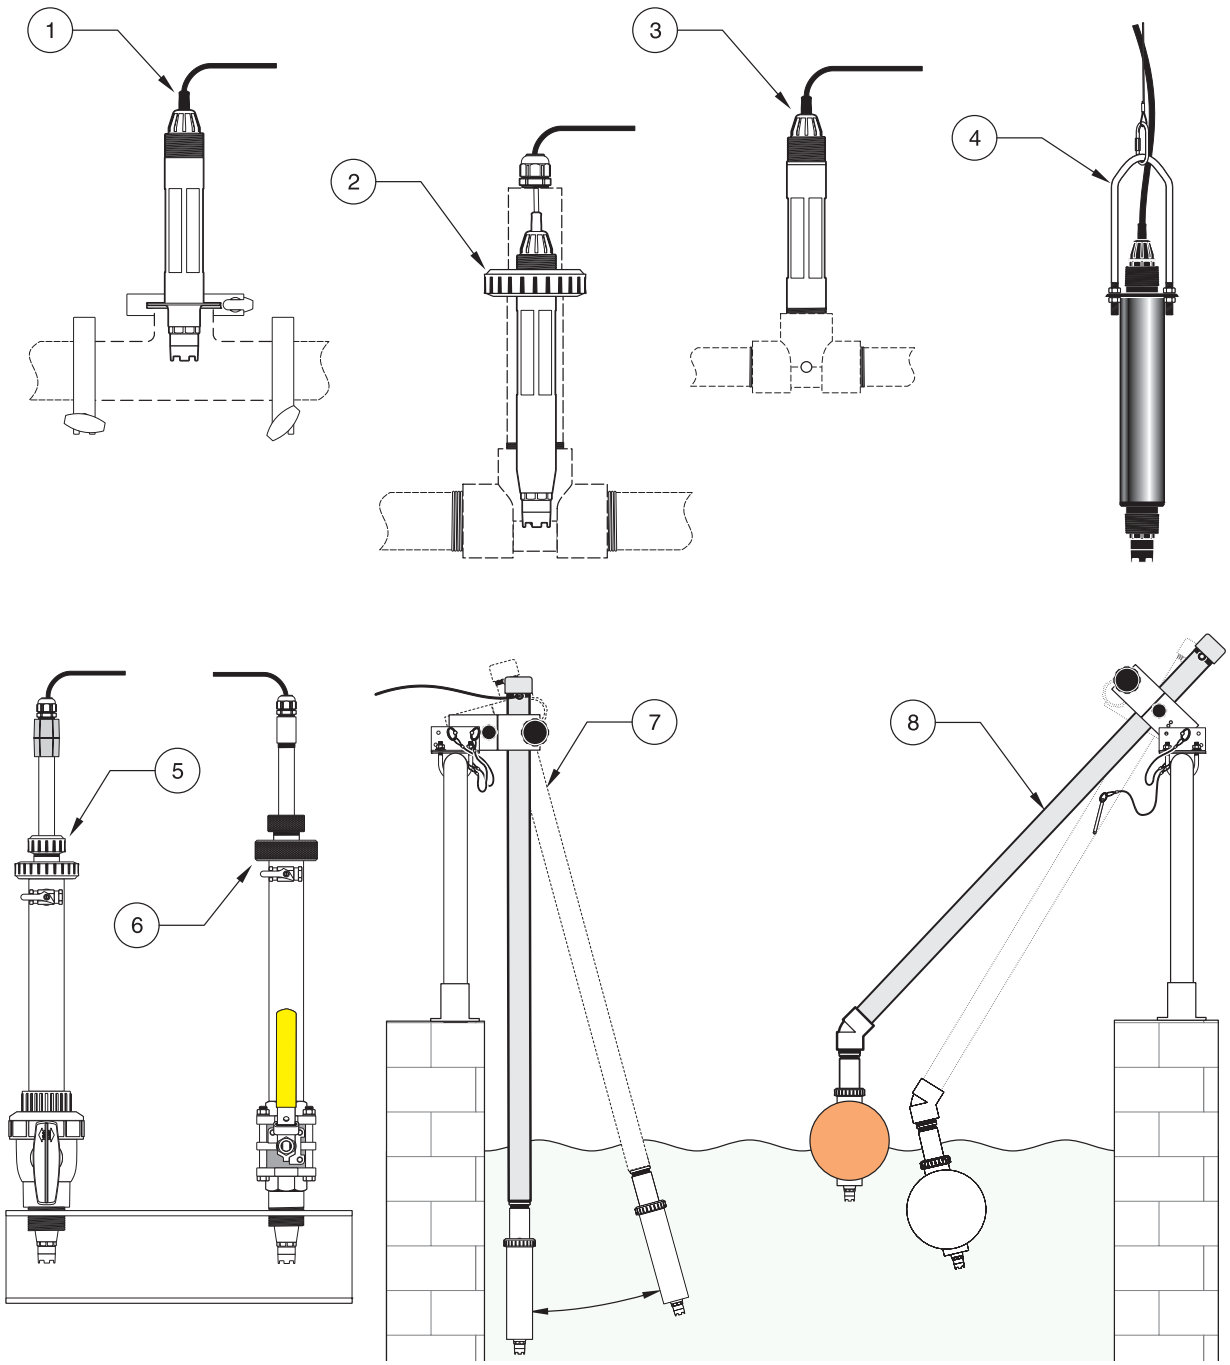


1. Mounting Clip	**14.** Hex Nut, ¼-28
13. Screw, pan head, ¼-28 x 1.25-in.	**15.** Mount clip, insert digital gateway, squeeze clip closed.

3.4 Installing the Sensor in the Sample Stream

Figure 12 Sensor Installation Examples

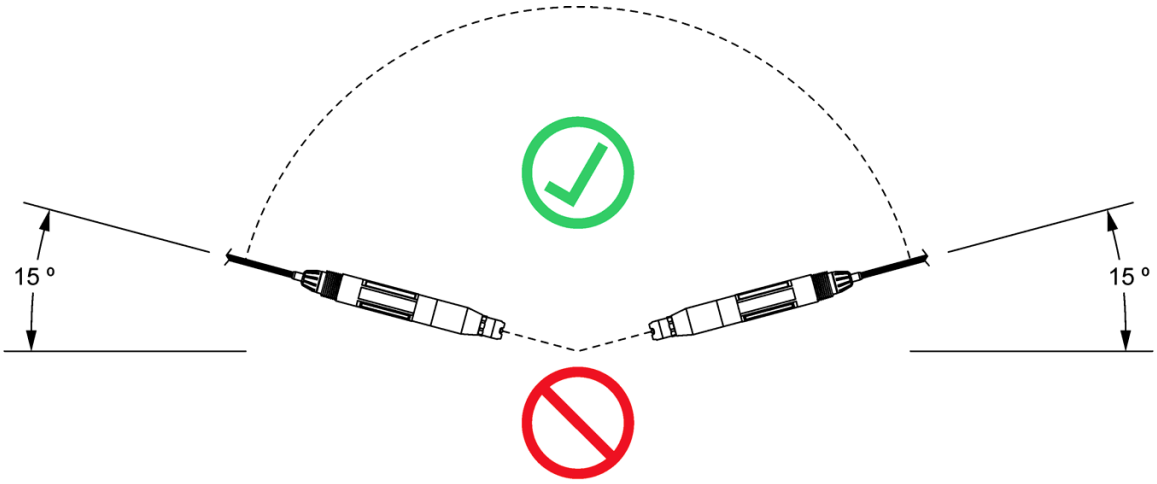


1. Sanitary mount	**19.** PVC Insertion mount
16. Union mount	**20.** Stainless steel insertion mount
17. Flow-through mount	**21.** Immersion mount
18. Hanging stainless steel sensor with the bale	**22.** Immersion mount, ball float

- Install the sensor so the sample contacts is representative of the entire process.
- Mount the sensor at least 508 mm (20 in) from the aeration basin wall, and immerse it at least 508 mm (20 in) into the process.

- Install the sensor using the instructions supplied with the installation apparatus. See Figure 12 for suggested mounting configurations.
- Sensor must be mounted at least 15º above horizontal. See Figure 13.

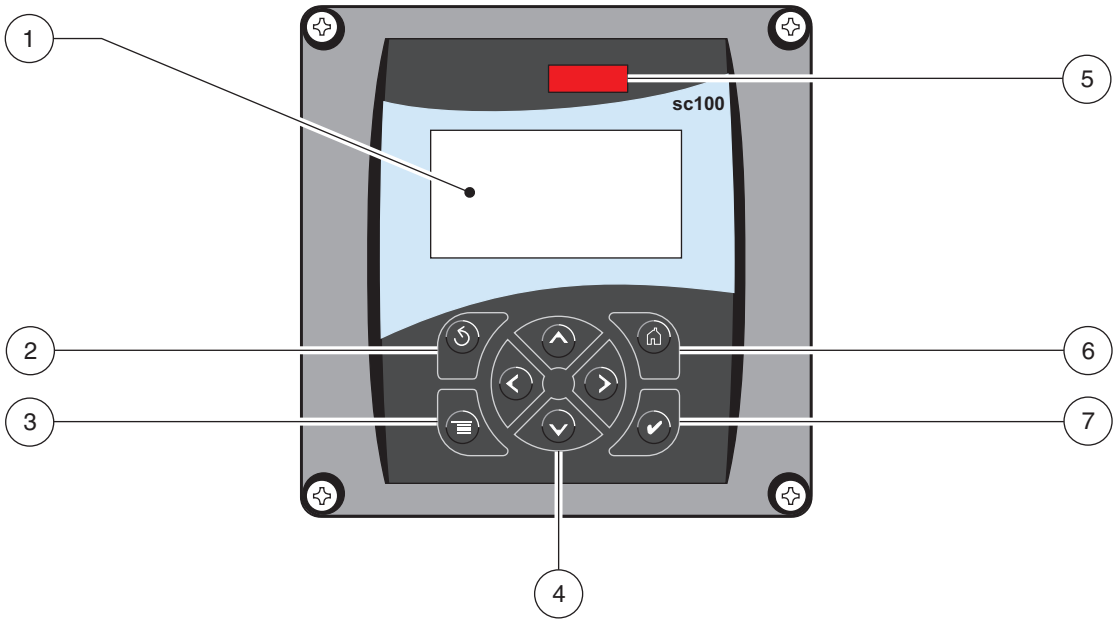
Figure 13 Sensor Mounting Angle



4.1 Using the sc100 Controller

The front of the controller is shown in Figure 14. The keypad consists of the eight keys described in Table 5.

Figure 14 Front of the Controller



1. Instrument display	**26.** IrDA window
23. BACK key	**27. HOME** key
24. MENU key	**28. ENTER** key
25. RIGHT, **LEFT**, **UP**, and **DOWN** keys	

Table 5 Controller Key Functions/Features

Number	Key	Function
2	back	Moves back one level in the menu structure.
3	menu	Moves to the main menu from other menus. This key is not active in menus where a selection or other input must be made.
4		Navigates through the menus, changes settings, and increments and decrements digits.
5	home	Moves to the Main Measurement screen from any other screen. This key is not active in menus where a selection or other input must be made.
6	enter	Accepts an input value, updates, or accepts displayed menu options.

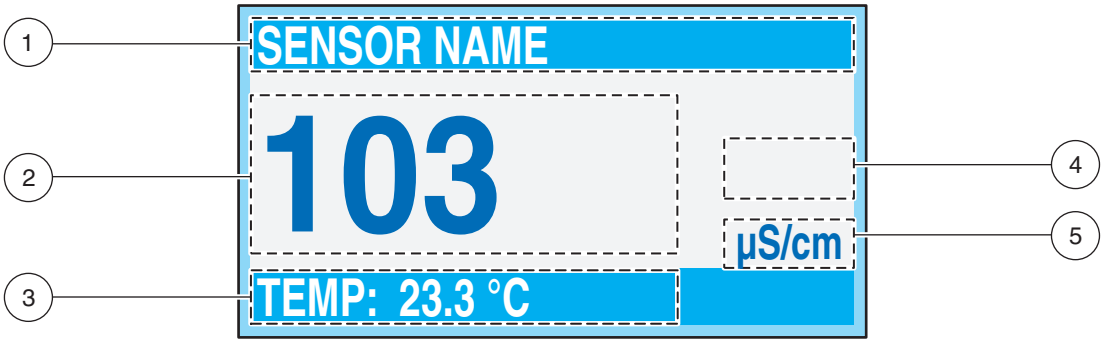
4.1.1 Controller Display Features

When a sensor is connected and the controller is in measurement mode, the controller display will show the current conductivity reading plus the sample temperature.

The display will flash on startup, when a sensor error has occurred, when the hold outputs function has been activated, and when a sensor is being calibrated.

An active system warning will cause the warning icon (a triangle with an exclamation point inside) to be displayed on the right side of the display.

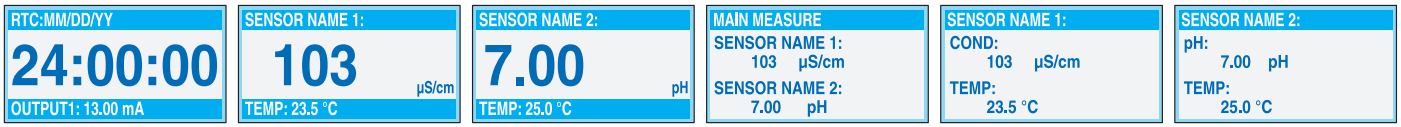
Figure 15 Display



1. Status bar. Indicates the sensor name and status of relays. The relay letter is displayed when the relay is energized.	**30.** Secondary measurement
	31. Warning icon area
29. Main measurement	**32.** Measurement units (µS, mS, S, mohm, TDS)

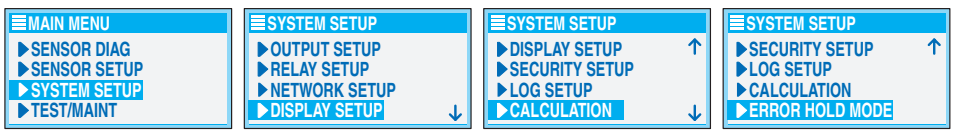
4.1.2 Important Key Presses

- Press the **HOME** key then the **RIGHT** or **LEFT** key to display two readings when two sensors are connected. Continue to press the **RIGHT** or **LEFT** key to toggle through the available display options as shown below.



- Press the **UP** and **DOWN** keys to toggle the status bar at the bottom of the measurement display to display the secondary measurement (temperature) and output information.

- When in Menu mode, an arrow may appear on the right side of the display to indicate that more menus are available. Press the **UP** or **DOWN** key (corresponding to the arrow direction) to display additional menus.



4.2 Using the sc1000 Controller

The sc1000 is a touch screen application. Use your finger to touch keys and menu commands. In normal operation the touch screen displays the measured values for the sensors selected.

4.2.1 Display Features

4.2.1.1 Using the Pop-up Toolbar

The pop-up toolbar provides access to the controller and sensor settings. The toolbar is normally hidden from view. To view the toolbar, touch the bottom-left of the screen.

Figure 16 Pop-up Toolbar Functions

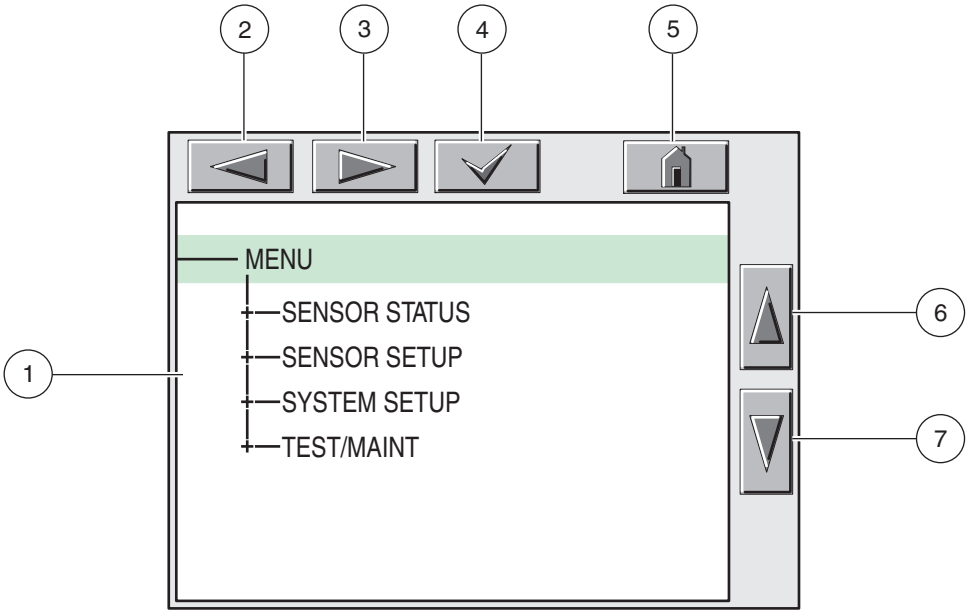
	MAIN MENU–displays the Main Menu Structure
	UP Arrow–scrolls up to the previous displayed value.
	Displays one value.
	Displays two values at the same time.
	Displays four values at the same time.
	LIST–displays the list of connected devices and sensors.
	DOWN Arrow–scrolls down to the next displayed value.

4.2.1.2 Using the Menu Windows

If the Menu button (from the pop-up toolbar) is selected, the Main Menu screen is opened. The Main Menu screen allows the user to view the sensor status, configure the sensor setup, system setup, and perform diagnostics.

The menu structure may vary depending on the configuration of the system.

Figure 17 Main Menu



1.	Display Area
33.	**BACK**
34.	**FORWARD**
35.	**ENTER**–confirms the entry or selection.
36.	**HOME**–changes to the display of measured values. The pop-up toolbar cannot open from the menu window. To view the Main Menu from this display, touch the Home button and then the bottom of the screen.
37.	**UP**–scrolls up
38.	**DOWN**–scrolls down

4.2.1.3 Navigating the Menu Windows

To view a menu item, touch the menu item or use the **UP** and **DOWN** keys to highlight the item. The menu item remains highlighted for approximately 4 seconds after it is selected. To view the highlighted command, select the area to the left of the menu item or select the **ENTER** button.

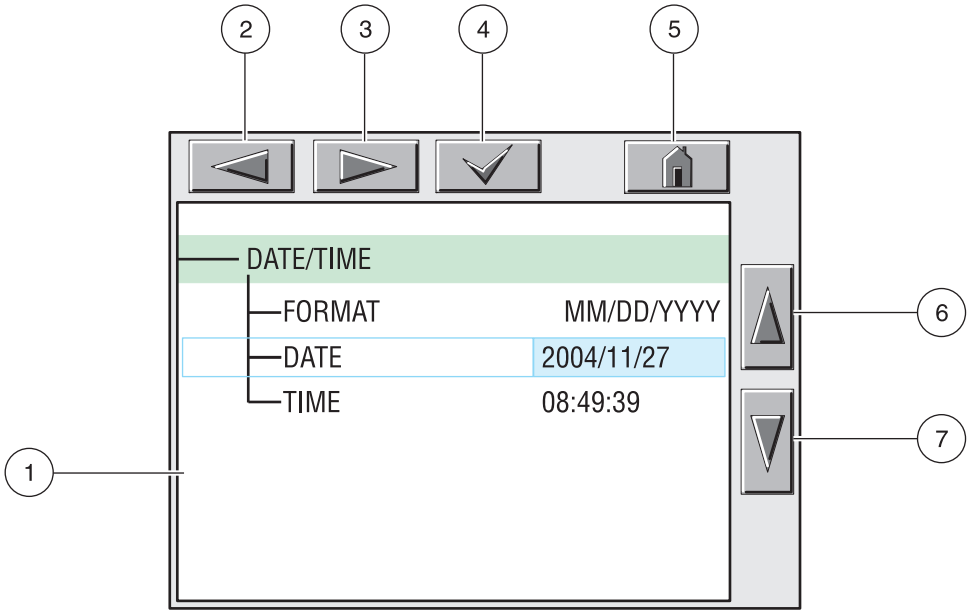
A "**+**" next to a menu command indicates there is a submenu. Touch the "+" to view the submenu. An "**i**" next to a menu command indicates it is information only.

If a menu item is editable, highlight the item and touch the far-left part of the menu item until it is highlighted and press **ENTER** or double-tap the highlighted item. A keypad will be displayed to change an entry (Figure 19 on page 25) or a list box will be displayed (Figure 20 on page 26).

Messages are displayed in the message window (Figure 21 on page 26).

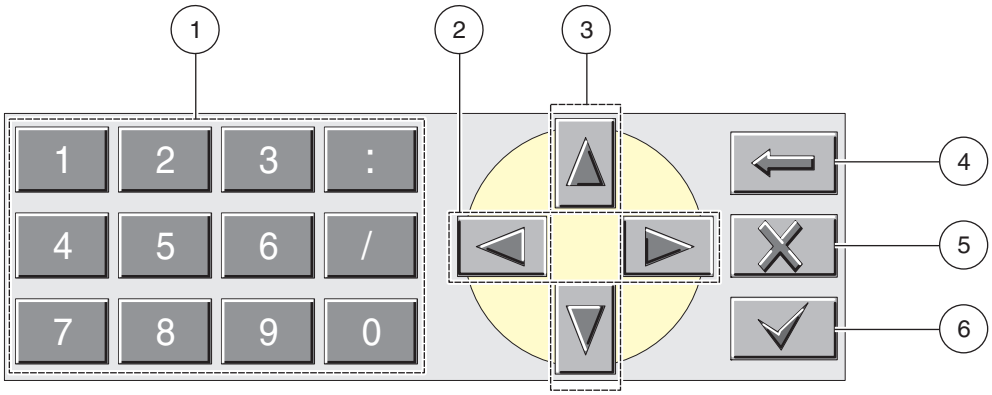
If an entry is incorrect, repeat the entry with the correct values. If the entry is outside the working range, a correction to the entry is made automatically.

Figure 18 Changing a Menu Item



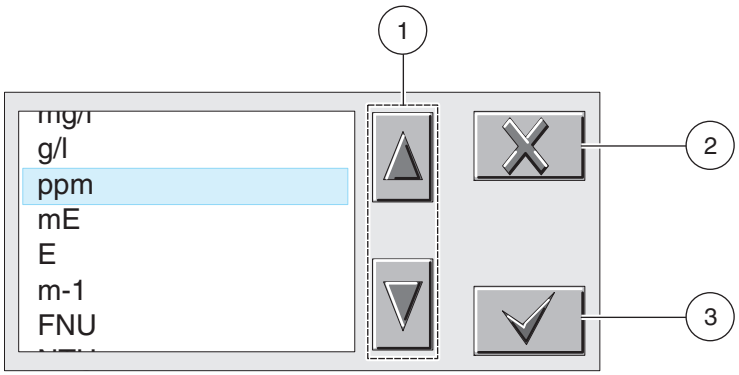
1. Display Area	**42.** **HOME**–changes to the display of measured values.
39. **BACK**	**43.** **UP**–scrolls up
40. **FORWARD**	**44.** **DOWN**–scrolls down
41. **ENTER**–confirms the entry or selection.	

Figure 19 Keypad



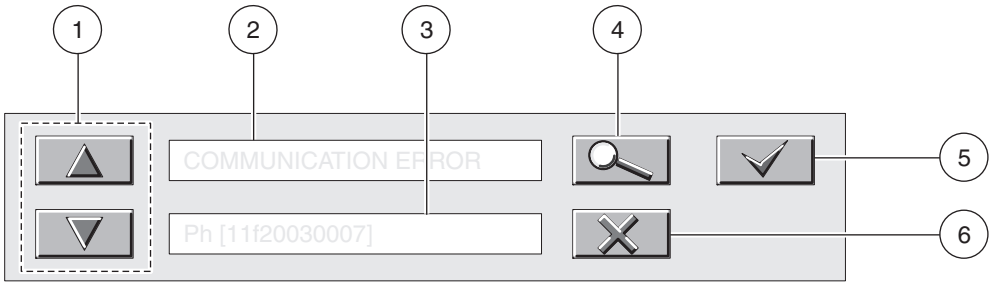
1. Enters numbers or the character as shown on the button.
45. Moves the cursor one position to the left or to the right.
46. Increase/Decrease a number or letter at the cursor position. Keep the button pressed to change the numbers/characters continuously.
47. Deletes the character to the left of the cursor.
48. **CANCEL**–cancels the entry.
49. **ENTER**–confirms the entry or selection.

Figure 20 List Box



1.	Scrolls up or down
50.	**CANCEL**–cancels and entry.
51.	**ENTER**–confirms a selection.

Figure 21 Message window



1.	Scrolls up or down.
52.	Displays the messages or warnings.
53.	Displays details on the selected entry.
54.	This button changes back to the previous display.
55.	**ENTER**–confirms an entry.
56.	**CANCEL**–cancels an entry.

Section 5 Operation

5.1 Sensor Setup

When a sensor is initially installed, the serial number of the sensor will be displayed as the sensor name. To change the sensor name refer to the following instructions:

1. Select Main Menu.
2. From the Main Menu, select SENSOR SETUP and confirm.
3. Highlight the appropriate sensor if more than one sensor is attached and confirm.
4. Select CONFIGURE and confirm.
5. Select EDIT NAME and edit the name. Confirm or cancel to return to the Sensor Setup menu.

5.2 Sensor Data Logging

The sc controller provides one data log and one event log for each sensor. The data log stores the measurement data at selected intervals. The event log stores a variety of events that occur on the devices such as configuration changes, alarms, warning conditions, etc. The data log and the event log can be read out in a CSV format. For downloading the logs please refer to the controller user manual.

5.3 Sensor Diagnostics Menu for pH and ORP Menu

SELECT SENSOR (if more than one sensor is attached)

STATUS	
ERROR LIST	See section 7.1 on page 37.
WARNING LIST	See section 7.2 on page 37.

5.4 pH Sensor Setup Menu

SELECT SENSOR (if more than one sensor is attached)

CALIBRATE	
1-POINT AUTO	Calibration with a single buffer — normally pH 7.
2-POINT AUTO	Calibration with two buffers — normally pH 7 and pH 4 or 10.
1-POINT MANUAL	Calibration against a single known sample.
2-POINT MANUAL	Calibration against two samples, both with a known pH.
TEMP ADJUST	Adjust the displayed temperature by up to ± 15 °C.
DEFAULT SETUP	Restores the system to the original factory calibration.

5.4 pH Sensor Setup Menu (continued)

CONFIGURE	
EDIT NAME	Enter a 10-digit name in any combination of symbols and alpha or numeric characters.
SELECT MEASURE	Select the appropriate measurement units to display.
DISPLAY FORMAT	Select the measurement resolution (xx.xx pH or xx.x pH).
TEMP UNITS	Choose from the displayed options (°C or °F).
LOG SETUP	Choose SENSOR INTERVAL to set the sensor log interval or select TEMP INTERVAL to set the temperature log interval.
REJECT FREQUENCY	Choose 50 or 60 Hz depending on the power line frequency for optimal noise rejection. Default is 60 Hz.
FILTER	Select 0–60 second signal averaging time.
TEMP ELEMENT	Select type of temperature element from the displayed choices.
SELECT BUFFER	Select the buffer type (standard 4, 7, 10 or DIN 19267) from the displayed choices.
PURE H20 COMP	Allows the user to specify that ammonia, morpholine, or other user-defined electrolyte is being used in the application, allowing a temperature-dependent linear slope factor to be applied to the measured pH.
CAL DAYS	Number of days since the last calibration. Default notification at 60 days.
SENSOR DAYS	Number of days the sensor has been in operation. Default notification at 365 days.
DEFAULT SETUP	Resets all user-editable options to their factory-defaults.
DIAG/TEST	
PROBE INFO	Display the sensor type, entered name of the sensor (Default: sensor serial number.), the sensor serial number, the software version number, and the sensor driver version number.
CAL DATA	Displays the pH slope and the date of the last calibration
SIGNAL	SENSOR SIGNAL: Displays the sensor output in mV SENSOR ADC COUNTS: Displays the sensor ADC counts TEMP ADC COUNTS: Displays raw data for temperature ADC counts. ADC counts are comparable to A/D counts and are for sensor electronic diagnostic purposes only. ELECTRODE STATE: Identifies the state of the electrode (good or bad) depending on whether the impedance is within preset limits. ACTIVE ELECT: Displays the impedance (Mohms) of the active electrode if Imped Status is set to Enabled. REF. ELECTRODE: Displays the impedance (Mohms) of the reference electrode if Imped Status is set to Enabled. IMPED STATUS: Sensor diagnostic. Choose Enabled or Disabled.
COUNTERS	SENSOR DAYS: displays the cumulative days the sensor has been in use. RESET SENSOR: Allows the sensor counter to be reset to zero. ELECTRODE DAYS: Cumulative days the electrode has been in use.

5.5 ORP Sensor Setup Menu

SELECT SENSOR (if more than one sensor is attached)

CALIBRATE	
1-POINT MANUAL	Calibration against a single known sample.
TEMP ADJUST	Adjust the displayed temperature by up to ± 15 °C.
DEFAULT SETUP	Restores the system to the original factory calibration.
CONFIGURE	
EDIT NAME	Enter up to a 10-digit name in any combination of symbols and alpha or numeric characters. Press **ENTER** when the entry is complete. The name will be displayed on the status line with the measurement value.
SELECT SENSOR	Choose from the displayed sensor type (pH or ORP).
TEMP UNITS	Choose from the displayed options (°C or °F).
LOG SETUP	Choose SENSOR INTERVAL to set the sensor log interval or select TEMP INTERVAL to set the temperature log interval.
AC FREQUENCY	Choose 50 or 60 Hz depending on the power line frequency for optimal noise rejection. Default is 60 Hz.
FILTER	Select 0–60 second signal averaging time.
TEMP ELEMENT	Select type of temperature element from the displayed choices.
SELECT BUFFER	Select the buffer type (standard 4, 7, 10 or DIN 19267) from the displayed choices.
PURE H20 COMP	Allows the user to specify that ammonia, morpholine, or other user-defined electrolyte is being used in the application, allowing a temperature-dependent linear slope factor to be applied to the measured pH.
CAL DAYS	Number of days since the last calibration. Default notification at 60 days.
SENSOR DAYS	Number of days the sensor has been in operation. Default notification at 365 days.
IMPED LIMITS	Set min/max electrode sensor impedance limits.
DEFAULT SETUP	Resets all user-editable options to their factory-defaults.
DIAG/TEST	
PROBE INFO	Display the sensor type, entered name of the sensor (Default: sensor serial number.), the sensor serial number, the software version number, and the sensor driver version number.
CAL DATA	Displays the pH slope and the date of the last calibration
SIGNAL	SENSOR SIGNAL: displays the sensor output in mV SENSOR ADC COUNTS: displays the sensor ADC counts TEMP ADC COUNTS: shows raw data for temperature ADC counts. ADC counts are comparable to A/D counts and are for sensor electronic diagnostic purposes only. ELECTRODE STATE: Identifies the state of the electrode (good or bad) depending on whether the impedance is within preset limits. ACTIVE ELECT: Shows the impedance (Mohms) of the active electrode if Imped Status is set to Enabled. REF. ELECTRODE: Shows the impedance (Mohms) of the reference electrode if Imped Status is set to Enabled. IMPED STATUS: Sensor diagnostic. Choose Enabled or Disabled.
COUNTERS	SENSOR DAYS: displays the cumulative days the sensor has been in use. RESET SENSOR: allows the sensor counter to be reset to zero. ELECTRODE DAYS: Cumulative days the electrode has been in use.

5.6 pH Calibration

The manufacturer offers one and two point automatic and manual calibrations for pH. An automatic calibration identifies the buffer table corresponding to the chosen buffer and automatically calibrates the probe after it stabilizes. A manual calibration is performed by placing the pH sensor in any buffer or sample with a known value and then entering that known value into the controller.

The value of the sample used in the manual calibration may be determined by laboratory analysis or comparison reading.

1. From the Main Menu, select SENSOR SETUP and confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and confirm.
4. Select 1 POINT AUTO. Select the available Output Mode (Active, Hold, or Transfer) and confirm.
5. Move the clean probe to buffer and confirm to continue.
6. Confirm when stable. A screen will display 1 Point Auto Complete and the slope (XX.X mV/pH).
7. Return the probe to process.

5.6.1 Two Point Automatic Calibration

1. From the Main Menu, select SENSOR SETUP and confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and confirm.
4. Select 2 POINT AUTO. Select the available Output Mode (Active, Hold, or Transfer) and confirm.
5. Move the clean probe to Buffer 1 and confirm.
6. Confirm when stable.
7. Move the clean probe to Buffer 2 and confirm.
8. Confirm when stable. A screen will display 2 Point Calibration Complete and the slope (XX.X mV/pH).
9. Return the probe to process.

5.6.2 One Point Manual Calibration

1. From the Main Menu, select SENSOR SETUP and confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and confirm.

4. Select 1 POINT MANUAL. Select the available Output Mode (Active, Hold, or Transfer) and confirm.

5. Move the clean probe to solution and confirm to continue.

6. Confirm when stable. Edit the solution value and confirm.

7. Confirm when stable. A screen will display 1 Point Manual Complete and the slope (XX.X mV/pH).

8. Return the probe to process.

5.6.3 Two Point Manual Calibration

1. From the Main Menu, select SENSOR SETUP and confirm.

2. Select the appropriate sensor if more than one is attached and confirm.

3. Select CALIBRATE and confirm.

4. Select 2 POINT MANUAL CAL. Select the available Output Mode (Active, Hold, or Transfer) and confirm.

5. Move the clean probe to Solution 1 and confirm.

6. Confirm when stable. Edit the solution value and confirm.

7. Move probe to solution 1 and confirm.

8. Confirm when stable. Edit the solution value and confirm.

9. A screen will display 2 Point Manual Cal Complete and the slope (XX.X mV/pH).

10. Return the probe to process.

5.7 ORP Calibration

The manufacturer offers a one point manual calibration for ORP. The value of the sample used in the manual calibration may be determined by laboratory analysis or comparison reading.

1. From the Main Menu, select SENSOR SETUP and confirm.

2. Select the appropriate sensor if more than one is attached and confirm.

3. Select CALIBRATE and confirm.

4. Select 1 POINT MANUAL CAL. Select the available Output Mode (Active, Hold, or Transfer) and confirm.

5. Move the clean probe to Solution and confirm.

6. Confirm when stable. Edit the solution value and confirm.

7. A screen will display 1 Point Manual Complete and the slope (XX.X mV).

8. Return the probe to process.

5.8 Concurrent Calibration of Two Sensors for pH and ORP

1. Begin a calibration on the first sensor and continue until “Wait to Stabilize” is displayed.
2. Select LEAVE and confirm. The display will return to the main measurement screen. The reading for the sensor currently being calibrated will flash.
3. Begin the calibration for the second sensor and continue until “Wait to Stabilize” is displayed.
4. Select LEAVE and confirm. The display will return to the main measurement screen and the reading for both sensors will flash. The calibration for both sensors are now running in the background.
5. To return to the calibration of either sensor select SENSOR SETUP from the Main Menu and confirm. Select the appropriate sensor and confirm.
6. The calibration in progress will be displayed. Continue with the calibration.

5.9 Adjusting the Temperature

View or change the temperature using the steps below.

1. From the Main Menu, select SENSOR SETUP and confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and confirm.
4. Select TEMP ADJUST and confirm.
5. Select MEASURED TEMP and confirm.
6. The temperature will be displayed. Edit the temperature and confirm.

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

DANGER
Seul un technicien qualifié peut effectuer les tâches d'installation décrites dans cette section du manuel.

DANGER
Explosion hazard. Do not connect or disconnect equipment unless power has been switched off or the area is known to be non-hazardous.

DANGER
Risque d'explosion. Couper le courant ou s'assurer que l'emplacement est designe non dangereux avant de replacer le aucon composant.

DANGER
Explosion hazard. Substitution of components may impair suitability for Class 1, Division 2.

DANGER
Risque d'explosion. La substitution de composants peut rendre ce materiel inacceptable pour les emplacements de Classe 1, Division 2..

6.1 Maintenance Schedule

Maintenance Task	90 days	Annually
Clean the sensor[1]	x	
Inspect sensor for damage	x	
Replace Salt Bridge and fill solution[2]		x
Calibrate Sensor (as required by regulatory agency)	**Per the schedule mandated by your regulatory agency.**	

[1] Cleaning frequency is application dependent. More or less frequent cleaning will be appropriate in some applications.
[2] Salt bridge replacement frequency is application dependent. More or less frequent replacement will be appropriate in some applications

6.2 Cleaning the Sensor

CAUTION
Before cleaning with acid, determine if the chemical reaction between the acid and the sample will create a hazardous chemical reaction. (For example, do not put a sensor that is used in a cyanide bath directly into a strong acid for cleaning because this chemical combination may produce poisonous cyanide gas.)

1. Clean the exterior of the sensor with a stream of water. If debris remains remove loose contaminate buildup by carefully wiping the entire measuring end of the sensor (process electrode, concentric metal ground electrode, and salt bridge) with a soft clean cloth. Rinse the sensor with clean, warm water.

2. Prepare a mild soap solution of warm water and dish detergent or other non-abrasive soap that does not contain lanolin such as laboratory glass cleaner.

Note: *Lanolin will coat the glass process electrode and can adversely affect sensor performance.*

3. Soak the sensor for 2 to 3 minutes in the soap solution.

4. Use a small soft bristle brush (such as a toothbrush) and scrub the entire measuring end of the sensor, thoroughly cleaning the electrode and salt bridge surfaces. If surface deposits cannot be removed by detergent solution cleaning, use muriatic acid (or other dilute acid) to dissolve them. The acid should be as dilute as possible. Experience will determine which acid to use and the appropriate dilution ratio. Some stubborn coatings may require a different cleaning agent. For assistance, contact Technical and Customer Service (U.S.A. only) on page 43.

DANGER
Acids are hazardous. Always wear appropriate eye protection and clothing in accordance with material safety data sheet recommendations.

5. Soak the entire measuring end of the sensor in dilute acid for no more than 5 minutes. Rinse the sensor with clean, warm water then place the sensor back into the mild soap solution for 2 to 3 minutes to neutralize any remaining acid.

6. Remove the sensor from the soap solution, and rinse the sensor again in clean, warm water.

7. After cleaning, always calibrate the measurement system.

6.2.1 Replacing the Standard Cell Solution and Salt Bridge

If calibration cannot be attained, rejuvenate the sensor by replacing its standard cell solution and salt bridge as shown in Figure 22. If calibration is still not possible, refer to Section 7 on page 37.

1. To remove the salt bridge, hold the sensor upright (electrode at top), and use pliers or a similar tool to turn it counterclockwise. Take care not to damage the protruding process electrode. Properly discard the old salt bridge.

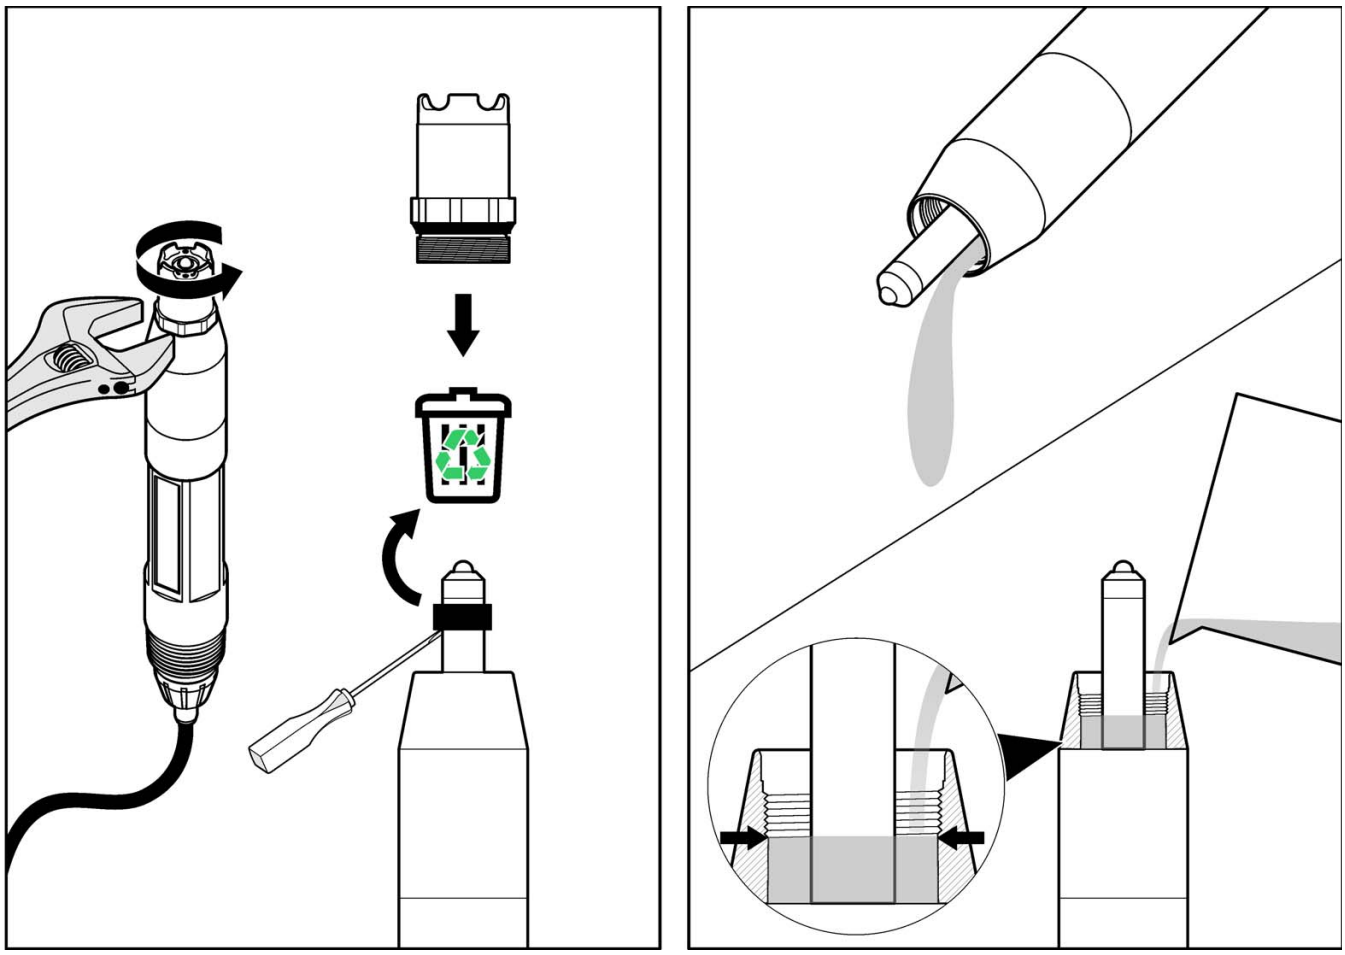
2. Replace the standard cell solution in the sensor reservoir.

   a. Pour out the aged solution, and thoroughly flush the reservoir with standard cell solution.

   b. Fill the reservoir to the bottom of the salt bridge mating threads with fresh standard cell solution (Cat. No. 25M1A1025-115).

3. Carefully thread the new salt bridge clockwise until it is finger-tight and the bottom surface of the salt bridge is in full contact with the top surface of the sensor body. Tighten the salt bridge another ½ turn with the wrench or tool.

Figure 22 Replacing Standard Cell Solution and Salt Bridge



Section 7 Troubleshooting

7.1 Error Codes

When a sensor is experiencing an error condition, the sensor reading on the measurement screen will flash and all relays and analog outputs associated with the sensor will be held. The following conditions will cause the sensor reading to flash:

- Sensor calibration
- Relay timer washing cycle
- Loss of communication

Highlight the Sensor Diag menu and press **ENTER**. Highlight Errors and press **ENTER** to determine the cause of the error.

Errors are defined in Table 6.

Table 6 Error Codes

Displayed Error	Definition	Resolution
ADC FAILURE	System measurement fails	Contact Technical Consulting Services.

7.2 Warnings

A sensor warning will leave all menus, relays, and outputs functioning normally, but will cause a warning icon to flash on the right side of the display. Highlight the Sensor Diag menu and press **ENTER** to determine the cause of the warning.

A warning may be used to trigger a relay and users can set warning levels to define the severity of the warning. Errors are defined in Table 7.

Table 7 Warning Codes

Displayed Warning	Definition	Resolution
PROBE OUT RANGE	Measured pH/ORP exceeds the expected value range.	Contact Technical Consulting Services.
TEMP OUT RANGE	Measured temperature exceeds the expected value range.	Contact Technical Consulting Services.
FLASH FAILURE	System flash memory write has failed.	Contact Technical Consulting Services.
ACTIVE. ELEC	Standard electrode is not performing within the required specifications.	Contact Technical Consulting Services.
REF. ELECTRODE	Reference electrode is not performing within the required specifications.	Contact Technical Consulting Services.
CAL REQUIRED	60 days has elapsed since the last calibration	Perform a calibration.
REPLACE SENSOR	One year has elapsed since the sensor has been installed.	Clean the sensor and replace the salt bridge and standard cell solution (see section 6.2 on page 34 and section 6.2.1 on page 35). Reset the counter in the SENSOR SETUP>CONFIGURE> SENSOR DAYS menu. If necessary, replace the sensor.

7.3 Troubleshooting the pH Sensor

Clean the sensor using the procedure described in section 6.2 on page 34. If the measuring system cannot be calibrated after cleaning, replace the standard cell solution and salt bridge (see section 6.2.1 on page 35) and try calibrating again. If the measuring system still cannot be calibrated, check the sensor operation.

Some simple tests using the sc100 or a multimeter and two pH buffers will determine if the pH sensor is operating properly. The use of pH 7 and pH 4 buffers is preferred but pH 10 can be used in place of pH 4 if it more closely covers the measurement range of interest.

Determine if the sensor has integral digital electronics or uses an external digital gateway. If the sensor uses a digital gateway, it will be hard-wired to the gateway through terminal connections inside the digital gateway enclosure. If the sensor uses the digital gateway and therefore does not have integral digital electronics, proceed with section 7.3.1. If the sensor has integral digital electronics, move to section 7.3.2 on page 39.

7.3.1 Troubleshooting a pH Sensor without Integral Digital Electronics

1. Disconnect the red, green, yellow, and black sensor wires from the digital gateway.

2. Place the sensor in a pH 7 buffer. Before continuing, allow the temperatures of the sensor and buffer to equalize to approximately 25 °C (70 °F).

3. Verify that the sensor temperature element (300 ohm thermistor) is operating properly by measuring the resistance between the yellow and black wires. The reading should be between 250 and 350 ohms at approximately 25 °C (70 °F).

4. Reconnect the yellow and black wires.

5. Connect the multimeter (+) lead to the red wire and (–) lead to the green wire. With the sensor in the pH 7 buffer, measure the dc millivolts. The sensor offset reading should be within the factory-specified limits of –50 and +50 mV. If it is, record the millivolt value reading and continue with step 6. If the reading is outside these limits, discontinue this test and contact Technical Support.

6. With the multimeter still connected, rinse the sensor with water and place it in either pH 4 or pH 10 buffer. Allow the temperatures of the sensor and buffer to equalize to approximately 25 °C (70 °F) then measure the sensor span reading as shown in Table 8 and Table 9 on page 39.

Span Reading in pH 4 Buffer
With the sensor in pH 4 buffer, the sensor span reading should be at least +160 mV more than the offset reading taken in step 5.

Table 8 Typical Span Reading Examples (pH 4 buffer)

Offset Reading (in pH 7 buffer)	Span Reading (in pH 4 buffer)
–50 mV	+110 mV
–25 mV	+135 mV
0 mV	+160 mV
+25 mV	+185 mV
+50 mV	+210 mV

Span Reading in pH 10 Buffer
With the sensor in pH 10 buffer, the sensor span reading should be at least –160 mV less than the noted offset reading taken in step 5.

Table 9 Typical Span Reading Examples (pH 10 buffer)

Offset Reading (in pH 7 buffer)	Span Reading (in pH 10 buffer)
–50 mV	–210 mV
–25 mV	–185 mV
0 mV	–160 mV
+25 mV	–135 mV
+50 mV	–110 mV

If the span reading is at least +160 mV more than or –160 mV less than the offset reading in pH 4 or pH 10, respectively, the sensor is within factory-specified limits. If not, contact Technical Support.

7.3.2 Troubleshooting the pH Sensor with Integral Digital Electronics

1. Place the sensor in pH 7 buffer and allow the buffer and sensor to reach temperature equilibrium. This can be verified by monitoring the sensor temperature value for a stable temperature measurement. This value is shown on the sc100 display when it is in measurement mode.

2. From the Sensor Setup Menu on the sc100, highlight “Diag/Test” and press **ENTER**.

3. Highlight “Sensor Signal” and press **ENTER**. This sensor offset reading should be within factory-specified limits of –50 and +50 mV. If it is, write down this millivolt value reading and perform step 4. If the reading is outside these limits, discontinue this test and contact Technical Support.

4. Rinse the sensor and place it in pH 4 or 10 buffer and allow the buffer and sensor to reach temperature equilibrium. This can be verified by monitoring the sensor temperature value for a stable temperature measurement. This value is located on the sc100 display when it is in measurement mode.

5. From the Sensor Setup Menu on the sc100, highlight “Diag/Test” and press **ENTER**.

6. Highlight “Sensor Signal” and press **ENTER**. Then measure the sensor span value.

Span Reading in pH 4 Buffer
With the sensor in pH 4 buffer, the sensor span reading should be at least +160 mV more than the offset reading as shown in Table 10 and Table 11.

Table 10 Typical Span Reading Examples (pH 4 buffer)

Offset Reading (in pH 7 buffer)	Span Reading (in pH 4 buffer)
–50 mV	+110 mV
–25 mV	+135 mV
0 mV	+160 mV
+25 mV	+185 mV
+50 mV	+210 mV

Span Reading in pH 10 Buffer
With the sensor in pH 10 buffer, the sensor span reading should be at least –160 mV less than the noted offset reading taken in step 6. Examples of typical readings:

Table 11 Typical Span Reading Examples (pH 10 buffer)

Offset Reading (in pH 7 buffer)	Span Reading (in pH 10 buffer)
–50 mV	–210 mV
–25 mV	–185 mV
0 mV	–160 mV
+25 mV	–135 mV
+50 mV	–110 mV

7. If the span reading is at least +160 mV more than or –160 mV less than the offset reading in pH 4 or pH 10, respectively, the sensor is within factory-specified limits. If not, contact Technical Support.

7.4 Checking ORP Sensor Operation

Simple tests using the sc100 or a multimeter and a 200 mV reference solution can determine if the ORP sensor is operating properly. Determine if the sensor has integral digital electronics or uses an external digital gateway. If the sensor uses a digital gateway, it will be hard-wired to the digital gateway through terminal connections within the digital gateway enclosure. If the sensor uses a digital gateway proceed with section 7.4.1. If the sensor has integral digital electronics, move to section 7.4.2 on page 40.

7.4.1 Troubleshooting the ORP Sensor without Integral Digital Electronics

1. Disconnect the red, green, yellow, and black sensor wires from the digital gateway.

2. Place the sensor in a 200 mV reference solution and allow the temperature of the sensor and reference solution to equalize to approximately 25 °C (70 °F).

3. Verify that the sensor temperature element (300 ohm thermistor) is operating by measuring the resistance between the yellow and black wires. The reading should be between 250 and 350 ohms at approximately 25 °C (70 °F).

4. Reconnect the yellow and black wires.

5. Connect the multimeter (+) lead to the red wire and (–) lead to the green wire. With the sensor in the 200 mV reference solution, measure the dc millivolts. The reading should be between 160 and 240 mV. If the reading is outside these limits, contact Technical Support.

7.4.2 Troubleshooting the ORP Sensor with Integral Digital Electronics

1. Place the sensor in 200 mV reference solution and allow the buffer and sensor to reach temperature equilibrium. This can be verified by monitoring the sensor temperature value for a stable temperature measurement. This value is located on the sc100 display when it is in measurement mode.

2. From the Sensor Setup Menu on the sc100, highlight “Diag/Test” and press **ENTER**. Highlight “Sensor Signal” and press **ENTER**. The reading should be between 160 and 240 mV. If the reading is outside these limits, contact Customer Service.

Section 8 Replacement Parts and Accessories

8.1 Replacement Items, Accessories, and Reagent and Standards

Item Description	QTY	Catalog Number
Air blast cleaning system, 115 V, includes Kynar® (PVDF) washer head with 7.6 m (25 ft) tubing and quick connect fitting, and a compressor in a NEMA 4X enclosure	each	1000A3335-005
Air blast cleaning system, 230 V, includes Kynar® (PVDF) washer head with 7.6 m (25 ft) tubing and quick connect fitting, and a compressor in a NEMA 4X enclosure	each	1000A3335-006
Air/Water blast cleaning head	each	1000A3335-004
Buffer, pH 7	500 mL (1 pint)	2283549
Buffer, pH 4	500 mL (1 pint)	2283449
Buffer, pH 10	500 mL (1 pint)	2283649
Buffer, pH 7	1 gallon	2283556
Buffer, pH 4	1 gallon	2283456
Buffer, pH 10	1 gallon	2283656
Buffer, pH 7	500 mL (1 pint)	2283549
Cable, interconnect, unterminated ends, specify length in whole feet	each	1W1100
Cable, sensor extension, 1 m (3 ft)	each	6122400
Cable, sensor extension, 7.7 m (25 ft)	each	5796000
Cable, sensor extension, 15 m (50 ft)	each	5796100
Cable, sensor extension, 31 m (100 ft)	each	5796200
Connector Cable	each	6139900
Instruction manual, Differential pH System, English	each	6120218
Plug, sealing, conduit opening	each	5868700
O-ring, Viton	each	5H1304
O-ring, EPDM	each	5H1306
O-ring, Perflouro	each	5H1096-019
ORP Standard Solution, 200 mV	500 mL (1 pint)	25M2A1001-115
ORP Standard Solution, 600 mV	500 mL (1 pint)	25M2A1002-115
ORP Standard Solution, 200 mV	1 gallon	25M2A1001-123
ORP Standard Solution, 600 mV	1 gallon	25M2A1002-123
Salt Bridge, PEEK® Body, PVDF outer junction	each	SB-P1SV
Salt Bridge Ryton® Body, PVDF outer junction	each	SB-R1SV
Standard Cell Solution	each	25M1A1025-115
Strain relief, Heyco	each	16664

Section 9 How to Order

U.S.A. Customers

By Telephone:
6:30 a.m. to 5:00 p.m. MST
Monday through Friday
(800) 227-HACH (800-227-4224)

By Fax:

Section 11 Limited Warranty

Hach Company warrants its products to the original purchaser against any defects that are due to faulty material or workmanship for a period of one year from date of shipment unless otherwise noted in the product manual.

In the event that a defect is discovered during the warranty period, Hach Company agrees that, at its option, it will repair or replace the defective product or refund the purchase price excluding original shipping and handling charges. Any product repaired or replaced under this warranty will be warranted only for the remainder of the original product warranty period.

This warranty does not apply to consumable products such as chemical reagents; or consumable components of a product, such as, but not limited to, lamps and tubing.

Contact Hach Company or your distributor to initiate warranty support. Products may not be returned without authorization from Hach Company.

Limitations

This warranty does not cover:

- Damage caused by acts of God, natural disaster, labor unrest, acts of war (declared or undeclared), terrorism, civil strife or acts of any governmental jurisdiction
- Damage caused by misuse, neglect, accident or improper application or installation
- Damage caused by any repair or attempted repair not authorized by Hach Company
- Any product not used in accordance with the instructions furnished by Hach Company
- Freight charges to return merchandise to Hach Company
- Freight charges on expedited or express shipment of warranted parts or product
- Travel fees associated with on-site warranty repair

This warranty contains the sole express warranty made by Hach Company in connection with its products. All implied warranties, including without limitation, the warranties of merchantability and fitness for a particular purpose, are expressly disclaimed.

Some states within the United States do not allow the disclaimer of implied warranties and if this is true in your state the above limitation may not apply to you. This warranty gives you specific rights, and you may also have other rights that vary from state to state.

This warranty constitutes the final, complete, and exclusive statement of warranty terms and no person is authorized to make any other warranties or representations on behalf of Hach Company.

Limitation of Remedies

The remedies of repair, replacement or refund of purchase price as stated above are the exclusive remedies for the breach of this warranty. On the basis of strict liability or under any other legal theory, in no event shall Hach Company be liable for any incidental or consequential damages of any kind for breach of warranty or negligence.

Section 12 Compliance Information

Hach Co. certifies this instrument was tested thoroughly, inspected and found to meet its published specifications when it was shipped from the factory.

The Model sc100/sc1000 Controller with Differential pH/ORP sensor has been tested and is certified as indicated to the following instrumentation standards:

Product Safety

UL 61010A-1 (ETL Listing # 65454)
CSA C22.2 No. 1010.1 (ETLc Certification # 65454)
Certified by Hach Co. to EN 61010-1 Amds. 1 & 2 (IEC1010-1) per 73/23/EEC, supporting test records by Intertek Testing Services.

Immunity

This equipment was tested for industrial level EMC per:

EN 61326 (EMC Requirements for Electrical Equipment for Measurement, Control and Laboratory Use) **per 89/336/EEC EMC:** Supporting test records by Hach Company, certified compliance by Hach Company.

Standards include:

IEC 1000-4-2:1995 (EN 61000-4-2:1995) Electrostatic Discharge Immunity (Criteria B)
IEC 1000-4-3:1995 (EN 61000-4-3:1996) Radiated RF Electromagnetic Field Immunity (Criteria A)
IEC 1000-4-4:1995 (EN 61000-4-4:1995) Electrical Fast Transients/Burst (Criteria B)
IEC 1000-4-5:1995 (EN 61000-4-5:1995) Surge (Criteria B)
IEC 1000-4-6:1996 (EN 61000-4-6:1996) Conducted Disturbances Induced by RF Fields (Criteria A)
IEC 1000-4-11:1994 (EN 61000-4-11:1994) Voltage Dip/Short Interruptions (Criteria B)

Additional Immunity Standard/s include:

ENV 50204:1996 Radiated Electromagnetic Field from Digital Telephones (Criteria A)

Emissions

This equipment was tested for Radio Frequency Emissions as follows:

Per **89/336/EEC** EMC: **EN 61326:1998** (Electrical Equipment for measurement, control and laboratory use—EMC requirements) Class “A” emission limits. Supporting test records by Hewlett Packard, Fort Collins, Colorado Hardware Test Center (A2LA # 0905-01) and certified compliance by Hach Company.

Standards include:

EN 61000-3-2 Harmonic Disturbances Caused by Electrical Equipment
EN 61000-3-3 Voltage Fluctuation (Flicker) Disturbances Caused by Electrical Equipment

Additional Emissions Standard/s include:

EN 55011 (CISPR 11), Class “A” emission limits

Canadian Interference-causing Equipment Regulation, IECS-003, Class A

Supporting test records by Hewlett Packard, Fort Collins, Colorado Hardware Test Center (A2LA # 0905-01) and certified compliance by Hach Company.

This Class A digital apparatus meets all requirements of the Canadian Interference-causing Equipment Regulations.
Cet appareil numèrique de la classe A respecte toutes les exigences du Rëglement sur le matÈriel brouilleur du Canada.

FCC PART 15, Class “A” Limits

Supporting test records by Hewlett Packard, Fort Collins, Colorado Hardware Test Center (A2LA # 0905-01) and certified compliance by Hach Company.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense. The following techniques of reducing the interference problems are applied easily.

1. Disconnect the Controller from its power source to verify that it is or is not the source of the interference.
2. If the Controller is connected into the same outlet as the device with which it is interfering, try another outlet.
3. Move the Controller away from the device receiving the interference.
4. Reposition the receiving antenna for the device receiving the interference.
5. Try combinations of the above.

Appendix A General pH Information

A.1 pH Measurement Theory

pH is the negative logarithm of the hydrogen ion activity and a measure of the acidity or alkalinity of a solution.

$$pH = -\log A[H+]$$

pH is normally measured using a glass electrode and a reference electrode.

The glass electrode acts as a transducer, converting chemical energy (the hydrogen ion activity) into an electrical energy (measured in millivolts). The reaction is balanced and the electrical circuit is completed by the flow of ions from the reference solution to the solution under test.

The electrode and reference solution together develop a voltage (emf) whose magnitude depends on the type of reference electrode, the internal construction of the glass electrode, the pH of the solution and the temperature of the solution. This voltage is expressed by the Nernst Equation:

$$E = E_o - (2.3\ RT/F) \times \log A[H+]$$
$$E = E_o - (\text{slope}) \times \log A[H+]$$

where:

E = the emf of the cell

E_o = the zero potential (isopotential) of the system. It depends on the internal construction of the glass and reference electrodes.

R = gas constant

T = temperature in Kelvin

A[H+] = activity of the hydrogen ion (assumed to be equivalent to the concentration of hydrogen ions)

F = Faraday constant

For every unit change in pH (or decade change in ion concentration) the emf of the electrode pair changes by 59.16 mV at 25 °C. This value is known as the Nernstian Slope of the electrode.

The pH electrode pair is calibrated using solutions of known and constant hydrogen ion concentration, called buffer solutions. The buffer solutions are used to calibrate both the electrode isopotential and slope.

A.2 PID Controller Basics

A pH control loop operates as follows: The pH meter measures the value of the pH in the effluent, and, if the pH is different from the setpoint, the controller actuates the reagent pump (or valve) that adds reagent to a mixing tank. The added reagent adjusts the pH value of the process.

The physical layout of the loop, the sizing of the pump (valve), type of mixing tank, and location of the pH electrodes all have a major impact on the ultimate performance of the loop, after the controller is tuned for optimal performance. The largest single performance factor is the delay time around the loop. This includes the response time of the

electrode/meter, time required to deliver the reagent to the process water, time required for the reagent to mix with and react with the process water, and the time required to deliver the completely mixed water to the electrode. If the delay times are too long or the mixing is not complete, the control will be poor regardless of how well the controller is tuned.

The Process pH Meter uses a PID (proportional, integral (reset), derivative (rate) control) control algorithm. Each of the instrument settings along with their effects on the control loop, are described below.

Mode
Manual: The manual output is specified in percent of full-scale PID output (4–20 mA) and is commonly used for testing the output device.

Auto: Allows the process to be controlled automatically using information specified in the Phase, Setpoint, Proportional Band, Integral, and Derivative menus as follows:

Phase
Direct: The control output action will cause the process value to increase.

Reverse: The control output action will cause the process value to decrease.

Setpoint
The setpoint is defined as the desired process value in pH

Proportional Band
The proportional band is the range in pH from the setpoint value where the controller provides proportional control. For example, the desired setpoint for the process is pH 7.0 and the process requires that a reagent must be added to the process water to bring it up to pH 7.0. If the proportional band is set to pH 1.0, the controller will provide proportional output control over the range of pH 6.0 to 8.0. When the process is at pH 6.0, the controller will provide a 100% control output level (assuming that Phase is set to Direct). When the process is at pH 7.0, the proportional control will provide a 0% control output level. When the process is at pH 6.5 the proportional control will provide a 50% output. The output action is equal to the difference between the setpoint and the process value, divided by the proportional band value.

Integral
The integral value is used to reduce the steady state error, between the process value and the setpoint, to zero. For example, assume a process can be manually controlled at a level of pH 8.0 by sending a 35% control output level to a reagent pump. Now, say that the system is set up for the controller to provide proportional only control, with the controller setpoint set to pH 8.0 and the proportional band set to pH 1.0. Note that the nearer the process gets to the pH 8.0 setpoint, the lower the control output level is. In fact, when the process is at pH 8.0, the output level will be 0%. Since the process requires that the pump be operated at 35% for the process to reach pH 8.0, its apparent that proportional-only control will never quite reach the desired setpoint of pH 8.0. This is where the integral control comes in.

Integral control can be thought of as adding up the output action from the proportional control over time. For example, the proportional control output reaches a steady state level of 5%. If the integral time is set to five minutes, the integral action of the controller will add an additional 5% to the controller output level over a 5-minute interval. The integral action is additive, so for every 5-minute interval an additional 5% is added to the controller's output level. This will allow the controller to bring the process to the desired setpoint level. Note that the longer the integral time setting, the longer it takes for the

integral action to affect the process. The integral control action is disabled by setting it to zero. Note that the integral time is in minutes.

Derivative
Derivative control is used to adjust the control output level based upon the rate at which the process value is approaching or passing the setpoint. Derivative control action would be used in cases where the process value can rapidly ramp up and overshoot the setpoint. The derivative setting is in minutes. The output action of the derivative control is equal to the rate of change of the process (in pH units per minute) times the derivative time, divided by the proportional band, times negative one. For example, if the process pH is changing at a rate of pH 0.20 per minute, the derivative time is set to 3.0 minutes, the proportional band is set to pH 0.80, and the action is “direct” the derivative control output action will be approximately equal to: (–0.20 pH/minute X 3.0 minute) /0.80 pH = –75%.

During calibration, the analog outputs can remain active, be held, or be transferred to a preset mA value.

All owners and operators should read this manual and/or be instructed on safe operating and maintenance procedures before attempting to uncrate, install, operate, adjust or service this equipment

Following are symbols used in this manual along with a description of their meanings:

DANGER
Indicates an imminently hazardous situation which, if not avoided, will result in death or severe injury.

WARNING
Indicates a potentially hazardous situation which, if not avoided, will result in death or severe injury

CAUTION
Indicates a potentially hazardous situation which, if not avoided, may result in minor/moderate injury and/or damage to equipment.

1.0 Warranty

Equipment manufactured by Hapman is warranted to be free of defective material and workmanship under the use and service quoted for a period of one year after date of shipment. This warranty is void if serviced by anyone other than Hapman service personnel.

Hapman agrees to replace or repair any defective parts it has manufactured as covered under this warranty. F.O.B. our plant, subject to inspection of the part in question by Hapman's personnel. No article may be returned to Hapman without Hapman's written consent.

Parts supplied but not manufactured by Hapman are subject to the warranties extended to Hapman by its suppliers. Hapman's liability is limited to such adjustment as the respective manufacturer makes to the seller.

In no event shall Hapman be liable for costs incurred due to equipment malfunction such as consequential damages, lost production or the expenses or losses incurred due to geographical location or fault of the product, difficulty of access to the product as installed, or time urgency on the part of the user and/or buyer of the equipment.

NOTICE:
While all information in this manual has been checked for accuracy, changes in design or specifications may occur at any time in HAPMAN's continuing program of product improvement. HAPMAN cannot assume responsibility for errors in the production of this manual, or for unsafe operating practice of those employing HAPMAN equipment.

⚠ WARNING

BEFORE INSTALLING, OPERATING OR MAINTAINING ANY EQUIPMENT, THE CONTENTS OF THIS MANUAL SHOULD BE THOROUGHLY REVIEWED AND UNDERSTOOD.

Statements and instructions set forth herein are based upon the best information and practices known to HAPMAN, but this may not be construed to suggest that every conceivable safety precaution is contained herein. As a matter of practicality, HAPMAN cannot guarantee that actions in accordance with such statements and instructions will result in the complete elimination of all hazards and thus assumes no liability for accidents which may occur.

For further information regarding installation, operation and maintenance please contact the factory service department.

2.0 Safety Instructions

⚠ CAUTION

All Hapman furnished equipment must be installed, operated and maintained in accordance with service instructions. Failure to follow these instructions may result in serious personal injury or property damage.

2.1 Once the pneumatic conveyor (sometimes referred to as the MiniVac™) has been properly positioned in the desired location, it must be securely fastened (anchored) to approved structural supporting beams or equipment before connecting the electric and air utilities.

2.2 Installation, operation and maintenance of electrical machinery must be performed only by qualified, trained and experienced personnel. Make sure that the motor and conveyor body is effectively grounded in accordance with OSHA safety and health standards, the National Electric Code and local codes.

2.3 Avoid physical contact in and around the pneumatically operated discharge gate because it can cause injury to the operator when it closes. The gate can severely pinch fingers and hands when it is activated.

2.4 Likewise, when a rotary valve is used for controlled discharge of product, it too can present a significant “pinch-point” hazard.

2.5 Keep clothing, hair, hands and other body parts away from the rotary valve and receiving pickup wand when the unit is operational.

2.6 Do not manually override or electrically bypass any protective device.

2.7 Periodically inspect the bolts and welds of the frame to ensure their continued integrity and tightness.

⚠ WARNING

2.8 Do not attempt to open, work on, clean, service, remove any protective cover, guard, or maintenance panel on the pneumatic conveyor until the **POWER IS TURNED OFF AND LOCKED OUT.**

2.9 Use extreme care and caution when handling combustible dusts, powders, and vapors because such conditions can introduce a potential fire/explosive hazard which may be caused by sparks (electrical, electrostatic, metal against metal) in the filter receiver or transport pipe.

Pneumatic filter receivers do not contain extinguishing or suppression equipment.

Should combustible dusts or explosive vapors be introduced to the conveyed material, consult NFPA (National Fire Prevention Association) guideline for recommended explosion relief (vent) devices and/or fire extinguishing equipment. Hapman conveyor equipment hoppers, filter/receivers and dust collectors do not contain explosion relief vents, except on special order.

2.10 Any equipment which is used in the processing or transporting of explosive materials in hazardous environments requires an evaluation on the part of the user and operator or proper and adequate equipment enclosures. Do not use your equipment in hazardous environments unless it has been properly equipped for the hazard.

2.11 Protective gloves, breathing masks, and other protective clothing required for the material being conveyed must be worn when using the pickup wand and when changing the cartridge filter to prevent over exposure to the material.

2.12 It is ultimately the operator's responsibility to implement the above-listed precautions and ensure proper use of the equipment. Keep these instructions and list of warnings with your machines at all times. **WORK SAFELY AT ALL TIMES**.

3.0 General Description and Installation

Designed for in-plant handling of most dry solids and powders, Hapman Mini-Vacuum conveyors deliver high performance, ultra-compact size, and cost effectiveness. Operating under negative pressure, or "vacuum"; material is drawn directly into the conveying line by airflow via pick up nozzle or hopper. Product loss and dusting is minimal as accidental leakage is drawn inward, providing maximum safety in handling toxic products.

The Hapman Mini-Vacuum system is particularly adaptable to providing material pick up from single or multiple hoppers, or open containers and delivering to one discharge point. Material laden air is transported through the line by induced air flow created by a positive-displacement blower or regenerative centrifugal fan. Material/air separation and discharge is accomplished by Hapman's compact receiver unit. The Hapman receiver provides highly-efficient final filtration through application of cartridge-type filtration technology.

Available in both standard and custom arrangements, each Hapman pneumatic conveyor system is designed for your specific application. The success of your conveyor installation will be dependent on understanding the operation of each component and its operation.

Please review the following guidelines when installing your pneumatic conveyor system. In addition, carefully review specific construction drawings that have been prepared by Hapman engineers for your applications.

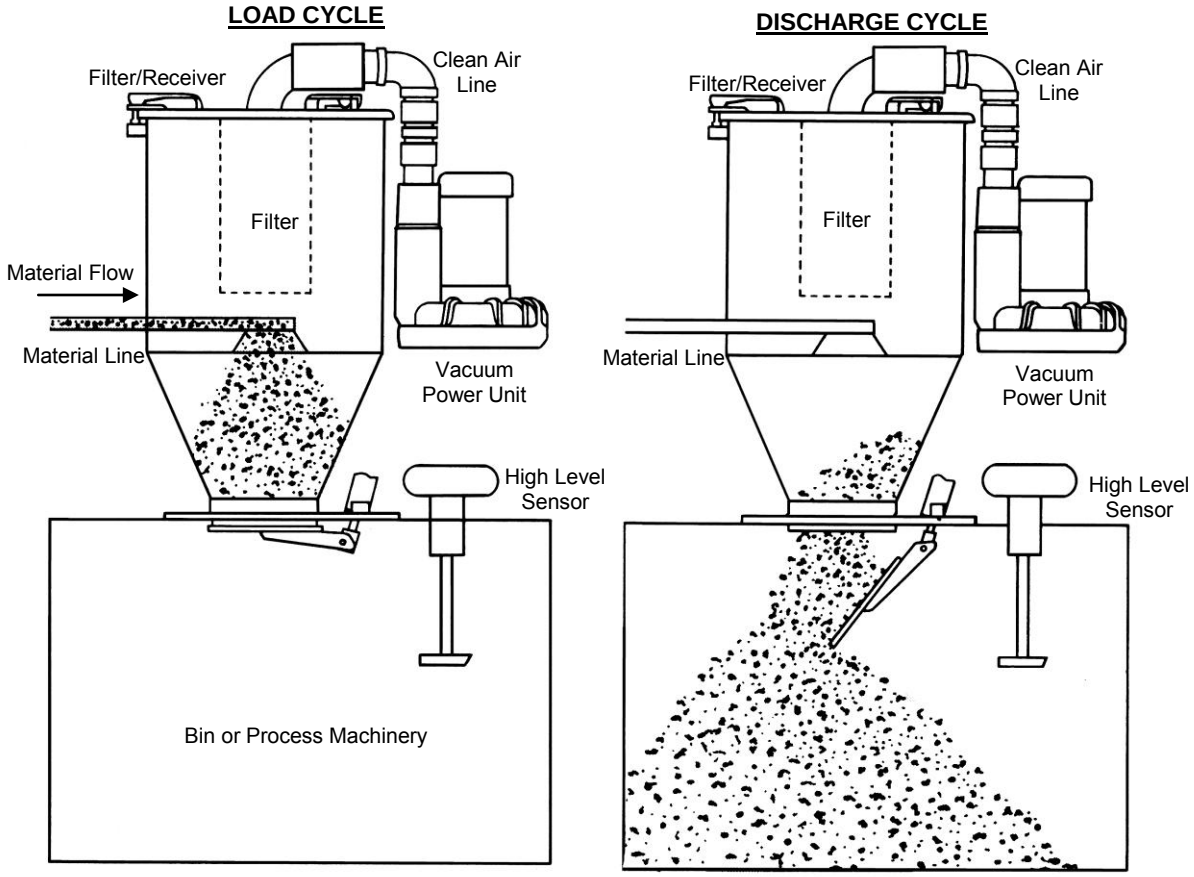
4.0 Hapman Pneumatic Conveyor Equipment



Hapman's miniature filter receiver units provide efficient separation and collection of air-borne solids that have been introduced into the conveying system. The air/material mixture enters the receiver plenum chamber and immediately begins to decelerate. Larger particles quickly fall from the air stream and collect in the receiver. Smaller particles remain entrained in the air flow, migrating upward and collecting on the filter media. The filtered air passes up through the receiver "lid" and continues to the vacuum blower inlet.

Collected dust begins to densify on the filter membrane. A solid state timer periodically energizes a solenoid operated air valve resulting in a burst of compressed air directed into the inside of the cartridge filter. The compressed air expands inside the filter and provides a momentary reverse air flow across the filter membrane. This dislodges the collected dust which falls into the receiver. The filter is now clean and resumes collecting dust from the conveying air stream.

NOTE: The filter cartridge, when reversed pulsed, may contain a significant amount of the material being conveyed. This material accumulates within the filter pleats and on end-caps. It is normal for the cartridge to look "dirty" as the material buildup densifies. This buildup of densified conveyed material actually aids in the air/material separation. The Hapman MiniVac™ receiver includes a side access door for filter access and ease of cleaning. See Major Features Index on Page 4.

Note: When preparing to clean the filter receiver, use extreme care when removing the filter from the filter receiver. Do not rest the filter cartridge on the edge of the receiver housing. The cartridge's delicate filter membrane will be damaged by the exposed receiver housing edge.

4.1 Major Components of Filter/Receiver Unit Include:

Discharge Gate

Standard filter receivers are equipped with a cylinder operated "dump" gate to periodically empty the filter plenum of collected material.

During normal operation, the discharge gate is in the closed position, sealing the receiver chamber. Once closed, a vacuum develops inside the receiver causing the material/air to flow through the transport line. At the beginning of the cycle, a solid state timer (located in the operators control station) energizes. This timer is adjustable; however, the factory setting is 4 seconds.

When the timer de-energizes, two events simultaneously occur. First, the vacuum breaker valve (located on blower inlet) opens and relieves the vacuum from the receiver chamber. In the absence of vacuum, material ceases to flow through the transport line. Next, the discharge gate is signaled to open allowing collected material to discharge from the receiver. After 4 seconds, the discharge gate is signaled to close and prepare for the next conveying cycle. The vacuum breaker valve is held open by a delay timer for a short time period to allow the dump gate to fully close. When the delay timer de-energizes, the vacuum breaker valve is closed and the convey cycle is repeated.

Solenoid Cabinet (Dump Gate model only)

The discharge gate and vacuum breaker valve are cylinder operated and controlled via electrically operated solenoids (110VAC). These solenoids, as well as the filter cleaning pilot solenoid, are mounted and wired inside a NEMA 4 enclosure mounted to the filter/receiver housing. Field wiring and compressed air connections are furnished for ease of installation.

NOTE: Solenoids are equipped with flow control fittings to control the Speed of the cylinder operated discharge gate.

Rotary Discharge Valve

An optional rotary discharge valve may be installed in lieu of a cylinder operated dump valve. This effectively increases the net conveyor capacity by eliminating the delay period necessary for dump gate discharge. The application of a rotary valve is usually limited to fine, free-flowing materials.

The rotary discharge valve provides an airlock seal between the interior of the filter/receiver chamber (under vacuum) and the discharge chute or hopper vessel (ambient pressure).

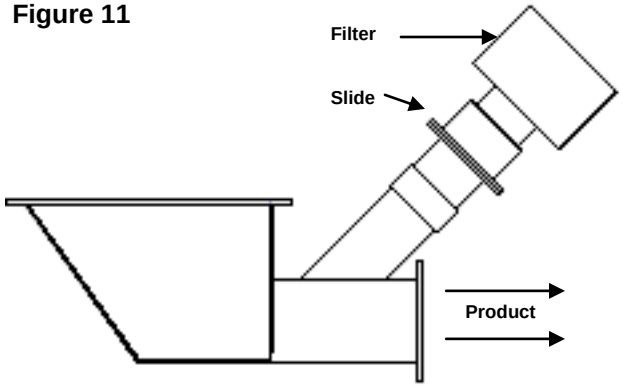
Rotary valves are normally supplied with 1/2 HP gear motor arrangement including shear-pin overload.

5.0 Material Feed Devices

5.1 Flooded Well Inlet

The Hapman flooded well inlet provides a controllable means of introducing most free-flowing solids into the conveying air stream. The inlet is attached to the discharge of material supply hoppers and can be fitted with a cylinder or manually operated shut-off gate to allow several feed points to be arranged on a single vacuum conveyor line.

Figure 11



Its design directs material to the bottom of the pneumatic conveyor line where it is swept away by the conveying air stream. Volumetric feeding is achieved by the natural angle of repose of the material. Adjustable flow rates are achieved by a movable slide. See Figure 11.

5.2 Rotary Inlet Valve (Figure 12)

Rotary valves are often utilized to provide more positive feed control into pneumatic conveyors. This type of valve more readily controls fluid material and prevents surging or flooding the conveyor line. See Figure 12.

5.3 Manual Pickup Wand (Figure 13)

Material can be unloaded from open containers using a hand-held pick-up lance or wand. The wand is constructed of concentric steel tubes which maintain infeed air flow when the wand top is buried deep into the material container. The wand can be adjusted to provide optimum material-to-air ratios to increase or decrease conveying rates as required. See Figure 13.

Figure 12
ROTARY INLET VALVE

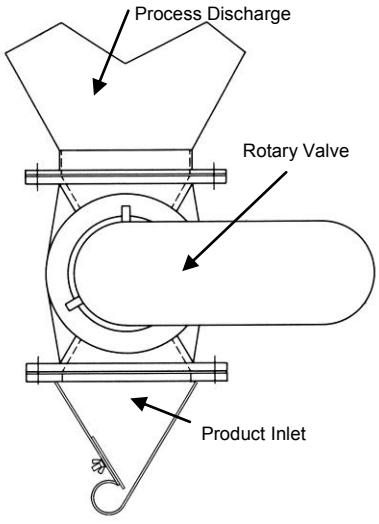


Figure 13
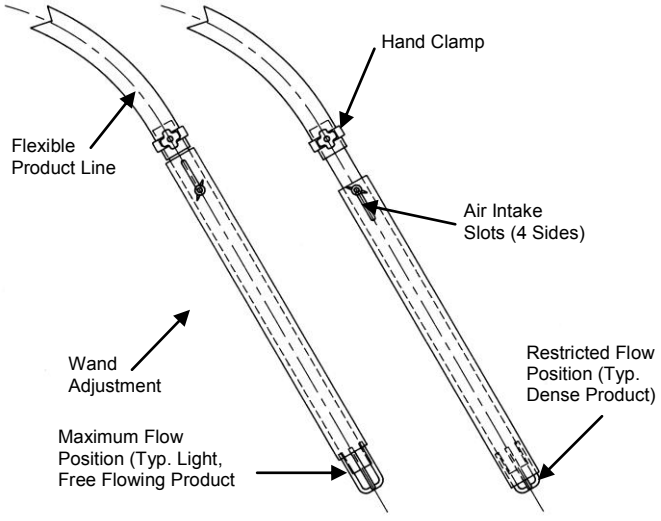
PICKUP WAND



6.0 Blower Packages

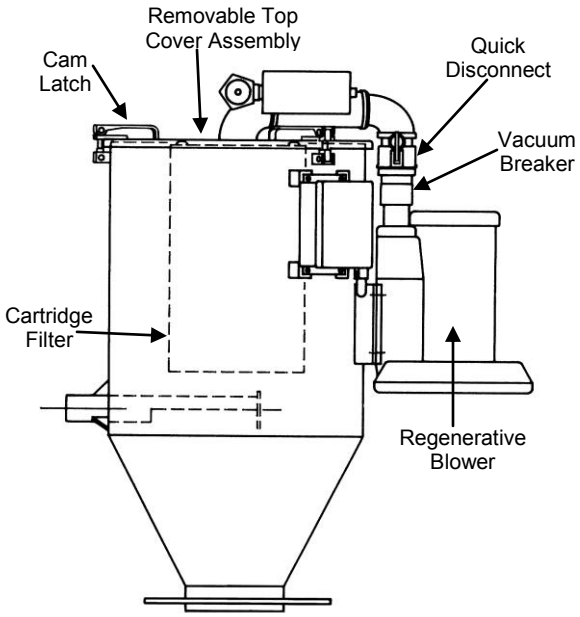
6.1 Regenerative

The regenerative blower utilizes a motor driven impeller that draws in air from the inlet port and then by centrifugal force, accelerates the air out through the discharge.

The regenerative blower works in principle by utilizing an annular shaped housing that turns air back to the base of the following blades where it is again hurled outward. Each regeneration imparts additional pressure to the air until it reaches the discharge where air is then diverted out of the blower.

Each blower is assembled as an integral part of the pneumatic receiver. A quick disconnect-cam/lever type coupling is furnished on the blower inlet. This coupling allows the vacuum line-top cover assembly to be easily removed for inspection of the filter cartridge. See Figure 14.

Figure 14



NOTE: Blower motor must be wired for clockwise rotation and should be verified before running the unit.

6.2 Positive Displacement

A positive displacement system utilizes a rotary blower that is either belt driven or direct coupled to the drive motor. The blower has two impellers rotating in opposite directions. As each impeller lobe passes the blower inlet, air is trapped and routed around the case and to the blower outlet.

Positive displacement blower systems are normally furnished with inlet and discharge silencers and a foam lined enclosure that will effectively dampen the noise level. A spring loaded vacuum relief valve is furnished in the clean air-vacuum line. The relief valve is factory set at a predetermined value.

The blower system may also be furnished with an auxiliary air inlet valve (manual ball valve). This valve can be used to bleed air into the clean air side of the receiver thus reducing both vacuum and system capacity.

A positive displacement blower system is normally located remote from the pneumatic receiver. Clean air-vacuum piping is furnished either in random lengths or cut to length as dictated by job requirements. A quick disconnect cam/lever type coupling is furnished at the filter receiver-top cover assembly. This coupling allows the vacuum line-top cover to be easily removed for inspection of the filter cartridge. See Figure 16.

7.0 Electronic Control Systems (Figure 17)

Inlet Rotary Timer:
Delays the starting of the inlet rotary valve after the pneumatic conveyor has started.
Typical setting = 5 seconds

Conveyor Delay Timer:
Delays the starting of the conveyor if a rotary valve is located on the discharge
Typical setting = 3 Seconds

Fill Timer:
When a dump gate is purchased this timer is used to set the fill time in between dumps.
Typical setting = 30 seconds

Dump Timer:
When a dump gate is purchased this timer is used to set the dump duration time.
Typical setting = 4 seconds

Vacuum Break Timer:
Used to set the amount of time the vacuum is vented to atmosphere.
Typical setting is 2 seconds longer then dump timer setting.

Pulse#1 on Timer:
Sets the duration of time an air pulse is delivered to clean filter#1.
Typical setting = 0.5 seconds

Pulse#1 off Timer:
Sets the amount of off time between each pulse for filter#1.
Typical setting = 30 seconds

Pulse#2 on Timer:
Sets the duration of time an air pulse is delivered to clean filter#2.
Typical setting = 0.5 seconds

Pulse#2 off Timer:
Sets the amount of off time between each pulse for filter#2.
Typical setting = 30 seconds

Pulse#3 on Timer:
Sets the duration of time an air pulse is delivered to clean filter#3.
Typical setting = 0.5 seconds

Pulse#3 off Timer:
Sets the amount of off time between each pulse for filter#3.
Typical setting = 30 seconds

Pulse#4 on Timer:
Sets the duration of time an air pulse is delivered to clean filter#4.
Typical setting = 0.5 seconds

Pulse#4 off Timer:
Sets the amount of off time between each pulse for filter#4.
Typical setting = 30 seconds

High level discharge Timer:
This timer is used when there is a high level sensor located at the discharge and when product falls below the high level this timer will start and once expired will restart the pneumatic conveyor
Typical setting = varies per receiver.

Discharge off delay Timer:
When a discharge rotary valve is purchased this timer is used to set the amount of time the discharge rotary valve continues to run after the pneumatic conveyor shuts off allowing the receiver to be emptied
Typical setting = 5 seconds

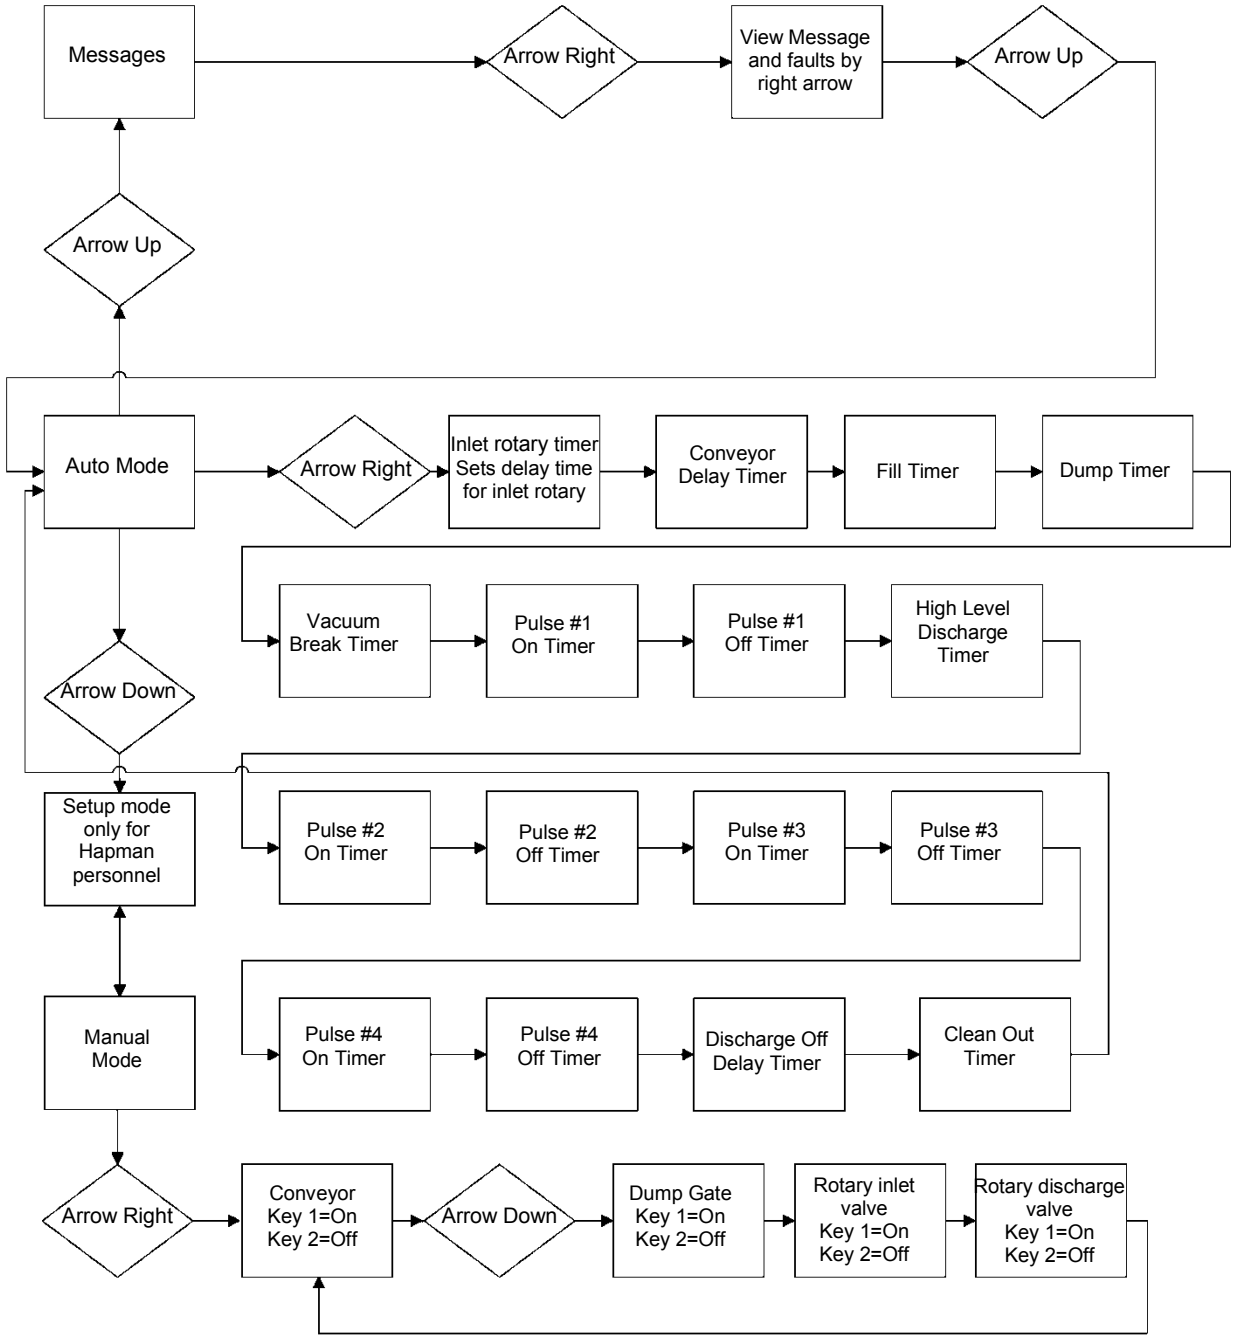
Clean out Timer:
When a dump gate is purchased this timer is used to clean out the pneumatic conveyors pipes in between dumping the product. This timer is only needed when there is long vertical drops.
Typical setting = 5 seconds.

Note:
Depending on options purchased only some of these 1imers will be visible when shipped to the end user.

How to enter values into a Timer:
When the auto mode is showing press right arrow to first Timer then press the 0 key until desired digit then enter correct value. If there is a Timer that you do not want to adjust then just press the enter key then the right arrow.

Isolate and lock power source prior to inspecting control panel wiring. Inspect control panel wiring for tightness

FIGURE 17
PNEUMATIC RECEIVER PLC FLOW DIAGRAM



8.0 Installation Instructions

8.1 Refer to Hapman general arrangement drawings when installing air-handling piping. The material handling capacity of your conveyor system has been calculated based upon a pre-determined number of straight lengths and bends of piping. Deviations or additions to the layout may impact the performance and capacity of the conveyor system. Piping runs should be kept in a horizontal and vertical axis at all times. Avoid sloped routing (upward or downward).

8.2 Inspect your equipment for loosening and breakage that may occur during shipment.
a. Inspect compressed air connections on the filter/receiver for tightness.
b. Check the tightness of the cartridge filter in the filter/receiver chamber.

8.3 Compressed air requirements:
a. Install 1/2" (minimum) air supply line to filter/receiver unit.
b. Compressed air should be 60-80 PSI; the filter/receiver will consume 2-3 SCFM of air (per unit maximum).

NOTE: Install regulator should plant air exceed 90 PSI.

c. Compressed air should be free from water, oil and solids. Oil will eventually plug the filter media and solids may cause solenoid malfunctions.

NOTE: Install a mist eliminator if the plant air quality is poor.

d. If pneumatic conveyor is installed outdoors or in unheated areas, the compressed air must be dried to appropriate dew point to prevent air lines from freezing.

8.4 Control System:

Isolate and lock power source prior to inspecting control panel wiring. Inspect control panel wiring for tightness. Verify timer settings (see illustrations for correct settings), and reinsert timers and relays that may have loosened during shipment.

8.5 Motor-Driven Devices: Check for correct rotation as indicated by the "rotation" arrow on housings of vacuum blower, fan or rotary valve.

8.6 Re-inspect conveyor piping for tightness, rigidly and leaks. Be sure that all piping connections have static grounding straps correctly installed.

8.7 Adjust, if necessary, flow control valves controlling speed of cylinder operated discharge gate. Gate should not slam open or closed.

8.8 Check lubrication levels, motor driven devices such as gearboxes and positive displacement blowers. Follow suggested lubrication inspection and replenishment according to manufacturer's instructions.

9.0 General Maintenance

An air conveying system that has been properly engineered, checked out, and adjusted for start-up is subject to little trouble. A regular maintenance schedule will help prevent malfunctions.

9.1 Weekly

1. Inspect blower discharge air for presence of dust, indicating filter failure.
2. Inspect compressed air line filter/oil separators for accumulation of oil, water and debris.
3. Check for smooth operation of air operated devices such as slide gates, discharge gates and vacuum breakers.

9.2 Monthly

1. Remove receiver lid and inspect for cartridge filter wear and excessive product buildup on filter media.
   Remove excess product buildup as necessary.
2. Check lubrication levels of positive displacement blower and gear boxes.
   Consult Appendix for further lubrication information.
3. Inspect conveyor piping for leaks and wear.
4. Energize pulse timer circuit (with blower off) and observe operation of the filter cleaning mechanism.

10.0 Replacement Parts for Receiver with Rotary Discharge Valve

When calling or writing for replacement parts, please reference the equipment serial number embossed on the Hapman nameplate affixed to equipment. See back of this manual for phone number and address of Hapman Service.

Hapman Filter Receivers – Rotary Discharge Valve Model "R"					
Item No.	Description	Model			
		16R/20R/24R	30R	36R	42R
1	Blower Assembly	1	1	1	1
2	Filter Cartridge	1	2	3	4
3	Pulse Air Valve	1	2	3	4
4	Rotary Valve	1	1	1	1
5	Solenoid NC 2-Way (Pulse)	1	2	3	4

NOTE: For Replacement Parts and Service for the Filter Receiver Discharge Gate See Page 18

Model No: _____

Installation, Operation and Maintenance Instructions

VB-007

VB-055

Important

Read and become familiar with this manual prior to uncrating and installing your Spencer Vortex Blower. Following the instructions detailed here will help you realize its full potential of efficient service and extended lifespan. Damage resulting from failure to follow correct procedure will void the warranty.

I. General

Scope
Information contained in this manual relates to Vortex Blowers standard and explosion-proof motor models VB-001S, VB-001, VB-002S, VB-002, VB-003S, VB-003, VB-004S, VB-004, VB-007S, VB-007, VB-019S, VB-019, VB-030S, VB-030, VB-037S, VB-037,VB-055, VB-075, and VB-110.

Limited Warranty
We warrant that this product will be free from defects in material and workmanship for a period of 18 months from date of shipment or 12 months from date of startup, whichever comes first. Within the warranty period, we shall repair or replace F.O.B. our Factory such products that are determined by us to be defective.

This warranty will not apply to any product which has been subjected to misuse, negligence, or accident, or misapplied or improperly installed. This warranty will not apply to any product which has been disassembled, repaired, or otherwise altered by any persons not authorized by the Spencer Vortex Service Department.

On units which include thermal protection, the thermal protection must be connected as recommended.

The guarantee of the motor and control manufacturers will govern the extent of our guarantee on such equipment. Warranty work on motors and controls must be authorized by Spencer and must be performed in an authorized shop as designated by the manufacturers.

The Spencer Turbine Company reserves the right to invoice all expenses incurred when repairs are made in the field at the specific request of the customer.

No assemblies or parts of assemblies will be accepted for repair or replacement under this warranty without prior authorization by The Spencer Turbine Company. For complete warranty information, obtain Spencer's Form 706, "Terms and Conditions of Sales."

Safety Precautions
Power sources, protective devices, and grounding provisions must be in accordance with wiring instructions provided in this manual.

Blower becomes hot during operation and may cause burns if touched.

Do not operate the blower under load conditions which exceed the rated full-load amps on the nameplate.

Do not install the blower in any area which may have an explosive atmosphere or which may contain flammable gases or liquids. Always provide proper ventilation. Do not install in any area which may subject the blower to corrosive liquids. Excessive moisture may cause electrical failure; install the blower in areas free from water or rain. Do not operate blower without motor cooling fan cover, or without impeller end cover.

Before installing blowers with explosion-proof motors, the buyer must check federal, state and local codes to see if such motors are appropriate for the intended application environment. It is the buyer's responsibility to determine the suitability of any product for a particular purpose.

Storage
If machine is to be stored for an extended period of time, it must be carefully protected from dampness and dirt.

II. Installation

Locating, Mounting, Connecting
Ambient temperature at the installed location should not be less than -5˚ F or greater than 104˚ F. Relative humidity should not exceed 80%.

Mount the blower in a horizontal or vertical position as shown in Figure 1. For models VB-055, VB-075 and VB-110, it is recommended to mount in the horizontal position only. Check with factory *prior* to mounting these models vertically.

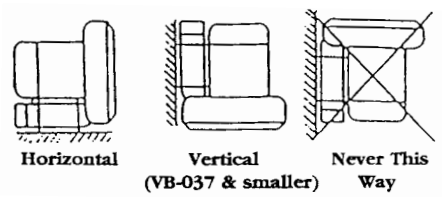

Fig. 1 Mounting Positions

Remove protective coverings, such as vinyl tape or plastic plugs, from the inlet and outlet ports. For models VB-004 and larger, attach to system piping using threaded connection as provided. Avoid excessive stress caused by pipe connector tightening or by misaligned pipe on the inlet and outlet ports. Support piping by brackets or other means. Models VB-001, VB-002 and

VB-003 are supplied with a patented (U.S. Patent 5,791,870) reversible flange with threaded pipe or tubing connections.

In the event the blower is located where dust, fibers, drops of water, or other particulates may be in the airstream, use a filter on the suction side of the piping. If foreign matter enters the impeller, it may clog, jam, or otherwise impair the blower performance.

Wiring

Caution: Confirm that the power source is the same as that indicated on the unit's nameplate. Application of incorrect voltage or improper phase connection may cause motor failure or other damage.

Use conductors and devices (such as the circuit breakers, starters, and switches shown in Figure 3) that are suitable for the applications shown in Tables 1 and 2 and are in compliance with the National Electric Code and applicable local codes and regulations. Motor terminal connections are shown below Table 1.

Provide protection from overheating of the motor windings. Some models are equipped with built-in thermal protectors (see Table 1). Where applicable, connect the leads from the pilot-duty thermal protector to the magnetic starter as shown in Fig. 3.

Check the direction of rotation of the blower.
To reverse the direction or rotation:

1) **for a single-phase motor, interchange motor leads 5 and 8.**
2) **for a three-phase motor, interchange any two of the three line connections.**

Caution: Install a properly-sized overload device and disconnect in accordance with local codes and regulations and dedicated only to the Vortex Blower.

Furnish the Vortex Blower and all associated electrical devices with a proper ground in accordance with all local codes and regulations.

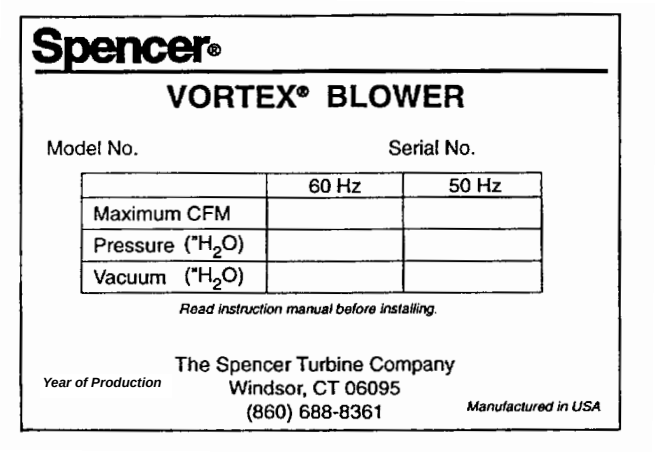

Fig. 4 Typical Nameplate

III. Operation

Limits of Operation

Operation at flows less than those indicated by the solid line on the applicable performance curve will cause overheating of the unit and is to be avoided. Throttling suction or discharge piping to reduce air volume increases differential pressure resulting in elevated temperature and increased power consumption. Use of pressure and/or vacuum relief valve recommended.

Maximum pressure and vacuum are indicated on the nameplate (see Fig. 4). These represent conditions at which the minimum allowable airflow (CFM) occurs. Check the operating pressure or vacuum to assure that the pressure or vacuum remains less than maximum.

For continuous operation at low air volume (on the dotted portion of the performance curve), provide a bypass in the piping and operate at a lower pressure than maximum operating pressure. See Performance Curves, Section V.

Caution: Low flow conditions may produce heat levels which may cause burns. Do not touch the blower in operation.

Temperature Rise

A NEMA Class F insulation system is used in the motor. Maximum allowable winding temperature is 265˚F. If a thermal protector or thermal relay activates because the temperature rise of the motor is higher than usual, investigate and correct the problem. Explosion-proof motors use a NEMA Class B insulation. Typical causes of motor overheating are given in Section VI, Troubleshooting Guide.

IV. Disassembly and Reassembly

A. General

1. Precautions should be taken when disassembling or reassembling the blower. See Warranty Terms.
2. Keep all parts clean.
3. Do not overtighten bolts and screws.

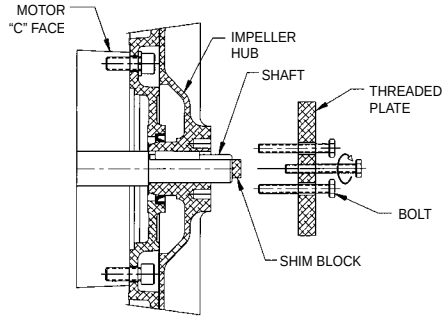

Fig. 5 Impeller Puller

B. Disassembly Procedure (Reassembly is performed in reverse order)

Caution: Shims are used to adjust the gap between the impeller and casing. When disassembling, take care to note the quantity of shims and their thickness. The shim stack replacement must be the correct thickness to assure proper clearance and to avoid degradation of performance.

1. Remove impeller cover; remove screws, pull cover away from case.
2. Unfasten lock washer; remove nut and washer.
3. Remove impeller from shaft by one of the following methods:
   a. manually pull the impeller outward, OR
   b. screw two bolts into tapped holes and pull on the bolts, OR (if the fit is tight)
   c. use a puller assembly (not furnished) as shown in Fig. 5.
4. Remove motor shaft key.
5. Remove case from motor; if necessary remove screws holding case to base and motor to case.
6. Remove shims from motor shaft if necessary; do not discard them. See Note above.

Caution: Motors are heavy. Lift motor on models larger than VB002 by the eyebolt on the motor with an aid from a lifting device.

C. Reassembly Guidance

1. The gap between the impeller and case is essential for proper performance of the unit. The shims between the shaft collar and impeller hub establish the spacing of this gap. In reassembly, before installing the impeller cover, check the gap between the impeller and case to assure that the measurement conforms to the gap specification on the assembly drawing (on the following pages) for your unit.

2. For models VB001, VB002 and VB003, gap clearance between impeller and unibody case should be checked around entire periphery of the impeller in accordance with Item 18, impeller to case gap specification prior to securing impeller.

3 On models VB004 thru VB110 remove Item 23 Plug located on bottom of the case and check impeller gap with a feeler gauge. Remove impeller and adjust shims to meet gap specification. With adjustments and gap check complete, replace plug tightly to prevent air leakage.

4. Fasten impellers using lockwashers and locknuts. Torgue locknut to recommended torque values in Table 3. Bend a lockwasher tab down into a lockwasher slot.

5. Reattach the impeller cover.

Catalog No.	Recommended Torque (Ft-Lb)

V. Vortex Blower Data

Pages 7 through 17 present information about the various blower models. This information is important in understanding your blower's performance, in using the blower in the proper operating range, and in ordering parts that might be needed.

A. Assembly Diagrams
At the top of each page is an assembly diagram of the unit. Items are identified by circled numbers around the diagram. Above each diagram is the gap specification.

B. Parts Lists
At the lower left of each diagram is a table giving the item number (shown on the Assembly Diagram), the Part No. for that item and the corresponding part description. In ordering parts, provide the model number, the part number and the description.

C. Performance Curves
At the lower right of each diagram are performance curves for 50Hz and 60Hz operation. The curves present the following information:

The upper line of each curve is pressure performance while the lower line is vacuum performance. The dashed portion at the left end of some of the curves indicates an intermittent-only operating area. See **Operation** Section on page 5.

D. Estimated Acoustical Noise Level at 1.5M, 60Hz

VI. Troubleshooting Guide

Trouble	Possible Cause	Corrective Action
Blower Does Not Turn and there is -		
A Humming Sound	– One phase of power line disconnected	Connect power leads properly
	– One phase of stator line open	Contact factory
	– Bearing(s) defective	Change defective bearing(s)
	– Impeller jammed by foreign material	Clean impeller
	– Impeller jammed against casing or side cover	Adjust gap
	– Rubbing of rotor core and stator core	Contact factory
	– Capacitor open (single-phase models)	Change capacitor
No Sound	– Two phases of power line disconnected	Connect power leads properly
	– Two phases of stator winding open	Contact factory
	– Faulty switch connection	Change switch
	– Fuse blown	Change fuse
Blower Turns, but -		
Fuse Blows	– Fuse capacity insufficient, wiring fault	Inspect wiring
	– Short circuit	Repair
	– Terminals shorted	Improve insulation and check connections
	– Excessive load	Increase air flow
Overheats or Thermal Protector Activates	– Power source unbalance; possible voltage drop	Check voltage; phases must be balanced within 5% and voltage must be within 10% of rated
	– Operating in single-phase condition	Check connections
	– Excessive friction due to defective bearings	Replace bearings
	– Impeller contaminated by foreign material	Clean impeller
	– Impeller rubbing against casing or side cover	Adjust gap
	– Operation at less than minimum rated flow	Increase air flow
Makes Abnormal Sound	– Impeller rubbing against casing or side cover	Adjust gap
	– Impeller rubbed by foreign material	Clean impeller
	– Bearing(s) defective	Replace bearings
	– There is a leak or air passages are clogged	Repair or clean
	– Loose cap screw	Tighten screw

Spencer®

Products & Services

Industrially rated products offering effective solutions for air and gas handling problems:

- Multistage centrifugal blowers
- Single stage centrifugal blowers
- Gas boosters and hermetic gas boosters
- Regenerative blowers
- Modular central vacuum systems
- Mobile or stationary integrated vacuum units
- Separators and dust collectors
- Custom-engineered products with special materials for extreme temperatures and pressures

Complementary accessories with single source convenience and compatibility:

- Standard and custom electrical control panels – UL, CUL Listed and C.E. Compliant available
- Valves, gauges, couplings, shrink sleeves, vibration isolators and other system components
- Comprehensive selection of tubing, fittings, vacuum hoses, valves and tools

Comprehensive engineering and other customer support services:

- The industry's largest complement of technical specialists in air and gas handling technology
- Worldwide parts and service organization
- Application research and testing facility

Worldwide organization of sales representatives and distributors offering:

- Product selection, installation and operation assistance
- Comprehensive system design services
- Follow-up services and troubleshooting

For the name and telephone number of your local Spencer Representative, call 800-232-4321 or email marketing@spencer-air.com

Description

When it comes to machine safety, Rockwell Automation knows that protection of personnel and equipment is your main concern. At the same time, flexibility and productivity are points that must also be considered as you design your safety system. Optimize all of these with the new Allen-Bradley SensaGuard family of noncontact switches.

Featuring the latest generation of RFID technology for coding and Inductive technology for sensing, SensaGuard's large sensing range and tolerance to misalignment is a cost-effective solution that is ideally suited for a wide range of industrial safety applications.

The SensaGuard product line is a Category 4 /SIL 3 rated switch per EN954-1, TÜV functional safety approved to IEC 61508.

Features

- Switches can be connect to a standard safety relay, for example, the MSR126, MSR127, MSR200/300 Family, SmartGuard and Safety I/O Blocks
- Multiple actuator sizes for large sensing distance
- IP 69K environmental rating
- Short-circuit and over-voltage protection
- Led located on the switch for door status and troubleshooting

Benefits

- No dedicated controller required
- Cat 4/SIL 3 rating maintained even with multiple units connected in series
- Switches can be connected in series with other devices (light curtain, E-stops, key interlock switches)
- Extended diagnostics for easy troubleshooting
- Large sensing distances
- Tolerance to misalignment
- Multiple sensing directions
- Stainless steel version suitable for use in harsh environments
- Use standard proximity brackets

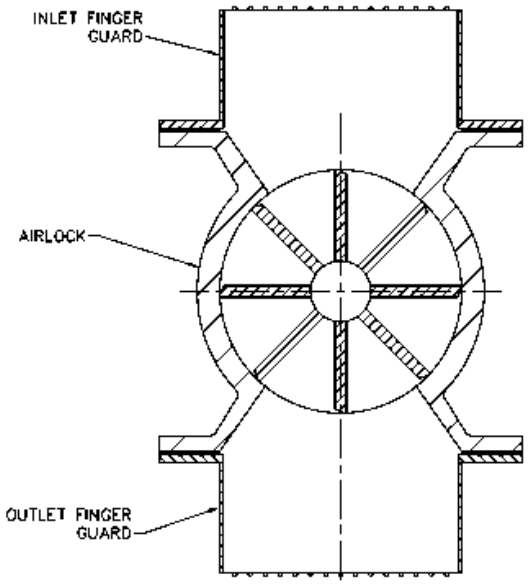
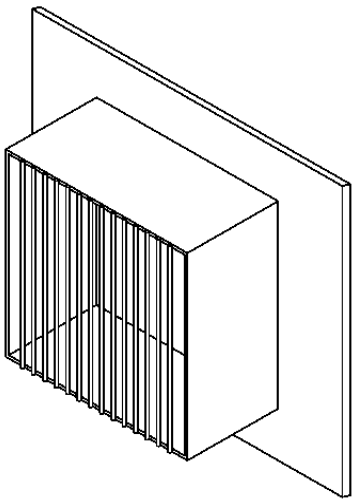
SAFETY FIRST

WARNING/CAUTION

DO NOT INSTALL ROTARY AIRLOCK VALVES & FEEDERS IN AN APPLICATION, WHICH LEAVES THE INLET OR THE OUTLET FLANGE OPENING EXPOSED.

INLET & OUTLET FLANGE GUARDS ARE MANDATORY IF EITHER THE INLET OR OUTLET FLANGES ARE EXPOSED.
THESE FLANGE GUARDS ARE AVAILABLE APON REQUEST





611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website:** www.acsvalves.com

Congratulations on your selection of an **"ACS"** Rotary airlock. The unit will require very little attention to keep it in good operating condition.

Safety Precautions

This Safety alert symbol is used to call your attention to an important safety message on equipment, safety decals and in manuals, to warn you of possible danger to your personal safety. When you see this symbol, be alert; your personal safety or the safety of the other persons is involved. Follow the instructions in the safety message.

The following definitions for identifying hazard levels are:

DANGER (RED) **–** Danger is used to indicate the presence of a hazard that WILL cause SEVERE personal injury, death, or substantial property damage of the warning is ignored.

WARNING (ORANGE) – Warning is used to indicate the presence of a hazard that CAN cause SEVERE personal injury, death, or substantial property damage if the warning is ignored.

CAUTION (YELLOW) – Caution is used to indicate the presence of a hazard that WILL or CAN cause MINOR personal injury or property damage if the warning is ignored.

WARNING: All owners and operators should read this manual, or be instructed in safe operating and maintenance procedures, before attempting to uncrate, install, operate, adjusts, or service this equipment.

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website:** www.acsvalves.com

RECEIVING YOUR AIRLOCK

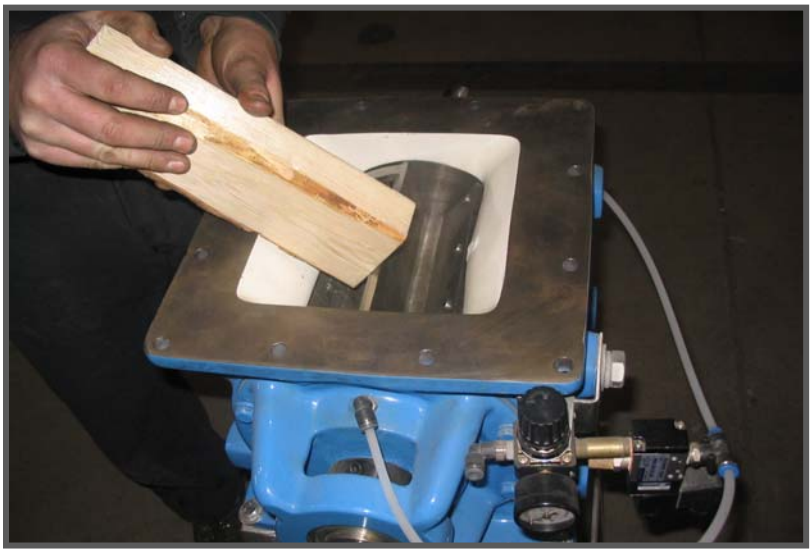
As soon as the equipment is received, it should be carefully inspected to make certain the unit is in good condition and all items listed on the packing list are received. Even though the equipment is mounted on heavy shipping skids at our plant, it is possible for it to be damaged in shipment. All damages or shortages should be noted on the Bill of Lading. Purchaser should take immediate steps to file reports and damage claims with the carrier. All damages incurred to the units in transit are the responsibilities of the common carrier since it is the manufacturer's policy to make shipment F.O.B. its factory: i.e., Ownership passes to purchaser when the unit is loaded and accepted by trucker. Any claims for in transit damage or shortage must be brought against the carrier by the Purchaser.

If the unit is not going to be installed soon after arrival, it should be stored in a warm, dry location to protect from corrosion to the machined surfaces.

CAUTION: Read All Instructions contained in this manual before installing and operating this equipment.

WARNING

FIGURE 1



ONCE PROTECTIVE FLANGE COVER IS REMOVED FROM VALVE, DO NOT PLACE HANDS OR FEET IN THE VALVE OR ATTEMPT TO TURN ROTOR ASSEMBLY BY HAND. TO TEST ROTATE THE ROTOR, USE A SOFT PUSH BAR (2 x 4) AS SHOWN IN FIGURE 1. WE RECOMMEND ALL OWNERS AND/OR OPERATORS OF THIS EQUIPMENT READ THIS MANUAL. FOLLOW SAFE OPERATING & MAINTENANCE PROCEDURES. SAFETY COMES FIRST!

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

OPERATING INSTRUCTIONS FOR ACS ROTARY AIRLOCK PACKAGE

Rotary Airlocks

The Rotary Airlock is one of the most important units in your material handling system. The function of the airlock is to hold pressure or vacuum in a pneumatic system, and also to meter products into conveying lines, or storage areas, (bins, tanks, hopper, etc.)

The airlock operates by filling each rotor pocket with material at the high point of rotation and then empties into conveying lines or storage areas at the low point of rotation.

In the case of conveying line, a blow-thru is used to allow the velocity of the air to move the material through the conveying line. After each rotor pocket has emptied into the blow-thru it still contains pressurized air. With some products, this air is allowed to escape up through the bulk material as soon as the edge of the rotor blade passes the edge of the inlet opening. The release of this pressurized air assists in maintaining a continuous flow of product to the airlock inlet. With some products, this air must be vented to atmosphere or to a dust collector, as it tends to hinder rather than help the flow of material into the airlock.
*The above procedure is endlessly repeated to produce a continuous flow of material at the discharge end of the conveying line.

The airlock rotor is precision machined to obtain the desired high degree of accuracy and close tolerance. Rotors may be supplied either with fixed or adjustable tips.

The airlock rotor is mounted on bearings at each end of the rotor shaft. Rotor clearance is small to prevent excessive air leakage back to the product inlet.

Installation of Airlock Packages

After airlock packages are uncrated, disconnect the chain drive and rotate the airlock with a soft push bar, the rotor should be able to rotate freely without binding.

Check clearance between rotor tips and valve housing. Clearance should not be greater than that specified on the invoice. If adjustable tips are provided and have shifted out of adjustment during shipping, re-adjust as per instructions found in maintenance section of this manual.

If airlock clearances and rotations are correct, replace chain drive, position an anchor package.

See Figure 1

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

Numerous types of bulk materials feeding devices can be connected to the inlet opening of an airlock. Bins, hoppers, mixers, sifters, screw conveyors, etc. all can be adapted for attachment to the airlock. In all cases, except sifters, rigidly attach the feeding device to the airlock flange, using silicone caulk to obtain an air-tight connection. Be sure all seams in the feeding device are air-tight.

If the airlock package is to be hung from a hopper, storage tank, etc. it may be necessary for some type of structural steel support. However, in most cases, the hopper or tank flange will have sufficient strength to support the weight of the airlock package.

Normally, it is not good practice to use the airlock to support equipment loads either in compression on the top flange or in tension from the bottom flange. Excessive loads will cause the housing to distort, which will result in the loss of precise clearances. Loss of clearance between the rotor and housing can result in excessive noise, binding and galling.

Flanges of components, which attach to the airlock must be flat and "square" with the airlock flanges. The machines flanges of cast airlock housing must not be forced or conform to warped or twisted fabricated flanges. This practice can result in broken airlock housing or loss of clearance as noted above.

If the airlock is to be installed with either the **inlet or discharge exposed, a guard must be mounted to the appropriate flange** in order to reduce the risk of personal injury to operators, maintenance personnel, or others who may be near the equipment. Any object placed in the inlet area or discharge area of the airlock will be sheared off. Inlet and discharge guards are available from **Ancaster Conveying Systems**.

Air Purge Kit - Optional

The optional air Purge Kit may be used to provide compressed air the shaft seal area on airlocks with either open or closed end rotors. This kit may also be used to provide compressed air to the end plate cavity on the airlocks with closed end rotors.

The Air Purge Kit should included a Filter/Regulator, 0-30 psi pressure gauge, tubing and miscellaneous fittings. Depending on the airlock model and what ports are to be purged, certain fittings supplied in the kit may not be required.

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

Air Purge Pressure Adjustment

Shut off the compressed air supply and bleed off air pressure before attempting to install or service the air purge assembly.

After installation is complete and while the filter/regulator is shut off completely, the air supply should be turned on.

After verifying that all connections are tight the regulator should be adjusted to provide the appropriate purge pressure to the airlock using the following guidelines.

1. Initial setting, prior to conveying product through the airlock or system should be 5 psig.
2. If the airlock is either receiving product from or discharging product to a pressure system the regulator should be set at 5 psig above the system conveying pressure.
3. If the airlock is used in a gravity flow application or is receiving or discharging only to a vacuum system the regulator should remain set at 5 psig.

Airlock Maintenance And Adjustment

Airlock maintenance is just as important as the unit is to the system. Type "CI" airlocks are assembled with sealed bearings, therefore requiring no lubrication.

Blade clearance should be checked as part of the maintenance program. Blade clearance should be within the allowable clearance range of the appropriate service. (See table). Each airlock is built to a standard, which is determined by its size and design operating conditions. The appropriate standard established for any airlock can be determined by checking the order acknowledgement.

Fixed tip airlocks obviously have no adjustment at tips, but should be checked to determine if the airlock is functioning in the system properly. Airlocks equipped with adjustable tips have a definite advantage. If clearances do not fall within rotor clearance range for the airlock, the tips can easily be adjusted. Adjusting tips of an airlock should be done as follows after electrical power is turned off.

Disconnect all electrical power to airlock before performing any maintenance.

1. Disconnect drive chain.
2. Access through either inlet or outlet.
3. Mark blades one through eight (assuming it is an 8-vane rotor).
4. Loosen bolts on number one blade.
5. Using two feeler gauges, insert between blade and housing, one at each end.
6. Push blade up tight against feeler gauges and tighten bolts.
7. Rotate blade and measure clearance on both sides of housing. This will determine which is tight side of housing.
8. Repeat steps 4, 5, &6 on all blades settings them against tight side of housing.

NOTE: As each blade is adjusted, make sure clearance is held uniformly by spinning rotor 360 degrees after completing steps 4, 5 & 6, and also by re-measuring with feeler gauge.

Disassembly of an airlock can be done quickly and efficiently by following the proper procedures.

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

Remove Rotor:

1. Determine which side rotor is to be pulled from. Normally clearance permitting, drive side is pulled to avoid dismantling of sprocket and re-alignment.
2. Disconnect drive chain
3. Loosen and remove bearing lock-collar at bearing opposite the drive side.
    a) Remove allen set screw from collar and peen down groove formed by set screw using a small flat punch.
    b) Loosen collar by rotating collar in the same direction as the shaft rotation. Use drift pin in the plain hole (not threaded set screw hole) and tap with hammer to rotate collar.
    c) Slide collar off shaft.
4. Airlocks with packing gland seals, loosen the packing gland bolts (2 ea.) opposite the drive side.
5. On type “CI” Airlocks loosen the shaft seal collar, located within the end plate bearing port.
6. Remove the bolts on end cover (side to be pulled).
7. On all models place wheel puller at end opposite the drive end, hooking it at back of bearing port. Place puller bolt at the shaft and push rotor through until it slides freely.
8. Remove rotor from housing gently to keep from forming burrs on rotor or housing.

Replacing Rotor

1. Carefully check to see if rotor or housing have burrs. (Blade tips, shrouds, and housing matching surfaces). If burrs are found, file them smooth using a fine file and then polish with emery paper.
2. Check rotor shaft, file and sue emery paper on any rough surface found.
3. Blow off rotor and shaft to clean any foreign material. Also check end cover to see that matching edges to housing are clean.
4. Gently slide rotor into housing. Rotor normally will not slide the last few inches easily. Use a large rubber hammer to pound rotor far enough to start end cover bolts, and tighten evenly.
5. Make sure rotor is centred in housing. If not, loosen bearing lock collars, and centre with rubber mallet by tapping end of shaft.
6. Tighten bearing lock collars in the direction opposite to shaft rotation.
7. Tighten packing gland bolts evenly or tighten shaft seal collar.
   Note: If rotor does not turn freely, loosen end cover bolts. Centre rotor with feeler gauges and retighten bolts evenly.
8. Turn rotor by hand. Check clearances and see that rotor turns freely in housing.

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

Removing End Covers

1. Remove bolts that attach end cover to housing
2. Loosen and remove bearing lock collar
   a) Remove allen set screw from collar and peen down groove formed by set screw using a small flat punch.
   b) Loosen collar by rotating collar in direction opposite shaft rotation. Use drift pin in the plain hole (not threaded set screw hole) and tap with hammer to rotate collar.
   c) Slide collar off shaft.
3. Loosen packing gland bolts or shaft seal collar, if applicable.
4. Attach wheel puller.
5. Tighten slowly until cover slides off shaft. If cover tends to bind on shaft, tap puller bolt with rubber mallet as you tighten.

Remove Press-Fit Bearings

1. Remove end cover.
2. Press bearing in the appropriate direction to remove from end plate.

Replacing Press-Fit Bearings

1. Align bearing with machined hole in end cover.
2. Be sure the eccentrically machined end of the inner bearing ring will be at the outer face of the endplate so that matching bearing lock collar can be properly installed.
3. Press the bearing in place.

Installing Press-Fit Bearing Lock Collar

1. Check to see that bearing has been pressed into endplate with eccentrically machined face of inner bearing ring facing outward toward the end of the shaft.
2. Slide collar on shaft with eccentrically machined, recessed face against the inner bearing ring. Rotate the collar in the opposite direction of shaft rotation until eccentric faces of collar and inner bearing ring engage.
3. Continue to rotate the collar in the opposite direction of shaft rotation until snug. Complete tightening by inserting pin in drift pin hole of the collar and tap with lightweight hammer.
4. Tighten allen set screw.

611 Argyle St. N. Caledonia, Ontario N3W 1M1 **TEL: (800) 655-3447** **FAX: (800) 955-4991**
Email: sales@acsvalves.com **Website: www.acsvalves.com**

Chain Drive Adjustment and Maintenance

Airlock drive chain tension. Check tension of airlock drive chain every 200 hours as follows:

A. Remove chain guard. Airlock drive chain should have no noticeable sag between gearmotor and valve sprockets. However, chain should be loose enough to allow a slight up and down motion with hand pressure applied midway between sprockets.
B. To adjust airlock drive chain, loosen two bolts securing gearmotor and change position of gearmotor to obtain desired degree of tightness. Tighten mounting parts and reinstall chain guard.
C. Clean and re-grease chain every 500 hours.

Inspection and Repair

Inspection and repair procedures given below provide sufficient information for restoring the package to peak operation. In most cases, repair simply consists of component replacement.

A. If airlock is not operating efficiently or satisfactory, remove from system, inspect and repair in accordance with preceding information.
B. Inspect airlock drive chain and sprockets for wear, loose links, and damage. Replace chain and sprockets if damage is noted. Be sure the same size sprockets are replacements for original sprockets.
C. Inspect base structure, chain guard, and brackets, for damage and deformation. Replace defective parts.
D. Check all accessory equipment to assure proper operation. Replace any components found to be defective.

When requesting service assistance, please have the following information at hand prior to calling system engineer.

1. Blower speed.
2. Vacuum or pressure gauge reading.
3. Pressure switch setting.
4. Blower motor amperage reading.
5. Airlock speed.
6. Method of feeding the valve.
7. Gearmotor amperage reading
8. Conveying line length
   a) Horizontal run
   b) Vertical run
   c) Number of elbows

Shaft Seals

- ACST-4 shaft seals are used on both ends of the rotor shaft for superior sealing
- Each shaft seal assembly consists of one virgin teflon sleeve and three quad rings, which fit snuggly over the teflon sleeve
- The teflon sleeve has a smooth self lubricated surface creating a tight seal with the quad rings
- Also available in a packing gland style shaft seal air purge assembly consisting of a lantern ring, 2 lip seals, lot teflon packing and a adjusting pusher plate
- Air purge seals connection option for severe applications

Terms and Conditions of Sale

These General Conditions of Sale are and shall be applicable to all sales of products and services of Ancaster Conveying Systems ("ACS"). No other or inconsistent conditions of sale shall be binding upon ACS unless specifically agreed to in writing by an authorized official of ACS. ACS' distributors and sales representatives are not authorized officials of ACS for purposes of this provision. Any failure by ACS to object to any inconsistent condition or other communication from a buyer of production or services from ACS shall not be construed as an acceptance of such other inconsistent provision or as a waiver of these General Conditions of Sales

PRICES: Published prices on standard products and services are subject to change without notice. Verbal quotations on custom productions or special services expire at the close of the business day they were made, if not first accepted in writing or withdrawn. Written quotations for custom productions or special services expire 30 days from the date which they bear, unless earlier withdrawn or unless the quotation specifically provides another expiration date.

OFFICIAL CORRESPONDANCE: All official correspondence to include, but not limited to Purchase orders, Specifications, Samples, Construction Drawings, Approval Documentations, Shipping Status, Reports, Shortages of Incorrect Equipment Claims and/or Warranty Claims must be made and addressed to ACS at its principal office in Caledonia, Ontario.

ACCEPTANCE: No purchase order shall be valid and/or binding upon ACS unless first accepted by ACS at its principal office in Caledonia, Ontario.
TERMS OF PAYMENT: Unless otherwise agreed to in writing, payment is due:

a) Net within 30 days from the date of invoice from buyers whose credit has been approved by ACS.
b) Upon delivery for all other buyers. ACS with charge a 1 ½ % per month service and carrying charge with respect to all balances which are not paid when due. If a shipment of ACS' products is delayed by the acts of omissions of a buyer, payment shall become due at the time such products would have been shipped and the products will thereafter be stored by ACS at the buyer's expense and risk.

CONFIDENTIALITY: All proposals and price quotations, including any drawings prepared by ACS are confidential and remain the property of ACS. Transmission of all or any part of such information to others, or the use of any such information for the purpose other than considering the purchase of the products described, is prohibited.

TAXES: Any federal, state, provincial or local tax, tariff or charge of duty levied on the sale by ACS of any product or service or on the use or possession of any product after shipment by ACS shall be borne by and paid for by the buyer. If ACS is required by law to collect any such tax, tariff, charge or duty, the buyer will pay the amount thereof to ACS on demand or provide to ACS at the time the purchase order, any applicable exemption certificate or additional documentation.

RESPONSIBILITY FOR DOCUMENTS: Any documents, drawings or samples submitted with a purchase must be picked up by the buyer within a 30-day period. ACS shall no longer be responsible for any such items and may discard them.

ESCALATION: Any price quoted by ACS is calculated on the basis of wage and materials cost in effect at the date of the quotation and may be subject to increase to reflect increases in wage and/or materials cost accordingly.
CHANGES IN SPECIFICATIONS: No specification change shall be valid unless in writing, signed by ACS and the buyer of the product.
LOCAL CONDITIONS: ACS shall not be responsible for determining whether products furnished to any buyer comply with local conditions, codes or interpretations. The buyers of the product shall have the sole responsibility for assuring such compliance.

SHIPPING: Shipping dates are approximate and are dependant upon availability of materials and the cooperation of the buyers. ACS shall not be subject to any liability because of delay in shipping resulting from strike, accident, weather, fire or other conditions beyond ACS' control. ACS shall not be responsible for damage or loss in transit, and the buyer of any product shall have the sole responsibility to pursue any claims against a carrier.

SHORTAGES OR INCORRECT EQUIPMENT: Claims by a buyer of products from ACS for shortages or incorrect products must be made in writing within 10 days after receipt of the shipment by the recipient. Failure to give such written notice to ACS shall constitute in an unqualified acceptance of the shipped products and waiver of any claim by the buyer.

INSTALLATION: Installation of the Products shall be at the expense of the buyer. ACS can provide installation and start-up service.
In any case where ACS is utilized, the buyer shall nevertheless be obligated to furnish all necessary skilled and unskilled labor, tools, rigging and appliances with respect to the erection of a Product, without responsibility or liability of ACS.
If a Product is installed without ACS' assistance, ACS warranties contained in these general conditions shall not be applicable in the event of any claim of damage which, in ACS opinion, results from inadequate or faulty installation.

WARRANTY: ACS warrants its Products on the following terms and conditions only. THESE EXPRESSED WARRANTIES ARE IN LIEU OF ANY OTHER OBILGATION OR WARRANTY, WHETHER EXPRESSED OR IMPLIED OR ARISING BY OPERATION OF LAW.

a) ACS warrants that each of its Products shall be free of defects in workmanship and materials for a period up to one year from the date of installation (but not to exceed 18 months from the date of shipment by ACS from its factory)
b) ACS warrants that any of its custom Products which are manufactured in accordance with specifications, drawings, plans and designs set forth in writing by the buyer shall reasonably conform to all such written specifications, drawings, plans and designs.
c) The warranties set forth in (a) and (b) above are subject to and limited by the following:
    I. ACS' warranty with respect to a component of a Product supplied by another shall not exceed the warranty of the other supplier in terms or conditions.
    II. ACS' warranties shall be inapplicable if in the opinion of ACS, the Product has been mechanically, electrically or environmentally abused or altered, or if the Product was improperly installed.

III. ACS' warranties are applicable only within the continental boundaries of the United States, Hawaii, Canada and Alaska.
IV. ACS' warranties are limited to the supply of replacements for the defective part(s), FOB factory.

THIS WARRANTEE IS EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTEESS, EXPRESS, IMPLIED OR STATUTORY, INCLUDING BOTH BUT NOT LIMITED TO THE WARRANTEE OF MECHHANTABILITY. THE WARRANTEE OF FITNESS FOR USE AND THE WARRANTEE OF FITNESS FOR ANY PARTICULAR PURPOSE AND EXCLUDES ANY CLAIMS FOR INDIRECT OR CONSEQUENTIAL LOSSES OR DAMAGES. BUYER ASSUMES ALL RISK AND LIABILITY FOR LOSS, DAMAGE OR INJURY TO THIRD PERSON OR PROPERTY ARISING FROM THE USE OF GOODS SUPPLIED BY SELLER TO BUYER. BUYER AGREES TO DEFEND, INDEMNIFY AND HOLD HARMLESS SELLER AGAINEST LIABILITY OR OBLIGATION THAT ARISE FROM CONTRACT OR TORT, INCLUDING BUT NOT LIMITED TO NEGILIGENCE INCLUDING STRICT LIABILITY OR OTHERWISE WITH RESPECT TO ANY INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS, OVERTIME , REPLACEMENT EQUIPMENT OR SERVICES, PENALTIES, LOSS OR DAMAGE TO BUYER OR ANY THIRD PERSON. IF THE GOODS THAT ARE THE SUBJECT OF THIS AGREEMENT CANNOT BE IN THE SELLER(S) DETERMINATION, ADEQUATELY REPAIRED OR REPLACED, SEELER(S) LIABLITY SHALL NOT EXCEED REPAYMENT OF THE AMOUNT OF PURCHASE FUNDS RECEIVED FROM BUYER.

GOVERNING LAW: Ontario law shall be applicable with respect to, and interpretation of these General Conditions of Sale.
RETURNS/CANCELLATIONS BY BUYER: Unilateral cancellation of a purchase order to ACS shall constitute a breach of contract and shall be subject to a cancellation/restocking charge. This charge shall be a minimum of 30% of the purchase order value and a maximum charge of the selling price of all materials and labor, purchased or expended by ACS to compensate for the disruptions in scheduling, planned productions and other direct costs. No approval shall be granted for the return of Goods under any circumstances where the original invoice date for such Goods is more than one-hundred eighty (180) days prior to the date that a request is made to ACS for such approval. No credit will be issued for returned Goods where the net amount involved is less than $100.00, except when an error made by ACS is to be corrected.

Start with a top-to-bottom equipment inspection and save year after year.

Proactively prevent component failures, major repairs and unplanned downtime.

Initial inspection puts you back on track. Your Hapman equipment was robustly engineered to run trouble-free for years. But you must properly maintain it to reap the savings – and it's too easy to fall behind. To keep maintenance on track, start with a top-to-bottom inspection of your Hapman equipment. One of our skilled technicians will conduct the 4-8 hour inspection. You'll get a detailed report with early warnings of part wear and/or impending component failures. We'll also evaluate your maintenance program and provide a 30-minute consultation so you can learn how to make cost-saving improvements. Fee: only $600 plus expenses.

Customized Managed Maintenance Program (MMP) minimizes "surprise" expenses. Included in your initial inspection will be a no-obligation MMP based on the level of maintenance assistance you want:

- Regularly scheduled equipment inspections by a Hapman technician
- Shared maintenance responsibilities between Hapman and your staff, or
- Full maintenance performed by Hapman

All three levels will improve your machine uptime, reliability, performance and longevity. And that's how you'll keep saving year after year.

YOUR INITIAL INSPECTION INCLUDES:

- Maintenance baseline for your Hapman equipment.
- Detailed inspection report pinpointing maintenance/repair needs.
- One-on-one consultation on how to maximize equipment longevity.
- No-obligation MMP to safeguard your equipment investment.

EXCLUSIVE SAVINGS

When you sign on for the Hapman MMP:

- Save 10% on Hapman service call rates.
- Save 10% on list price of all MMP-covered parts purchases.

TO LEARN MORE WAYS TO SAVE WITH MMP OR TO SCHEDULE AN INSPECTION, CONTACT US TODAY:

800-427-6260 (US/Can) or 269-343-1675

Thank you for your recent purchase of the following McLanahan equipment with your Purchase Order 18000630 HD referencing our Sales Order 113957.

This document contains important information regarding the installation & operations of your new equipment. Having recommended spare parts at your plant will assure minimum down time in order to perform periodic maintenance and will also eliminate the expense of air freight of critical parts. They are available for immediate shipment from our inventory.

When ordering parts, you will be required to provide the equipment's serial number.

- (4) 3X3 DG NITRILE PUMP ASM W/ 15 HP DRIVE
  S/N: **20182093- 20182096**

We suggest you become familiar with the enclosed literature to ensure the proper installation of this equipment.

Should you have any questions regarding the installation and/or operation of the equipment you have purchased, please contact our Process Equipment Department at (615) 451-4440.

Sincerely,

McLanahan Corporation

Safety Precautions

Overview

READ THIS MANUAL IN ITS ENTIRETY BEFORE BEGINNING OPERATION.

- **DO NOT** install, operate or service this equipment (or any portion thereof) without fully understanding the information contained herein.
- **DO NOT** operate this equipment in any manner other than that for which it has been designed or approved.

NOTE: A copy of this manual **must** be provided to the operator of this equipment and **must** be kept with the equipment at all times.

The safety instructions presented throughout this manual do not supersede any other directives or practices associated with this equipment or its operation. Rather, they are to be used in addition to any other applicable guidelines set forth by governing bodies (ANSI, ISO, OSHA, MSHA, etc.), plant administrators, signs, tags or placards, etc. (Refer to the **TAGS** section of this manual for information regarding safety and instructional tags provided with the equipment.) In the event of conflicting information, **always use the guidelines providing the highest degree of protection/safety.**

The safety instructions used throughout this manual and on the equipment contain a "signal word" (CAUTION, WARNING or DANGER) that indicates the seriousness of the hazard as described below.

DANGER *indicates an imminently hazardous situation, which, if not avoided, will result in death or serious injury.*

WARNING *indicates a potentially hazardous situation, which, if not avoided, could result in death or serious injury.*

CAUTION *indicates a potentially hazardous situation, which, if not avoided, may result in minor or moderate injury.*

CAUTION *(used without the safety alert symbol) indicates a potentially hazardous situation, which, if not avoided, may result in property damage.*

The safety instructions listed below are general guidelines. Additional safety instructions are listed throughout this manual as required. **All** safety instructions **must** be followed at all times to ensure personal safety and to prevent equipment damage.

Verify that all personnel are clear of any/all moving or rotating parts (or parts that are subject to movement or rotation) before installing, operating or servicing this equipment or any portion thereof.

Verify that all guards and safety devices are in place, secured and functional before operating this equipment or any portion of it. **DO NOT** circumvent or disable any safety devices.

Lockout/Tagout all controls and secure all applicable components to prevent unexpected movement before performing any maintenance, repairs or adjustments on this equipment or any portion thereof.

Lockout/Tagout power at the source before accessing any electrical panels or devices on this equipment or before performing any maintenance or repairs to the power line(s) feeding this equipment.

Wear appropriate personal protective equipment at all times.

Obey all safety tags and signs and replace any that are illegible or missing.

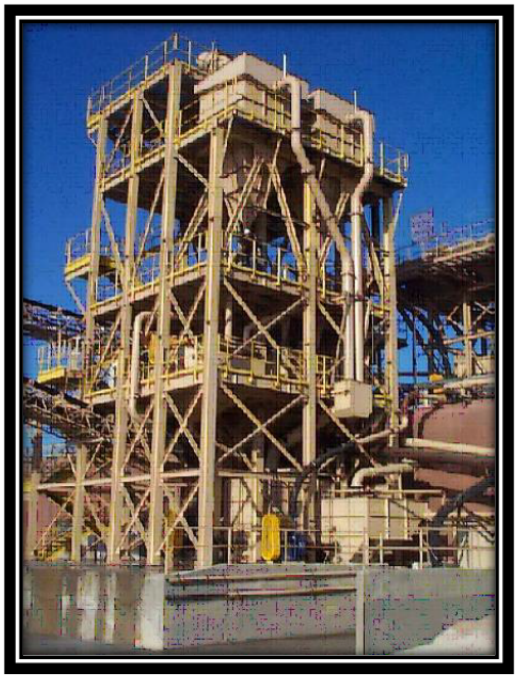
If any questions arise concerning the safe operation of this equipment, or if clarification of any information is required, cease operation and contact **McLanahan Corporation** immediately.

The McLanahan Pump

Introduction

The Aggregate Processing Division of McLanahan is a major manufacturer of process plants for the minerals industry. The McLanahan Model lllr is the latest generation of successful abrasion/corrosion-resistant slurry handling pumps.

This manual should be carefully read before attempting to install or operate this McLanahan Model lllr Pump.



Service, Selection and Support

Total Service

From design to installation and beyond, McLanahan engineers are available to give advice on your slurry pumping needs and solutions for your problems.

The McLanahan Model lllr range has been designed to offer a wide choice of pump sizes to suit most slurry pumping applications. A standard questionnaire is available to ensure that the most complex installation, as well as the more straightforward pumping application, receives individual consideration.

McLanahan can also advise on the ancillary components within the pumping system. The provision of low head loss valves, gland feed pumps, priming devices and flexible bends, all incorporating application specific linings for trouble-free life, are an important aspect of ensuring a totally successful pump installation.

Design Specifications and Options

The McLanahan Model lllr standard casing is designed for a maximum working pressure of 88psi (6 bar). A high pressure casing is available, rated at 272psi (18.5 bar). Please contact McLanahan for pressures higher than this.

The pump units in the McLanahan Model lllr range are designated by the size of suction and discharge ports. Units up to 4” (100mm) have equal size suction and discharge; above this, the Model lllr has a larger suction than discharge. Size is given in inches i.e. 8”/6” (200/150mm) Model lllr has an 8” (200mm) suction port and a 6” (150mm) discharge port.

Suction and discharge flanges are universal and, as a standard, are available in ASA150 drilling patterns. Other drilling patterns (metric & BS4504) are available to special order. Orientation of discharge to 4 positions according to installation requirements.

The McLanahan Model lllr pump components are designed and manufactured in accordance with appropriate International Quality Standards, such as ISO9000.

"Pumptec" Computer Software

Many complex calculations are needed in order to

- Size a pump
- Establish the optimum pipeline carrying velocity
- De-rate the pump for a slurry duty
- Calculate pipeline friction head losses
- Calculate power absorbed
- Analyze the system head

McLanahan Corporation uses unique software, **Pumptec,** to perform these calculations.

The pump is able to adapt to a change of V-belt sheave ratios and different speeds. However, it is **crucial** to recalculate duty parameters and check motor and drives to guarantee that they are not overloaded under any normal operating condition.

Please consult McLanahan Corporation before making any changes to your pump system to ensure the correct combination of speed and power is selected.

Input criteria required:

- Volume to be pumped
- Percent solids
- Gradation of solids (top size & 50% passing size)
- Specific Gravity of Solids
- Specific Gravity of Liquid
- Temperature of Liquid
- Elevation above sea level
- Height of liquid level in tank (**if negative suction**, height from liquid surface to center line of pump inlet)
- Vertical height from pump inlet to discharge point
- Pressure required at delivery point
- Pipe diameter (inside diameter important)
- Pipe material
- Pipe fittings – type and quantity

Pumptec: Computer Aided Support

To complement and facilitate optimum selection of your slurry system, McLanahan uses **Pumptec.**

This unique computer program:

- Analyzes the effects of changing slurry density
- Calculates the P_{50} particle size from a sieve analysis
- Calculates settling velocities and select pump sizes
- Calculates pipeline frictional losses in various pipe materials and pipe fittings
- Calculates the pump duty and selects a pump and drive based on input parameters
- Prints full application and selection data including NPSH, BEP, RPM, HP, etc.

Troubleshooting is made easier using **Pumptec** Software to evaluate different scenarios.

Design Condition (To be filled in by distributor or owner)

The following data should be completed as a record of the duty for which the pump was originally sold. During its lifetime the pumping requirements may change; if so, the new speed and operating conditions must be carefully engineered. McLanahan engineers are able to assist you in doing this. U.S. units are used, unless otherwise noted.

Gland Options

Gland Seals

The **gland** is usually the weakest point on any **pump**; therefore, it requires the most attention and maintenance. All glands need cooling and lubrication between the sliding surfaces, so **a leisurely drip from the glands is normal**. **NOTE: DO NOT PREVENT DRIP.** All glands must be finally adjusted while the pump is running.

The McLanahan Glands have been developed to minimize the attention and service needed; Pressure of the fluid being pumped, the size and shape of the solid particles and the concentration of the solid particles in the liquid all affect wear and tear on pumps. Three unique seal arrangements have been developed and McLanahan engineers can give advice regarding the optimum selection for a specific duty.

"H" and "P" Glands

The slurry pressure at the gland is reduced by back pump out vanes on the impeller. The rubber axial expeller, which is a stretch fit on the shaft of the "H" and "P" glands, is used to avert waste.

The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the "H" Gland, the adjusting gland must be eased **outward** to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to provide a flawless seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible and at a pressure of about 3-5psi (2-4m water gauge) above the discharge pressure. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

“D” Gland

This is a unique type of mechanical seal. The **face seal** runs against the **hard wearing face**.

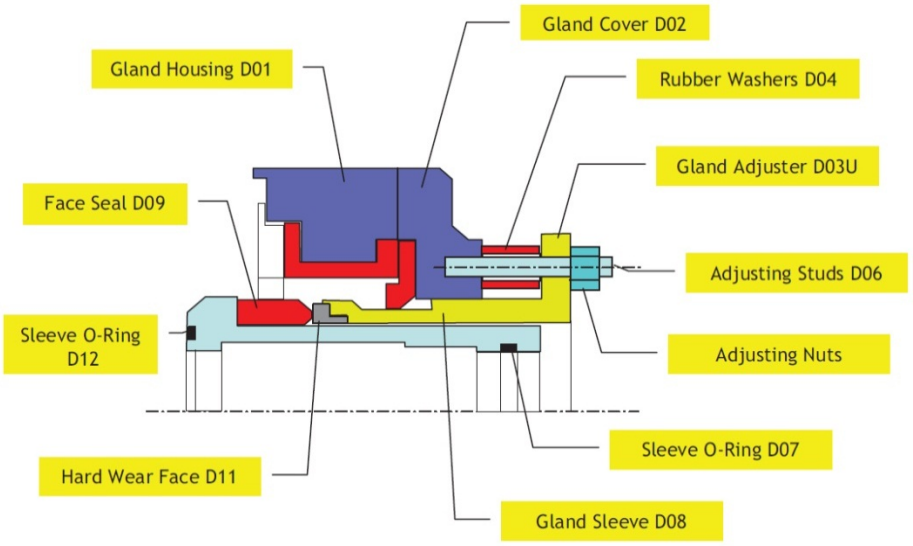
The **face seal** acts as a spring and if any grit particles get between the rotating rubber and stationary **wear face** it is pressed into the rubber. The **face seal** is a stretch fit on the **shaft sleeve**. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface. Be sure not to over-tighten the adjusting sleeve.

When the pump is first started, ensure that the adjusting nuts are finger tight. While the pump runs, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to a year without further attention in a good application.

Dry Gland

Also known as "D" type gland
This gland has a unique proprietary design and is unlike conventional mechanical seals. A rotating rubber **face seal** is adjusted against a static **hard wearing face**; it is **self-lubricating** - pressure from inside the pump head forces small amounts of liquid between the surfaces for lubrication.

Note: The gland needs no external water source to lubricate the gland; both small amounts of water and the fines do exit the pump, accumulating at its base, hence the term **dry gland**.

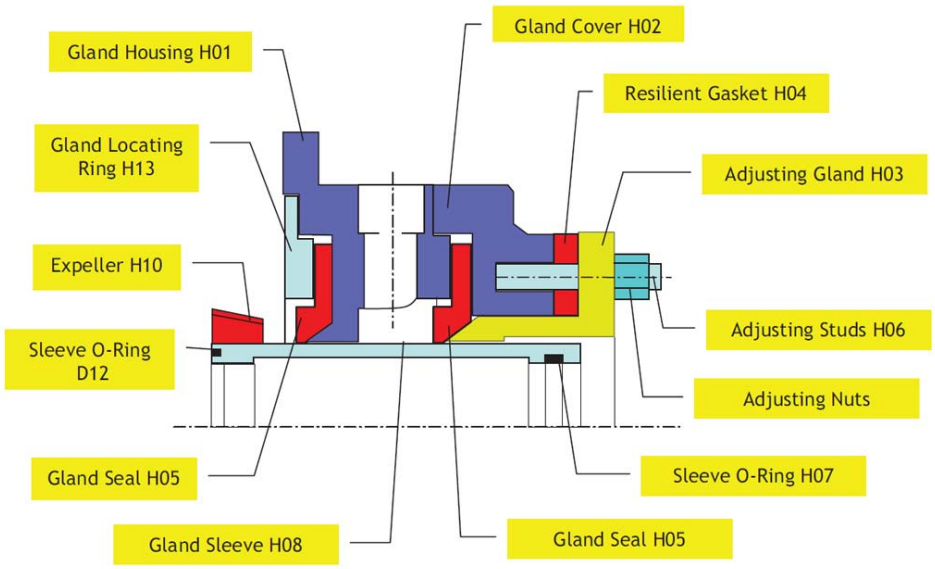


The **face seal** acts as a spring; if any grit particles get between the rotating rubber and **stationary wear face**, it is pressed into the rubber. The **face seal** is a stretch fit on the shaft sleeve. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface.

While the pump is running, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to one year without further attention in a typical application.

Hydrostatic Gland

Also known as "H" type gland
This gland has a unique proprietary design with the lowest maintenance and longest life. The unique rubber gland seal is designed to deflect inwards to provide an effective seal. The **slurry pressure** at the gland is reduced by back pump out vanes on the impeller; when fitted, it is reduced by the **rubber axial expeller**, which is a stretch fit on the shaft of the "H" gland sleeve.



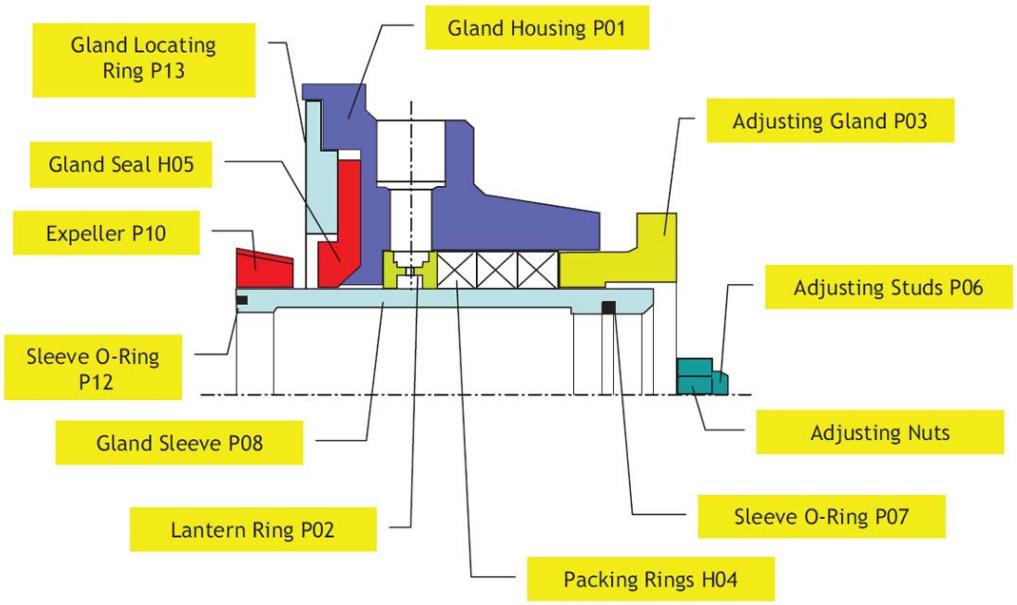
The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the H Gland, the adjusting gland must be eased outwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

Packed Gland

“P” Type Gland
In a classic “stuffing box” design, sealing is obtained by compressing the gland packing rings onto the shaft sleeve. The gland offers the capacity to seal the pump even at high pressures, for instance, in series pumping.



The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the “P” gland, the adjusting gland must face inwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of “digging” onto the gland sleeve.

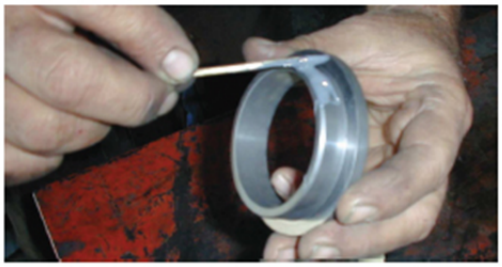
The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

A pressure-fed grease supply can be used with the “P” gland; be sure to use synthetic rubber parts (special order).

Assembly of Dry Gland – Hard Wear Face & Gland Adjuster (2” x 2” shown)

1. Check all components

2. Extrude epoxy from package & mix thoroughly



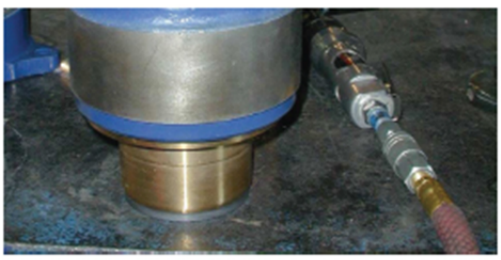
3. Apply epoxy to outer rim of Hard Wear Face (D11)

4. Place ‘O’ Ring (D10) on outer rim of Hard Wear Face (D11). Position ‘O’ Ring at leading edge.

5. Position Hard Wear Face & ‘O’ Ring into Gland Adjuster (D03U)

6. Using a slight twisting motion Carefully push Hard Wear Face into Adjuster

7. Wipe off excess epoxy



8. Place a heavy object on top of the assembly until dry (min 30 minutes)

General Pump Suction Requirements

A pump does not "suck," as fluid has no tensile strength. The centrifugal expulsion of fluids creates a low pressure area at the eye of the impeller; atmospheric pressure, plus any static head, pushes fluid into the pump. It is essential that suction systems do not restrict flow from the sump into the pump. With slurries, this is even more important as the solids themselves can settle and cause obstructions to flow.

In order to maintain the short pipelines and prevent obstruction**, cleaning is essential**. A trap to remove tramp material is beneficial as well.

Air entrained in the slurry reduces the pump's capacity and head; an air vent pipe on the suction pipe close to the pump inlet is often essential.

The pump will operate best if the flow velocity approaching the impeller is evenly distributed across the suction eye, and is sensibly axial, without swirl.

Pump performance is potentially impaired by a number of factors. Intake conditions in the sump, such as the formation of vortices, can cause an uneven flow over the eye of the impeller. Intake conditions in the suction pipeline, such as a sharp bend just before the pump, can affect performance as well.

Installation

Important Notes

- The maintenance of rotating machinery should be done by experienced mechanics.
- Protective clothing as well as proper tools and lifting equipment, all in good condition, must be used.
- Do not lift heavy weights without mechanical aids.
- Do not take any risks with your health and safety.
- If a pump has run without discharge, the fluid temperature and pressure may be dangerously high.
- The casing suspension arm is fitted as a maintenance aid only.
- The installer must ensure that guards are fitted in accordance with national & local regulations.

The following notes cover most situations; however, certain installations will require additional assessments.

Noise

Because of its heavy construction, rigid bearing housing and the sound attenuation due to the rubber lining, the noise generated by a bare shaft McLanahan Pump is low: less than 70dB (A).

The noise emission from a complete pump and drive unit will be dependent upon various factors including that from the motor, its fan and the V-belt drive. To obtain an indication of the noise level generated by a specific complete unit, take the highest component noise level, which is generally the motor, and multiply by 1.15.
For example:

dB (A) pump + dB (A) motor + dB (A) drive = 1.15 x dB (A) motor.

Other factors, including the piping system and hydraulically-generated noise as well as any reflected noise, will affect the final installed figure.

Foundations

Location and dimensions must be checked and matched to the pump-certified drawing when holding down bolts, bolt holes in steel work or pockets in concrete. The foundations must be rigid.

The pump base must be level in its final position; it must also be rigidly supported at each bolt, which is designed to hold it down, before the bolts are tightened.

Pipe Work

The suction and delivery pipe work must be independently supported and the pump must not be used as an anchor to pull the pipes into position.

The procedure for discarding solids in an emergency situation should be planned before it is needed. If the removal of suction and delivery pipe work is planned ahead of time, it will facilitate unblocking and servicing of the pump.

Precautionary checks that need to be completed include:

- Areas that could cause restriction on the suction side
- The possibility of thermal expansion in the pipework causing undue loads on the pump
- The pipework should match up to the pump without strain

The lining on the McLanahan model lllr is continued out to form gaskets on the suction and discharge flanges, therefore the use of joint rings or additional gaskets is not necessary. Connections to the pump should be made using flat-faced flanges only.

When fitting McLanahan pumps to rubber-lined equipment such as valves, hose or lined pipe, a steel gasket must be used.

Power

Check that the motor voltage, power and starter rating and supply match.

Gland Services

If gland sealing water is required, the quantity, quality and availability should be checked.

Access

Crane capacity and access routes from the delivery point should be checked. Access for maintenance, protection from flooding, as well as ventilation for motor cooling, must all be checked.

Impeller Adjustment Axially

The position of the rotating element must be set so there is a minimum running clearance, approximately 1/16” – 1/8” between the suction bush and the impeller. The bearing housing must then be locked into position. This clearance should be checked by bolting a dummy flange or stub pipe to the suction flange. This ensures any movement of the rubber lining on connection is allowed. Once connected to suction and delivery lines, the unit should be checked for free rotation.

Coupling Alignment

The pump and motor couplings must be aligned in accordance with good engineering practice. Axial or radial run-out must be less than 0.05 mm total indicated reading on a clock gauge. With V-belt pulleys, the faces of the couplings must be exactly in line and the shafts must be parallel to each other. A check with a straight edge or string line across the pulley faces should have no visible gap.

Motor Rotation

Before the belts are fitted or the couplings are connected, the direction of rotation of the motor must be checked. Incorrect motor rotation can cause the impeller to unscrew and destroy the pump.

Tension V-belts

When the motor's direction of rotation is correct, fit and tension the V-belts in accordance with the maker's recommendation. In general, a quarter to a half twist of the belt will be possible at the center of the belt by simply using fingers. Check the tension after a few running hours.

Belt Guard

The belt guard provided with this pump unit is manufactured with the shaft aperture fully closed with mesh. On installation of the V-belt drive and determination of pulley centers, the shaft guard is offered up and the mesh relieved locally to allow the shafts to pass through. Allowance may be required for movement of shafts when belt tensioning.

The mesh should be relieved and a guard should be fitted in a manner which prevents accidental contact with the rotating parts of the drive assembly.

The installer must ensure that the guard is installed in accordance with national and local regulations.

Gland Service

When these are fitted, be sure that gland water supply and protection systems are working.

Greased Bearings

The pump bearings have been greased at the factory. **Over-greasing them can cause them to overheat**; they should be looked over but may not need grease. **Suitable grease types** are: Shell Alvania 3, Mobil EP2, Caltex LS3 or their equivalents.

Final Checks

- All nuts and bolts are tight
- Gland adjusting nuts are finger tight
- No loose material is lying around the pump set
- The guards are securely fitted and the pump is safe to start

The running speed of the pump must not exceed the following:

Pump	1½ x 1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
MAX RPM	2750	2400	2100	1600	1400	1200	1200	900

Electrical Installation

This equipment must be installed and controlled in accordance with applicable national and local regulations.

Gland Services

On the hydrostatic gland and also on the packed gland, it is usually necessary to have a clean water flushing supply to the gland.

The pressure should be 3-5 psi (2-4m) water gauge above the pump discharge pressure (remember to include the S.G. of the slurry) and the flow rate should be in accordance with the table below.

Pump	units	1½x1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
Water flow.	USgpm	1	1	1	2	2	2	3	4
Water flow.	liter/sec	0.04	0.04	0.05	0.07	0.07	0.09	0.1	0.2

The gland flushing water should be clean. The life of the gland and gland sleeve is significantly affected by the cleanliness of the flushing water. Although a few particles will not do instant damage, the seal life will be reduced. Slurry must not be used.

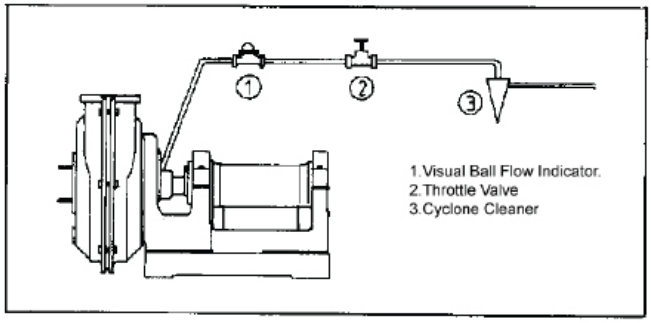
There are many combinations of flow control devices that may be used. A few of these are shown on the diagram below. The objective is to maintain a secure supply of clean flushing water to extend the gland life.

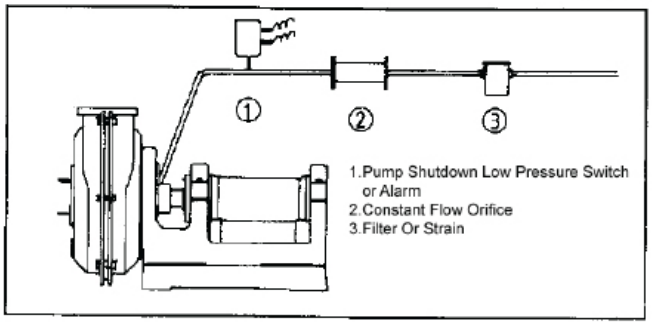
With pumps in series, there are three main ways of supplying gland service water.

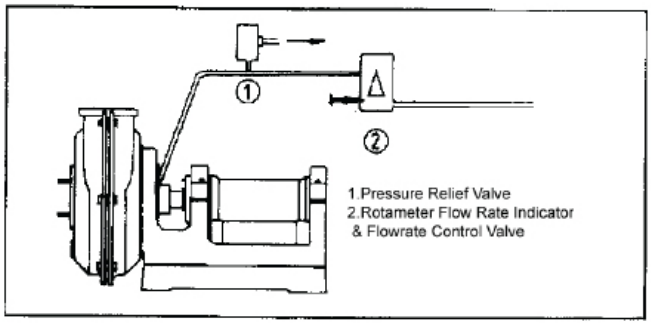
- Individual dedicated pumps at the correct pressure and flow rate.
- One large pump at the highest pressure throttling down the supply to each pump in the series.
- One multi-stage pump tapping off a supply at a different stage to each pump in the series.

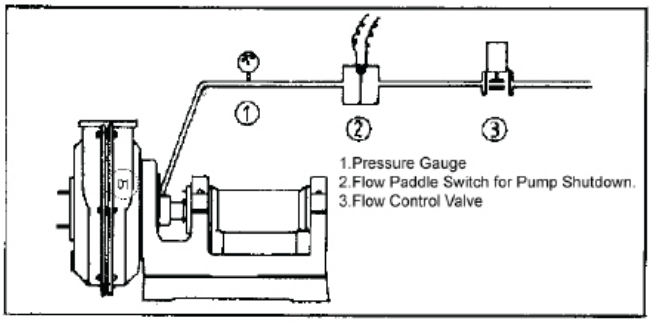
Gland Service Systems

These are a few typical systems. Any selection of items may be combined.









Lubrication and Cooling

Additional grease must only be added about twice per year, as the bearings are already lubricated. **DO NOT over grease the bearings**.

The bearing assemblies are all checked in the factory to prove that they are correctly assembled.

The bearings are designed to run at high temperatures (maximum 120° C) and the grease has to be compatible with this operating condition. Clean grease must be used.

If water gets into the bearings, the assembly must be stripped, thoroughly dried and greased over; then, any seal failure must be corrected.

Recommended greases are Shell Alvania 3, Mobile EP2, Caltex LS3 or their equivalents.

Start-Up Procedure

The recommended procedure to follow is listed below:

- Check the free rotation of the pump
- If required, verify that water for gland services is running
- At first start, or after any work on the electric motor terminal box, check direction of rotation **with drive belts removed**.
- Prime the pump
- Check that all guards are in place and that the pump is safe to run
- Start the pump
- If the pipeline is empty and there is no discharge valve (possibly due to abrasive nature of the product), the pump motor may be bogged down for a period of time and the pump may begin to go through the process of cavitation. This condition should be examined to evaluate the possible long term effect on the equipment.
- Check the pump for noise, vibration or any hot spots.
- **Adjust the gland to maintain a drip**, which is necessary for lubrication and for cooling.

Shutdown Procedure

This depends ultimately on the system and process flow requirements but the following procedure is recommended.

- Stop the flow of solids into the sump.
- Turn the sluicing water or run system on water only to wash out the pump and delivery pipeline.
- Shut down the pump.
- Shut down the gland service water system.

In cold weather, the pump and auxiliary equipment should be drained to prevent freezing damage.

Disassembly Procedure

Check that all power is switched off and isolated and that it is safe, electrically and mechanically, to work the pump. The following sequence is a general guide to stripping the pump for inspection. Refer to Cross Section drawings in Appendix.

On sizes up to the 4x4 (100x100) there is no separate suction bush or liner.

1. Remove the suction pipe and inspect for wear.
2. Check the suction bush liner for wear, noting any uneven wear pattern and position. Check the axial clearance.
3. Between the suction bush liner and the eye of the impeller (or on smaller pumps between the casing liner and eye of the impeller).
4. Remove nuts and suction bush. The suction bush liner is pushed out of the suction bush from the suction side. Some water spread under the lip of the suction bush liner will lubricate its passage out of the suction bush.

5. Remove casing bolts after supporting the suction side casing. Lift off the suction side casing. A crane will be necessary on the larger pumps.
6. The impeller is exposed for inspection. Hold the shaft using a spanner, which is a good fit, on the flats between the gland and the flinger. The impeller is screwed onto the shaft with an Acme right hand thread. The impeller may be very tightly locked onto the shaft and may need an impact force or a long lever to loosen it. If the impeller is to be used again, protect the rubber against damage. Inspect the impeller and note unusual wear patterns in the flow passages and back or front pump out vanes. Check that the "O" ring behind the impeller has sealed against the gland sleeve and slurry has not corroded the impeller or shaft thread. This "O" ring should be replaced at every strip-down.
7. Remove the axial expeller, which is a stretch fit on the gland sleeve. If "D" gland is fitted, the gland sleeve should be removed at this point.
8. Support the gland side casing, undo the casing to pedestal nuts and remove casing half along with the gland assembly. Undo the gland holding screws and remove the gland assembly. Undo liner nuts. The casing liner can now be removed for inspection; be sure to note any unusual wear patterns.
9. Remove bearing pedestal caps and fixings; unfasten the axial positioning jack to enable bearing assembly to be removed.
10. To disassemble the bearing assembly, remove the gland sleeve, flinger and bearing covers. The bearings can be inspected at this stage. If there is no sign of damage, the bearings should not be disturbed and they should merely be washed out with mild solvent oil and re-greased.
11. Press the shaft (with the bearing still fitted) out of the bearing housing. Push the shaft from the impeller side out of the bearing housing. The inner ring of the front bearing will still be attached to the shaft and can be removed later.
12. The remainder of the front bearing can then be withdrawn from housing.
13. Loosen the tab washer, undo the locknut and pull the end bearing off of the shaft.

Notes:

1. The 2x2, 3x3 and 4x4 pumps do not have a loose suction bush liner or suction bush.
2. The 10x8 (250/200) and larger sizes have the inside gland cover, which is held in position by (H14 / P14 / D14). Undo and withdraw the inside gland cover from the impeller side.
3. The Casing Suspension Arm is fitted as a maintenance aid ONLY and as much may be used to support **singularly**, either of the casing halves and its associated liner or the impeller. It must not be used for any other purpose. Suspension arm not fitted to 1.5 x 1.5 and 2x2 (50/50) pump.

Assembly Procedure

Before assembly, ensure all parts are clean and free of old grease and dirt. The new bearings or replacement bearings should be generously filled with grease between the rollers. Check that the Neoprene grease seals are not soft or distorted. Replace if necessary.

1. Clamp the shaft horizontally in a vice. Heat the spherical roller end bearing in an oil bath or induction heater to 240°F (115°C) and fit it to the drive end of the shaft using clean insulated gloves. Ensure the inner ring of the bearing is hard against its seat by tapping it with a brass pin. Fit the tab washer and the lock nut.
2. Fit the inner ring of the front bearing to the impeller end of the shaft. Ensure, by tapping with a brass pin, that it is hard against its seat.
3. Clamp bearing housing securely, grease bearing. Fit shaft and end bearing assembly into housing. Ensure that outer race of bearing is hard against seat.
4. Fit neoprene seal and bearing cover seal to end cover and fix to bearing housing using set screws.

5. Mount bearing housing vertically with front end upwards and wedge shaft so it is central in the housing. Fill front bearing with grease and carefully tap outer ring into bearing housing.
6. Fit neoprene seal and bearing seal cover to front cover and fix to bearing housing using set screws. Fit V-Ring Seal to shaft and place with slight tension against front cover. Fit flinger ring to shaft and locate in position using screw clamp supplied with flinger ring.
7. Set bearing housing assembly into pedestal and loosely assemble bearing pedestal caps with pedestal cap screws; fit axial positioning jack. Rarely, shims are required for shaft alignment; if factory fitted, the thickness of shim required will be stamped on the vertical face of the pedestal adjacent to the pedestal cap stud.
8. If "D" gland is to be fitted – loosely assemble gland components without damaging the wearing face when fitting. Leave the gland sleeve out, as well as "O" rings and face seal. Fit the gland side liner into the gland side casing by securing with liner nuts. Bolt the gland assembly loosely to the casing. Fit the casing and gland assembly to the pedestal using fixings; take care not to damage the wearing face against the shaft on assembly. Fit the "O" rings and face seal to gland sleeve. Slide home onto shaft, through casing and into the gland assembly. Carefully align gland components (specifically check concentricity of gland parts relative to the shaft) and tighten all fixings.
9. If "H" or "P" gland is to be fitted, fit "O" rings to gland sleeve. Slide home onto the shaft. Loosely assemble gland components, slide over shaft and onto the gland sleeve. Fit the gland side liner into the gland side casing securing with liner nuts. Fit the casing to the pedestal using fixings. Carefully align the components of the gland assembly (specifically check concentricity of gland parts relative to the shaft) and fit to the casing. The axial expeller will then have a stretch fit over the gland sleeve.
10. Smear the impeller thread on the shaft with protective long life graphite grease before screwing on the impeller, ensuring that the impeller "O" ring is fitted into the gland sleeve.
11. Fit the suction side liner in the suction side casing using liner nuts.
12. Fit the suction bush liner inside the suction bush before bolting it to the suction side casing using the bolts. NOTE: using soapy water will facilitate the process.
13. Check the concentricity of the fit between suction bush liner and the impeller.
14. Using the axial positioning jack, adjust the impeller toward the suction bush liner, keeping the holding down studs loose. Check the axial clearance between the impeller and the suction bush liner. A steel ring or dummy flange should be bolted to the suction flange to simulate any distortion in the suction bush liner when connected to the suction pipe before the axial clearance is checked. This clearance should be set at approximately 1/8". Rotate the shaft to ensure effective clearance.
15. Tighten the bearing holding down nuts and the axial positioning jack.

ATTENTION PLANT OPERATORS:
HANG THIS NEAR YOUR PUMP

McLanahan Model IIIr Centrifugal Pump With Type "D" Gland

MOTOR DIRECTION TEST

	ALWAYS PERFORM THE MOTOR DIRECTION TEST WITH THE V BELTS REMOVED

Note: The pump ships with the V-belts removed

	WARNING: RUNNING THE PUMP IN THE WRONG DIRECTION MAY CAUSE THE IMPELLER TO UNSCREW, AND DESTROY THE PUMP.

A motor direction test should be carried out without the belts installed before running the pump for the first time, or after any work on the motors, switchgear or softstart that may affect the direction of rotation of the motor.

STARTING UP AND RUNNING THE PUMP

	BEFORE STARTING, ENSURE THAT THIS PUMP IS BEING SUPPLIED WITH GLAND SERVICE WATER. RUNNING THE PUMP WITHOUT GLAND SERVICE WATER WILL DESTROY THE GLAND

With the pump full of water, and all isolation valves open (if present) start the pump. The pump should immediately start pumping.

BEFORE STARTING THE PUMP FOR THE FIRST TIME

The gland should be pre-set before starting the pump for the first time. To do so:

- Fill the feed sump with water and open the suction isolation valve (if present).
- Evenly adjust the gland Adjusting Nuts (see section 5) so a steady trickle leaks from the gland. Note: On a "P" Gland, tightening the nuts decreases the leak rate.

	WARNING: THE PUMP MUST NOT BE ALLOWED TO RUN IF IT DOES NOT DISCHARGE
	DANGER: RUNNING THE PUMP WITH NO DISCHARGE WILL CAUSE THE LIQUID INSIDE THE PUMP TO HEAT UP. IN EXTREME CASES THIS CAN LEAD TO THE LIQUID BOILING, & THE PUMP CASE MAY EXPLODE

The outside of the pump may not feel hot, as the rubber lining of the pump acts as thermal insulation. If by accident the pump has run without pumped discharge, it must be stopped immediately and the cause of the problem investigated.

	DANGER: IF IT IS SUSPECTED THAT THE PUMP HAS OPERATED WITHOUT DISCHARGE, EXTREME CAUTION SHOULD BE USED IN DRAINING THE PUMP – THE LIQUID INSIDE MAY BE DANGEROUSLY HOT AND UNDER PRESSURE

PRIMING

The McLanahan centrifugal pump is NOT self-priming. For this reason the pump must be installed with a flooded suction, or with the appropriate system for suction lift.

ADJUSTING THE "P" TYPE PACKED GLAND:

Before starting, the gland should have been adjusted so a steady trickle leaks from the gland (see section 2). Check that Gland Service Water is being supplied. See the Manual for details of the flow & pressure requirements.

Final adjustment of the gland should be done with the pump in operation. Tighten the adjusting nuts until the leak reduces to drips. (60 drops /minute maximum, 5 TO 45 drops per minute minimum). Care must be exercised not to tighten too much, which may lead to damage to the seal.

	WARNING: THE ADJUSTING NUTS SHOULD BE ADJUSTED INCREMENTALY, EVENLY, AND IN TURN, TO ENSURE THAT THE GLAND COMPONENTS STAY PARALLEL. TIGHTENING ONE NUT MORE THAN THE OTHERS MAY CAUSE MISALIGNMENT AND DAMAGE TO THE GLAND

STOPPING THE PUMP

Before stopping the pump, it is advisable (if possible) to run the pump on clear water before turning it off, to prevent solids from settling out in the pump casing.

LUBRICATION

The Pump comes from the factory fully greased. The Shaft Bearings should be greased with the correct grade of grease every 1000 hours of operation. Inject grease into the grease nipples by six strokes of a regular size (2" diameter body) grease gun.

The recommended grease is "Conoco Tacna HD No. 2" or equivalent grade grease.

MAINTENANCE

Except for attention to the gland while the pump is in operation, there is no daily maintenance required on the pump. It is essential, however, that routine inspections be carried out, with the first such inspection taking place approximately three months from startup. This inspection should provide some idea of the wear rate, which will be a guide for scheduling future inspections and maintenance. For instructions on dismantling and reassembling the pump, see the instruction manual supplied with the pump.

SPARES

Recommended spare parts are listed in the instruction manual. It is recommended that a supply of the wear parts listed be kept in stock so as to minimize down time in the event of failure of the part. (SEE NEXT PAGE)

PUMP BEARING TEMPERATURE

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. At 150 F (65 C) the assembly will be uncomfortable to the hands for more than a second or two, but this is not unduly hot for the bearing assemblies. The bearings are designed to run at high temperatures, maximum 120° C.

3X3 DRY GLAND, NITRILE PUMP SPARE PARTS LIST

OVERVIEW

McLANAHAN CORPORATION recommends that you keep certain replacement parts at your facility. These parts will be available in the event of a breakdown and will also be available to perform any repairs that must be made as a result of regularly scheduled maintenance checks. **McLANAHAN CORPORATION** stocks a wide variety of commonly used components; however storing these parts at your facility will eliminate the expense of air-freighting critical parts that may be required during a breakdown situation. Refer to the "PARTS LIST AND ASSEMBLY" drawing(s) to assist with parts identification, part numbers and quantities. Contact the Parts Department at **McLANAHAN CORPORATION** for price and availability of all parts for your McLanahan equipment.

Qty	Part Number	Description	Lead Time	
1	09110203321	Dry Gland Repair Kit, Nitrile	Stock	
1	09110003133	Suction Side Liner, Nitrile	Stock	
1	09110003134	Gland Side Liner, Nitrile	Stock	
1	09110003135	Impeller, Nitrile	Stock	
1	09110003116	Bearing Assembly	Stock	
1	09110003225	Bearing Repair Kit	Stock	
1	09110003202	Shaft	Stock	

Appendix - Long Term Storage

General:

The following are recommendations in reference to long term storage of McLanahan Pumps and Drives; McLanahan does not accept liability for components under these conditions. Documentation and photographic evidence is necessary for warranties to apply.

Preventive Maintenance for Stored Rotating Spares

In the absence of data on premature bearing failures and armature/shaft sag and imbalance, we recommend a general procedure as follows:

The motor shaft targets should generally be used on any motor of 50HP or higher. They also should be used on fans and any other large rotating equipment that sits in storage for lengthy periods of time. By rotating these shafts monthly (or more, depending on the floor vibrations), you are preventing armature and shaft sag as well as false brinelling of the bearings into the races.

You may also find some smaller motors that have premature bearing failures after prolonged storage in your facility. If this is the case, the shaft targets should be attached (with double-stick foam tape) and smaller motors must be rotated.

What is False Brinelling?

Whenever a **non-rotating bearing** is subjected to external vibration, **false brinelling** can occur. A protective oil film cannot form between the races and rotating elements when the bearing isn't turning, causing metal-to-metal contact. False brinelling can occur during transportation, typically truck or rail, and during motor storage if the storage area is subject to vibration.

Another type of brinelling, **true brinelling** occurs in **rotating bearings**.

Pump

If stored, the pump should be kept in a clean, dry, vibration-free environment. The shaft should be rotated manually every three (3) months, or at the same interval as recommended by the electric motor manufacturer. In order to care for the natural rubber linings and components, follow the recommendations below.

Electric Motor

The following information is reprinted from the WEG "Installation and Maintenance Manual for NEMA low Voltage Electric Motors"

Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three phase motors be raised by their eyebolts. Raising and lowering must be steady; otherwise bearings may be harmed. When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere. Other objects should not be placed on or against them. Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to re-grease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing

the protective film that impedes metal-to-metal contact. As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

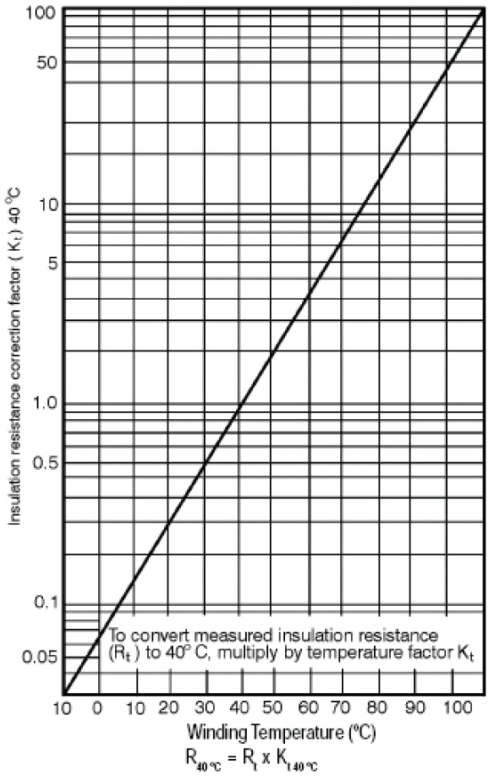
Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance. If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter. If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:
1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature. If the motor is stored for an extensive period, the rotor must be periodically rotated. Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula: $Rm = Vn + 1$

Where: Rm – minimum recommended insulation resistance in MΩ with winding at 40°C
Vn – rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance vs temperature of the winding (see graph below).



Example:
Ambient temperature = 50°C
Motor winding resistance at 50°C = 1.02 MΩ
Correction to 40°C

R 40°C = R 50°C x K 50°C
R 40º C = 1.02 x 1.3
R 40º C = 1.326 M&
The minimum resistance Rm will be:
Rm = Vn + 1
Rm = 0.440 + 1
Rm = 1.440 MΩ

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation.

This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service. On motors which have been in service for a while, a comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. The cause for any substantial or sudden reduction should be determined, followed by corrective action.

Insulation resistance is usually measured with a **megger**.

In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

Drying the windings

Only qualified personnel should carry out this operation. The temperature should not rise more than 5°C per hour and the overall temperature should not exceed 105°C; if either of these two things occur, vapor which is harmful to the insulation, may be generated.

Temperature should be accurately controlled and insulation resistance should be properly measured at regular intervals during the drying process. During early stages of drying, insulation resistance will decrease as a result of the temperature increasing. However, the resistance will increase again when the insulation dries a little more.

The drying process should be extended until successive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well-ventilated during the drying operation to ensure that the dampness is really removed.

Heat for drying can be obtained from outside sources such as an oven or space heater, or by introducing a current through the actual winding of the motor being dried.

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection. The installation of motors in environments where there are vapors, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) standards.

Under no circumstances are motors to be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air. The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects. The place of installation should allow for renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

Rubber Products

Rubber products in storage can be adversely affected by several factors, including:

- Temperature
- Humidity
- Ozone
- Sunlight
- Oils
- Solvents
- Corrosive liquids and fumes
- Insects and rodents
- Radiation

The warehousing area should be relatively cool, dark and free from dampness and mildew. All rubber products should be used on a first-in, first-out basis since even under these conditions an unusual length of time in storage can result in the deterioration of certain products.

The ideal storage temperature for rubber products is 50 to 70°F (10 to 21°C) with a maximum limit of 100°F (38°C). If stored below 32°F (0°C), some products may become stiff and should be warmed before being placed in service. Rubber products should not be stored near sources of heat, such as radiators and base heaters.

Rubber products **should not** be stored under conditions of high or low humidity.

To protect against the adverse effects of ozone, rubber products should not be stored near electrical equipment that may generate ozone and should not be stored for any lengthy period in geographical areas of known high ozone concentrations. Exposure to direct and reflected sunlight should also be avoided.

Whenever viable, rubber products should be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons; this will provide protection against the deteriorating effects of oils, solvents and corrosive liquids, and will also provide some protection against ozone and sunlight.

Certain rodents and insects thrive on rubber products, so the equipment must be protected.

McLanahan ***Pump Applications***

Sand plants
Feeding sand and water to all types of classification and dewatering plants; effluent water transfer duties.

Coal preparation plants
For dense medium circuits, feeding hydrocyclones, filtrate pumping, handling the underflow from thickeners, disposal of effluent, etc.

Chemical manufacturing & Environmental applications
McLanahan pumps, by virtue of their various rubber linings, are suitable for pumping many chemical solutions, acid or alkaline, at moderate temperatures and for the disposal of effluent.

Cement manufacture
Slurry feed to: tube mill circuits, thickener feed and underflow, flotation plant circuits.

Metalliferous mining
Mill circuits, feeding hydrocyclones, cyanide plant filter residues, concentrates, tailings disposal and other pulp and slurry handling duties.

Irrigation systems and dredging
Silt removal in dams and canal sand traps

Paper mills
China clay slurries, paper stock, effluent disposal

Steel works and manufacturing applications
Pickling acid distribution circuits in plate and wire de-scaling plants, abrasive wet scrubber blow-down

Power stations
Boiler house ash disposal, de-scaling plants

China clay production
Feeding slurry to hydrocyclones and for general use in the preparation of china clay

Glass manufacturing
Feeding polishing media, sand plants, handling effluent

Troubleshooting

If a pump fails to pump through a blockage, switch off **immediately**. Take extreme care as the pump may be filled with scorching steam and solids at a high pressure.

Wear and Replacement of Parts

To obtain the best service and performance from the pump, periodic routine inspections should be executed. The rate of wear on pumps is not precisely predictable since it varies from one application to the next, so intervals at which these inspections should be made vary. Initially, the pump should be allowed to run for a period of time (for example, three months); afterward, an examination of the pump will give some idea of the length of life, which may be expected from the rubber-covered parts.

No Discharge When Pump Runs

The pump must not be allowed to run if it does not discharge. If it is noted that the pump has been running without discharge, cease it immediately.

Take extreme care in dismantling after such an occurrence due to high temperature and pressure, which may be present in the pump casing. Do not remove the drain plug until the fluid temperature in the pump has dropped.

Air Lock

Air lock in the casing is the most common cause of failure on a newly installed pump. Even when a pump is well below water level, it may retain a large bubble inside the casing, which prevents the start of pumping. This phenomenon is far more likely with horizontal undershot discharge branch arrangements than any other practical configuration. It is least likely with horizontal overshot arrangements.

If you suspect air lock as the cause of failure to pump, start and stop pump several times to drive the air out, one fraction at a time. When using this procedure, ensure that you do not damage the motor starter or burn out the motor by trying too many starts in a short period of time. The number of permissible attempts will vary with the equipment installed but usually it is safe to try one start every three to four minutes.

Inadequate Prime

Failure to pump may be caused by inadequate priming. This is usually rectified by allowing more time for priming to occur.

It is possible when “jet priming” to have such a small amount of priming water that the pump will never prime; in this case, more water for the priming option will be needed.

Usually, the diameter of the priming branch should be at least one-third of the diameter of the suction pipe. NOTE: 2” (50mm) will prime 6” (150mm), 3” (80mm) will prime 8” (200mm) etc. The minimum water required is about 30% of the pump capacity.

If priming is by vacuum pump, there must be a valve or at least an air-lock on the delivery side. The vacuum pump must be able to “beat” the air leakage throughout the gland. To assist in this, always attempt to prime with the gland water running, no matter what style of priming is being attempted.

Installation Faults

Failure to discharge on start-up can be caused by installation faults. The most common is inadequate sump capacity. The result of installing a sump with inadequate capacity is to risk repeated air-locks of the pump. This can happen when the pump reduces the water level, either allowing a vortex to form, which air-locks the pump, or (when water is introduced to the sump) it entrains so much air that it produces the same effect.

A small sump can easily prevent any discharge reaching the end of the pump discharge line. The only remedy is to extend the sump capacity. We recommend sumps of at least one minute's pumping time as a minimum. NOTE: This recommendation does not apply to feed regulating sumps in sand plants where greater capacity is required.

Other installation faults are more obvious, such as tramp material lodged over a pump suction or a kinked suction hose.

Brief Discharge Only

1. **Air Lock**

A pump with a suction lift and partial air lock will often start to pump at a greatly reduced rate after each start, and then it will give up completely. At the discharge end of the pipe this may appear as a brief surge followed by failure.

This problem can only be overcome by closer attention to the priming system.

2. **Obstructed Suction**

If the suction line is obstructed either by tramp material or a delaminated suction hose lining, the pump may start well. However, when the discharge rate rises, the suction obstruction throttles the pump in a way that it quickly fails by gross cavitation.

Detection of this sort of condition is difficult. The only way to guarantee finding out what is actually happening is by using a vacuum gauge immediately before the pump suction. An obstructed suction line will be indicated by a sudden increase in vacuum reading immediately before the failure.

3. **Lack of Delivery Resistance**

A pump, which is required to pump with a suction or with a fair length of suction pipe, although with practically no resistance on the delivery side, may pump briefly before failing. The reason for this is that centrifugal pumps on open discharge need positive pressure on the suction eye to prevent gross cavitation. If the installation does not provide sufficient positive pressure on the suction side, the pump will fail.

Usually, the easiest way to overcome this difficulty is to artificially create resistance on the delivery side by extending the pipe work or introducing a valve or other resistance, such as an orifice.

Pumps water but not solids

1. **Air Leaks on Suction Side**

Joints in the suction line or air entrainment with feed into a sump may be insufficient if they are made poorly. Poorly made joints sometimes prevent a pump from pumping water satisfactorily. However, when solids are introduced (particularly coarse solids) the pump has a more arduous duty; it has to entrain the solids into the fast moving stream in the suction pipe. In effect, it has to "dredge" the solids

into the stream. Even if the solids were already moving in the right general direction, they must be accelerated up to the water velocity and thus they act as a suction resistance for the pump.

Introducing solids into an aerated system will cause failure. The pump can only handle a small margin of solids when pumping water alone. Air leaks can usually be detected as water leaks when the pump is not running; **where water can get out, air can get in**. Air entrainment with the feed can sometimes be overcome by the use of baffles in the sump. The air bubbles have time to rise to the surface before being drawn down to the suction.

2. Poor Suction Line

Several different factors in the suction line may allow a pump to appear adequate when it is not. A long suction line, a line with a considerably small diameter or a line with a restriction (sudden step-downs in diameter are the worst) will all affect whether or not the pump can handle solids. The reasons for this are explained in the two previous paragraphs.

Reworking the suction line is the only solution to this problem. If the line increased in diameter it should be brought to the pump inlet diameter by a specially rolled flanged taper pipe. It must not be stepped down by a mismatch.

3. Electric Motor Wrongly Wired

Most Squirrel Cage Induction Motors can be wired in two ways: **Star** or **Delta**. In order to reduce the current surge when a motor is brought **on line**, some users start their motors in **Star.** They do this because this mode gives good starting torque and a reduced starting current surge. Then, change to running their motors in **Delta** once smooth starting has been achieved. The **Delta** mode of powering the motor increases the speed close to synchronous speed, which is maximum, and maintains a constant speed under variations in load.

If a motor is left to run continuously in **Star**, it will vary its speed dramatically with load. If a mistake has been made in the wiring of the motor, it may appear that the pump is unable to pick up solids but is still pumping water. The reason would be that on **Star**, the motor speed drops when the solids load comes on.

To detect this fault, the easiest method is to check the speed of the motor shaft and compare it with the Nameplate rating. There should not be more than a few RPM difference between Nameplate RPM rating and actual speed, no matter what load the pump is pulling.

NOTE: Correction of this fault is intended for an electrician.

Overloads for Motor Trip Out

1. Wrong Pump Speed

The power drawn by a centrifugal pump discharging through a given delivery system is approximately proportional to the cube of its speed. As an example, if the speed is changed by 20% to 1.2 times the original speed, you can expect its power demand to rise by the cube of 1.2, i.e. 1.728, or nearly 73% above the original. Even a rise in speed of 10% to 1.1 times the original speed will give a rise of 33% in power demanded by the pump.

The relationship is not exact but it is close enough for field calculation purposes.

If a pump is run at the wrong speed, it can make a considerable difference to the load drawn from the motor.

Calculation of the correct pump speed is based on:

- Flow rate to be pumped
- Difference in height between pump and discharge points
- Length, diameter and inner surface of pipeline through which pump must deliver
- Number of elbows, bends, valves, other fittings in pipeline
- Equipment at end of pipeline such as hydrocyclones, pressurized distributors, jets, etc.
- Grading, tonnage and specific gravity of solids to be pumped
- Pump performance curves

As far as fault finding is concerned, the actual RPM of a pump should be compared with the RPM specified. Corrections to pump speed can be made by pulley changes.

2. Changed Pipeline System

It is not uncommon for a pump speed to be calculated on the basis of a pipeline system intended to be used at the time of the negotiations for the purchase of the pump, but to be commissioned into service with a different pipeline system. A client may say, "but it's not such a high lift so the pump does not have to work quite so hard." **This is not true.** At a given pump speed, a pump will pump a larger amount through a shorter pipeline (or lesser vertical height) and **will take more power**, not less.

When confronted with this situation, the only thing to do is to calculate the correct **head** and RPM before making a pulley change. The affinity rule can be used or the drive can be recalculated.

3. Low Voltage

The power consumed by an electric motor is the product of the voltage, amperage and power factor for the motor. If a pump demands a certain power from the motor, the motor in turn will demand corresponding amperage from the electric supply system. However, if the voltage of the electric supply system happens to be lower than normal, the motor will draw extra amps to meet the pump's power demand. This way the power consumed by the motor, the product of voltage, amperage and power factor remains unchanged.

Circumstances where lower than standard voltages might be encountered include:

- When power supply is from a generator set
- At the end of a long trailing cable
- At the end of an electric supply system remote from the nearest transformer substation
- In an area where very heavy start-up loads can occur, such as near large crusher stations or long conveyor installations

Low voltage can readily cause a motor overload by drawing higher than expected amps; this is, in no way, related to the pump itself.

If low voltage is suspected as the cause of motor overload, a qualified electrician should be called.

4. Wrongly Set Overload Protection

All motor starting equipment has some form of overload protection equipment built into the system so a burnt out motor or locked-rotor motor does not cause more extensive damage. If a motor repeatedly drops out on overload and there is no other readily apparent reason, the electrical overload protection equipment should be checked.

5. Mechanical Fault in Pump

The pump shaft should be free to turn by hand. Remove the V-belts and check the pump shaft for freedom to turn. If there is no resistance, the fault must be in the motor. If a jarring or resistance can be felt when attempting to turn the pump shaft, drop off the suction pipe and check the clearance between the impeller and suction plate. Also check for blockages.

If this proves clear, remove the suction bush and look for marks on the surface of the impeller, which might indicate if the impeller has been rubbing. In this case, rotate the shaft again to determine if the resistance is still present; if it is, remove the impeller and inspect the gland side liner. If there is still no evidence of rubbing, rotate the shaft by hand again to check that the resistance is still present; then, remove the gland sleeve. If the resistance can still be felt by hand it can only be the bearings of the pump.

The remedies for the faults, which may be revealed by this step-by-step approach are:

- Impeller rubs on suction bush: release bearing housing, set impeller to suction bush clearance by adjusting position of bearing housing until impeller runs free. Tighten bearing housing. Replace suction pipe. Re-align belt drive.
- Impeller rubs on gland half lining; reset the suction bush clearance. Check for movement of casing liner.
- Seizure in the gland area. Strip and inspect.
- Shaft tight in bearings; there is no simple field remedy if the pump shaft is found to be tight in the bearings, the rotating assembly must be removed and stripped for inspection of the bearings and grease seals.

6. Air Entrainment

In sump-fed pump systems, air entrainment with the pump feed can produce periodic overloads on the motor by the following sequence of events:

- Air entrainment with feed gives the pump a “spongy” pulp, which reduces the pump throughput and power.
- Flow through the sump is reduced allowing air in the feed now entering the sump to escape to the surface. Solids, of course, reach the pump suction.
- The pump now has a largely de-aired pulp of far greater percentage solids than intended, and the power demand rises. At this stage the pump may choke. This is a dangerous condition.
- Pump entrains the accumulated solids into suction pipeline and begins to pump normally again, increasing throughput through sump.
- Air entrainment begins to reach pump suction again and sequence repeats.
- Air entrainment can permanently reduce slurry throughput and make it appear as if the pump is not working.

In small installations this surge may be repeated at three minute intervals; in large installations, it may take as long as five minutes for the full cycle to complete. If the cycle terminates at stage three, the pump may explode, if it is left to run while blocked.

Pump Handles Only a Limited Percentage Solids

Pump Speed Incorrect

With increasing solids feed into a pumping system three major factors will limit the percentage solids handled:

- Friction resistance increases, leaving less pressure on the delivery side to maintain the velocity in the pipeline
- Critical (settling) velocity for the pulp in the pipeline increases
- Pump performance "drops" so that the total head generated by the pump diminishes

Clearly, if the pump speed has been calculated for water only, increasing tonnages of solids are fed into the system; the combination of factors above may soon produce a situation where the pipeline velocity is too low to maintain movement of the solids.

Air Entrainment

Under 15.3, section 1 above, there is an explanation of how a pump can handle water, but due to the air entrainment, fails when solids are introduced to the system. The same fault can sometimes explain why a pump appears to perform well on pulp up to a certain percentage solids, then "gives up" when this is passed.

Poor Suction Line

A suction line layout as described in 15.3, section 2 is far worse as the percentage solids is increased and can become completely blocked.

Cavitation

If a pump is expected to draw relatively coarse solids from a sump below the pump centerline, depending on the speed of the pump and its capacity in relation to the flow rate being handled, it may suffer from cavitation. When this happens, and the onset is often quite sudden and sharp, the total head generated by the pump diminishes dramatically. As described previously, the conditions for blocking a line are suddenly created; namely reduced delivery pressure for maintaining flow combined with increased requirement for velocity in the pipeline.

Generally, if cavitation is the source of the trouble, there is ample evidence; audible cavitation "rattle" in the pump or from the bearings, sudden reduction in power demand, the gland leaks or draws air and there is a dramatic drop in delivery pressure.

The solution to the problem is to make the suction arrangements as smooth as possible without restrictions as well as to arrange for the feed to come gradually up to load without sudden surges of solids. If these measures do not overcome the problem it may be necessary to change the suction line to a size larger and fit a flat topped taper-piece to the pump suction. If trouble persists, a larger pump will have to be installed. Something effective must be done as the situation is potentially dangerous.

Gland Will Not Seal Adequately

1. Poor Adjustment

The outer seal of a Hydrostatic gland assembly must be allowed to rub lightly on the gland sleeve for an effective seal to be maintained. If the gland adjuster is pushed in too far this will lift the seal off the sleeve and the gland will leak profusely. When seeing a leaking gland, most people immediately think

to tighten it. With the Hydrostatic gland, the **gland adjuster must be moved outward to reduce leakage.**

Type D and P glands should be tightened for reduction of leakage in the same way as standard packed glands in water pumps. **Over tightening should be avoided**, especially on "D" glands as a drip is always necessary to lubricate the rubber face seal.

2. Dry Running

The glands will not be damaged by a few seconds of running without lubrication and cooling by water, but if either gland runs for a length of time without water in the pump, there is danger of melting the rubber seals. If a Type D gland has been correctly adjusted, this is a fairly remote danger because without hydraulic pressure to force the rubber seal against the gland seat, the seal should run without touching the seat. However, do not run a pump in dry conditions because of the danger of damaging the gland seals.

Once seals have been damaged in this way, they must be replaced.

3. Too Much Sealing Pressure

Too much water pressure in either type of gland can make the glands almost impossible to seal reliably. With Hydrostatic glands the solution to the problem is to insert a pressure control in the gland water line. With Type D glands the problem usually only arises with pumps being run in a series or as booster pumps. In either case, the only solution is to convert the pump over to H gland or P gland and provide suitably pressured gland water.

4. Inadequate Prime

The "snore" condition for operating a pump is very difficult to seal without unacceptable leakage. Under this condition a pump continuously receives a good proportion of air drawn in with the pulp from the sump, in which the level is too low, or the sump has inadequate capacity, or both. The sump should contain a minimum of one minute's pumping time.

Excessive Heat in Drive

1. Slack V-belts

The most common cause for generation of heat in the drive to a newly installed pump is undoubtedly lack of tension in the V-belts. All V-belts should be tensioned periodically and newly commissioned drives should be re-tensioned an hour or so after start up.

This fault is easily detected (pulleys are the hottest part of the drive) as the belts will have been slipping.

2. Hot pump Bearings

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. Providing the shaft is free spinning by hand, the heat generated while running under power is probably immaterial. At 150°F (65°C) the assembly will be uncomfortable to the hands for more than a second or two; this is not unduly hot for the bearing assembles. If the bearing is failing, the shaft will not run free.

3. Inadequate Lubrication of Pump Bearings

The bearings will be charged with grease before dispatch from the factory. Details of lubricants are given in this Manual.

Addition of grease should be tried if bearings become very hot or noisy. Excess greasing should be avoided.

4. Motor Runs Hot

Motors are intended to run hot. With Continuous Maximum Rated Motors, the temperature rises are surprising and are allowed for in the design of the motor and the selection of the insulation.

Generally, heat from a motor can be safely ignored, provided the amperage drawn is lower or equal to the nameplate rating. Many motors are fitted with Thermistors in the windings, which sense the temperature rise and are wired to operate a cut-out relay if the temperature exceeds a safe limit.

If a pump is choked when the motor starts, the protection must trip out the supply to the motor.

Bearing troubles in motors are generally indicated b noise as well as heat and can sometimes be detected by use of a long-stemmed screwdriver. The blade of the screwdriver is pushed against the bearing cover and the ear of the investigator pushed up to the handle. With a limited amount of experience bearing "rumble" can quite easily be detected.

Sudden Reduction in Discharge

1. Change in Feed Conditions

Operators do not always recognize a pump as simply one element in a complete system and any change in that system will bear on all the parts of it. For instance, if a screen rejecting plus ¼" (6 mm) material is worn and passes 1" (25 mm) stones, this affects the pump performance. The suction resistance of the larger stones will cause the suction pressure to reduce and have less head available for pushing the pulp through the delivery side piping.

At the pump, the larger stones will make a significant difference to the pump performance, decreasing flow and potentially causing damage to Impeller and Linings.

In the pipeline, the large stones will probably progress by "saltation," that is, leaping along the bottom of the pipe. The rest of the pulp is fully in suspension and has to flow past these slow moving obstacles. Overall this means the resistance of the pipeline to flow has increased, thus, again reducing flow.

A simple fault such as a screen cloth with a hole in it can cause a sudden reduction in discharge. If it causes the pipeline to block, the condition is potentially dangerous.

Other changes in feed conditions, which must be investigated are: increased tonnage of solids, change of grading of solids and change in manner of introduction of solids to pump system. On this last count, a plant, which was started in summer, and is bin-fed via a vibrating feeder, will perform differently in winter when the wetter feed "hangs up" in the feed bin and collapses down onto the feeder intermittently in larger dollops.

2. Air leaks on the Suction Pipe

A pipe, which has been steadily wearing away from the inside may break through to the open air near a flange (in a welded area) at the bottom of the pipe, which is where the coarsest solids run. In a suction pipe this will almost certainly allow air into the pipe with all the resultant ills described elsewhere.

Frequently, a pinhole leak will not allow enough air into a pump for any of the five faults listed to become critical. Operators, being human, postpone the repair or replacement of the worn pipe. The last chapter of the saga occurs surprisingly quickly and usually on nightshift – when fault produces a blocked pipeline.

3. Suction Blockage

In dredging applications there is always the danger that the pump suction will be suddenly submerged in collapsed solids from the surrounding pit contours. When pumping from a sump, the same thing can happen when solids, which have been clinging precariously to the steel sides of the sump, subside and momentarily block the pump suction.

If the pump is feeding a fair length of delivery piping, it will not be possible for the long column of pulp in that piping to come instantly to rest when the suction gets blocked. The pulp in an 8" (200mm) pipe, 1000 ft (300 m) long, moving at 10ft/sec (3 m/sec) has considerable momentum. It cannot be stopped dead in the same short length of time it takes to block the suction.

The result is a massive reduction in pressure throughout the system. It can cause a massive "water hammer" and surges that can split the pump casing, valves and piping. This can cause hoses to collapse – delivery as well as suction – and almost invariably leads to a great gulp of air being sucked through the pump gland. Usually this is sufficient to air-lock the pump.

When an operator hears the air hiss into the gland and then has to contend with the resultant air-lock, the assumption is that the gland is at fault for pump failure. However, the trouble generally begins at the end of the suction pipe and the gland collapses afterward.

In dredging applications, better control should be taken over the pit development. In sump-fed systems, the feed pulp can sometimes be directed to flush away any build-up of solids on the sides or valleys of the sump.

If this is not possible, a larger capacity take-off box at the base of the sump must improve the situation. The blocked pipeline situation is potentially dangerous.

4. Tramp Material

The simplest explanations of a fault should never be overlooked. If the complaint is sudden reduction in discharge, drain the sump and before removing any pipe work or dismantling the pump in any way, examine the take-off box at the base of the sump.

Sudden Increases in Power Demand

5. Damage Inside Pump

Pumps wear with each use. Results of abrasion, which will give an increase in power demand, are shown below in order of occurrence frequency.

- Excessive gap between impeller and suction bush
- Cut or ripped rubber in suction bush or casing gland rubbing against impeller
- Worn out cutwater
- Worn out or broken casing liners
- Impeller worn through back shroud
- Impeller passages worn significantly wider than intended

6. Change in Pipeline System

DO NOT alter pipeline system by shortening or changing layout. If altered, it will pump larger amounts and take more power.

7. Low Voltage

A new installation near the pump site can make a significant difference in the amount of voltage available, depending on the electric distribution system in the area. Lower volts means higher current for the same power output of the motor.

8. Changed Pump Speed

When dismounting both pump and motor pulleys, electricians have, in the past, interchanged the pulleys when reassembling the pump set. Ensure this does not happen.

9. Air Entrainment

In sump-fed pump systems, air entrainment can produce cyclic pump overload, caused by a change to the amount or direction in which a sump is fed. It could also be caused by a casual change to the feed type baffle arrangement in the sump.

Rapid Component Wear

1. Air Entrainment

As an experiment, place some sand in an empty bottle, fill the bottle to the very top with water, place the palm of one hand over the top and shake the bottle. You will find it difficult to move the sand vigorously against your hand. Now tip out a third of the water, and repeat the test. You will undoubtedly feel the sand in the air-water froth hitting your palm.

The point of the experiment is to show how much more readily sand can move around in froth than it can in water without air bubbles. Therefore any air leaks in the suction side accelerate abrasion.

If air entrainment is severe enough to produce an air lock in the presence of solids and water, the result is an escalation of the abrasion rate.

Air entrainment can also cause severe abrasion indirectly. With cyclic changes in pulp density due to air, the pump may have to handle far denser pulp than intended. This is also an abrasive accelerator.

2. Properties of the Solids

When confronted with a rapid abrasion problem such as coarse or sharp-edged particles, always reduce pump speed if possible. A larger pump with a larger diameter impeller will be rotating slower at the suction eye of the impeller for a given head than a smaller pump would. So, if wear on the leading edge of the vanes occurs, a larger pump would help.

3. Change in Feed Conditions

A change in feed conditions, such as extra tonnage, coarser grading or higher proportion of crushed material will all affect the rate of wear on a pump. As an example, deposits from a river are notoriously variable; the proportion of crushed sand in relation to natural sand can vary widely. However, to the operator, sand is sand, and the fact that the pump is now handling, say 80% crushed material, while three months ago it was 60% natural sand may not appear significant.

If there is a permanent change in feed conditions, which makes component life unsatisfactory, consider modifying the pump. A two-stage pump set will allow each pump to run at about 70% of the speed that a single unit would run, which would make a significant change to the abrasion rate.

4. Shaft Misalignment

After several years of wear and tear, the saddles on the pedestal occasionally wear out, thus allowing the shaft to point downward. If the eccentricity of the shaft through the gland is severe enough, the gland will not seal properly. There will also be a misalignment between the eye of the impeller and the suction bush, which will detract from pump performance. In this case, the most effective solution, reducing cost and saving time, would be to purchase a new pedestal. Temporarily, the saddles may be packed with shims; however, these inevitably get lost during impeller adjustment.

Mechanical Failure

1. Broken Shaft

Typically, the only broken shafts on McLanahan pumps are those where there has been tramp material in the feed, a bearing has seized, or slurry has worn through the gland sleeve. In this case, wear will of course weaken the shaft.

2. Broken Pedestal or Casing

Although the front bracket of the pump pedestal appears massive, it can be broken down from the box section of the pedestal by simply starting the pump backwards. As a result, the impeller will begin to unscrew from the shaft, and while in motion, strikes the suction bush, which is fixed in place by the flange of the suction pipe work. Because something has to give, occasionally, with older shafts, the thread in the shaft is stripped instead of the pedestal being broken.

Realigning broken pedestals can be quite difficult; therefore, the quickest, most cost-effective way to fix a broken pedestal is merely to replace it.

A pump running backwards is an electrical problem, which is overcome quite easily, and should not happen to begin with. Electricians are required to check the direction of rotation of a motor prior to fitting the V-belts onto the pulleys.

3. Pump Explodes

The centrifugal pump (McLanahan or any other) can potentially explode by running with pulp or water in the casing when there is no discharge. This can happen in a pump that is drawing pulp from a sump and pumping it to a cyclone through a rising pipeline. If the pump receives a sudden surge of solids, which blocks off the suction, flow will cease. In the delivery line, the solids will settle in the rising pipe but will be unable to enter the casing because the impeller will still be spinning.

As the impeller rotates, the pump will continue absorbing power. The power raises the fluid temperature. The water will eventually boil and the pressure may be enough to destroy the rubber or cause the pump head to explode. **If a pump head feels unusually warm and is not discharging**, switch the power off immediately. **Do not approach the pump** until it has been relieved of pressure, preferably through the suction or discharge pipework by flushing away the solids plugs. A sign that a pump may explode will be a considerable amount of steam leaking from the gland.

NOTE: at this point, even if a pump does not feel hot, be extremely cautious when dismantling, as the pump may be full of scalding water. Do not remove the drain plug until certain the fluid temperature in the pump has reduced. If in doubt, carefully clear blockages in the manner described above.

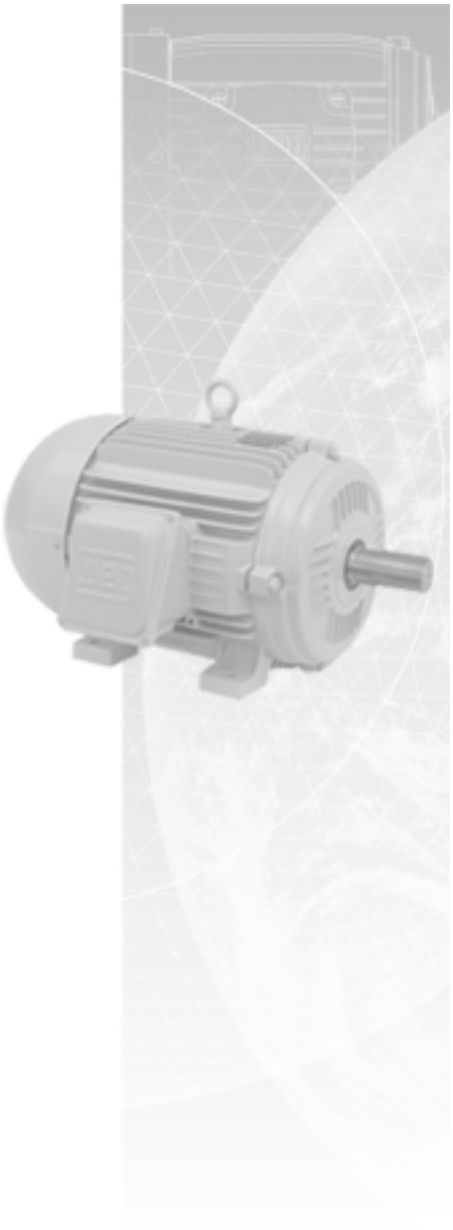
INSTALLATION AND MAINTENANCE MANUAL FOR NEMA LOW VOLTAGE ELECTRIC MOTORS



The electric motor is the item of equipment most widely used by man in his pursuit of progress, as virtually all machines and many renowned inventions depend upon it.
By virtue of the prominent role the electric motor plays in the comfort and welfare of mankind, it must be regarded and treated as a prime power unit embodying features that merit special attention, including its installation and maintenance.
This means that the electric motor should receive proper attention.
Its installation and routine maintenance require specific care to ensure perfect operation and longer life of the unit.
THE WEG ELECTRIC MOTOR INSTALLATION AND MAINTENANCE MANUAL provides the necessary information to properly install, maintain and preserve the most important component of all equipment:

THE ELECTRIC MOTOR!

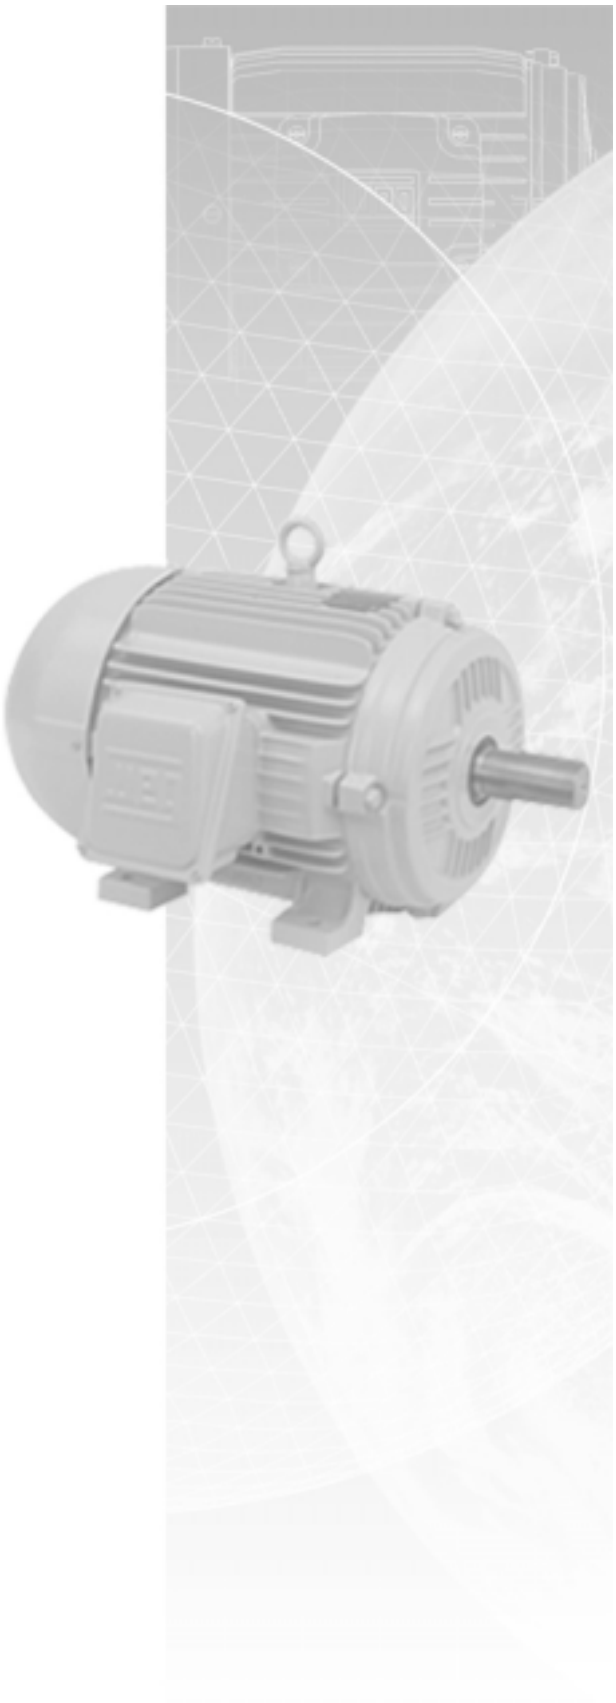
1. Introduction



This manual covers all the three-phase and single-phase asynchronous squirrel-cage induction motors, from 140T to 580T frame sizes.

The motors described in this manual are subject to continuous improvement and all information is subject to change without notice.
For further details, please consult WEG.

2. Basic Instructions

2.1 Safety Instructions

All personnel involved with electrical installations, either handling, lifting, operation and maintenance, should be well-informed and up-to-date concerning the safety standards and principles that govern the work and carefully follow them.
Before work commences, it is the responsibility of the person in charge to ascertain that these have been duly complied with and to alert his personnel of the inherent hazards of the job in hand.
It is recommended that these tasks be undertaken only by qualified personnel and they should be instructed to:

- avoid contact with energized circuits or rotating parts,
- avoid by-passing or rendering inoperative any safeguards or protective devices,
- avoid extended exposure in close proximity to machinery with high noise levels,
- use proper care and procedures in handling, lifting, installing, operating and maintaining the equipment, and
- follow consistently any instructions and product documentation supplied when they do such work.

Before initiating maintenance procedures, be sure that all power sources are disconnected from the motor and accessories to avoid electric shock.
Fire fighting equipment and notices concerning first aid should not be lacking at the job site; these should be visible and accessible at all times.

2.2 Delivery

Prior to shipment, motors are factory-tested and balanced. They are packed in boxes or bolted to a wooden base.
Upon receipt, we recommend careful handling and a physical examination for damage which may have occurred during transportation.
In the event of damage and in order to guaranty insurance coverage, both the nearest WEG sales office and the carrier should be notified without delay.

2.3 Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three-phase motors be raised by their eyebolts. Raising and lowering must be steady and joltless, otherwise bearings may be harmed.
When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere.
Other objects should not be placed on or against them.
Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to regrease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing the protective film that impedes metal-to-metal contact.
As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance.
If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter.
If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:

1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature.

If the motor is stored for an extensive period, the rotor must be periodically rotated.
Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula:

$$Rm = Vn + 1$$

Where: Rm - minimum recommended insulation resistance in MΩ with winding at 40°C
Vn - rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance v.s temperature of the winding with the aid of Figure 2.1; it's possible verify that resistance practically doubles every 10°C that insulating temperature is lowered.

Example:

Ambient temperature = 50°C
Motor winding resistence at 50°C = 1.02 MΩ
Correction to 40°C

$$R_{40°C} = R_{50°C} \times K_{50°C}$$

$$R_{40°C} = 1.02 \times 1.3$$

$$R_{40°C} = 1.326\ M\Omega$$

The minimum resistence Rm will be:

$$Rm = Vn + 1$$
$$Rm = 0.440 + 1$$
$$Rm = 1.440\ M\Omega$$

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation. This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service.
On motors which have been in service for a period of time much larger values are often attained. A comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. Any substantial or sudden reduction is suspect and the cause determined and corrective action taken.
Insulation resistance is usually measured with a MEGGER.
In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

2.3.1 Drying the windings

This operation should be carried out with maximum care, and only by qualified personnel. The rate of temperature rise should not exceed 5°C per hour and the temperature of the winding should not exceed 105°C. An overly high final temperature as well as a fast temperature increase rate can each generate vapour harmful to the insulation.
Temperature should be accurately controlled during the drying process and the insulation resistance measured at regular intervals.
During the early stages of the drying process, insulation resistance will decrease as a result of the temperature increase, but the resistance will increase again when the insulation becomes dryer.
The drying process should be extended until sucessive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well ventilated during the drying operation to ensure that the dampness is really removed.
Heat for drying can be obtained from outside sources (an oven), energization of the space heater (optional), or introducing a current through the actual winding of the motor being dried.

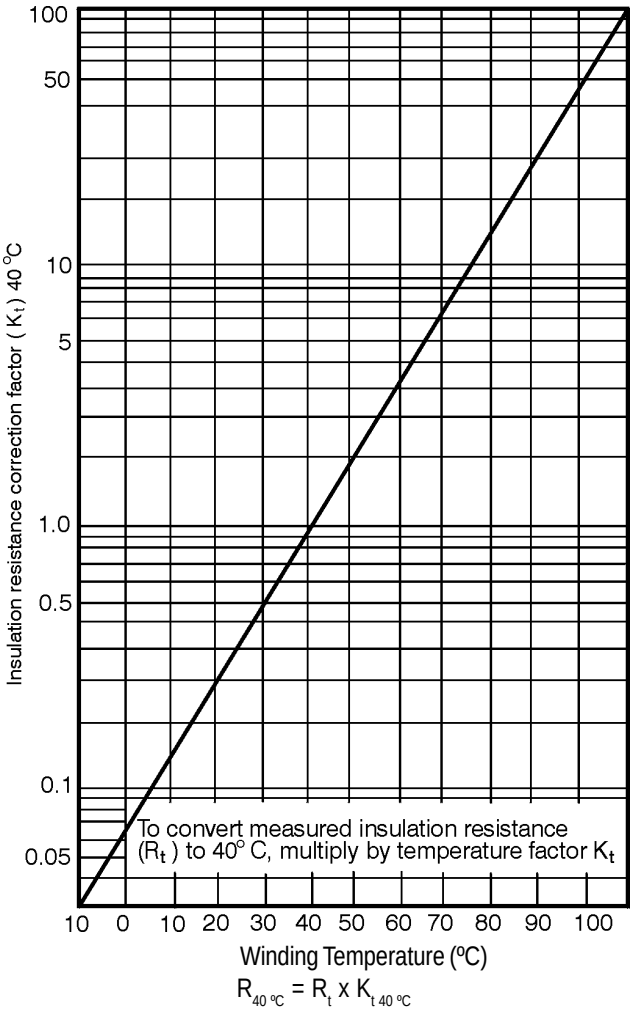


Figure 2.1

3. Installation

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection.
The installation of motors in environments where there are vapours, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) Standards.
Under no circumstances can motors be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air.
The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects.
The place of installation should allow for air renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

3.1 Mechanical Aspects

3.1.1 Foundation

The motor base must be levelled and as far as possible free of vibrations. A concrete foundation is recommended for motors over 100 HP. The choice of base will depend upon the nature of the soil at the place of erection or of the floor capacity in the case of buildings.
When dimensioning the motor base, keep in mind that the motor may occasionally be run at a torque above that of the rated full load torque.
Based upon Figure 3.1, foundation stresses can be calculated by using the following formula:

$$F1 = 0.2247\ (0.009\ x\ g\ x\ G - 213\ Tmáx/A)$$

$$F2 = 0.2247\ (0.009\ x\ g\ x\ G + 213\ Tmax/A\ )$$

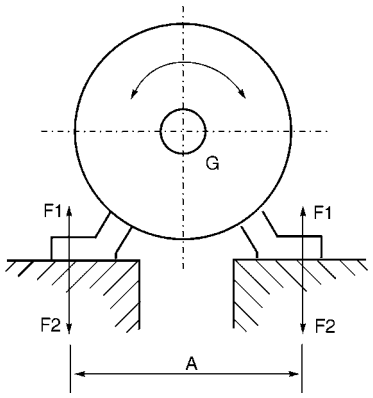

Figure 3.1 - Base stresses

Where:

F1 and F2 - Lateral stress (Lb)
g - Force of gravity (32.18 ft/s^2)
G - Weight of motor (Lb)
Tmax - Maximum torque (Lb . Ft)
A - Obtained from the dimensional drawing of the motor (in)

Sunken bolts or metallic base plates should be used to secure the motor to the base.

3.1.2 Types of Bases

a) Slide Rails

When motor drive is by pulleys the motor should be mounted on slide rails and the lower part of the belt should be pulling.
The rail nearest the drive pulley is positioned in such a manner that the adjusting bolt be between the motor and the driven machine.
The other rail should be positioned with the bolt in the opposite position, as shown in Figure 3.2.
The motor is bolted to the rails and set on the base. The drive pulley is aligned such that its center is on a plane with the center of the driven pulley and the motor shaft and that of the machine be parallel.

The belt should not be overly stretched, see Figure 3.11.
After the alignment, the rails are fixed.

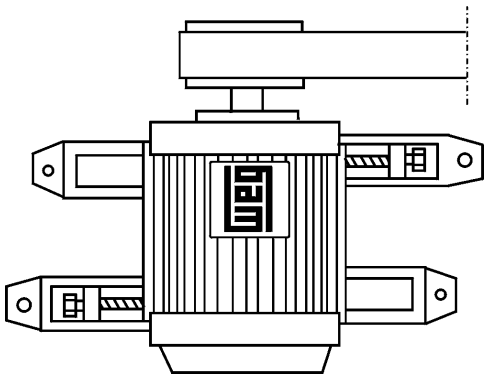

Figure 3.2 - Positioning of slide rails for motor alignment

b) Foundation Studs

Very often, particularly when drive is by flexible coupling the motor is anchored directly to the base with foundation studs.
It is recommended that shim plates of approximately 0.8 inches be used between the foundation studs and the feet of the motor for replacement purposes. These shim plates are useful when exchanging one motor for another of larger shaft height due to variations allowed by standard tolerances.
Foundation studs should neither be painted nor rusted as both interfere with to the adherence of the concrete, and bring about loosening.
After accurate alignment and levelling of the motor, the foundation studs are cemented and their screws tightened to secure the motor.

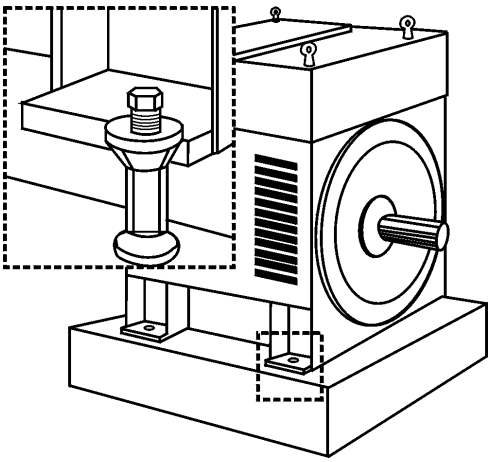

Figure 3.3 - Motor mounted on a concrete base with foundation studs

3.1.3 Alignment

The electric motor should be accurately aligned with the driven machine, particularly in cases of direct coupling. An incorrect alignment can cause bearing failure vibrations and even shaft rupture.
The best way to ensure correct alignment is to use dial gauges placed on each coupling half, one reading radially and the other exially - Figure 3.5.

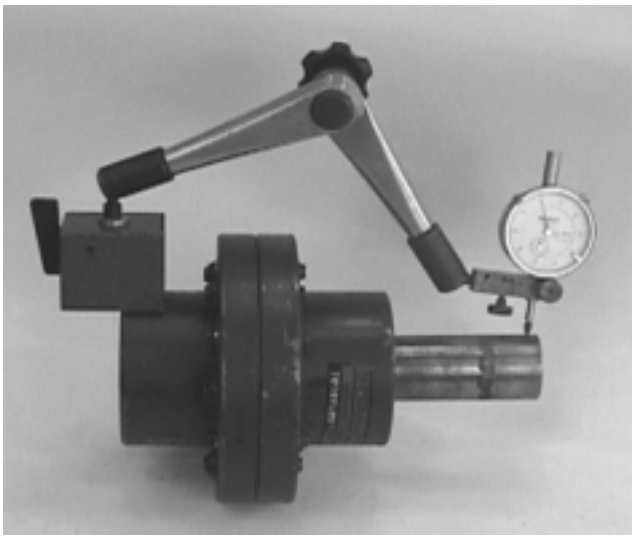

Figure 3.5 - Alignment with dial gauges

Thus, simultaneous readings are possible and allow for checking for any parallel (Figure 3.6a) and concentricity deviations (Figure 3.6b) by rotating the shafts one turn.
Gauge readings should not exceed 0.02 inches. If the installer is sufficiently skilled, he can obtain alignment with feeler gauges and a steel ruler, providing that the couplings are perfect and centered - Figure 3.6c.

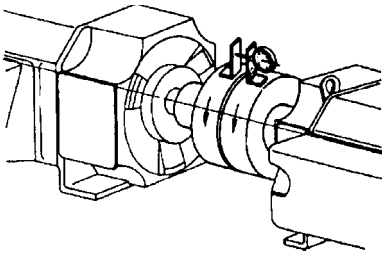

Figure 3.6a - Deviation from parallel

Figure 3.6b - Deviation from concentricity

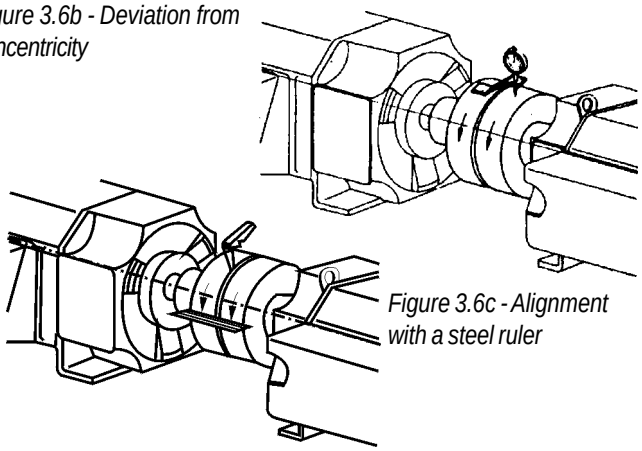

Figure 3.6c - Alignment with a steel ruler

3.1.4 Coupling

a) Direct Coupling

Direct coupling is always preferable due to its lower cost, space economy, no belt slippage and lower accident risk.
In the case of speed ratio drives, it is also common to use a direct coupling with a reducer (gear box).

CAUTION: Carefully align the shaft ends using, whenever feasible, a flexible coupling.

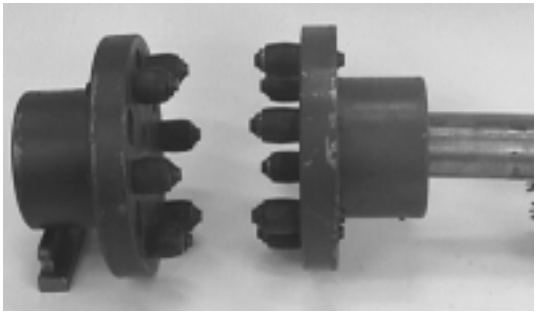

Figure 3.7 - A type of direct coupling

b) Gear Coupling

Poorly aligned gear couplings are the cause of jerking motions which bring about the vibration of the actual drive and vibrations within the motor.

Therefore, due care must be given to perfect shaft alignment: exactly parallel in the case of straight gears, and at the correct angle for bevel or helical gears.
Perfect gear engagement can be checked by the insertion of a strip of paper on which the teeth marks will be traced after a single rotation.

c) Belt and Pulley Coupling

Belt coupling is most commonly used when a speed ratio is required.
Assembly of Pulleys: To assemble pulleys on shaft ends with a keyway and threaded end holes the pulley should be inserted halfway up the keyway merely by manual pressure.
On shafts without threaded end holes the heating of the pulley to about 80°C is recommended, or alternatively, the devices illustrated in Figure 3.8 may be employed.

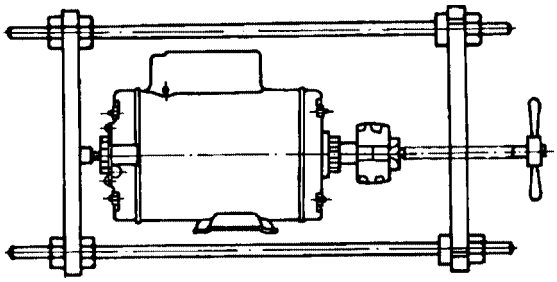

Figure 3.8 - Pulley mounting device

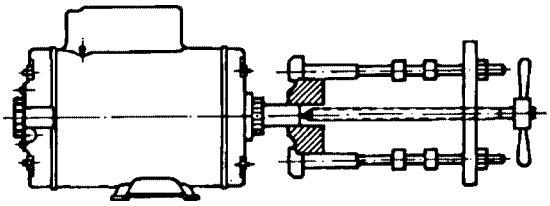

Figure 3.8a - Pulley extractor

Hammers should be avoided during the fitting of pulleys and bearings. The fitting of bearings with the aid of hammers leaves blemishes on the bearing races. These initially small flaws increase with usage and can develop to a stage that completely impairs the bearing.
The correct positioning of a pulley is shown in Figure 3.9.

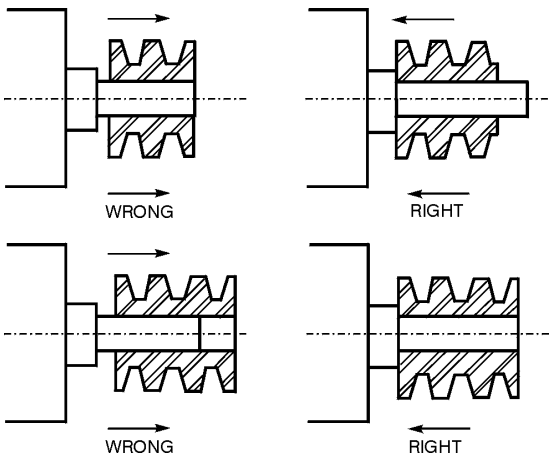

Figure 3.9 - Correct positioning of pulley on the shaft

RUNNING: To avoid needless radial stresses on the bearings it is imperative that shafts are parallel and the pulleys perfectly aligned. (Figure 3.10).

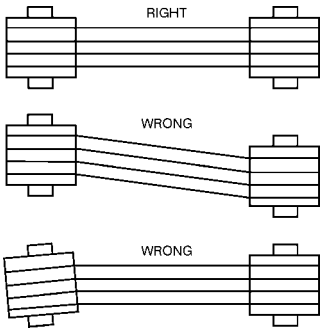

Figure 3.10 - Correct pulley alignment

Laterally misaligned pulleys, when running, transmit alternating knocks to the rotor and can damage the bearing housing. Belt slippage can be avoided by applying a resin (rosin for example).
Belt tension should be sufficient to avoid slippage during operation (Figure 3.11).
Pulleys that are too small should be avoided; these cause shaft flexion because belt traction increases in proportion to a decrease in the pulley size. Table 1 determines minimum pulley diameters, and Tables 2 and 3 refer to the maximum stresses acceptable on motor bearings up to frame 580. Beyond frame size 600, an analysis should be requested from the WEG engineering.

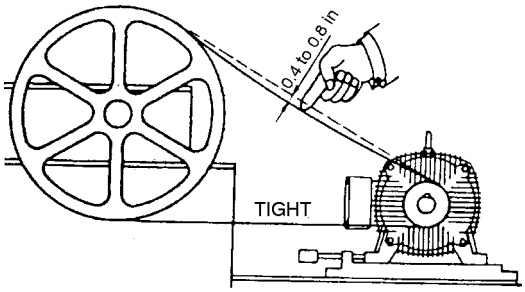

Figure 3.11 - Belt tensions

***Table 1** - Minimum pitch diameter of pulleys*

Important: 1) Peripheral speeds for solid grey cast iron pulleys FC 200 is V = 115 ft/s.
2) Use steel pulleys when peripheral speed is higher than 115 ft/s.
3) V-belt speed should not exceed 115 ft/s.

56 D	63	88	105	145	59	81	101	138

The maximum radial load for each frame are determined, by graphs.

INSTRUCTIONS ON HOW TO USE THE GRAPHS

1 - Maximum radial load on shaft.
2 - Maximum radial load on bearings.

Where: X - Half of pulley width (inches)
Fr- Maximum radial load in relation to the diameter and pulley width.

Example:
Verify whether a 2HP motor, II Pole, 60Hz withstands a radial load of 110Lb, considering a pulley width of 4 inches.

Frame: 145T
Fr: 110Lb
X: 2 inches

1 - Mark the distance X
2 - Find out line N = 3600 for bearing
Based on the above, this bearing withstands a radial load of 130Lb.

3.2 Electrical Aspects

3.2.1 Feed System

Proper electric power supply is very important. The choice of motor feed conductors, whether branch or distribution circuits, should be based on the rated current of the motors as per NFPA-70 Standard article 430.
Tables 4, 5 and 6 show minimum conductor gauges sized according to maximum current capacity and maximum voltage drop in relation to the distance from the distribution center to the motor, and to the type of installation (Overhead or in ducts).

To determine the conductor gauge proceed as follows:

a) Determine the current by multiplying the current indicated on the motor nameplate by 1.25 and then locate the resulting value on the corresponding table.
If the conductor feeds more than one motor, the value to be sought on the table should be equal 1.25 times the rated current of the largest motor plus the rated current of the other motors.
In the case of variable speed motors, the highest value among the rated currents should be considered.
When motor operation is intermittent, the conductors should have a current carrying capacity equal or greater, to the product of the motor rated current times the running cycle factor shown on Table 7.

***Table 7** - Running cycle factor*

Motor Short

Motor short time rating / Duty Classification	5min	15min	30 at 60min	Continuos
Short (operating valves, activating contacts etc)	1.10	1.20	1.50	-
Intermittent (passenger or freight elevators, tools, pumps, rolling bridges etc)	0.85	0.85	0.90	1.40
Cyclic (rolling mills,mining machines etc)	0.85	0.90	0.95	1.40
Variable	1.10	1.20	1.50	2.00

b) Locate the rated voltage of the motor and the feed network distance in the upper part of the corresponding table. The point of intersection of the distance column and the line referring to current will indicate the minimum required gauge of the conductor.

Example:
Size the conductors for a 15 HP, three-phase, 230V, 42A, motor located 200 feet from the main supply with cables laid in conduits.

a) Current to be located: 1.25 x 42A = 52.5A
b) Closest value on table 6:55A
c) Minimum gauge: 6 AWG

3.2.2 Starting of Electric Motor

Induction motors can be started by the following methods:

Direct Starting

Whenever possible a three-phase motor with a squirrel cage rotor should be started directly at full supply voltage by means of a contactor (Connection diagram a). This method is called Direct-on-Line (DOL) starting.
There are DOL starter assemblies available combining a three-pole contactor, a bimetal relay (overload protection device), and a fuse (short circuit protection on branch circuit).
DOL starting is the simplest method, only feasible however, when the locked rotor current (LRC) does not influence the main electric supply lines.
Initial locked rotor current (LRC) in induction motors reach values six to eight times the value of the full load current. During starting by the DOL method, starting current can reach these high levels. The main electrical supply should be rated sufficiently, such that during the starting cycle no supply disturbance to others on the power network is caused by the voltage drop in the main supply.
This can be achieved under one of the following situations:

a) The rated main supply current is high enough for the locked rotor current not to be proportionally high.
b) Motor locked rotor current is low with no effect on the networks.
c) The motor is started under no-load conditions with a short starting cycle and, consequently, a low locked rotor current with a transient voltage drop tolerable to other consumers.

Starting with a compensating switch (auto-transformer starting)

Should direct on line starting not be possible, either due to restrictions imposed by the power supply authority or due to the installation itself, reduced voltage indirect starting methods can be employed to lower the locked rotor current. The single line connection diagram (C) shows the basic components of a compensating switch featuring a transformer (usually an auto-transformer) with a series of taps corresponding to the different values of the reduced voltage. Only three terminals of the motor are connected to the switch, the other being interconnected as per diagram, for the indicated voltage.

Star-Delta starting

It is fundamental to star-delta starting that the three-phase motor has the necessary numbers of leads for both connections:

6 leads for Y/Δ
or 12 leads for YY/ΔΔ

All the connections for the various voltages are made through terminals in the terminal box in accordance with the wiring diagram that accompanies the motor. This diagram may be shown on the nameplate or in the terminal box.
The star-delta connection is usually used only in low-voltage motors due to normally available control and protection devices. In this method of starting the locked rotor current is approximately 30% of the original LRC. The locked rotor torque is reduced proportionally as well. For this reason, it is very important before deciding to use

star-delta starting to verify if the reduced locked rotor torque in "STAR" connection is enough to accelerate the load.

3.2.3 Motor Protection

Motor circuits have, in principle, two types of protection: motor overload, locked rotor and protection of branch circuit from short circuits. Motors in continuous use should be protected from overloading by means of a device incorporated into the motor, or by an independent device, usually a fixed or adjustable thermal relay equal or less than to the value derived from multiplying the rated feed current at full load by:

- 1.25 for motors with a service factor equal or superior to 1.15 or;

- 1.15 for motors with service factor equal to 1.0.

Some motors are optionally fitted with overheating protective detectors (in the event of overload, locked rotor, low voltage, inadequate motor ventilation) such as a thermostat (thermal probe), thermistor (PTC), RTD type resistance which dispense with independent devices.

THERMOSTAT (THERMAL PROBE)**:** Bimetallic thermal detectors with normally closed silver contacts. These open at pre-determined temperatures. Thermostats are series connected directly to the contactor coil circuit by two conductors.

THERMISTORS: Semi-conductor heat detectors positive temperature coeficient (PTC) that sharply change their resistance upon reaching a set temperature. Thermistors, depending upon the type, are series or parallel-connected to a control unit that cuts out the motor feed, or actuates an alarm system, in response to the thermistors reaction.

RESISTANCE TEMPERATURE DETECTORS (RTD) - PT 100:The resistance type heat detector (RTD) is a resistance element usually manufactured of copper or platinum.
The RTD operates on the principle that the electrical resistance of a metallic conductor varies linearly with the temperature. The detector terminals are connected to a control panel, usually fitted with a temperature gauge, a test resistance and a terminal changeover switch.

Subject to the desired degree of safety and the client's specification, three (one per phase) or six (two per phase) protective devices can be fitted to a motor for the alarm stems, circuit breaker or combined alarm and circuit breaker, with two leads from the terminal box to the alarm or circuit breaker system and four for the combined system (alarm and circuit breaker).
Table 9 compares the two methods of protection.

3.3 Start-up

3.3.1 Preliminary Inspection

Before starting a motor for the first time, it will be necessary to:

a) Remove all locking devices and blocks used in transit and check that the motor rotates freely;

b) Check that the motor is firmly secured and that coupling elements are correctly mounted and aligned.;

c) Ascertain that voltage and frequency correspond to those indicated on the nameplate. Motor performance will be satisfactory with main supply voltage fluctuation within ten per cent of the value indicated on the nameplate or a frequency fluctuation within five per cent or, yet, with a combined voltage and frequency variance within ten per cent;

d) Check that connections are in accordance with the connection diagram shown on the nameplate and be sure that all terminal screws and nuts are tight;

e) Check the motor for proper grounding. Providing that there are no specifications calling for ground-insulated installation, the motor must be grounded in accordance with prevalent standard for grounding electrical machines. The screw identified by the symbol ⏚ should be used for this purpose.
This screw is generally to be found in the terminal box or on one foot of the frame;

f) Check that motor leads connecting with the mains, as well as the control wires and the overload protection device, are in accordance with Nema Standards;

g) If the motor has been stored in a damp place, or has been stopped for some time, measure the insulating resistance as recommended under the item covering storage instructions;

h) Start the motor uncoupled to ascertain that it is turning in the desired direction. To reverse the rotation of a three-phase motor, invert two terminal leads of the mains supply.
High voltage motors bearing an arrow on the frame indicating rotation direction can only turn in the direction shown.

3.3.2 The First Start-up

Three-Phase Motor with Cage Rotor:
After careful examination of the motor, follow the normal sequence of starting operations listed in the control instructions for the initial start-up.

3.3.3 Operation

Drive the motor coupled to the load for a period of at least one hour while watching for abnormal noises or signs of overheating.
Compare the line current with the value shown on the nameplate.
Under continuous running conditions without load fluctuations this should not exceed the rated current times the service factor, also shown on the nameplate.
All measuring and control instruments and apparatus should be continuously checked for anomalies, and any irregularities corrected.

3.3.4 Stopping

Warning:

To touch any moving part of a running motor, even though

disconnected, is a danger to life and limb.

Three-phase motor with cage rotor:
Open the stator circuit switch. With the motor at a complete stop, reset the auto-transformer, if any, to the "start" position.

Notes:
- The ZZ bearings from 6201 to 6307 do not require relubrication as its life time is about 20,000 hours.
- Tables 1 and 2 are intended for the lubrication period under bearing temperature of 70ºC (for bearings up to 6312 and NU 312) and temperature of 85ºC (for bearings 6314 and NU 314 and larger).
- For each 15ºC of temperature rise, the relubrication period is reduced by half.
- The relubrication periods given above are for those cases applying Polyrex® EM grease.
- When motors are used on the vertical position, their relubrication interval is reduced by half if compared to horizontal position motors.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:
- Lithium base or complex of lithium or polyurea and highly refined mineral oil.
- Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:
- Although Polyrex® EM is compatible with types of grease given above, we do no recommended to mix it with any other greases.
- If you intend to use a type of grease different than those recommended above , first contact WEG.
- On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrification interval are given on an additional nameplate attached to the motor.

4. Maintenance

A well-designed maintenance program for electric motors can be summed up as: periodical inspection of insulation levels, temperature rise, wear, bearing lubrication and the occasional checking of fan air flow.
Inspection cycles depend upon the type of motor and the conditions under which it operates.

4.1 Cleanliness

Motors should be kept clean, free of dust, debris and oil. Soft brushes or clean cotton rags should be used for cleaning. A jet of compressed air should be used to remove non-abrasive dust from the fan cover and any accumulated grime from the fan and cooling fins.
Oil or damp impregnated impurities can be removed with rags soaked in a suitable solvent.
Terminal boxes fitted to motors with IP55 protection should be cleaned; their terminals should be free of oxidation, in perfect mechanical condition, and all unused space dust-free.
Motors with IPW 55 protection are recommended for use under unfavourable ambient conditions.

4.2 Lubrication

Proper lubrication extends bearing life.

Lubrication Maintenance Includes:

a) Attention to the overall state of the bearings;
b) Cleaning and lubrication;
c) Critical inspection of the bearings.

Motor noise should be measured at regular intervals of one to four months. A well-tuned ear is perfectly capable of distinguishing unusual noises, even with rudimentary tools such as a screw driver, etc., without recourse to sophisticated listening aids or stethescopes that are available on the market.
A uniform hum is a sign that a bearing is running perfectly. Bearing temperature control is also part of routine maintenance.
Constant temperature control is possible with the aid of external thermometers or by embedded thermal elements. WEG motors are normally equipped with grease lubricated ball or roller bearings.
Bearings should be lubricated to avoid metallic contact of the moving parts, and also for protection against corrosion and wear. Lubricant properties deteriorate in the course of time and mechanical operation: furthermore, all lubricants are subject to contamination under working conditions.
For this reason lubricants must be renewed and any lubricant consumed needs replacing from time to time.

4.2.1 Periodical Lubrication

WEG motors are supplied with sufficient grease for a long running period. Lubrication intervals, the amount of grease and the type of bearing used in frames 140T to 580T are to be found in Tables 11, 12 and 13.
Lubrication intervals depend upon the size of the motor, speed, working conditions and the type of grease used.

4.2.2 Quality and Quantity of Grease

Correct lubrication is important!
Grease must be applied correctly and in sufficient quantity as both insufficient or excessive greasing are harmful.
Excessive greasing causes overheating brought about by the greater resistance encountered by the rotating parts and, in particular, by the compacting of the lubricant and its eventual loss of lubricating qualities.
This can cause seepage with the grease penetrating the motor and dripping on the coils.

GREASES FOR MOTOR BEARINGS

For operating temperatures from -30 to 170ºC	
Type	**Supplier**
Polyrex® EM	Esso

4.2.3 Lubricating Instructions

a) Frame 140T to 210T motors
Frame 140T to 210T size motors are not fitted with grease nipples. Lubrication is carried out during periodical overhauls when the motor is taken apart.

Cleaning and Lubrication of Bearings

With the motor dismantled and without extracting the bearings from the shaft, all existing grease should be removed and the bearings cleaned with Diesel oil, kerosene or other solvent, until thoroughly clean.
Refill the spaces between the balls or rollers and the bearing cages with grease immediately after washing. Never rotate bearings in their dry state after washing.
For inspection purposes apply a few drops of machine oil. During these operations maximum care and cleanliness is recommended to avoid the penetration of any impurities or dust that could harm the bearings. Clean all external parts prior to reassembly.

b) Frame 360T to 580T Motors
Motors above 360T frame size are fitted with regreasable bearing system.
The lubrication system from this frame size upwards was designed to allow the removal of all grease from the bearing races through a bleeder outlet which at the same time impedes the entry of dust or other contaminants harmful to the bearing.
This outlet also prevents injury to the bearings from the well-known problem of over-greasing.

It is advisable to lubricate while the motor is running, to allow the renewal of grease in the bearing case.
Should this procedure not be possible because of rotating parts in the proximity of the nipple (pulleys, coupling sleeves, etc.) that are hazardous to the operator the following procedure should be followed:
- Inject about half the estimated amount of grease and run the motor at full speed for approximately a minute; switch off the motor and inject the remaining grease.
The injection of all the grease with the motor at rest could cause penetration of a portion of the lubricant through the internal seal of the bearing case and hence into the motor.

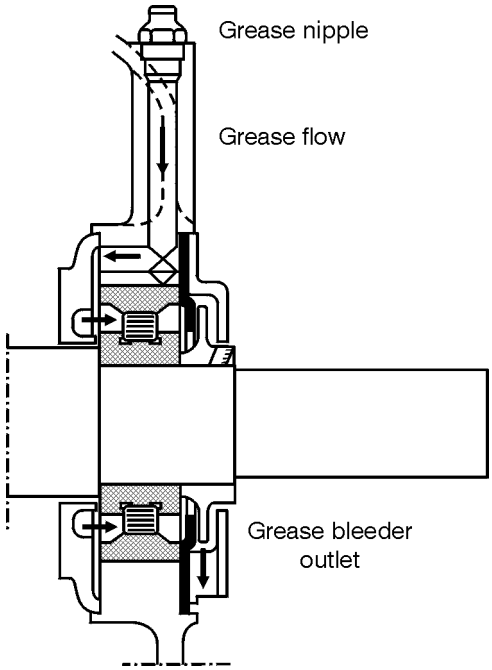

Figure 4.1 - Bearings and lubrication system

Nipples must be clean prior to introduction of grease to avoid entry of any alien bodies into the bearing.
For lubricating use only a manual grease gun.

Bearing Lubrication Steps

1. Cleanse the area around the grease nipples with clean cotton fabric.
2. With the motor running, add grease with a manual grease gun until the lubricant commences to be expelled from the bleeder outlet, or until the quantity of grease recommended in Tables 12 or 13 has been applied.
3. Allow the motor to run long enough to eject all excess grease.

4.2.4 Replacement of Bearings

The opening of a motor to replace a bearing should only be carried out by qualified personnel.
Damage to the core after the removal of the bearing cover can be avoided by filling the gap between the rotor and the stator with stiff paper of a proper thickness.

Providing suitable tooling is employed, disassembly of a bearing is not difficult.
The extractor grips should be applied to the sidewall of the inner ring to be stripped, or to an adjacent part.
To ensure perfect functioning and to prevent injury to the bearing parts, it is essential that the assembly be undertaken under conditions of complete cleanliness and by competent personnel.
New bearings should not be removed from their packages until the moment of assembly.
Prior to fitting a new bearing, ascertain that the shaft has no rough edges or signs of hammering.

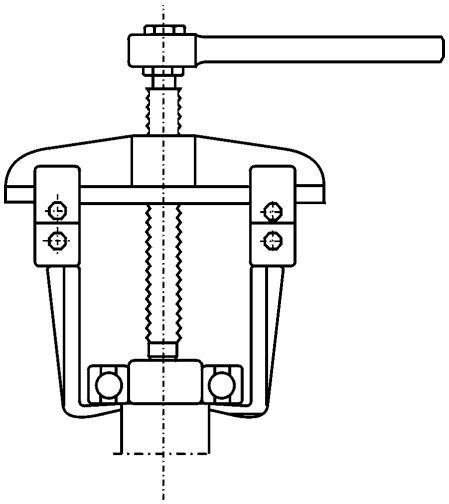

Figure 4.2 - A bearing extractor

During assembly bearings cannot be subjected to direct blows.
The aid used to press or strike the bearing should be applied to the inner ring.

4.3 Air Gap Checking (Large Rating Open Motors)

Upon the completion of any work on the bearings check the gap measurement between the stator and the rotor using the appropriate gazes.
The gap variation at any two vertically opposite points must be less than 10% of the average gap measurement.

4.4 Explosion Proof Motor Repair Steps

4.4.1 Objective

In view of the heavy liability associated with burning of motors of this type, this product has been designed and manufactured to high technical standards, under rigid controls. In addition, in many areas it is required that explosion proof motors ONLY be repaired by licensed personnel or in licensed facilities authorized to do this type of work.
The following general procedures, safeguards, and guidelines must be followed in order to ensure repaired explosion proof motors operate as intended.

4.4.2 Repair Procedure and Precautions

Dismantle the damaged motor with appropriate tools without hammering and/or pitting machined surfaces such as enclosure joints, fastening

holes, and all joints in general.
The position of the fan cover should be suitably marked prior to removal so as to facilitate reassembly later on.
Examine the motor's general condition and, if necessary, disassemble all parts and clean them with kerosene. Under no circumstances should scrapers, emery papers or tools be used that could affect the dimensions of any part during cleaning.
Protect all machined parts against oxidation by applying a coating of vaseline or oil immediately after cleaning.

STRIPPING OF WINDINGS
This step requires great care to avoid knocking and/or denting of enclosure joints and, when removing the sealing compound from the terminal box, damage or cracking of the frame.

IMPREGNATION
Protect all frame threads by inserting corresponding bolts, and the joint between terminal box and frame, by coating it with a non-adhesive varnish (ISO 287 - ISOLASIL).
Protective varnish on machined parts should be removed soon after treating with impregnating varnish. This operation should be carried out manually without using tools.

ASSEMBLY
Inspect all parts for defects, such as cracks, joint incrustations, damaged threads and other potential problems.
Assemble using a rubber headed mallet and a bronze bushing after ascertaining that all parts are perfectly fitted.
Bolts should be positioned with corresponding spring washers and evenly tightened.

TESTING
Rotate the shaft by hand while examining for any drag problems on covers or fastening rings.
Carry out running tests as for standard motors.

MOUNTING THE TERMINAL BOX
Prior to fitting the terminal box all cable outlets on the frame should be sealed with a sealing compound (Ist layer) and an Epoxy resin (ISO 340) mixed with ground quartz (2nd layer) in the following proportions:

340A resin	50 parts
340B resin	50 parts
Ground quartz	100 parts

Drying time for this mixture is two hours during which the frame should not be handled and cable outlets should be upwards.
When dry, see that the outlets and areas around the cables are perfectly sealed.
Mount the terminal box and paint the motor.

4.4.3 Miscellaneous Recommendations

- Any damaged parts (cracks, pittings in machined surfaces, defective threads) must be replaced and under no circumstances should attempts be made to recover them.
- Upon reassembling explosion proof motors IPW55 the substitution of all seals is mandatory.
- Should any doubts arise, consult WEG.

5. Malfunctioning

Most malfunctions affecting the normal running of electric motors can be prevented by maintenance and the appropriate precautions.
While ventilation, cleanliness and careful maintenance are the main factors ensuring long motor life, a further essential factor is the prompt attention to any malfunctioning as signalled by vibrations, shaft knock, declining insulation resistance, smoke or fire, sparking or unusual slip ring or brush wear, sudden changes of bearing temperatures.
When failures of an electric or mechanical nature arise, the first step to be taken is to stop the motor and subsequent examination of all mechanical and electrical parts of the installation.
In the event of fire, the installation should be isolated from the mains supply, which is normally done by turning off the respective switches.
In the event of fire within the motor itself, steps should be taken to restrain and suffocate it by covering the ventilation vents.
To extinguish a fire, dry chemical or $C0_2$ extinguishers should be used - never water.

5.1 Standard Three-Phase Motor Failures

Owing to the widespread usage of asynchronous three-phase motors in industry which are more often repaired in the plant workshops, there follows a summary of possible failures and their probable causes, detection and repairs.
Motors are generally designed to Class B or F insulation and for ambient temperatures up to 40°C.
Most winding defects arise when temperature limits, due to current overload, are surpassed throughout the winding or even in only portions thereof. These defects are identified by the darkening or carbonizing of wire insulation.

5.1.1 Short Circuits Between Turns

A short circuit between turns can be a consequent of two coinciding insulation defects, or the result of defects arising simultaneously on two adjacent wires. As wires are randomly tested, even the best quality wires can have weak spots. Weak spots can, on occasion, tolerate a voltage surge of 30% at the time of testing for shorting between turns, and later fail due to humidity, dust or vibration.
Depending on the intensity of the short, a magnetic hum becomes audible.
In some cases, the three-phase current imbalance can be so insignificant that the motor protective device fails to react. A short circuit between turns, and phases to ground due to insulation failure is rare, and even so, it nearly always occurs during the early stages of operation.

5.1.2 Winding Failures

a) One burnt winding phase

This failure arises when a motor runs wired in delta and current fails in one main conductor.
Current rises from 2 to 2.5 times in the remaining winding with a simultaneous marked fall in speed. If the motor stops, the current will increase from 3.5 to 4 times its rated value.
In most instances, this defect is due to the absence of a protective switch, or else the switch has been set too high.

b) Two burnt winding phases

This failure arises when current fails in one main conductor and the motor winding is star-connected. One of the winding phases remains currentless while the others absorb the full voltage and carry an excessive current.
The slip almost doubles.

c) Three burnt winding phases

Probable cause 1

Motor only protected by fuses; an overload on the motor will be the cause of the trouble.
Consequently, progressive carbonizing of the wires and insulation culminate in a short circuit between turns, or a short against the frame occurs.
A protective switch placed before the motor would easily solve this problem.

Probable cause 2

Motor incorrectly connected. For example: A motor with windings designed for 230/400V is connected through a star-delta switch to 400V connection.
The absorted current will be so high that the winding will burn out in a few seconds if the fuses or a wrongly set protective switch fail to react promptly.

Probable cause 3

The star-delta switch is not commutated and the motor continues to run for a time connected to the star under overload conditions.
As it only develops 1/3 of its torque, the motor cannot reach rated speed. The increased slip results in higher ohmic losses arising from the Joule effect. As the stator current, consistent with the load, may not exceed the rated value for the delta connection, the protective switch will not react.
Consequent to increased winding and rotor losses the motor will overheat and the winding burn out.

Probable cause 4

Failures from this cause arise from thermal overload, due to too many starts under intermittent operation or to an overly long starting cycle.
The perfect functioning of motor operating under these conditions is only assured when the following values are heeded:
a) number of starts per hour;
b) starting with or without load;
c) mechanical brake or current inversion;
d) acceleration of rotating masses connected to motor shaft;
e) load torque vs. speed during acceleration and braking.

The continuous effort exerted by the rotor during intermittent starting brings about heavier losses which provoke overheating.
Under certain circumstances with the motor idle there is a possibility that the stator winding is subjected to damage as a result of the

heating of the motor. In such a case, a slip ring motor is recommended as a large portion of the heat (due to rotor losses) is dissipated in the rheostat.

5.1.3 Rotor Failures

If a motor running under load conditions produces a noise of varying intensity and decreasing frequency while the load is increased, the reason, in most cases, will be an unsymmetrical rotor winding.
In squirrel-cage motors the cause will nearly always be a break in one or more of the rotor bars; simultaneously, periodical stator current fluctuations may be recorded. As a rule, this defect appears only in molded or die cast aluminum cages.
Failures due to spot heating in one or another of the bars in the rotor stack are identified by the blue coloration at the affected points.
Should there be failures in various contiguous bars, vibrations and shuddering can occur as if due to an unbalance, and are often interpreted as such. When the rotor stack acquires a blue or violet coloration, it is a sign of overloading.
This can be caused by overly high slip, by too many starts or overlong starting cycles. This failure can also arise from insufficient main voltage.

5.1.4 Bearing Failures

Bearing damage is a result of overloading brought about by an overly taut belt or axial impacts and stresses.
Underestimating the distance between the drive pulley and the driven pulley is a common occurrence.
The arc of contact of the belt on the drive pulley thus becomes inadmissibly small and thereby belt tension is insufficient for torque transmission.
In spite of this it is quite usual to increase belt tension in order to attain sufficient drive.
Admittably, this is feasible with the latest belt types reinforced by synthetic materials.
However, this practice fails to consider the load on the bearing and the result is bearing failure within a short time.
Additionally there is the possibility of the shaft being subjected to unacceptably high loads when the motor is fitted with a pulley that is too wide.

5.1.5 Shaft Fractures

Although bearings traditionally constitute the weaker part, and the shafts are designed with wide safety margins, it is not beyond the realm of possibility that a shaft may fracture by fatigue from bending stress brought about by excessive belt tension.
In most cases, fractures occur right behind the drive end bearing.
As a consequence of alternating bending stress induced by a rotating shaft, fractures travel inwards from the outside of the shaft until the point of rupture is reached when resistance of the remaining shaft cross-section no longer suffices.
Avoid additional drilling the shaft (fastening screw holes) as such operations tend to cause stress concentration.

5.1.6 Unbalanced V-Belt Drives

The substitution of only one of a number of other parallel belts on a drive is frequently the cause of shaft fractures, as well as being malpractice.
Any used, and consequently stretched belts retained on the drive, especially those closest to the motor, while new and unstretched belts are placed on the same drive turning farther from the bearing, can augment shaft stress.

5.1.7 Damage Arising from Poorly Fitted Transmission Parts or Improper Motor Alignment

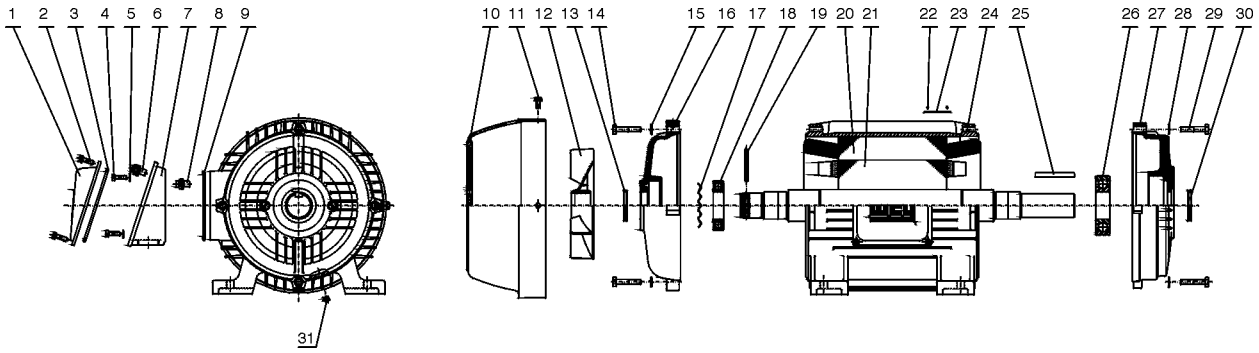
Damage to bearing and fracture in shafts often ensue from inadequate fitting of pulleys, couplings or pinions. There parts “knock” when rotating. The defect is recognized by the scratches that appear on the shaft or the eventual scalelike flaking of the shaft end.
Keyways with edges pitted by loosely fitted keys can also bring about shaft failures.
Poorly aligned couplings cause knocks and radial and axial shaking to shaft and bearings.
Within a short while these malpractices cause the deterioration of the bearings and the enlargement of the bearing cover bracket located on the drive end side.
Shaft fracture can occur in more serious cases.

5.2 Troubleshooting chart

FAILURE	PROBABLE CAUSE	CORRECTIVE MEASURES
Motor fails to start	• No voltage supply • Low voltage supply • Wrong control connections • Loose connection at some terminal lug • Overload	• Check feed connections to control system and from this to motor. • Check voltage supply and ascertain that voltage remains within 10% of the rated voltage shown on the motor nameplate. • Compare connections with the wiring diagram on the motor nameplate. • Tighten all connections. • Try to start motor under no-load conditions. If it starts, there may be an overload condition or a blocking of the starting mechanism. Reduce load to rated load level and increase torque.
High noise level	• Unbalance • Distorted shaft • Incorrect alignment • Uneven air gap • Dirt in the air gap • Extraneous matter stuck between fan and motor casing • Loose motor foundation • Worn bearings	• Vibrations can be eliminated by balancing rotor. If load is coupled directly to motor shaft, the load can be unbalanced. • Shaft key bent; check rotor balance and eccentricity. • Check motor aligment with machine running. • Check shaft for warping or bearing wear. • Dismantle motor and remove dirt or dust with jet of dry air. • Dismantle motor and clean. Remove trash or debris from motor vicinity. • Tighten all foundation studs. If necessary, realign motor. • Check lubrication. Replace bearing if noise is excessive and continuous.
Overheating of bearings	• Excessive grease • Excessive axial or radial strain on belt • Deformed shaft • Rough bearing surface • Loose or poorly fitted motor end shields • Lack of grease • Hardened grease cause locking of balls • Foreign material in grease	• Remove grease bleeder plug and run motor until excess grease is expelled. • Reduce belt tension. • Have shaft straightened and check rotor balance. • Replace bearings before they damage shaft. • Check end shields for close fit and tightness around circumference. • Add grease to bearing. • Replace bearings. • Flush out housings and relubricate.
Intense bearing vibration	• Unbalanced rotor • Dirty or worn bearing • Bearing rings too tight on shaft and/or bearing housing • Extraneous solid particles in bearing	• Balance rotor statically and dynamically. • If bearing rings are in perfect condition, clean and relubricate the bearing, otherwise, replace bearing. • Before altering shaft or housing dimensions, it is advisable to ascertain that bearing dimensions correspond to manufacturer's specifications. • Take bearing apart and clean. Reassemble only if rotating and support surfaces are unharmed.
Overheating of motor	• Obstructed cooling system • Overload • Incorrect voltages and frequecies • Frequent inversions • Rotor dragging on stator • Unbalanced electrical load (burnt fuse, incorrect control)	• Clean and dry motor; inspect air vents and windings periodically. • Check application, measuring voltage and current under normal running conditions. • Compare values on motor nameplate with those of mains supply. Also check voltage at motor terminals under full load. • Exchange motor for another that meets needs. • Check bearing wear and shaft curvature. • Check for unbalanced voltages or operation under single-phase condition.

6. Spare Parts and Component Terminology

THREE-PHASE MOTORS IP55 NEMA
Frames 140T - W180T - 180T - 210T and W210T

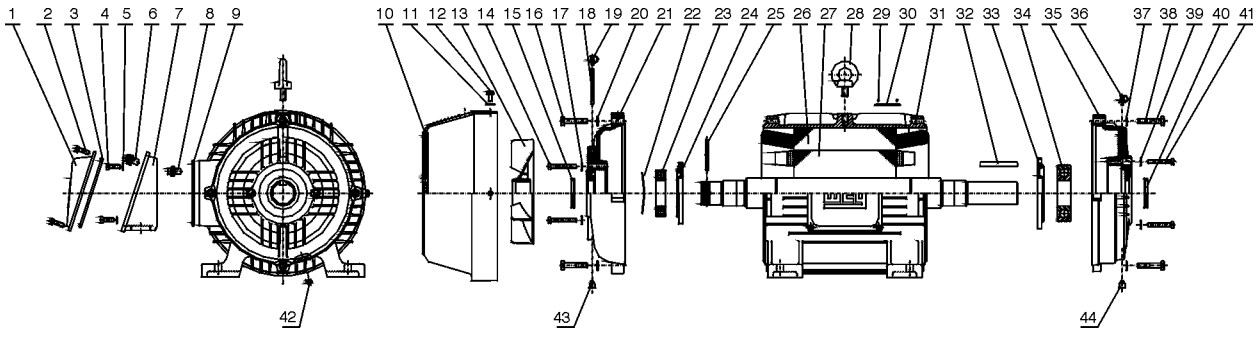


Part Nr.	Description
1	Terminal box cover
2	Terminal box cover fixing bolt
3	Terminal box cover gasket
4	Terminal box fixing bolt
5	Terminal box fixing washer
6	Terminal box grounding lug
7	Terminal box
8	Frame grounding lug
9	Terminal box o'ring gasket
10	Fan cover
11	Fan cover fixing bolt
12	Fan

Part Nr.	Description
13	V'Ring
14	Non-drive end endshield fixing bolt
15	Non-drive end endshield washer
16	Non-drive endshield
17	Spring washer
18	Non-drive bearing
19	Fan fixing pin
20	Wound stator
21	Rotor / shaft assembly
22	Nameplate fixing rivet
23	Nameplate
24	Frame

Part Nr.	Description
25	Shaft key
26	Drive end bearing
27	Drive endshield
28	Drive endshield washer
29	Drive end endshield fixing bolt
33	V'Ring
31	Drain plug

THREE-PHASE MOTORS IP55 NEMA
Frames 250T - W250T - 280T and 320T

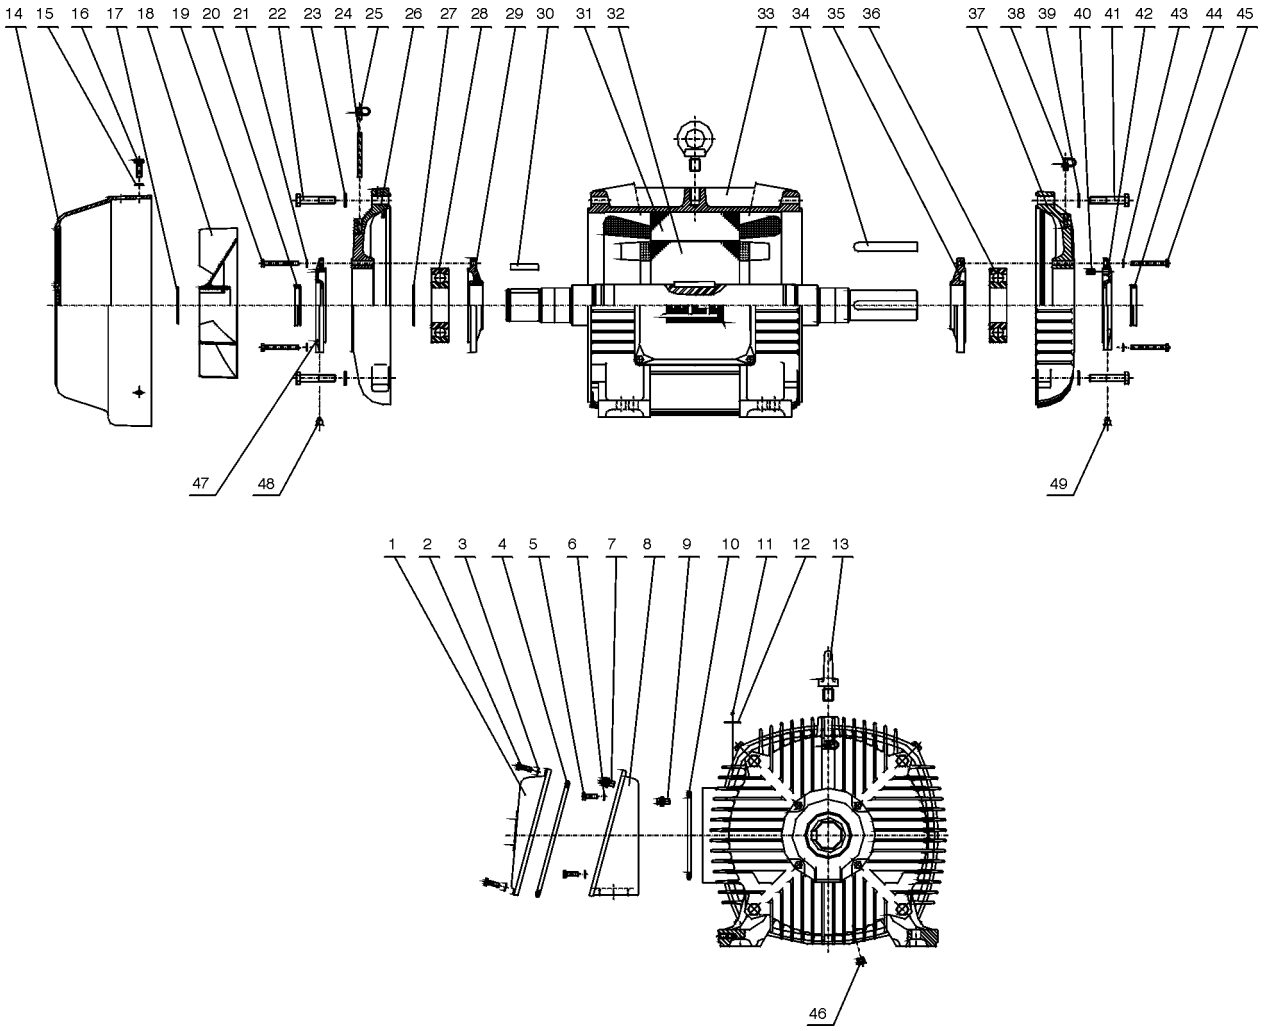


Part Nr.	Description
1	Terminal box cover
2	Terminal box cover fixing bolt
3	Terminal box cover gasket
4	Terminal box fixing bolt
5	Terminal box fixing washer
6	Terminal box grounding lug
7	Terminal box
8	Frame grounding lug
9	Terminal box o'ring gasket
10	Fan cover
11	Fan cover washer
12	Fan cover fixing bolt
13	Fan
14	Non-drive end bearing cap bolt
15	V'Ring

Part Nr.	Description
16	Non-drive end endshield fixing bolt
17	Non-drive end bearing cap washer
18	Non-drive end grease nipple
19	Non-drive end grease nipple cover
20	Non-drive end endshield washer
21	Non-drive endshield
22	Spring washer
23	Non-drive end bearing
24	Non-drive end bearing cap
25	Fan fixing pin
26	Wound stator
27	Rotor and shaft
28	Eyebolt
29	Nameplate fixing rivet

Part Nr.	Description
30	Nameplate
31	Frame
32	Shaft key
33	Drive end bearing cap
34	Drive end bearing
35	Drive andshield
36	Drive end grease nipple cover
37	Drive endshield washer
38	Drive end endshield fixing bolt
39	Drive end bearing cap washer
40	V'Ring
41	Drive end bearing cap fixing bolt
42	Drain plug
43	Non-drive and grease relief
44	Drive end grease relief

THREE-PHASE MOTORS IP55 NEMA T
Frames 360T - 400T - 440T - 500T and 580T

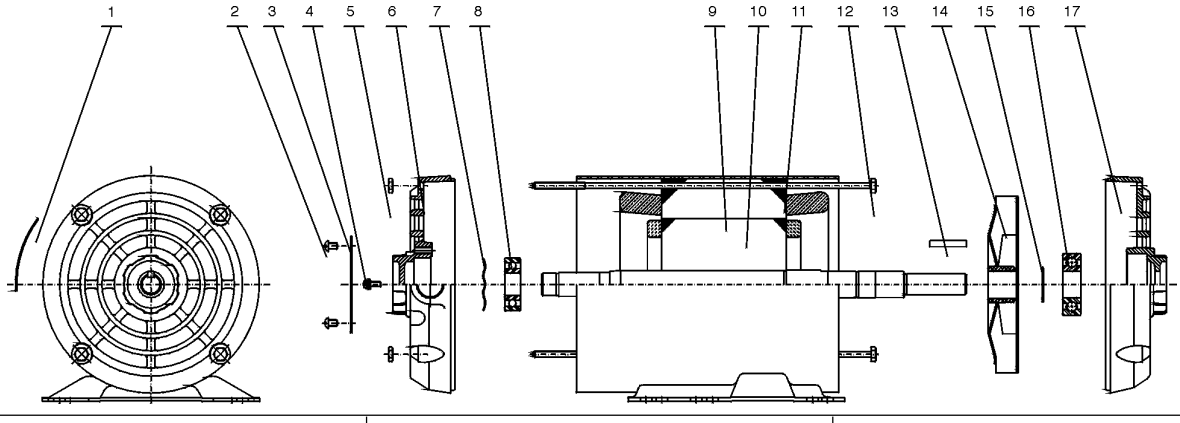


Part Nr.	Description
1	Terminal box cover
2	Terminal box cover fixing bolt
3	Terminal box cover washer
4	Terminal box cover gasket
5	Terminal box fixing bolt
6	Terminal box fixing washer
7	Terminal box grounding lug
8	Terminal box
9	Frame grounding lug
10	Terminal box o'ring gasket
11	Nameplate fixing rivet
12	Nameplate
13	Eyebolt
14	Fan cover
15	Fan cover washer
16	Fan cover fixing bolt
17	Fan fixing ring

Part Nr.	Description
18	Fan
19	Non-drive end bearing cap bolt
20	V'Ring
21	Non-drive end bearing cap washer
22	Non-drive end endshield fixing bolt
23	Non-drive end endshield washer
24	Non-drive end grease nipple
25	Non-drive end grease nipple cover
26	Non-drive enshield
27	Bearing cap
28	Non-drive bearing
29	Internal non-drive end bearing cap
30	Fan fixing key
31	Wound stator
32	Rotor / shaft assembly
33	Frame

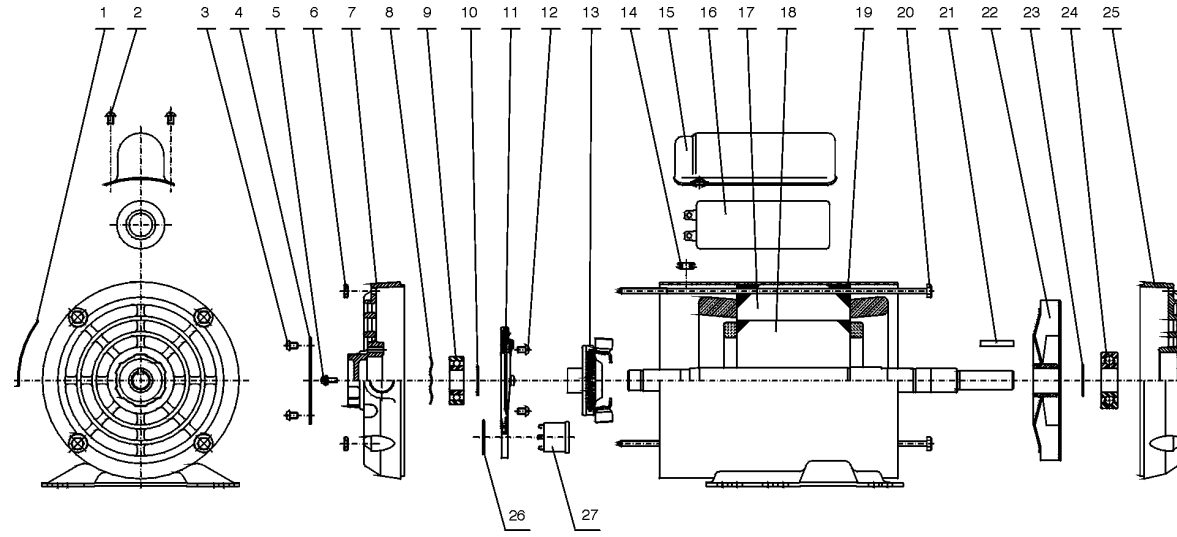
Part Nr.	Description
34	Shaft key
35	Internal drive end bearing cap
36	Drive end bearing
37	Drive endshield
38	Drive end grease nipple cover
39	Drive endshield washer
40	Pre-load spring
41	Drive end endshield fixing bolt
42	External drive end bearing cap
43	Drive end bearing cap washer
44	V'Ring
45	Drive end bearing cap fixing bolt
46	Drain plug
47	External non-drive end bearing cap
48	Non drive end grease relief
49	Non-drive end grease relief

THREE-PHASE MOTORS NEMA 56
Frames A56 - B56 - D56 - F56H and G56H



Part Nr.	Description
1	Sticker
2	Terminal box cover fixing bolt
3	Terminal box cover
4	Grounding lug
5	Through bolt fastening nut
6	Non-drive endshield
7	Spring washer
8	Non-drive end bearing
9	Wound stator
10	Rotor / shaft assembly
11	Frame
12	Through bolt
13	Shaft key
14	Fan
15	Drive end bearing fastening washer
16	Drive end bearing
17	Drive endshield

SINGLE-PHASE MOTORS NEMA 56
Frames B48 - C48 - C56 - A56 - B56 - D56 - F56H - G56H



Part Nr.	Description
1	Sticker
2	Capacitor cover fixing bolt
3	Terminal box cover fixing bolt
4	Terminal box cover
5	Grounding lug
6	Through bolt fastening nut
7	Non-drive endshield
8	Spring washer
9	Non-drive and bearing
10	Non-drive and bearing fastening washer
11	Stationary switch
12	Stationary switch fastening bolt
13	Centrifugal switch
14	Rubber ring for lead passing hole to capacitor
15	Capacitor cover
16	Capacitor
17	Wound stator
18	Rotor / shaft assembly
19	Frame
20	Through bolt
21	Shaft key
22	Fan
23	Drive end bearing fastening washer
24	Drive end bearing
25	Drive endshield
26	Overload thermal protector fixing ring
27	Overload thermal protector

Note: *For F56H and G56H frame motors: 1) Part nr. 2 = 3 pieces; 2) Part nr. 15 and 16 = 2 pieces*

Thank you for your recent purchase of the following McLanahan equipment with your Purchase Order 18000888 HD referencing our Sales Order 114630.

This document contains important information regarding the installation & operations of your new equipment. Having recommended spare parts at your plant will assure minimum down time in order to perform periodic maintenance and will also eliminate the expense of air freight of critical parts. They are available for immediate shipment from our inventory.

When ordering parts, you will be required to provide the equipment's serial number.

- (2) PUMP ASSEMBLIES NITRILE, DRY GLAND 1.5X1.5 W/ DRIVE
  S/N: **20182147 -20182148**

We suggest you become familiar with the enclosed literature to ensure the proper installation of this equipment.

Should you have any questions regarding the installation and/or operation of the equipment you have purchased, please contact our Process Equipment Department at (615) 451-4440.

Sincerely,

McLanahan Corporation

Safety Precautions

Overview

READ THIS MANUAL IN ITS ENTIRETY BEFORE BEGINNING OPERATION.

- **DO NOT** install, operate or service this equipment (or any portion thereof) without fully understanding the information contained herein.
- **DO NOT** operate this equipment in any manner other than that for which it has been designed or approved.

NOTE: A copy of this manual **must** be provided to the operator of this equipment and **must** be kept with the equipment at all times.

The safety instructions presented throughout this manual do not supersede any other directives or practices associated with this equipment or its operation. Rather, they are to be used in addition to any other applicable guidelines set forth by governing bodies (ANSI, ISO, OSHA, MSHA, etc.), plant administrators, signs, tags or placards, etc. (Refer to the **TAGS** section of this manual for information regarding safety and instructional tags provided with the equipment.) In the event of conflicting information, **always use the guidelines providing the highest degree of protection/safety.**

The safety instructions used throughout this manual and on the equipment contain a "signal word" (CAUTION, WARNING or DANGER) that indicates the seriousness of the hazard as described below.

DANGER *indicates an imminently hazardous situation, which, if not avoided, will result in death or serious injury.*

WARNING *indicates a potentially hazardous situation, which, if not avoided, could result in death or serious injury.*

CAUTION *indicates a potentially hazardous situation, which, if not avoided, may result in minor or moderate injury.*

CAUTION *(used without the safety alert symbol) indicates a potentially hazardous situation, which, if not avoided, may result in property damage.*

The safety instructions listed below are general guidelines. Additional safety instructions are listed throughout this manual as required. **All** safety instructions **must** be followed at all times to ensure personal safety and to prevent equipment damage.

Verify that all personnel are clear of any/all moving or rotating parts (or parts that are subject to movement or rotation) before installing, operating or servicing this equipment or any portion thereof.

Verify that all guards and safety devices are in place, secured and functional before operating this equipment or any portion of it. **DO NOT** circumvent or disable any safety devices.

Lockout/Tagout all controls and secure all applicable components to prevent unexpected movement before performing any maintenance, repairs or adjustments on this equipment or any portion thereof.

Lockout/Tagout power at the source before accessing any electrical panels or devices on this equipment or before performing any maintenance or repairs to the power line(s) feeding this equipment.

Wear appropriate personal protective equipment at all times.

Obey all safety tags and signs and replace any that are illegible or missing.

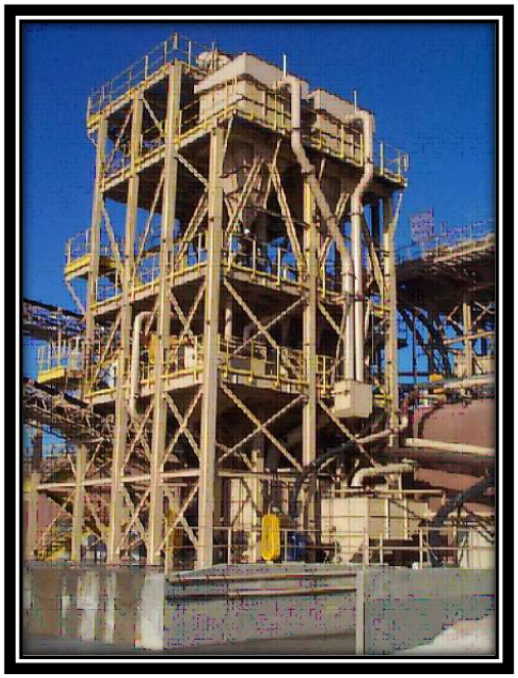
If any questions arise concerning the safe operation of this equipment, or if clarification of any information is required, cease operation and contact **McLanahan Corporation** immediately.

The McLanahan Pump

Introduction

The Aggregate Processing Division of McLanahan is a major manufacturer of process plants for the minerals industry. The McLanahan Model lllr is the latest generation of successful abrasion/corrosion-resistant slurry handling pumps.

This manual should be carefully read before attempting to install or operate this McLanahan Model lllr Pump.



Service, Selection and Support

Total Service

From design to installation and beyond, McLanahan engineers are available to give advice on your slurry pumping needs and solutions for your problems.

The McLanahan Model lllr range has been designed to offer a wide choice of pump sizes to suit most slurry pumping applications. A standard questionnaire is available to ensure that the most complex installation, as well as the more straightforward pumping application, receives individual consideration.

McLanahan can also advise on the ancillary components within the pumping system. The provision of low head loss valves, gland feed pumps, priming devices and flexible bends, all incorporating application specific linings for trouble-free life, are an important aspect of ensuring a totally successful pump installation.

Design Specifications and Options

The McLanahan Model lllr standard casing is designed for a maximum working pressure of 88psi (6 bar). A high pressure casing is available, rated at 272psi (18.5 bar). Please contact McLanahan for pressures higher than this.

The pump units in the McLanahan Model lllr range are designated by the size of suction and discharge ports. Units up to 4” (100mm) have equal size suction and discharge; above this, the Model lllr has a larger suction than discharge. Size is given in inches i.e. 8”/6” (200/150mm) Model lllr has an 8” (200mm) suction port and a 6” (150mm) discharge port.

Suction and discharge flanges are universal and, as a standard, are available in ASA150 drilling patterns. Other drilling patterns (metric & BS4504) are available to special order. Orientation of discharge to 4 positions according to installation requirements.

The McLanahan Model lllr pump components are designed and manufactured in accordance with appropriate International Quality Standards, such as ISO9000.

"Pumptec" Computer Software

Many complex calculations are needed in order to

- Size a pump
- Establish the optimum pipeline carrying velocity
- De-rate the pump for a slurry duty
- Calculate pipeline friction head losses
- Calculate power absorbed
- Analyze the system head

McLanahan Corporation uses unique software, **Pumptec,** to perform these calculations.

The pump is able to adapt to a change of V-belt sheave ratios and different speeds. However, it is **crucial** to recalculate duty parameters and check motor and drives to guarantee that they are not overloaded under any normal operating condition.

Please consult McLanahan Corporation before making any changes to your pump system to ensure the correct combination of speed and power is selected.

Input criteria required:

- Volume to be pumped
- Percent solids
- Gradation of solids (top size & 50% passing size)
- Specific Gravity of Solids
- Specific Gravity of Liquid
- Temperature of Liquid
- Elevation above sea level
- Height of liquid level in tank (**if negative suction**, height from liquid surface to center line of pump inlet)
- Vertical height from pump inlet to discharge point
- Pressure required at delivery point
- Pipe diameter (inside diameter important)
- Pipe material
- Pipe fittings – type and quantity

Pumptec: Computer Aided Support

To complement and facilitate optimum selection of your slurry system, McLanahan uses **Pumptec.**

This unique computer program:

- Analyzes the effects of changing slurry density
- Calculates the P_{50} particle size from a sieve analysis
- Calculates settling velocities and select pump sizes
- Calculates pipeline frictional losses in various pipe materials and pipe fittings
- Calculates the pump duty and selects a pump and drive based on input parameters
- Prints full application and selection data including NPSH, BEP, RPM, HP, etc.

Troubleshooting is made easier using **Pumptec** Software to evaluate different scenarios.

Design Condition (To be filled in by distributor or owner)

The following data should be completed as a record of the duty for which the pump was originally sold. During its lifetime the pumping requirements may change; if so, the new speed and operating conditions must be carefully engineered. McLanahan engineers are able to assist you in doing this. U.S. units are used, unless otherwise noted.

Details of Solids

Description of Solids: _____

Noise Level: _____db (A)

Gland Options

Gland Seals

The **gland** is usually the weakest point on any **pump**; therefore, it requires the most attention and maintenance. All glands need cooling and lubrication between the sliding surfaces, so **a leisurely drip from the glands is normal**. **NOTE: DO NOT PREVENT DRIP.** All glands must be finally adjusted while the pump is running.

The McLanahan Glands have been developed to minimize the attention and service needed; Pressure of the fluid being pumped, the size and shape of the solid particles and the concentration of the solid particles in the liquid all affect wear and tear on pumps. Three unique seal arrangements have been developed and McLanahan engineers can give advice regarding the optimum selection for a specific duty.

"H" and "P" Glands

The slurry pressure at the gland is reduced by back pump out vanes on the impeller. The rubber axial expeller, which is a stretch fit on the shaft of the "H" and "P" glands, is used to avert waste.

The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the "H" Gland, the adjusting gland must be eased **outward** to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to provide a flawless seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible and at a pressure of about 3-5psi (2-4m water gauge) above the discharge pressure. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

“D” Gland

This is a unique type of mechanical seal. The **face seal** runs against the **hard wearing face**.

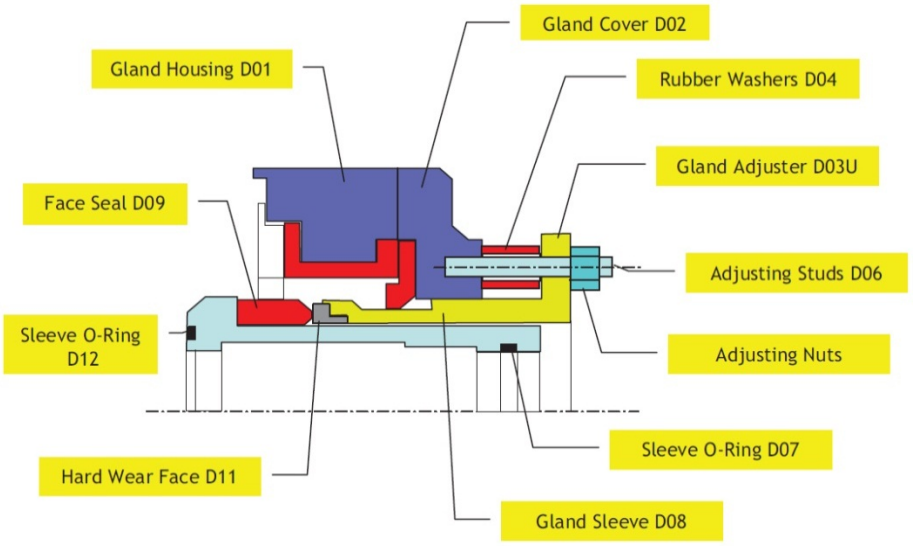
The **face seal** acts as a spring and if any grit particles get between the rotating rubber and stationary **wear face** it is pressed into the rubber. The **face seal** is a stretch fit on the **shaft sleeve**. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface. Be sure not to over-tighten the adjusting sleeve.

When the pump is first started, ensure that the adjusting nuts are finger tight. While the pump runs, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to a year without further attention in a good application.

Dry Gland

Also known as "D" type gland
This gland has a unique proprietary design and is unlike conventional mechanical seals. A rotating rubber **face seal** is adjusted against a static **hard wearing face**; it is **self-lubricating** - pressure from inside the pump head forces small amounts of liquid between the surfaces for lubrication.

Note: The gland needs no external water source to lubricate the gland; both small amounts of water and the fines do exit the pump, accumulating at its base, hence the term **dry gland**.

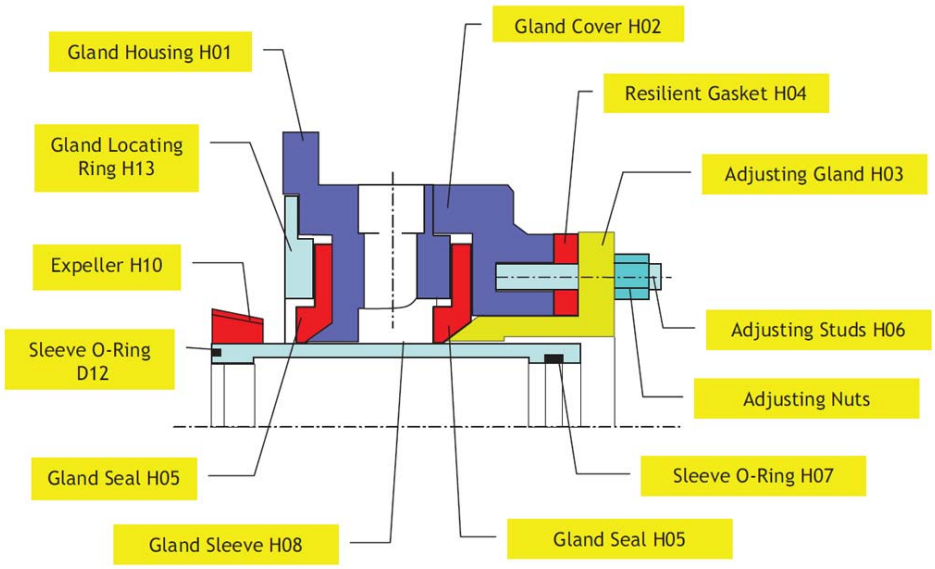


The **face seal** acts as a spring; if any grit particles get between the rotating rubber and **stationary wear face**, it is pressed into the rubber. The **face seal** is a stretch fit on the shaft sleeve. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface.

While the pump is running, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to one year without further attention in a typical application.

Hydrostatic Gland

Also known as "H" type gland
This gland has a unique proprietary design with the lowest maintenance and longest life. The unique rubber gland seal is designed to deflect inwards to provide an effective seal. The **slurry pressure** at the gland is reduced by back pump out vanes on the impeller; when fitted, it is reduced by the **rubber axial expeller**, which is a stretch fit on the shaft of the "H" gland sleeve.



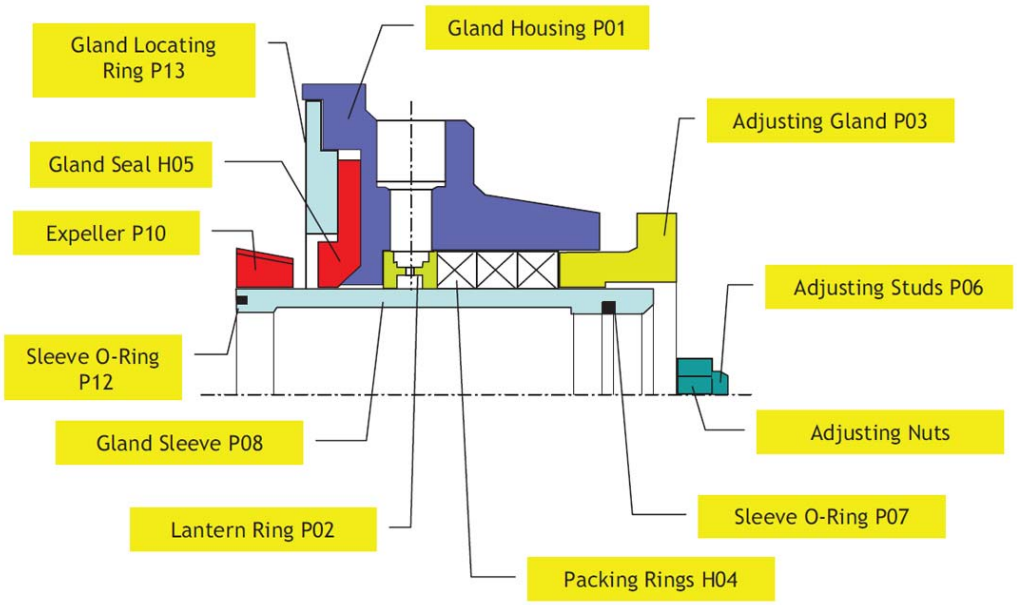
The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the H Gland, the adjusting gland must be eased outwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

Packed Gland

“P” Type Gland
In a classic “stuffing box” design, sealing is obtained by compressing the gland packing rings onto the shaft sleeve. The gland offers the capacity to seal the pump even at high pressures, for instance, in series pumping.



The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the “P” gland, the adjusting gland must face inwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of “digging” onto the gland sleeve.

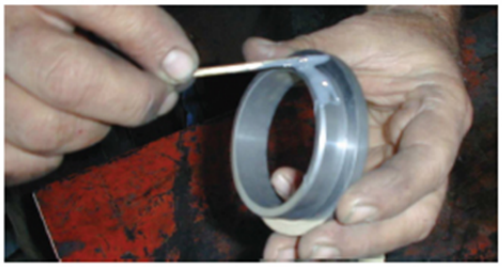
The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

A pressure-fed grease supply can be used with the “P” gland; be sure to use synthetic rubber parts (special order).

Assembly of Dry Gland – Hard Wear Face & Gland Adjuster (2” x 2” shown)

1. Check all components

2. Extrude epoxy from package & mix thoroughly



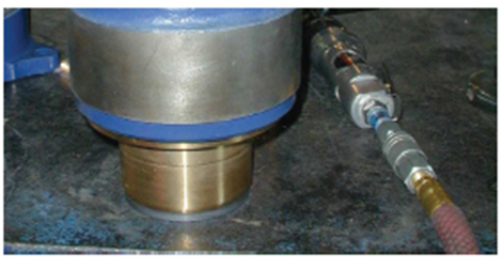
3. Apply epoxy to outer rim of Hard Wear Face (D11)

4. Place ‘O’ Ring (D10) on outer rim of Hard Wear Face (D11). Position ‘O’ Ring at leading edge.

5. Position Hard Wear Face & ‘O’ Ring into Gland Adjuster (D03U)

6. Using a slight twisting motion Carefully push Hard Wear Face into Adjuster

7. Wipe off excess epoxy



8. Place a heavy object on top of the assembly until dry (min 30 minutes)

General Pump Suction Requirements

A pump does not "suck," as fluid has no tensile strength. The centrifugal expulsion of fluids creates a low pressure area at the eye of the impeller; atmospheric pressure, plus any static head, pushes fluid into the pump. It is essential that suction systems do not restrict flow from the sump into the pump. With slurries, this is even more important as the solids themselves can settle and cause obstructions to flow.

In order to maintain the short pipelines and prevent obstruction**, cleaning is essential**. A trap to remove tramp material is beneficial as well.

Air entrained in the slurry reduces the pump's capacity and head; an air vent pipe on the suction pipe close to the pump inlet is often essential.

The pump will operate best if the flow velocity approaching the impeller is evenly distributed across the suction eye, and is sensibly axial, without swirl.

Pump performance is potentially impaired by a number of factors. Intake conditions in the sump, such as the formation of vortices, can cause an uneven flow over the eye of the impeller. Intake conditions in the suction pipeline, such as a sharp bend just before the pump, can affect performance as well.

Installation

Important Notes

- The maintenance of rotating machinery should be done by experienced mechanics.
- Protective clothing as well as proper tools and lifting equipment, all in good condition, must be used.
- Do not lift heavy weights without mechanical aids.
- Do not take any risks with your health and safety.
- If a pump has run without discharge, the fluid temperature and pressure may be dangerously high.
- The casing suspension arm is fitted as a maintenance aid only.
- The installer must ensure that guards are fitted in accordance with national & local regulations.

The following notes cover most situations; however, certain installations will require additional assessments.

Noise

Because of its heavy construction, rigid bearing housing and the sound attenuation due to the rubber lining, the noise generated by a bare shaft McLanahan Pump is low: less than 70dB (A).

The noise emission from a complete pump and drive unit will be dependent upon various factors including that from the motor, its fan and the V-belt drive. To obtain an indication of the noise level generated by a specific complete unit, take the highest component noise level, which is generally the motor, and multiply by 1.15.

For example:

dB (A) pump + dB (A) motor + dB (A) drive = 1.15 x dB (A) motor.

Other factors, including the piping system and hydraulically-generated noise as well as any reflected noise, will affect the final installed figure.

Foundations

Location and dimensions must be checked and matched to the pump-certified drawing when holding down bolts, bolt holes in steel work or pockets in concrete. The foundations must be rigid.

The pump base must be level in its final position; it must also be rigidly supported at each bolt, which is designed to hold it down, before the bolts are tightened.

Pipe Work

The suction and delivery pipe work must be independently supported and the pump must not be used as an anchor to pull the pipes into position.

The procedure for discarding solids in an emergency situation should be planned before it is needed. If the removal of suction and delivery pipe work is planned ahead of time, it will facilitate unblocking and servicing of the pump.

Precautionary checks that need to be completed include:

- Areas that could cause restriction on the suction side
- The possibility of thermal expansion in the pipework causing undue loads on the pump
- The pipework should match up to the pump without strain

The lining on the McLanahan model lllr is continued out to form gaskets on the suction and discharge flanges, therefore the use of joint rings or additional gaskets is not necessary. Connections to the pump should be made using flat-faced flanges only.

When fitting McLanahan pumps to rubber-lined equipment such as valves, hose or lined pipe, a steel gasket must be used.

Power

Check that the motor voltage, power and starter rating and supply match.

Gland Services

If gland sealing water is required, the quantity, quality and availability should be checked.

Access

Crane capacity and access routes from the delivery point should be checked. Access for maintenance, protection from flooding, as well as ventilation for motor cooling, must all be checked.

Impeller Adjustment Axially

The position of the rotating element must be set so there is a minimum running clearance, approximately 1/16” – 1/8” between the suction bush and the impeller. The bearing housing must then be locked into position. This clearance should be checked by bolting a dummy flange or stub pipe to the suction flange. This ensures any movement of the rubber lining on connection is allowed. Once connected to suction and delivery lines, the unit should be checked for free rotation.

Coupling Alignment

The pump and motor couplings must be aligned in accordance with good engineering practice. Axial or radial run-out must be less than 0.05 mm total indicated reading on a clock gauge. With V-belt pulleys, the faces of the couplings must be exactly in line and the shafts must be parallel to each other. A check with a straight edge or string line across the pulley faces should have no visible gap.

Motor Rotation

Before the belts are fitted or the couplings are connected, the direction of rotation of the motor must be checked. Incorrect motor rotation can cause the impeller to unscrew and destroy the pump.

Tension V-belts

When the motor's direction of rotation is correct, fit and tension the V-belts in accordance with the maker's recommendation. In general, a quarter to a half twist of the belt will be possible at the center of the belt by simply using fingers. Check the tension after a few running hours.

Belt Guard

The belt guard provided with this pump unit is manufactured with the shaft aperture fully closed with mesh. On installation of the V-belt drive and determination of pulley centers, the shaft guard is offered up and the mesh relieved locally to allow the shafts to pass through. Allowance may be required for movement of shafts when belt tensioning.

The mesh should be relieved and a guard should be fitted in a manner which prevents accidental contact with the rotating parts of the drive assembly.

The installer must ensure that the guard is installed in accordance with national and local regulations.

Gland Service

When these are fitted, be sure that gland water supply and protection systems are working.

Greased Bearings

The pump bearings have been greased at the factory. **Over-greasing them can cause them to overheat**; they should be looked over but may not need grease. **Suitable grease types** are: Shell Alvania 3, Mobil EP2, Caltex LS3 or their equivalents.

Final Checks

- All nuts and bolts are tight
- Gland adjusting nuts are finger tight
- No loose material is lying around the pump set
- The guards are securely fitted and the pump is safe to start

The running speed of the pump must not exceed the following:

Pump	1½ x 1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
MAX RPM	2750	2400	2100	1600	1400	1200	1200	900

Electrical Installation

This equipment must be installed and controlled in accordance with applicable national and local regulations.

Gland Services

On the hydrostatic gland and also on the packed gland, it is usually necessary to have a clean water flushing supply to the gland.

The pressure should be 3-5 psi (2-4m) water gauge above the pump discharge pressure (remember to include the S.G. of the slurry) and the flow rate should be in accordance with the table below.

Pump	units	1½x1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
Water flow.	USgpm	1	1	1	2	2	2	3	4
Water flow.	liter/sec	0.04	0.04	0.05	0.07	0.07	0.09	0.1	0.2

The gland flushing water should be clean. The life of the gland and gland sleeve is significantly affected by the cleanliness of the flushing water. Although a few particles will not do instant damage, the seal life will be reduced. Slurry must not be used.

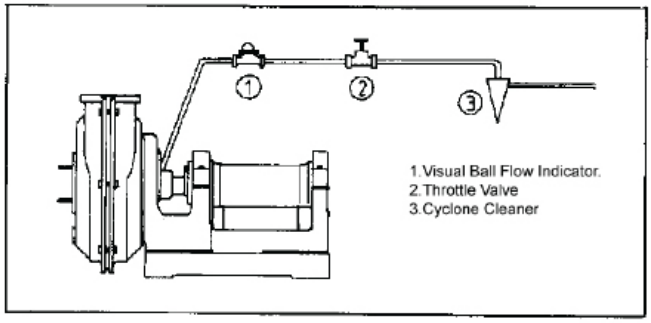
There are many combinations of flow control devices that may be used. A few of these are shown on the diagram below. The objective is to maintain a secure supply of clean flushing water to extend the gland life.

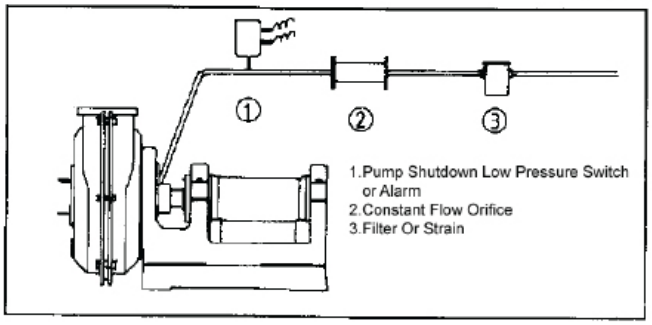
With pumps in series, there are three main ways of supplying gland service water.

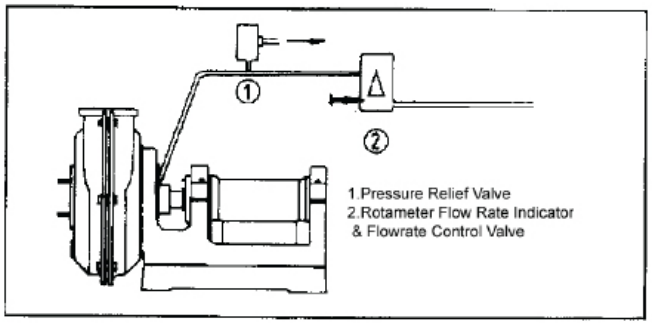
- Individual dedicated pumps at the correct pressure and flow rate.
- One large pump at the highest pressure throttling down the supply to each pump in the series.
- One multi-stage pump tapping off a supply at a different stage to each pump in the series.

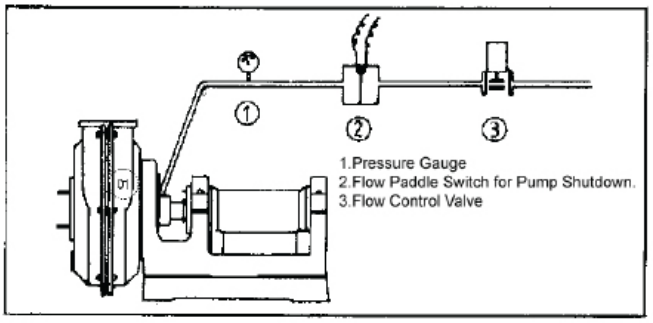
Gland Service Systems

These are a few typical systems. Any selection of items may be combined.









Lubrication and Cooling

Additional grease must only be added about twice per year, as the bearings are already lubricated. **DO NOT over grease the bearings**.

The bearing assemblies are all checked in the factory to prove that they are correctly assembled.

The bearings are designed to run at high temperatures (maximum 120° C) and the grease has to be compatible with this operating condition. Clean grease must be used.

If water gets into the bearings, the assembly must be stripped, thoroughly dried and greased over; then, any seal failure must be corrected.

Recommended greases are Shell Alvania 3, Mobile EP2, Caltex LS3 or their equivalents.

Start-Up Procedure

The recommended procedure to follow is listed below:

- Check the free rotation of the pump
- If required, verify that water for gland services is running
- At first start, or after any work on the electric motor terminal box, check direction of rotation **with drive belts removed**.
- Prime the pump
- Check that all guards are in place and that the pump is safe to run
- Start the pump
- If the pipeline is empty and there is no discharge valve (possibly due to abrasive nature of the product), the pump motor may be bogged down for a period of time and the pump may begin to go through the process of cavitation. This condition should be examined to evaluate the possible long term effect on the equipment.
- Check the pump for noise, vibration or any hot spots.
- **Adjust the gland to maintain a drip**, which is necessary for lubrication and for cooling.

Shutdown Procedure

This depends ultimately on the system and process flow requirements but the following procedure is recommended.

- Stop the flow of solids into the sump.
- Turn the sluicing water or run system on water only to wash out the pump and delivery pipeline.
- Shut down the pump.
- Shut down the gland service water system.

In cold weather, the pump and auxiliary equipment should be drained to prevent freezing damage.

Disassembly Procedure

Check that all power is switched off and isolated and that it is safe, electrically and mechanically, to work the pump. The following sequence is a general guide to stripping the pump for inspection. Refer to Cross Section drawings in Appendix.

On sizes up to the 4x4 (100x100) there is no separate suction bush or liner.

1. Remove the suction pipe and inspect for wear.
2. Check the suction bush liner for wear, noting any uneven wear pattern and position. Check the axial clearance.
3. Between the suction bush liner and the eye of the impeller (or on smaller pumps between the casing liner and eye of the impeller).
4. Remove nuts and suction bush. The suction bush liner is pushed out of the suction bush from the suction side. Some water spread under the lip of the suction bush liner will lubricate its passage out of the suction bush.

5. Remove casing bolts after supporting the suction side casing. Lift off the suction side casing. A crane will be necessary on the larger pumps.
6. The impeller is exposed for inspection. Hold the shaft using a spanner, which is a good fit, on the flats between the gland and the flinger. The impeller is screwed onto the shaft with an Acme right hand thread. The impeller may be very tightly locked onto the shaft and may need an impact force or a long lever to loosen it. If the impeller is to be used again, protect the rubber against damage. Inspect the impeller and note unusual wear patterns in the flow passages and back or front pump out vanes. Check that the "O" ring behind the impeller has sealed against the gland sleeve and slurry has not corroded the impeller or shaft thread. This "O" ring should be replaced at every strip-down.
7. Remove the axial expeller, which is a stretch fit on the gland sleeve. If "D" gland is fitted, the gland sleeve should be removed at this point.
8. Support the gland side casing, undo the casing to pedestal nuts and remove casing half along with the gland assembly. Undo the gland holding screws and remove the gland assembly. Undo liner nuts. The casing liner can now be removed for inspection; be sure to note any unusual wear patterns.
9. Remove bearing pedestal caps and fixings; unfasten the axial positioning jack to enable bearing assembly to be removed.
10. To disassemble the bearing assembly, remove the gland sleeve, flinger and bearing covers. The bearings can be inspected at this stage. If there is no sign of damage, the bearings should not be disturbed and they should merely be washed out with mild solvent oil and re-greased.
11. Press the shaft (with the bearing still fitted) out of the bearing housing. Push the shaft from the impeller side out of the bearing housing. The inner ring of the front bearing will still be attached to the shaft and can be removed later.
12. The remainder of the front bearing can then be withdrawn from housing.
13. Loosen the tab washer, undo the locknut and pull the end bearing off of the shaft.

Notes:

1. The 2x2, 3x3 and 4x4 pumps do not have a loose suction bush liner or suction bush.
2. The 10x8 (250/200) and larger sizes have the inside gland cover, which is held in position by (H14 / P14 / D14). Undo and withdraw the inside gland cover from the impeller side.
3. The Casing Suspension Arm is fitted as a maintenance aid ONLY and as much may be used to support **singularly**, either of the casing halves and its associated liner or the impeller. It must not be used for any other purpose. Suspension arm not fitted to 1.5 x 1.5 and 2x2 (50/50) pump.

Assembly Procedure

Before assembly, ensure all parts are clean and free of old grease and dirt. The new bearings or replacement bearings should be generously filled with grease between the rollers. Check that the Neoprene grease seals are not soft or distorted. Replace if necessary.

1. Clamp the shaft horizontally in a vice. Heat the spherical roller end bearing in an oil bath or induction heater to 240°F (115°C) and fit it to the drive end of the shaft using clean insulated gloves. Ensure the inner ring of the bearing is hard against its seat by tapping it with a brass pin. Fit the tab washer and the lock nut.
2. Fit the inner ring of the front bearing to the impeller end of the shaft. Ensure, by tapping with a brass pin, that it is hard against its seat.
3. Clamp bearing housing securely, grease bearing. Fit shaft and end bearing assembly into housing. Ensure that outer race of bearing is hard against seat.
4. Fit neoprene seal and bearing cover seal to end cover and fix to bearing housing using set screws.

5. Mount bearing housing vertically with front end upwards and wedge shaft so it is central in the housing. Fill front bearing with grease and carefully tap outer ring into bearing housing.
6. Fit neoprene seal and bearing seal cover to front cover and fix to bearing housing using set screws. Fit V-Ring Seal to shaft and place with slight tension against front cover. Fit flinger ring to shaft and locate in position using screw clamp supplied with flinger ring.
7. Set bearing housing assembly into pedestal and loosely assemble bearing pedestal caps with pedestal cap screws; fit axial positioning jack. Rarely, shims are required for shaft alignment; if factory fitted, the thickness of shim required will be stamped on the vertical face of the pedestal adjacent to the pedestal cap stud.
8. If "D" gland is to be fitted – loosely assemble gland components without damaging the wearing face when fitting. Leave the gland sleeve out, as well as "O" rings and face seal. Fit the gland side liner into the gland side casing by securing with liner nuts. Bolt the gland assembly loosely to the casing. Fit the casing and gland assembly to the pedestal using fixings; take care not to damage the wearing face against the shaft on assembly. Fit the "O" rings and face seal to gland sleeve. Slide home onto shaft, through casing and into the gland assembly. Carefully align gland components (specifically check concentricity of gland parts relative to the shaft) and tighten all fixings.
9. If "H" or "P" gland is to be fitted, fit "O" rings to gland sleeve. Slide home onto the shaft. Loosely assemble gland components, slide over shaft and onto the gland sleeve. Fit the gland side liner into the gland side casing securing with liner nuts. Fit the casing to the pedestal using fixings. Carefully align the components of the gland assembly (specifically check concentricity of gland parts relative to the shaft) and fit to the casing. The axial expeller will then have a stretch fit over the gland sleeve.
10. Smear the impeller thread on the shaft with protective long life graphite grease before screwing on the impeller, ensuring that the impeller "O" ring is fitted into the gland sleeve.
11. Fit the suction side liner in the suction side casing using liner nuts.
12. Fit the suction bush liner inside the suction bush before bolting it to the suction side casing using the bolts. NOTE: using soapy water will facilitate the process.
13. Check the concentricity of the fit between suction bush liner and the impeller.
14. Using the axial positioning jack, adjust the impeller toward the suction bush liner, keeping the holding down studs loose. Check the axial clearance between the impeller and the suction bush liner. A steel ring or dummy flange should be bolted to the suction flange to simulate any distortion in the suction bush liner when connected to the suction pipe before the axial clearance is checked. This clearance should be set at approximately 1/8". Rotate the shaft to ensure effective clearance.
15. Tighten the bearing holding down nuts and the axial positioning jack.

ATTENTION PLANT OPERATORS:
HANG THIS NEAR YOUR PUMP

McLanahan Model IIIr Centrifugal Pump With Type "D" Gland

MOTOR DIRECTION TEST

	ALWAYS PERFORM THE MOTOR DIRECTION TEST WITH THE V BELTS REMOVED

Note: The pump ships with the V-belts removed

	WARNING: RUNNING THE PUMP IN THE WRONG DIRECTION MAY CAUSE THE IMPELLER TO UNSCREW, AND DESTROY THE PUMP.

A motor direction test should be carried out without the belts installed before running the pump for the first time, or after any work on the motors, switchgear or softstart that may affect the direction of rotation of the motor.

STARTING UP AND RUNNING THE PUMP

	BEFORE STARTING, ENSURE THAT THIS PUMP IS BEING SUPPLIED WITH GLAND SERVICE WATER. RUNNING THE PUMP WITHOUT GLAND SERVICE WATER WILL DESTROY THE GLAND

With the pump full of water, and all isolation valves open (if present) start the pump. The pump should immediately start pumping.

BEFORE STARTING THE PUMP FOR THE FIRST TIME

The gland should be pre-set before starting the pump for the first time. To do so:

- Fill the feed sump with water and open the suction isolation valve (if present).
- Evenly adjust the gland Adjusting Nuts (see section 5) so a steady trickle leaks from the gland. Note: On a "P" Gland, tightening the nuts decreases the leak rate.

	WARNING: THE PUMP MUST NOT BE ALLOWED TO RUN IF IT DOES NOT DISCHARGE
	DANGER: RUNNING THE PUMP WITH NO DISCHARGE WILL CAUSE THE LIQUID INSIDE THE PUMP TO HEAT UP. IN EXTREME CASES THIS CAN LEAD TO THE LIQUID BOILING, & THE PUMP CASE MAY EXPLODE

The outside of the pump may not feel hot, as the rubber lining of the pump acts as thermal insulation. If by accident the pump has run without pumped discharge, it must be stopped immediately and the cause of the problem investigated.

	DANGER: IF IT IS SUSPECTED THAT THE PUMP HAS OPERATED WITHOUT DISCHARGE, EXTREME CAUTION SHOULD BE USED IN DRAINING THE PUMP – THE LIQUID INSIDE MAY BE DANGEROUSLY HOT AND UNDER PRESSURE

PRIMING

The McLanahan centrifugal pump is NOT self-priming. For this reason the pump must be installed with a flooded suction, or with the appropriate system for suction lift.

ADJUSTING THE "P" TYPE PACKED GLAND:

Before starting, the gland should have been adjusted so a steady trickle leaks from the gland (see section 2). Check that Gland Service Water is being supplied. See the Manual for details of the flow & pressure requirements.

Final adjustment of the gland should be done with the pump in operation. Tighten the adjusting nuts until the leak reduces to drips. (60 drops /minute maximum, 5 TO 45 drops per minute minimum). Care must be exercised not to tighten too much, which may lead to damage to the seal.

	WARNING: THE ADJUSTING NUTS SHOULD BE ADJUSTED INCREMENTALY, EVENLY, AND IN TURN, TO ENSURE THAT THE GLAND COMPONENTS STAY PARALLEL. TIGHTENING ONE NUT MORE THAN THE OTHERS MAY CAUSE MISALIGNMENT AND DAMAGE TO THE GLAND

STOPPING THE PUMP

Before stopping the pump, it is advisable (if possible) to run the pump on clear water before turning it off, to prevent solids from settling out in the pump casing.

LUBRICATION

The Pump comes from the factory fully greased. The Shaft Bearings should be greased with the correct grade of grease every 1000 hours of operation. Inject grease into the grease nipples by six strokes of a regular size (2" diameter body) grease gun.

The recommended grease is "Conoco Tacna HD No. 2" or equivalent grade grease.

MAINTENANCE

Except for attention to the gland while the pump is in operation, there is no daily maintenance required on the pump. It is essential, however, that routine inspections be carried out, with the first such inspection taking place approximately three months from startup. This inspection should provide some idea of the wear rate, which will be a guide for scheduling future inspections and maintenance. For instructions on dismantling and reassembling the pump, see the instruction manual supplied with the pump.

SPARES

Recommended spare parts are listed in the instruction manual. It is recommended that a supply of the wear parts listed be kept in stock so as to minimize down time in the event of failure of the part. (SEE NEXT PAGE)

PUMP BEARING TEMPERATURE

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. At 150 F (65 C) the assembly will be uncomfortable to the hands for more than a second or two, but this is not unduly hot for the bearing assemblies. The bearings are designed to run at high temperatures, maximum 120° C.

1.5 X 1.5 DRY GLAND NITRILE PUMP SPARE PARTS LIST

OVERVIEW

McLANAHAN CORPORATION recommends that you keep certain replacement parts at your facility. These parts will be available in the event of a breakdown and will also be available to perform any repairs that must be made as a result of regularly scheduled maintenance checks. **McLANAHAN CORPORATION** stocks a wide variety of commonly used components; however storing these parts at your facility will eliminate the expense of air-freighting critical parts that may be required during a breakdown situation. Refer to the "PARTS LIST AND ASSEMBLY" drawing(s) to assist with parts identification, part numbers and quantities. Contact the Parts Department at **McLANAHAN CORPORATION** for price and availability of all parts for your McLanahan equipment.

Qty	Part Number	Description	Lead Time	
1	09111002000	Gland Repair Kit, Nitrile	Stock	
1	09110001134	Gland Side Liner	Stock	
1	09110001133	Suction Liner	Stock	
1	09110001135	Impeller	Stock	
1	09110002225	Bearing Repair Kit	Stock	
2	293946042	V-BELTS BX42	2 weeks	

Appendix - Long Term Storage

General:

The following are recommendations in reference to long term storage of McLanahan Pumps and Drives; McLanahan does not accept liability for components under these conditions. Documentation and photographic evidence is necessary for warranties to apply.

Preventive Maintenance for Stored Rotating Spares

In the absence of data on premature bearing failures and armature/shaft sag and imbalance, we recommend a general procedure as follows:

The motor shaft targets should generally be used on any motor of 50HP or higher. They also should be used on fans and any other large rotating equipment that sits in storage for lengthy periods of time. By rotating these shafts monthly (or more, depending on the floor vibrations), you are preventing armature and shaft sag as well as false brinelling of the bearings into the races.

You may also find some smaller motors that have premature bearing failures after prolonged storage in your facility. If this is the case, the shaft targets should be attached (with double-stick foam tape) and smaller motors must be rotated.

What is False Brinelling?

Whenever a **non-rotating bearing** is subjected to external vibration, **false brinelling** can occur. A protective oil film cannot form between the races and rotating elements when the bearing isn't turning, causing metal-to-metal contact. False brinelling can occur during transportation, typically truck or rail, and during motor storage if the storage area is subject to vibration.

Another type of brinelling, **true brinelling** occurs in **rotating bearings**.

Pump

If stored, the pump should be kept in a clean, dry, vibration-free environment. The shaft should be rotated manually every three (3) months, or at the same interval as recommended by the electric motor manufacturer. In order to care for the natural rubber linings and components, follow the recommendations below.

Electric Motor

The following information is reprinted from the WEG "Installation and Maintenance Manual for NEMA low Voltage Electric Motors"

Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three phase motors be raised by their eyebolts. Raising and lowering must be steady; otherwise bearings may be harmed. When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere. Other objects should not be placed on or against them. Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to re-grease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing

the protective film that impedes metal-to-metal contact. As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

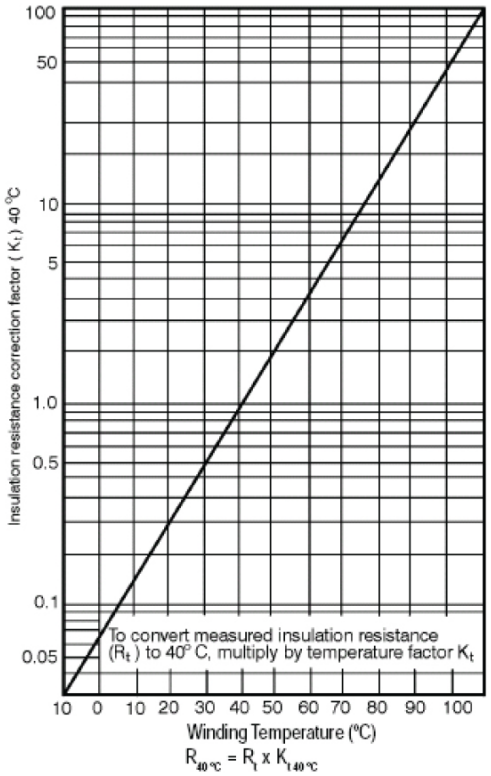
Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance. If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter. If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:
1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature. If the motor is stored for an extensive period, the rotor must be periodically rotated. Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula: $Rm = Vn + 1$

Where: Rm – minimum recommended insulation resistance in MΩ with winding at 40°C
Vn – rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance vs temperature of the winding (see graph below).



Example:
Ambient temperature = 50°C
Motor winding resistance at 50°C = 1.02 MΩ
Correction to 40°C

R 40°C = R 50°C x K 50°C
R 40º C = 1.02 x 1.3
R 40º C = 1.326 M&
The minimum resistance Rm will be:
Rm = Vn + 1
Rm = 0.440 + 1
Rm = 1.440 MΩ

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation.

This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service. On motors which have been in service for a while, a comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. The cause for any substantial or sudden reduction should be determined, followed by corrective action.

Insulation resistance is usually measured with a **megger**.

In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

Drying the windings

Only qualified personnel should carry out this operation. The temperature should not rise more than 5°C per hour and the overall temperature should not exceed 105°C; if either of these two things occur, vapor which is harmful to the insulation, may be generated.

Temperature should be accurately controlled and insulation resistance should be properly measured at regular intervals during the drying process. During early stages of drying, insulation resistance will decrease as a result of the temperature increasing. However, the resistance will increase again when the insulation dries a little more.

The drying process should be extended until successive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well-ventilated during the drying operation to ensure that the dampness is really removed.

Heat for drying can be obtained from outside sources such as an oven or space heater, or by introducing a current through the actual winding of the motor being dried.

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection. The installation of motors in environments where there are vapors, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) standards.

Under no circumstances are motors to be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air. The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects. The place of installation should allow for renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

Rubber Products

Rubber products in storage can be adversely affected by several factors, including:

- Temperature
- Humidity
- Ozone
- Sunlight
- Oils
- Solvents
- Corrosive liquids and fumes
- Insects and rodents
- Radiation

The warehousing area should be relatively cool, dark and free from dampness and mildew. All rubber products should be used on a first-in, first-out basis since even under these conditions an unusual length of time in storage can result in the deterioration of certain products.

The ideal storage temperature for rubber products is 50 to 70°F (10 to 21°C) with a maximum limit of 100°F (38°C). If stored below 32°F (0°C), some products may become stiff and should be warmed before being placed in service. Rubber products should not be stored near sources of heat, such as radiators and base heaters.

Rubber products **should not** be stored under conditions of high or low humidity.

To protect against the adverse effects of ozone, rubber products should not be stored near electrical equipment that may generate ozone and should not be stored for any lengthy period in geographical areas of known high ozone concentrations. Exposure to direct and reflected sunlight should also be avoided.

Whenever viable, rubber products should be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons; this will provide protection against the deteriorating effects of oils, solvents and corrosive liquids, and will also provide some protection against ozone and sunlight.

Certain rodents and insects thrive on rubber products, so the equipment must be protected.

McLanahan ***Pump Applications***

Sand plants
Feeding sand and water to all types of classification and dewatering plants; effluent water transfer duties.

Coal preparation plants
For dense medium circuits, feeding hydrocyclones, filtrate pumping, handling the underflow from thickeners, disposal of effluent, etc.

Chemical manufacturing & Environmental applications
McLanahan pumps, by virtue of their various rubber linings, are suitable for pumping many chemical solutions, acid or alkaline, at moderate temperatures and for the disposal of effluent.

Cement manufacture
Slurry feed to: tube mill circuits, thickener feed and underflow, flotation plant circuits.

Metalliferous mining
Mill circuits, feeding hydrocyclones, cyanide plant filter residues, concentrates, tailings disposal and other pulp and slurry handling duties.

Irrigation systems and dredging
Silt removal in dams and canal sand traps

Paper mills
China clay slurries, paper stock, effluent disposal

Steel works and manufacturing applications
Pickling acid distribution circuits in plate and wire de-scaling plants, abrasive wet scrubber blow-down

Power stations
Boiler house ash disposal, de-scaling plants

China clay production
Feeding slurry to hydrocyclones and for general use in the preparation of china clay

Glass manufacturing
Feeding polishing media, sand plants, handling effluent

Troubleshooting

If a pump fails to pump through a blockage, switch off **immediately**. Take extreme care as the pump may be filled with scorching steam and solids at a high pressure.

Wear and Replacement of Parts

To obtain the best service and performance from the pump, periodic routine inspections should be executed. The rate of wear on pumps is not precisely predictable since it varies from one application to the next, so intervals at which these inspections should be made vary. Initially, the pump should be allowed to run for a period of time (for example, three months); afterward, an examination of the pump will give some idea of the length of life, which may be expected from the rubber-covered parts.

No Discharge When Pump Runs

The pump must not be allowed to run if it does not discharge. If it is noted that the pump has been running without discharge, cease it immediately.

Take extreme care in dismantling after such an occurrence due to high temperature and pressure, which may be present in the pump casing. Do not remove the drain plug until the fluid temperature in the pump has dropped.

Air Lock

Air lock in the casing is the most common cause of failure on a newly installed pump. Even when a pump is well below water level, it may retain a large bubble inside the casing, which prevents the start of pumping. This phenomenon is far more likely with horizontal undershot discharge branch arrangements than any other practical configuration. It is least likely with horizontal overshot arrangements.

If you suspect air lock as the cause of failure to pump, start and stop pump several times to drive the air out, one fraction at a time. When using this procedure, ensure that you do not damage the motor starter or burn out the motor by trying too many starts in a short period of time. The number of permissible attempts will vary with the equipment installed but usually it is safe to try one start every three to four minutes.

Inadequate Prime

Failure to pump may be caused by inadequate priming. This is usually rectified by allowing more time for priming to occur.

It is possible when “jet priming” to have such a small amount of priming water that the pump will never prime; in this case, more water for the priming option will be needed.

Usually, the diameter of the priming branch should be at least one-third of the diameter of the suction pipe. NOTE: 2” (50mm) will prime 6” (150mm), 3” (80mm) will prime 8” (200mm) etc. The minimum water required is about 30% of the pump capacity.

If priming is by vacuum pump, there must be a valve or at least an air-lock on the delivery side. The vacuum pump must be able to “beat” the air leakage throughout the gland. To assist in this, always attempt to prime with the gland water running, no matter what style of priming is being attempted.

Installation Faults

Failure to discharge on start-up can be caused by installation faults. The most common is inadequate sump capacity. The result of installing a sump with inadequate capacity is to risk repeated air-locks of the pump. This can happen when the pump reduces the water level, either allowing a vortex to form, which air-locks the pump, or (when water is introduced to the sump) it entrains so much air that it produces the same effect.

A small sump can easily prevent any discharge reaching the end of the pump discharge line. The only remedy is to extend the sump capacity. We recommend sumps of at least one minute's pumping time as a minimum. NOTE: This recommendation does not apply to feed regulating sumps in sand plants where greater capacity is required.

Other installation faults are more obvious, such as tramp material lodged over a pump suction or a kinked suction hose.

Brief Discharge Only

1. **Air Lock**

A pump with a suction lift and partial air lock will often start to pump at a greatly reduced rate after each start, and then it will give up completely. At the discharge end of the pipe this may appear as a brief surge followed by failure.

This problem can only be overcome by closer attention to the priming system.

2. **Obstructed Suction**

If the suction line is obstructed either by tramp material or a delaminated suction hose lining, the pump may start well. However, when the discharge rate rises, the suction obstruction throttles the pump in a way that it quickly fails by gross cavitation.

Detection of this sort of condition is difficult. The only way to guarantee finding out what is actually happening is by using a vacuum gauge immediately before the pump suction. An obstructed suction line will be indicated by a sudden increase in vacuum reading immediately before the failure.

3. **Lack of Delivery Resistance**

A pump, which is required to pump with a suction or with a fair length of suction pipe, although with practically no resistance on the delivery side, may pump briefly before failing. The reason for this is that centrifugal pumps on open discharge need positive pressure on the suction eye to prevent gross cavitation. If the installation does not provide sufficient positive pressure on the suction side, the pump will fail.

Usually, the easiest way to overcome this difficulty is to artificially create resistance on the delivery side by extending the pipe work or introducing a valve or other resistance, such as an orifice.

Pumps water but not solids

1. **Air Leaks on Suction Side**

Joints in the suction line or air entrainment with feed into a sump may be insufficient if they are made poorly. Poorly made joints sometimes prevent a pump from pumping water satisfactorily. However, when solids are introduced (particularly coarse solids) the pump has a more arduous duty; it has to entrain the solids into the fast moving stream in the suction pipe. In effect, it has to "dredge" the solids

into the stream. Even if the solids were already moving in the right general direction, they must be accelerated up to the water velocity and thus they act as a suction resistance for the pump.

Introducing solids into an aerated system will cause failure. The pump can only handle a small margin of solids when pumping water alone. Air leaks can usually be detected as water leaks when the pump is not running; **where water can get out, air can get in**. Air entrainment with the feed can sometimes be overcome by the use of baffles in the sump. The air bubbles have time to rise to the surface before being drawn down to the suction.

2. Poor Suction Line

Several different factors in the suction line may allow a pump to appear adequate when it is not. A long suction line, a line with a considerably small diameter or a line with a restriction (sudden step-downs in diameter are the worst) will all affect whether or not the pump can handle solids. The reasons for this are explained in the two previous paragraphs.

Reworking the suction line is the only solution to this problem. If the line increased in diameter it should be brought to the pump inlet diameter by a specially rolled flanged taper pipe. It must not be stepped down by a mismatch.

3. Electric Motor Wrongly Wired

Most Squirrel Cage Induction Motors can be wired in two ways: **Star** or **Delta**. In order to reduce the current surge when a motor is brought **on line**, some users start their motors in **Star.** They do this because this mode gives good starting torque and a reduced starting current surge. Then, change to running their motors in **Delta** once smooth starting has been achieved. The **Delta** mode of powering the motor increases the speed close to synchronous speed, which is maximum, and maintains a constant speed under variations in load.

If a motor is left to run continuously in **Star**, it will vary its speed dramatically with load. If a mistake has been made in the wiring of the motor, it may appear that the pump is unable to pick up solids but is still pumping water. The reason would be that on **Star**, the motor speed drops when the solids load comes on.

To detect this fault, the easiest method is to check the speed of the motor shaft and compare it with the Nameplate rating. There should not be more than a few RPM difference between Nameplate RPM rating and actual speed, no matter what load the pump is pulling.

NOTE: Correction of this fault is intended for an electrician.

Overloads for Motor Trip Out

1. Wrong Pump Speed

The power drawn by a centrifugal pump discharging through a given delivery system is approximately proportional to the cube of its speed. As an example, if the speed is changed by 20% to 1.2 times the original speed, you can expect its power demand to rise by the cube of 1.2, i.e. 1.728, or nearly 73% above the original. Even a rise in speed of 10% to 1.1 times the original speed will give a rise of 33% in power demanded by the pump.

The relationship is not exact but it is close enough for field calculation purposes.

If a pump is run at the wrong speed, it can make a considerable difference to the load drawn from the motor.

Calculation of the correct pump speed is based on:

- Flow rate to be pumped
- Difference in height between pump and discharge points
- Length, diameter and inner surface of pipeline through which pump must deliver
- Number of elbows, bends, valves, other fittings in pipeline
- Equipment at end of pipeline such as hydrocyclones, pressurized distributors, jets, etc.
- Grading, tonnage and specific gravity of solids to be pumped
- Pump performance curves

As far as fault finding is concerned, the actual RPM of a pump should be compared with the RPM specified. Corrections to pump speed can be made by pulley changes.

2. Changed Pipeline System

It is not uncommon for a pump speed to be calculated on the basis of a pipeline system intended to be used at the time of the negotiations for the purchase of the pump, but to be commissioned into service with a different pipeline system. A client may say, "but it's not such a high lift so the pump does not have to work quite so hard." **This is not true.** At a given pump speed, a pump will pump a larger amount through a shorter pipeline (or lesser vertical height) and **will take more power**, not less.

When confronted with this situation, the only thing to do is to calculate the correct **head** and RPM before making a pulley change. The affinity rule can be used or the drive can be recalculated.

3. Low Voltage

The power consumed by an electric motor is the product of the voltage, amperage and power factor for the motor. If a pump demands a certain power from the motor, the motor in turn will demand corresponding amperage from the electric supply system. However, if the voltage of the electric supply system happens to be lower than normal, the motor will draw extra amps to meet the pump's power demand. This way the power consumed by the motor, the product of voltage, amperage and power factor remains unchanged.

Circumstances where lower than standard voltages might be encountered include:

- When power supply is from a generator set
- At the end of a long trailing cable
- At the end of an electric supply system remote from the nearest transformer substation
- In an area where very heavy start-up loads can occur, such as near large crusher stations or long conveyor installations

Low voltage can readily cause a motor overload by drawing higher than expected amps; this is, in no way, related to the pump itself.

If low voltage is suspected as the cause of motor overload, a qualified electrician should be called.

4. Wrongly Set Overload Protection

All motor starting equipment has some form of overload protection equipment built into the system so a burnt out motor or locked-rotor motor does not cause more extensive damage. If a motor repeatedly drops out on overload and there is no other readily apparent reason, the electrical overload protection equipment should be checked.

5. Mechanical Fault in Pump

The pump shaft should be free to turn by hand. Remove the V-belts and check the pump shaft for freedom to turn. If there is no resistance, the fault must be in the motor. If a jarring or resistance can be felt when attempting to turn the pump shaft, drop off the suction pipe and check the clearance between the impeller and suction plate. Also check for blockages.

If this proves clear, remove the suction bush and look for marks on the surface of the impeller, which might indicate if the impeller has been rubbing. In this case, rotate the shaft again to determine if the resistance is still present; if it is, remove the impeller and inspect the gland side liner. If there is still no evidence of rubbing, rotate the shaft by hand again to check that the resistance is still present; then, remove the gland sleeve. If the resistance can still be felt by hand it can only be the bearings of the pump.

The remedies for the faults, which may be revealed by this step-by-step approach are:

- Impeller rubs on suction bush: release bearing housing, set impeller to suction bush clearance by adjusting position of bearing housing until impeller runs free. Tighten bearing housing. Replace suction pipe. Re-align belt drive.
- Impeller rubs on gland half lining; reset the suction bush clearance. Check for movement of casing liner.
- Seizure in the gland area. Strip and inspect.
- Shaft tight in bearings; there is no simple field remedy if the pump shaft is found to be tight in the bearings, the rotating assembly must be removed and stripped for inspection of the bearings and grease seals.

6. Air Entrainment

In sump-fed pump systems, air entrainment with the pump feed can produce periodic overloads on the motor by the following sequence of events:

- Air entrainment with feed gives the pump a “spongy” pulp, which reduces the pump throughput and power.
- Flow through the sump is reduced allowing air in the feed now entering the sump to escape to the surface. Solids, of course, reach the pump suction.
- The pump now has a largely de-aired pulp of far greater percentage solids than intended, and the power demand rises. At this stage the pump may choke. This is a dangerous condition.
- Pump entrains the accumulated solids into suction pipeline and begins to pump normally again, increasing throughput through sump.
- Air entrainment begins to reach pump suction again and sequence repeats.
- Air entrainment can permanently reduce slurry throughput and make it appear as if the pump is not working.

In small installations this surge may be repeated at three minute intervals; in large installations, it may take as long as five minutes for the full cycle to complete. If the cycle terminates at stage three, the pump may explode, if it is left to run while blocked.

Pump Handles Only a Limited Percentage Solids

Pump Speed Incorrect

With increasing solids feed into a pumping system three major factors will limit the percentage solids handled:

- Friction resistance increases, leaving less pressure on the delivery side to maintain the velocity in the pipeline
- Critical (settling) velocity for the pulp in the pipeline increases
- Pump performance "drops" so that the total head generated by the pump diminishes

Clearly, if the pump speed has been calculated for water only, increasing tonnages of solids are fed into the system; the combination of factors above may soon produce a situation where the pipeline velocity is too low to maintain movement of the solids.

Air Entrainment

Under 15.3, section 1 above, there is an explanation of how a pump can handle water, but due to the air entrainment, fails when solids are introduced to the system. The same fault can sometimes explain why a pump appears to perform well on pulp up to a certain percentage solids, then "gives up" when this is passed.

Poor Suction Line

A suction line layout as described in 15.3, section 2 is far worse as the percentage solids is increased and can become completely blocked.

Cavitation

If a pump is expected to draw relatively coarse solids from a sump below the pump centerline, depending on the speed of the pump and its capacity in relation to the flow rate being handled, it may suffer from cavitation. When this happens, and the onset is often quite sudden and sharp, the total head generated by the pump diminishes dramatically. As described previously, the conditions for blocking a line are suddenly created; namely reduced delivery pressure for maintaining flow combined with increased requirement for velocity in the pipeline.

Generally, if cavitation is the source of the trouble, there is ample evidence; audible cavitation "rattle" in the pump or from the bearings, sudden reduction in power demand, the gland leaks or draws air and there is a dramatic drop in delivery pressure.

The solution to the problem is to make the suction arrangements as smooth as possible without restrictions as well as to arrange for the feed to come gradually up to load without sudden surges of solids. If these measures do not overcome the problem it may be necessary to change the suction line to a size larger and fit a flat topped taper-piece to the pump suction. If trouble persists, a larger pump will have to be installed. Something effective must be done as the situation is potentially dangerous.

Gland Will Not Seal Adequately

1. Poor Adjustment

The outer seal of a Hydrostatic gland assembly must be allowed to rub lightly on the gland sleeve for an effective seal to be maintained. If the gland adjuster is pushed in too far this will lift the seal off the sleeve and the gland will leak profusely. When seeing a leaking gland, most people immediately think

to tighten it. With the Hydrostatic gland, the **gland adjuster must be moved outward to reduce leakage.**

Type D and P glands should be tightened for reduction of leakage in the same way as standard packed glands in water pumps. **Over tightening should be avoided**, especially on "D" glands as a drip is always necessary to lubricate the rubber face seal.

2. Dry Running

The glands will not be damaged by a few seconds of running without lubrication and cooling by water, but if either gland runs for a length of time without water in the pump, there is danger of melting the rubber seals. If a Type D gland has been correctly adjusted, this is a fairly remote danger because without hydraulic pressure to force the rubber seal against the gland seat, the seal should run without touching the seat. However, do not run a pump in dry conditions because of the danger of damaging the gland seals.

Once seals have been damaged in this way, they must be replaced.

3. Too Much Sealing Pressure

Too much water pressure in either type of gland can make the glands almost impossible to seal reliably. With Hydrostatic glands the solution to the problem is to insert a pressure control in the gland water line. With Type D glands the problem usually only arises with pumps being run in a series or as booster pumps. In either case, the only solution is to convert the pump over to H gland or P gland and provide suitably pressured gland water.

4. Inadequate Prime

The "snore" condition for operating a pump is very difficult to seal without unacceptable leakage. Under this condition a pump continuously receives a good proportion of air drawn in with the pulp from the sump, in which the level is too low, or the sump has inadequate capacity, or both. The sump should contain a minimum of one minute's pumping time.

Excessive Heat in Drive

1. Slack V-belts

The most common cause for generation of heat in the drive to a newly installed pump is undoubtedly lack of tension in the V-belts. All V-belts should be tensioned periodically and newly commissioned drives should be re-tensioned an hour or so after start up.

This fault is easily detected (pulleys are the hottest part of the drive) as the belts will have been slipping.

2. Hot pump Bearings

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. Providing the shaft is free spinning by hand, the heat generated while running under power is probably immaterial. At 150°F (65°C) the assembly will be uncomfortable to the hands for more than a second or two; this is not unduly hot for the bearing assembles. If the bearing is failing, the shaft will not run free.

3. Inadequate Lubrication of Pump Bearings

The bearings will be charged with grease before dispatch from the factory. Details of lubricants are given in this Manual.

Addition of grease should be tried if bearings become very hot or noisy. Excess greasing should be avoided.

4. Motor Runs Hot

Motors are intended to run hot. With Continuous Maximum Rated Motors, the temperature rises are surprising and are allowed for in the design of the motor and the selection of the insulation.

Generally, heat from a motor can be safely ignored, provided the amperage drawn is lower or equal to the nameplate rating. Many motors are fitted with Thermistors in the windings, which sense the temperature rise and are wired to operate a cut-out relay if the temperature exceeds a safe limit.

If a pump is choked when the motor starts, the protection must trip out the supply to the motor.

Bearing troubles in motors are generally indicated b noise as well as heat and can sometimes be detected by use of a long-stemmed screwdriver. The blade of the screwdriver is pushed against the bearing cover and the ear of the investigator pushed up to the handle. With a limited amount of experience bearing "rumble" can quite easily be detected.

Sudden Reduction in Discharge

1. Change in Feed Conditions

Operators do not always recognize a pump as simply one element in a complete system and any change in that system will bear on all the parts of it. For instance, if a screen rejecting plus ¼" (6 mm) material is worn and passes 1" (25 mm) stones, this affects the pump performance. The suction resistance of the larger stones will cause the suction pressure to reduce and have less head available for pushing the pulp through the delivery side piping.

At the pump, the larger stones will make a significant difference to the pump performance, decreasing flow and potentially causing damage to Impeller and Linings.

In the pipeline, the large stones will probably progress by "saltation," that is, leaping along the bottom of the pipe. The rest of the pulp is fully in suspension and has to flow past these slow moving obstacles. Overall this means the resistance of the pipeline to flow has increased, thus, again reducing flow.

A simple fault such as a screen cloth with a hole in it can cause a sudden reduction in discharge. If it causes the pipeline to block, the condition is potentially dangerous.

Other changes in feed conditions, which must be investigated are: increased tonnage of solids, change of grading of solids and change in manner of introduction of solids to pump system. On this last count, a plant, which was started in summer, and is bin-fed via a vibrating feeder, will perform differently in winter when the wetter feed "hangs up" in the feed bin and collapses down onto the feeder intermittently in larger dollops.

2. Air leaks on the Suction Pipe

A pipe, which has been steadily wearing away from the inside may break through to the open air near a flange (in a welded area) at the bottom of the pipe, which is where the coarsest solids run. In a suction pipe this will almost certainly allow air into the pipe with all the resultant ills described elsewhere.

Frequently, a pinhole leak will not allow enough air into a pump for any of the five faults listed to become critical. Operators, being human, postpone the repair or replacement of the worn pipe. The last chapter of the saga occurs surprisingly quickly and usually on nightshift – when fault produces a blocked pipeline.

3. Suction Blockage

In dredging applications there is always the danger that the pump suction will be suddenly submerged in collapsed solids from the surrounding pit contours. When pumping from a sump, the same thing can happen when solids, which have been clinging precariously to the steel sides of the sump, subside and momentarily block the pump suction.

If the pump is feeding a fair length of delivery piping, it will not be possible for the long column of pulp in that piping to come instantly to rest when the suction gets blocked. The pulp in an 8" (200mm) pipe, 1000 ft (300 m) long, moving at 10ft/sec (3 m/sec) has considerable momentum. It cannot be stopped dead in the same short length of time it takes to block the suction.

The result is a massive reduction in pressure throughout the system. It can cause a massive "water hammer" and surges that can split the pump casing, valves and piping. This can cause hoses to collapse – delivery as well as suction – and almost invariably leads to a great gulp of air being sucked through the pump gland. Usually this is sufficient to air-lock the pump.

When an operator hears the air hiss into the gland and then has to contend with the resultant air-lock, the assumption is that the gland is at fault for pump failure. However, the trouble generally begins at the end of the suction pipe and the gland collapses afterward.

In dredging applications, better control should be taken over the pit development. In sump-fed systems, the feed pulp can sometimes be directed to flush away any build-up of solids on the sides or valleys of the sump.

If this is not possible, a larger capacity take-off box at the base of the sump must improve the situation. The blocked pipeline situation is potentially dangerous.

4. Tramp Material

The simplest explanations of a fault should never be overlooked. If the complaint is sudden reduction in discharge, drain the sump and before removing any pipe work or dismantling the pump in any way, examine the take-off box at the base of the sump.

Sudden Increases in Power Demand

5. Damage Inside Pump

Pumps wear with each use. Results of abrasion, which will give an increase in power demand, are shown below in order of occurrence frequency.

- Excessive gap between impeller and suction bush
- Cut or ripped rubber in suction bush or casing gland rubbing against impeller
- Worn out cutwater
- Worn out or broken casing liners
- Impeller worn through back shroud
- Impeller passages worn significantly wider than intended

6. Change in Pipeline System

DO NOT alter pipeline system by shortening or changing layout. If altered, it will pump larger amounts and take more power.

7. Low Voltage

A new installation near the pump site can make a significant difference in the amount of voltage available, depending on the electric distribution system in the area. Lower volts means higher current for the same power output of the motor.

8. Changed Pump Speed

When dismounting both pump and motor pulleys, electricians have, in the past, interchanged the pulleys when reassembling the pump set. Ensure this does not happen.

9. Air Entrainment

In sump-fed pump systems, air entrainment can produce cyclic pump overload, caused by a change to the amount or direction in which a sump is fed. It could also be caused by a casual change to the feed type baffle arrangement in the sump.

Rapid Component Wear

1. Air Entrainment

As an experiment, place some sand in an empty bottle, fill the bottle to the very top with water, place the palm of one hand over the top and shake the bottle. You will find it difficult to move the sand vigorously against your hand. Now tip out a third of the water, and repeat the test. You will undoubtedly feel the sand in the air-water froth hitting your palm.

The point of the experiment is to show how much more readily sand can move around in froth than it can in water without air bubbles. Therefore any air leaks in the suction side accelerate abrasion.

If air entrainment is severe enough to produce an air lock in the presence of solids and water, the result is an escalation of the abrasion rate.

Air entrainment can also cause severe abrasion indirectly. With cyclic changes in pulp density due to air, the pump may have to handle far denser pulp than intended. This is also an abrasive accelerator.

2. Properties of the Solids

When confronted with a rapid abrasion problem such as coarse or sharp-edged particles, always reduce pump speed if possible. A larger pump with a larger diameter impeller will be rotating slower at the suction eye of the impeller for a given head than a smaller pump would. So, if wear on the leading edge of the vanes occurs, a larger pump would help.

3. Change in Feed Conditions

A change in feed conditions, such as extra tonnage, coarser grading or higher proportion of crushed material will all affect the rate of wear on a pump. As an example, deposits from a river are notoriously variable; the proportion of crushed sand in relation to natural sand can vary widely. However, to the operator, sand is sand, and the fact that the pump is now handling, say 80% crushed material, while three months ago it was 60% natural sand may not appear significant.

If there is a permanent change in feed conditions, which makes component life unsatisfactory, consider modifying the pump. A two-stage pump set will allow each pump to run at about 70% of the speed that a single unit would run, which would make a significant change to the abrasion rate.

4. Shaft Misalignment

After several years of wear and tear, the saddles on the pedestal occasionally wear out, thus allowing the shaft to point downward. If the eccentricity of the shaft through the gland is severe enough, the gland will not seal properly. There will also be a misalignment between the eye of the impeller and the suction bush, which will detract from pump performance. In this case, the most effective solution, reducing cost and saving time, would be to purchase a new pedestal. Temporarily, the saddles may be packed with shims; however, these inevitably get lost during impeller adjustment.

Mechanical Failure

1. Broken Shaft

Typically, the only broken shafts on McLanahan pumps are those where there has been tramp material in the feed, a bearing has seized, or slurry has worn through the gland sleeve. In this case, wear will of course weaken the shaft.

2. Broken Pedestal or Casing

Although the front bracket of the pump pedestal appears massive, it can be broken down from the box section of the pedestal by simply starting the pump backwards. As a result, the impeller will begin to unscrew from the shaft, and while in motion, strikes the suction bush, which is fixed in place by the flange of the suction pipe work. Because something has to give, occasionally, with older shafts, the thread in the shaft is stripped instead of the pedestal being broken.

Realigning broken pedestals can be quite difficult; therefore, the quickest, most cost-effective way to fix a broken pedestal is merely to replace it.

A pump running backwards is an electrical problem, which is overcome quite easily, and should not happen to begin with. Electricians are required to check the direction of rotation of a motor prior to fitting the V-belts onto the pulleys.

3. Pump Explodes

The centrifugal pump (McLanahan or any other) can potentially explode by running with pulp or water in the casing when there is no discharge. This can happen in a pump that is drawing pulp from a sump and pumping it to a cyclone through a rising pipeline. If the pump receives a sudden surge of solids, which blocks off the suction, flow will cease. In the delivery line, the solids will settle in the rising pipe but will be unable to enter the casing because the impeller will still be spinning.

As the impeller rotates, the pump will continue absorbing power. The power raises the fluid temperature. The water will eventually boil and the pressure may be enough to destroy the rubber or cause the pump head to explode. **If a pump head feels unusually warm and is not discharging**, switch the power off immediately. **Do not approach the pump** until it has been relieved of pressure, preferably through the suction or discharge pipework by flushing away the solids plugs. A sign that a pump may explode will be a considerable amount of steam leaking from the gland.
